It is many years since I saw this lovely evergreen shrub flowering so freely as it is at the present time in the gardens at Wych Cross Place, Sussex. The plants were placed in their present position against a south wall eight or nine years ago, and, though of slow growth, they have made considerable progress, and at the present time are in full bloom. The foliage somewhat resembles that of a holly, though rather smaller. The flowers are tubular in shape, and bright red and yellow, and are very conspicuous against the dark-green, shining foliage. When well established and in full bloom, no shrub that I am acquainted with is more attractive. Though introduced as far back as 1853, it is like a great many other hard-wooded plants — not generally cultivated. In some places in the south, where the winters are not too severe, this shrub does well in the open. The largest plant I ever saw was growing in the open in a garden in Dorsetshire; it was then a good-sized bush. Some cuttings I had from this plant were rooted, and planted in the gardens at Buxted Park, where they grew well, but were killed during a severe winter some few years ago. In the north, where the winters are more severe, the desfontainea is worthy of cultivation under glass; in fact, it was as a greenhouse plant that I first made its acquaintance. When grown out in the open it should have a sheltered position, but grows best when afforded the protection of a south wall. At Wych Cross Place it usually needs no protection. The soil most suited to its requirements is that of a light, sandy, peaty nature; given this, and a well-drained position, it makes one of the most interesting shrubs we have. Cuttings will root freely under a bell glass in a mixture of peat and sand.

### Cæsalpinia japonica.

I have on more than one occasion drawn attention to this most interesting shrub. At the present time it is flowering most profusely and is very attractive, the long spikes of canary-yellow flowers standing upright, like those of the horse chestnut, well above the foliage. This is a shrub of more recent introduction, and deserves to be far better known than is the case at the present time. It is about a quarter of a century ago since I first saw it. In habit the foliage somewhat resembles that of the thorn acacia, but the flower spikes are more loose, and stand erect. When in bloom, as it is at the present time, there can be no two opinions about its beauty as an ornamental flowering shrub. It needs a sheltered position to grow well.

### Ozothamnus rosmarinifolius.

Close to the specimen of Desfontainea at Wych Cross Place is an example of this ozothamnus, covering a large space on a terrace wall, and is now covered with its small white flowers. This is a native of Van Diemen's Land, therefore, is not hardy in all parts of this country, but where the situation is favourable it grows freely. When planted in a warm position facing south, and afforded a little protection during severe weather from the biting winds, it does well. The soil round the roots should be mulched in winter to prevent the frost reaching the roots. Should the plant be cut back by the severity of the weather, young growths will spring up again from the roots. Propagation may be effected by cuttings inserted in sandy peat under a bell glass or in a cold frame; they should be potted up, and grown on for two or three years in pots to have them well established before planting them out.

## PECKHAM RYE PARK.

This favourite resort of South-east London is, compared with most parks, of a decidedly unorthodox character, as within recent years a large natural wood, containing glades and avenues, mainly consisting of elm trees, has been added thereto. An old farm, too, has been merged into the area of the park, and now forms one of the most delightful features to be found there. What was formerly the kitchen garden of the farm house is now the site of an Old English garden, so termed, for, though it contains many old-world features, yet the floral display is, in many cases, at least, brought up to date by the addition of the finest of the newer forms. The pergolas there are well furnished with the choicest of climbing roses, as well as other subjects.

What is of great importance to the visitor is that wide-spreading umbrageous trees are scattered here and there, and the seats, which are numerous, form a delightfully cool retreat during the summer. Though this desire for shade has not been so pronounced this year as it was last, yet many of the trees are sufficiently dense to keep off a good shower, and on this account they have been often appreciated. The plentiful—one might almost say lavish—distribution of seats, is one of the most pronounced features of Peckham Rye Park, and one much appreciated by the general public.

Beside seats of the style to be met with in all parks, advantage is taken wherever suitable spots exist, to erect rustic ones of all sizes, so that the single individual in search of solitude may be accommodated, as well as the family party. Although in harmony with their surroundings, these seats are exceedingly comfortable, so much so indeed that they are usually well occupied, and tend to suggest the thought that this example might be more generally followed.

In this part of the park there is a space given up to a collection of uncommon trees and shrubs, most of which are in a thriving state. The different conifers represented by some flourishing examples are, considering their close proximity to a crowded neighbourhood, doing remarkably well.

It must not be thought that the whole of this portion of the grounds is left in a state of wild, untrammelled nature, as, of course, walks are, in some cases, indispensable, and there are many instances in which the "art that doth improve nature" may be noted. For instance, advantage has been taken of a low-lying portion, kept moist by a tiny streamlet, to plant hardy bamboos and other moisture-loving plants. The bamboos have not been planted many years, but they have made magnificent growth, so much so, indeed, that they and their associates promise ere long to be one of the features of the park.

Close by, in a spot sheltered from the east wind, a collection of camellias, at present limited in number, has been planted, and are thriving remarkably well. The profusion with which they bloomed, and the promise of a grand display as they get larger are equally remarkable. Given such a spot, camellias are a delightful class of outdoor shrubs, a fact which seems to be very generally ignored.

It must not be thought that the summer floral display suffers any diminution by reason of the attention devoted to more uncommon subjects, for there is a herbaceous border some 250 yards or thereabouts in length, which has a background of ornamental shrubs, and contains a choice collection of flowering subjects disposed in groups or masses, so that the prominent features of each kind can be plainly seen. A continuation of this border, which used to be devoted to a miscellaneous collection of summer-flowering subjects, is this year treated somewhat differently. Like the herbaceous border, this has a pronounced background of shrubs, in front of which is a broad but irregular belt of Paul Crampel pelargonium, with an edging of Cineraria maritima, Iresine Herbsti, and Kœniga maritima. This sounds decidedly formal, but it is not really so, as the shrubs in the background, and the various light-tinted subjects, such as Leucophyta (calocephalus) Browni, Artemisia arborea, and Gnaphalium microphyllum, are interspersed with the pelargoniums, all tend to tone down the mass of colour, and thus form a pleasing combination. Probably, owing to the fact that they are on raised ground, the pelargoniums are this season flowering with more freedom than they are in some places.

On the opposite side of the walk from this border the principal flower beds are situated, and of them it may be said that the reputation of former years is well maintained. Of course, the weather has been decidedly unfavourable for some subjects, while, on the other hand, there are others much more effective than was the case last year. Fuchsias have, as everywhere else, done remarkably well, and the collection at Peckham includes some varieties rarely seen planted out. Ivy-leaved pelargoniums are also satisfactory, and the effective arrangement of many of the beds shows that the matter has been thoroughly thought out. A large bed of succulents is very attractive, while specimen hydrangeas in full bloom, plunged in the turf, show their adaptability for this mode of treatment.

A very important item in connection with public parks nowadays is that provision must be made to enable the public to play different kinds of games, a work that entails a considerable amount of forethought on those responsible for the carrying out of details. At Peckham there is a large space devoted to cricket and football, and to this a bowling green has been recently added. Beside these attractive features a band plays frequently on Peckham Rye, just outside the precincts of the park.

W. T.

---

**Gentiana asclepiadea.** — The Willow Gentian is a valuable plant for the rock garden, for it produces its lovely purple-blue flowers all along the stems at a time when few subjects are in flower. It succeeds in ordinary moist soil, and can be naturalised in favourable positions in the wild garden, especially by the stream side. The white variety is equally worth growing, but is not quite so vigorous in growth.—J. GARDNER.

**Plumbago rosea.**—This ranks as one of the brightest and most beautiful warm house plants we have for winter flowering, and now is the time to encourage free growth by feeding the roots periodically. The plants require liberal culture during the growing season in order to produce as many strong growths as possible, each of which should yield a panicle of bright scarlet flowers in the winter months. Unfortunately, the plant is shy in "breaking" after stopping the leaders but if this be done judiciously, in conjunction with favourable atmospheric conditions, strong specimens with several growths will result. Admit air freely during the hottest part of the day, but close the house and syringe early in the afternoon.—H. T. MARTIN.

# NOTES FROM SCOTLAND.

## The Autumn Season.

The very welcome advent of three weeks' dry, breezy, and for the most part unclouded weather, with present prospects of a continuance of the same for some time longer, has wrought an almost magical change in vegetation, and the aspect of the country landscape in general; while in the minds of those largely or entirely depending upon the produce of the soil for a livelihood, it has banished the gloomy forebodings that prevailed a month ago in respect to agricultural matters. These were most acute in regard to the grain crops, which at the time were thought to be almost ruined with the continuous rains. Now, however, due in a large measure to sunshine and drying winds, bountiful and fairly well-conditioned crops are being garnered very rapidly, thus compensating to a considerable extent for the difficulty and extra expense incurred in cutting and winnowing the same.

## Bedding Plants.

All kinds of these are now making a fuller and brighter show of colour than at any time during the past summer; while herbaceous plants having grown very strongly, have since developed flowers in abundance, and many subjects that are usually past their best at this date mingle their colours with others that are true autumn-flowering species; hence but few blanks, always difficult to avoid in mixed collections, are in evidence.

## Roses in Garden and Shrubbery.

Interesting and beautiful as roses were at the latter part of July—a time, by the way, at which we were favoured with seasonable weather—they are scarcely less so now; added to which the colour of the blooms seems intensified; while their lasting properties, either upon the plants or when cut and used in vases, are far superior. Hybrid tea roses are, perhaps, the best and most reliable for autumn flowering, though many of the hybrid perpetuals leave but little to be desired in this respect; and, where the foliage has been kept clear of insect pests, long sturdy stems, surmounted by exquisite blooms and efficient leaf-growth, are now available for room or table decoration.

## Rambling and China Roses.

Many varieties of the first-named, but more particularly the Wichuraiana section, make a very pretty display of bloom until quite late in the season, which shows to good effect among the ever-changing foliage tints upon the various trees and shrubs by which the roses are surrounded. This refers to the suitability of this section for planting in partly-shaded positions, or where sunlight and air may be more pronounced at this time than at an earlier period; hence the flowering is retarded, and the blooms linger much longer than would be the case if fully exposed throughout. In gardens of any considerable extent there are usually trees, hard-wood or otherwise, that are passing beyond their youthful stages. Instead of removing these entirely, it is often possible to maintain some semblance of order by reducing the branches, and, after excavating and refilling with good soil a spacious trench about their bases, to plant therein one or several varieties of climbing roses, selected to colour according to taste in this respect, or the environment of the respective positions.

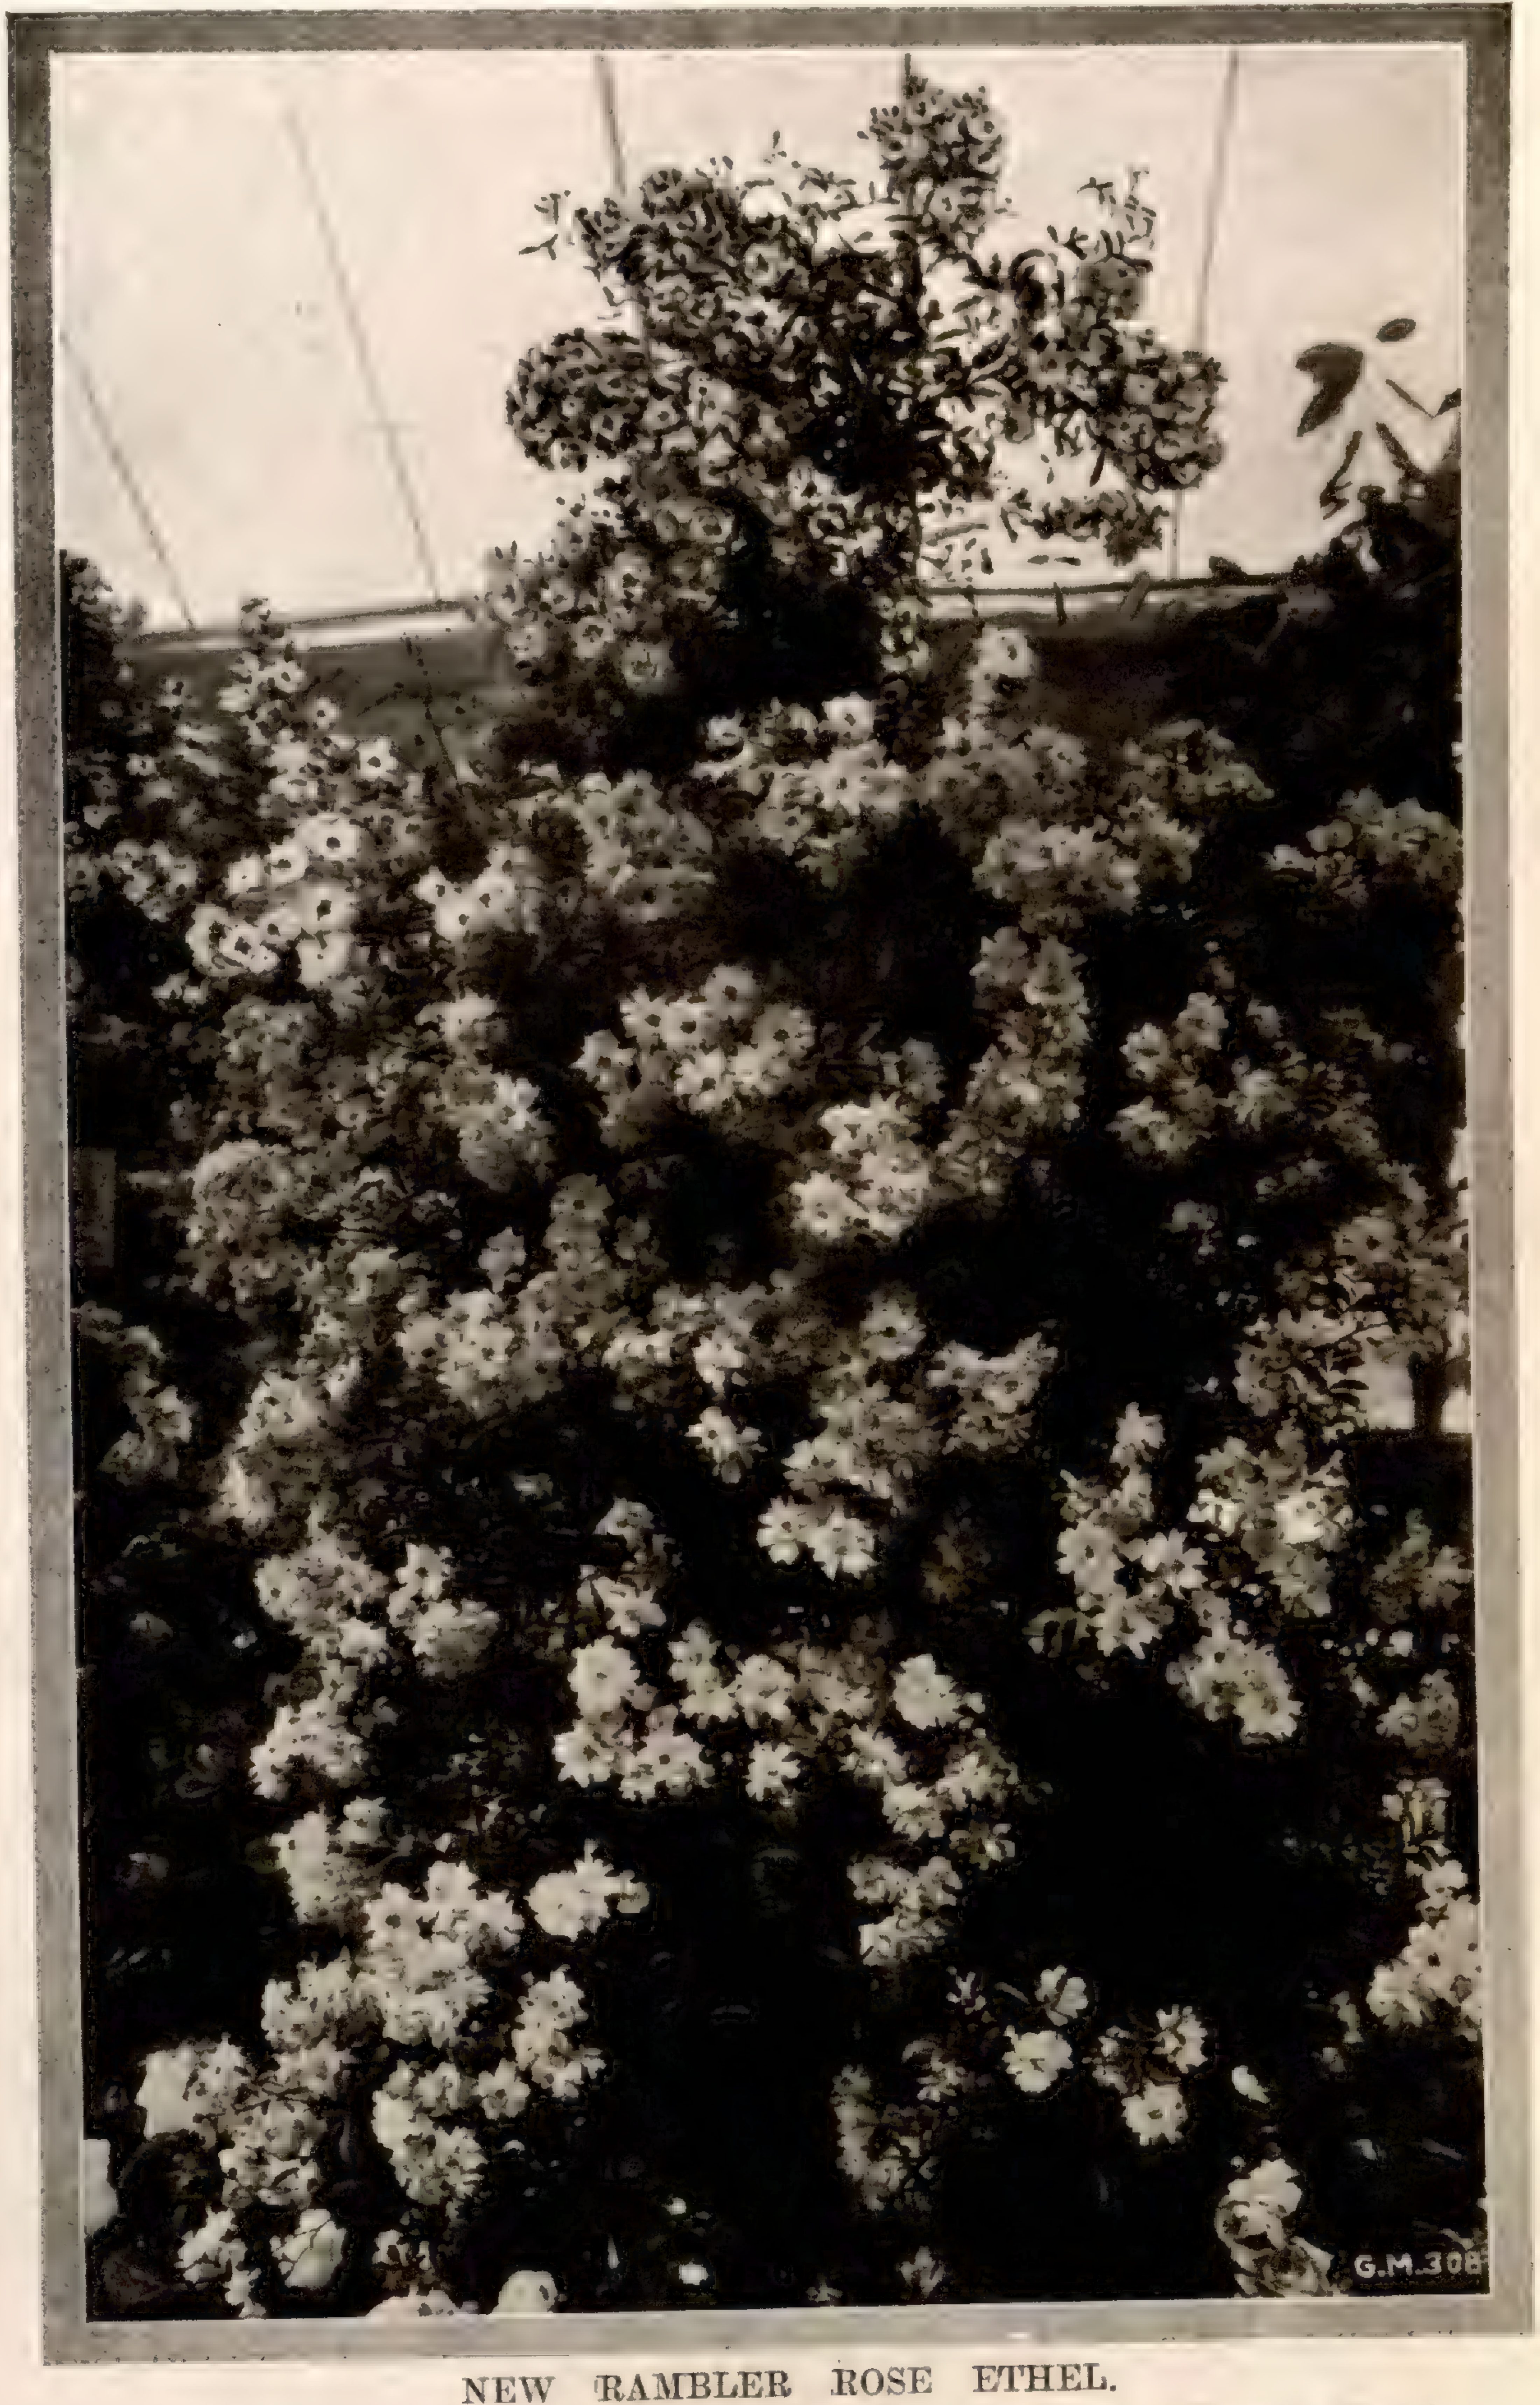
The China type of rose is generally considered a dwarf, which is so far correct while the pruning is severely carried out each year; but allowed to grow, and given the support of a wall or fence, the plants attain a height of several feet, or even yards, and flower profusely at this period of the year. Choice of aspect is of little importance with these, and the common pink variety grows here with more freedom against a wall whereon the sun has but little, if any, direct influence, than it does in what would be thought more highly-favoured positions. The flowers are very beautiful in appearance upon the plants. The crimson variety, Fellenberg, is the best of this class for massing with which I am acquainted. In growth it is moderately dwarf, very branching in habit, and flowers practically the whole season if the decayed flower-heads are kept off. Ducher (pure white) is good for variety, but the coloured forms seem to elicit most attention. Of these Charlotte Klemm, Comtesse du Cayla, Madame Eugene Resal, Queen Mab, and, lastly, the well-known favourite, Mrs. Bosanquet, are all worthy of extended cultivation, if only for autumn display.

James Day.

Galloway House, Wigtownshire.

# NEW RAMBLING ROSE ETHEL.

A rose of great beauty for garden decoration and one that has secured the recognition of two great societies is Ethel, a Wichuraiana variety for which Mr. Charles Turner, Slough, is responsible. It is a rambler of moderate growth, but particularly free-flowering, and carrying its medium-sized, semi-double flowers in very large and elegant clusters. The exquisite shade of rich pink colouring, with paler centre exhibited by the flowers of this charming rose make the variety most effective, whether the blooms decorate an arch or pergola, a wall or a pillar, or are used in a cut state in the home. At the National Rose Society's exhibition held at Regent's Park on July 7, 1911, Mr. Charles Turner was awarded a Card of Commendation for Ethel, and at the Holland Park show on July 2 of the present year the Royal Horticultural Society granted an Award of Merit.



NEW RAMBLER ROSE ETHEL.
Flowers bright pink. A.M., R.H.S., July 2. Mr. Charles Turner, Slough.

## NEW MEDAL ROSES.

In offering these few remarks on the roses which this year have been awarded medals by the National Rose Society in the seedling rose classes at Southampton, Royal Botanic Society's Gardens, Belfast, and Westminster, the writer trusts they will be accepted as merely first impressions, gathered, for the most part, from a few minutes' acquaintance in the place of exhibition; impressions which doubtless will have to be modified on a more intimate acquaintance with the varieties under review.

NEW H.T. ROSE BRITISH QUEEN.
Flowers creamy-white. Gold Medal, N.R.S., September 12. Messrs. S. McGredy and Son, Portadown.

The most striking feature of the seedlings exhibited this year is the colour--yellow in all shades and degrees—which makes the description of them somewhat difficult. Of the following medal roses of 1912, one has an opinion that, for a grower of specimen blooms, Coronation, a seedling of Messrs. Hugh Dickson, Lim., will prove the best rose of the year, and Mrs. F. Vanderbilt, a seedling of Messrs. S. McGredy and Son, the most useful for decorative purposes, grown outdoors. And yet neither of these roses gained the highest award!

British Queen.—H.T. (S. McGredy and Son), creamy-white, good size, superb shape, pointed globular, petals reflexed, blooms produced on slender upright stems, sweet-scented, habit branching, very free-flowering. It seems to be just as good in damp weather as in dry, which is surprising, as the texture of the petals is somewhat thin. The raiser has a very high opinion of it, and no wonder, as when seen growing at Portadown in July, a batch of several hundreds, the sight viewed from a distance appeared as a veritable snowstorm. On a closer inspection of the plants, the difficulty was to find any rough, or even damaged, flowers; every bloom, large or small, seemed perfect. Silver-gilt Medal, N.R.S., Belfast. Gold Medal, N.R.S., Westminster.

Colleen.—H.T. (S. McGredy and Son). Blooms carried erect, colour bright pink, with deeper shading, high-pointed centre, large, very attractive. Habit, on maidens, vigorous, upright, free-flowering. The depth of petals was remarkable. We understand that Mr. E. G. Hill, of Richmond, U.S.A., thinks so highly of this rose for commercial purposes that he has acquired the distributing rights of it in America. Silver-gilt Medal, N.R.S., Belfast.

Coronation.—H.P. (Hugh Dickson, Lim.). Soft clear peach pink, very large, globular, superb form, petals of good substance and reflexed, very double. One of the largest roses hitherto exhibited. Foliage dark green and leathery. Habit, as seen on maidens, similar to Frau Karl Druschki. Free-flowering. A massive, very attractive, and most promising "exhibition" variety. Silver-gilt Medal, N.R.S., Belfast.

H. E. Richardson.—H.T. (Hugh Dickson, Lim.). A very sweet-scented rose, the colour of Horace Vernet. Blooms of medium size. A beautiful group of this was staged at Belfast rose show in 1911, as well as this year. Habit, on maidens, tall, carrying the flowers upright. The blooms, however, like Horace Vernet, have a tendency to come rough. Silver-gilt Medal, N.R.S., Belfast.

H. Vessey Machin.—H.T. (Alex. Dickson and Sons). A large rich crimson flower, petals of good substance and reflexed. Habit, as seen on maidens, short and upright. The plant, apparently, does not carry many flowers, but those it has are exceedingly handsome. This variety will probably be wanted by exhibitors of specimen roses. Gold Medal, N.R.S., Belfast.

Irish Flame.—T. (Alex. Dickson and Sons). A decorative single tea of the Irish Elegance type. Of similar growth, but the flowers are smaller and more cupped. Colour very striking, distinct, ruddy bronze-yellow, difficult to describe. Best in the bud stage. A grand basket of this variety was exhibited at Southampton, but, from an inspection of the plants at Newtownards, one is inclined to think it took a good many plants to fill such a basket. It will, however, be wanted by exhibitors in the table decoration classes. Gold Medal, N.R.S., Southampton.

Lady Mary Ward.—H.T. (S. McGredy and Son). Colour, rich orange, shaded yellow. Medium-sized flowers, habit dwarf. Very distinct and attractive, especially as seen growing at Portadown. Gold Medal, N.R.S., Belfast.

Little Dorrit. — T. (Paul and Son). Blooms salmon-pink, flamed rosy-crimson, medium sized, well-formed, semi-double flowers. Silver-gilt Medal, N.R.S., Westminster.

Mrs. Andrew Carnegie.—H.T. (James Cocker and Sons). Colour lemon-white, large pointed bloom, sweet-scented, petals of great depth, but thin in texture. An enlarged Niphetos, erect. The flowers exhibited had the appearance of being grown, or at least shaded, under glass. It does not seem to have been exhibited at the N.R.S. shows again this year. Gold Medal, N.R.S., Royal Botanic Gardens.

Mrs. Charles E. Pearson.—H.T. (S. McGredy and Son). Colour orange, flushed with red. Apparently a Pernetiana of the Arthur H. Goodwin type, but much deeper in colour. Blooms of fair size, imbricated form. In a large batch of seedlings at Portadown, by reason of its remarkable colour, it was the first to attract the writer's attention. A charming decorative variety. Gold Medal, N.R.S., Westminster.

Mrs. C. Reed.—H.T. (Messrs. Lowe and Shawyer). Colour pale pink, with lemon shading, globular, resembling Clara Watson. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

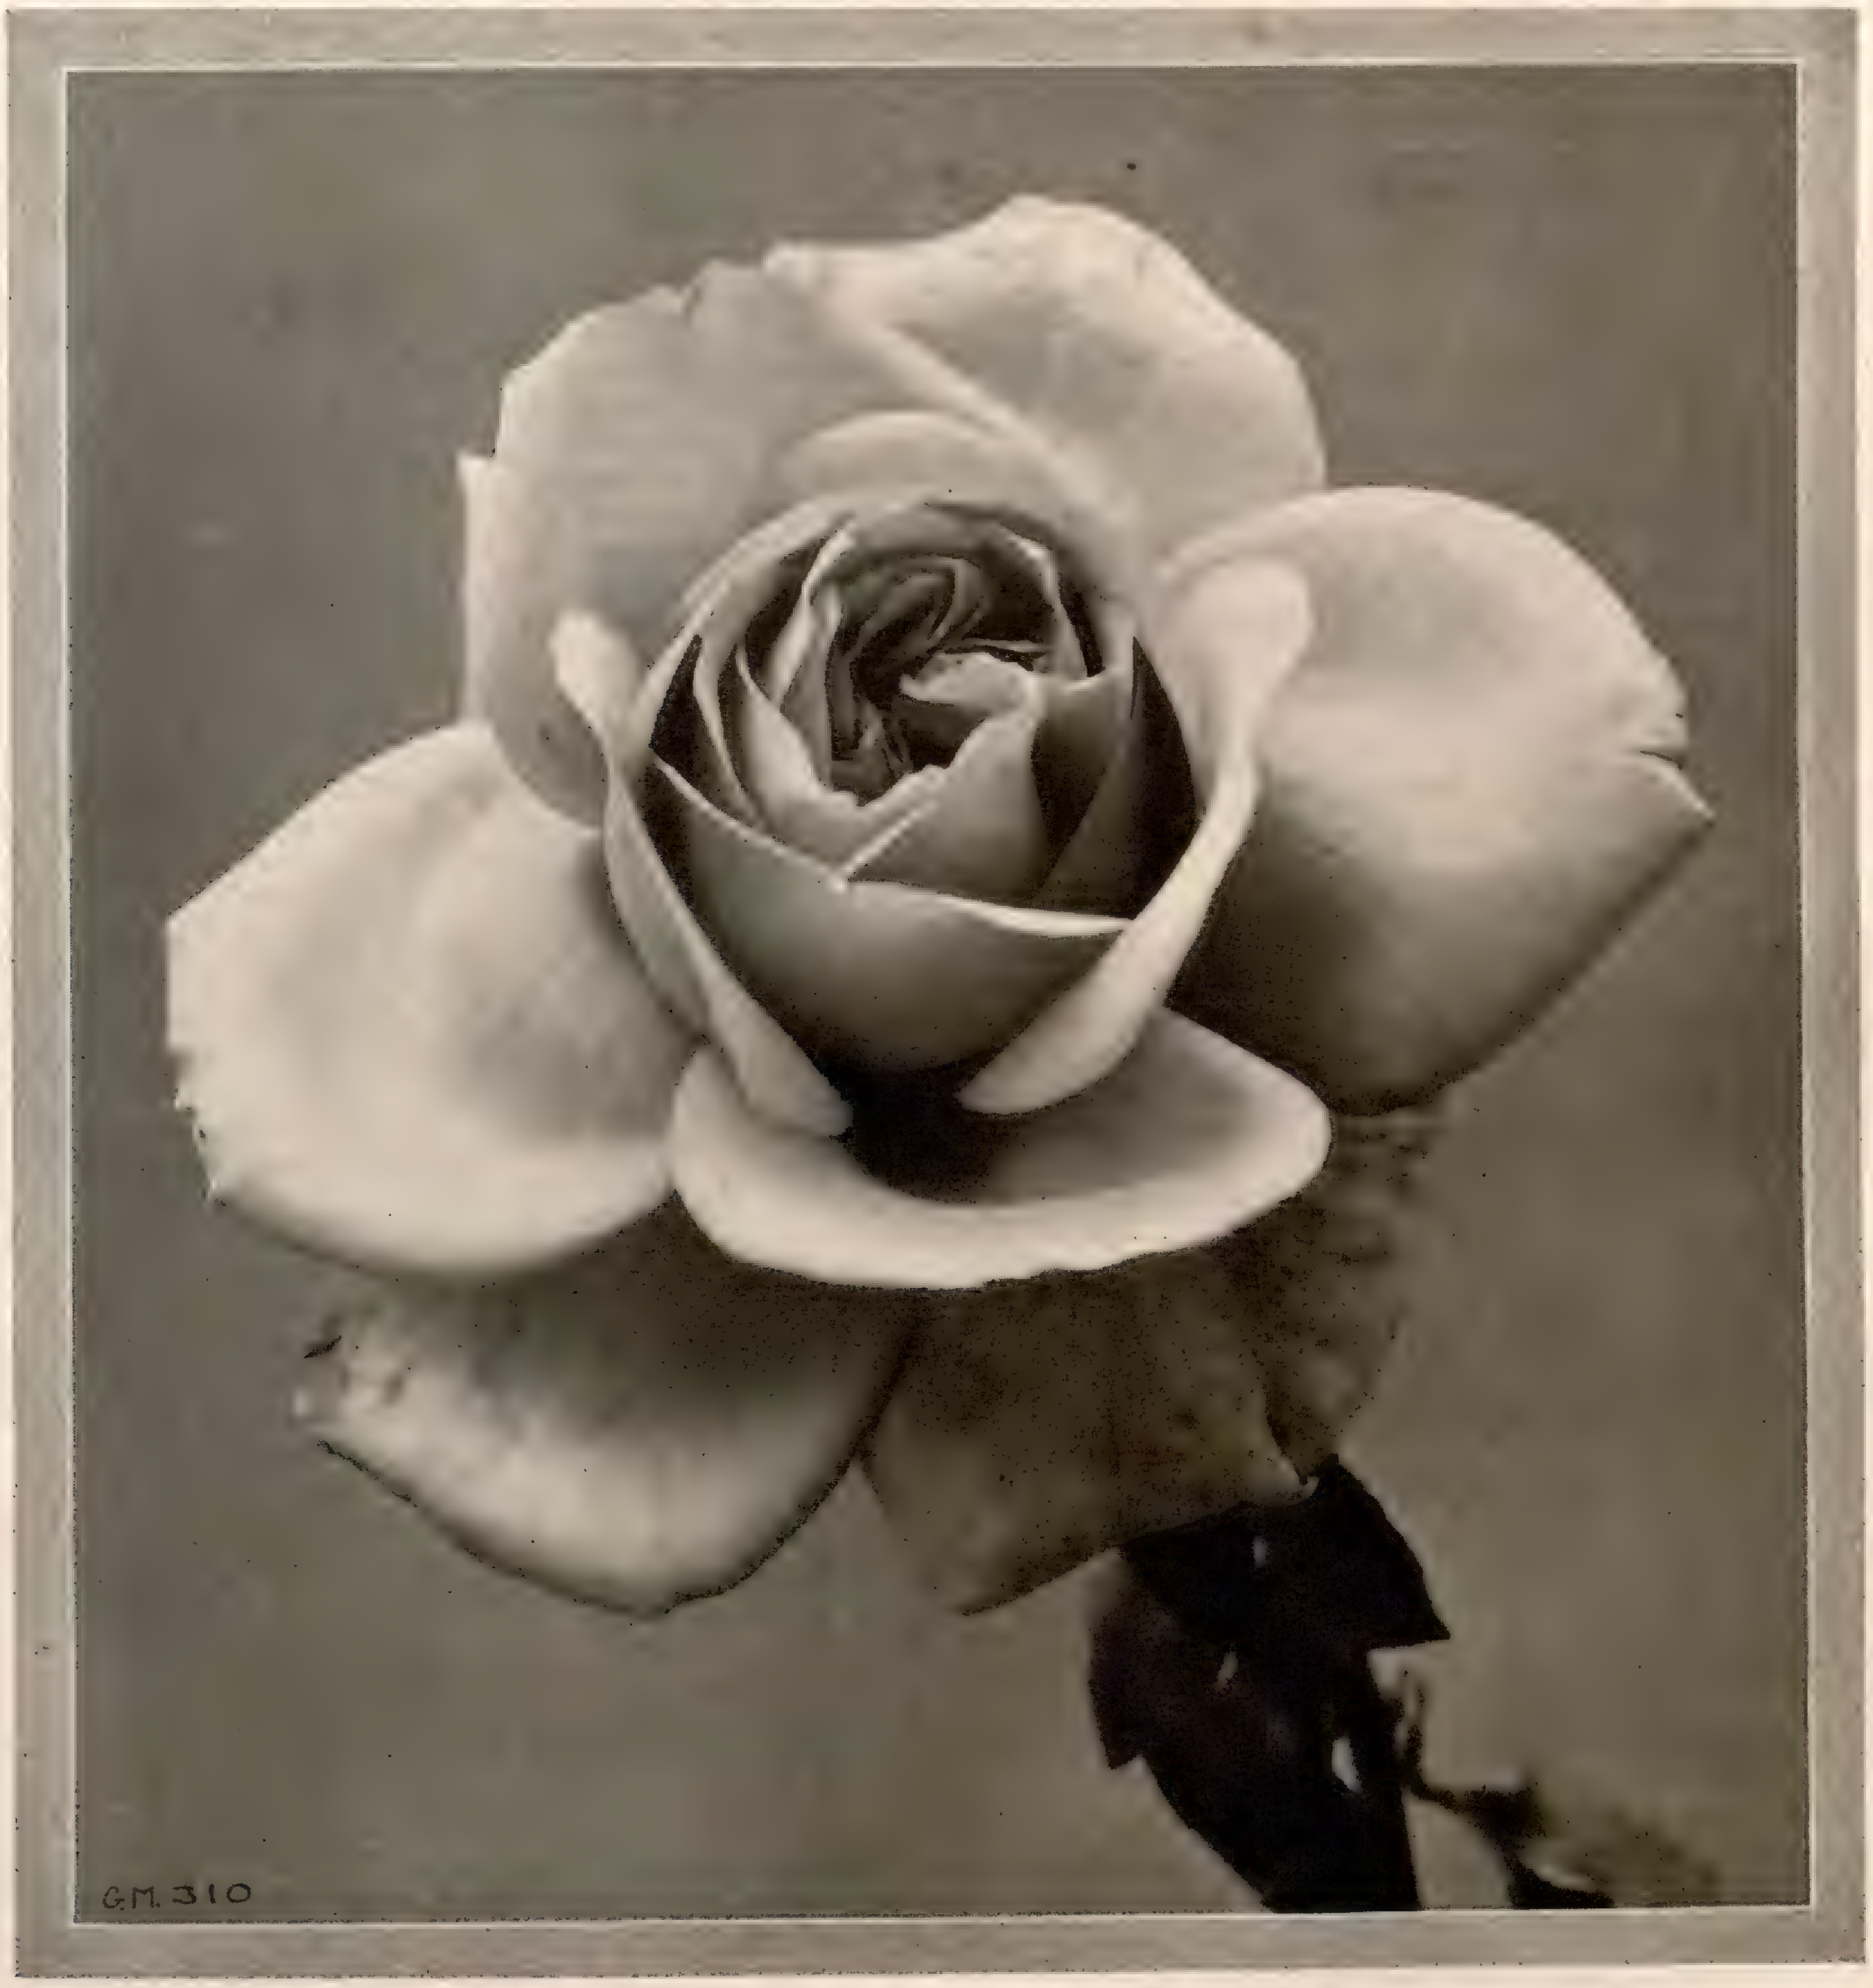
Mrs. C. S. Hunting.—H.T. (Hugh Dickson, Lim.). Colour light chamois-yellow, difficult to describe. Petals firm, apparently of free-flowering habit. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

Mrs. E. Part.—H.T. (S. McGredy and Son). A decorative variety, the colour of which is difficult to describe in definite terms, a blend between brilliant red and deep salmon. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

Mrs. James Lynas.—H.T. (Hugh Dickson, Lim.). Flowers large, blush-pink, good form. Silver-gilt Medal, N.R.S., Belfast.

Mrs. R. D. McClure.—H.T. (Hugh Dickson, Lim.). Colour soft rose-pink, shaded salmon; of the Lyon Rose type. Attractive as exhibited. Silver-gilt Medal, N.R.S., Belfast.

Mrs. F. Vanderbilt.—H.T. (S. McGredy and Son). Colour deep orange-red. A splendid stand of this remarkable variety was staged at the Belfast exhibition. As seen at Portadown the colour was very attractive. A promising, distinct, decorative variety. Silver-gilt Medal, N.R.S., Belfast.



NEW H.T. ROSE MRS. S. C. HUNTING.
Flowers chamois-yellow. Silver Medal, N.R.S., July 9. Messrs. Hugh Dickson, Lim.

Moonlight.—H.T. (Rev. J. H. Pemberton). A perpetual-flowering cluster rose; colour lemon-white, with golden stamens, semi-single; habit vigorous, branching; growth, three to four feet. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

Old Gold.—H.T. (S. McGredy and Son). A decorative rose. Colour scarlet, orange blooms, small but elegant, best in bud stage. It is likely to be in much demand for table decoration, the colour being so distinct and attractive. The basket of this variety received an unanimous vote; it was so well arranged. The exhibitor has a large number of plants from which to cut. Gold Medal, N.R.S., Royal Botanic Gardens.

Queen of the Musks.—(Paul and Son). A pretty cluster rose, apparently of dwarf habit. Light pink semi-double flowers. Silver-gilt Medal, N.R.S., Westminster.

Queen Mary.—T. (Alex. Dickson and Sons).—A small-flowered semi-single decorative rose. Sweetly pretty. Colour, lower half of petals bright yellow, upper half brilliant rosy-pink. In form it resembles a china. Habit free, branching, blooms erect. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

St. Helena.—H.T. (Benjamin R. Cant and Sons). Colour distinct, cream, with pink flush. Flower of perfect shape in the way of Joseph Hill, high-pointed centre, petals reflexed. Growth vigorous. Should prove useful to the exhibitor of specimen blooms. The raiser staged a beautiful twenty-four box of it at Southampton, and a magnificent flower at Colchester show. Gold Medal, N.R.S., Southampton.

Sunburst.—H T. (Pernet-Ducher). Probably the most attractive rose of the year, as exhibited. Colour a definite orange-yellow. Blooms of medium size, pointed, produced on long footstalks. Habit, as seen at Lyons, robust and branching. In the open, the blooms of the first growth are pale lemon, some almost white, but on the second growth the colour is deeper, although not so rich as when cultivated under glass. It promises to be one of the best new forcing roses. Silver-gilt Medal, N.R.S., Royal Botanic Gardens; Gold Medal, N.R.S., Westminster.

William Cooper.—H.T. (Hugh Dickson, Lim.). A fine flower of deep rose colour, pointed, borne on long, stiff stems, but not very distinct. Silver-gilt Medal, N.R.S., Royal Botanic Gardens.

George Dickson.—H.T. (Alex. Dickson and Sons). This rose won its award, a Gold Medal, at the N.R.S. show at Ulverston last year, and therefore lies beyond the scope of this article. Nevertheless, the raisers can claim for it a distinction that is seldom, if ever, reached by a new seedling in so early a stage of its career—a distinction of being awarded this year two Silver Medals, one at Regent's Park and the other at Belfast, for the best bloom of any hybrid tea in the exhibition. By naming this seedling after their much-respected father, Mr. George Dickson, the "Sons" evidently considered it an extra good rose—a view the writer took of it some two or three years ago. It is a magnificent well-built flower of the Horace Vernet type, but distinct. Colour velvety-crimson. Growth on maidens vigorous. Without a doubt it is one of the very best seedlings of 1911.

JOSEPH H. PEMBERTON.

---

**Verbena Miss Willmot.**—When properly treated this is a charming variety for filling a few flower beds in the summer time. Mildew is an enemy of the plants, and will soon cripple them if they are grown in a shallow soil or in a draughty quarter. Another important point is the proper hardening of the plants.—G. B.

## A SOUTH BULB BORDER.

There is infinite variety of interest to be gained from the culture of delicate bulbous plants out of doors, for not only are the suitable species extraordinarily numerous and beautiful, but experiments will establish gardening records, by proving that many a greenhouse subject will submit to outdoor life in England if suitably located and well treated.

The best, in the sense of the widest results, can be obtained in south coast counties, but there are many inland places where the conditions are favourable. Sometimes height above sea-level is the advantageous circumstance, ensuring dryness of winter atmosphere, as in many parts of East Sussex, where myrtles, eucalyptus, and aralias flourish in the open. Sheltered, warm valleys, however, are also admirable localities, since a raised bed or border can be adequately drained, and the concentrated warmth will then be unmixed with evil.

But in even an ordinarily genial garden, neither in a seaside town nor a noted health resort, wonderful displays can be gained from bulbous plants that are not hardy, if a border is devoted to them against a south wall, and either a few outjutting evergreens, or a length of wall or fence, are arranged to give protection at the two ends of the space. Racking southwest winds always do harm, because they come frequently in summer, tearing the blossoms into strips, and bruising the foliage that is generally so attractive in the lily family. East winds of spring are harmful in other ways, checking the young growth, nipping off the scarcely starting shoots, and chilling the soil. But with a screen afforded against each of these wind enemies, the south bulb border is certain to be a success; the number of species grown will have to be determined by the local temperature conditions.

It is best to start the border in August or September, as many bulbs can then be planted, while the soil will be in a perfect state for the plantings of later months. Equal portions of turfy loam, leaf-mould, old cow-manure, and half-portions of brick rubble and coarse sand, should constitute this soil, while peat should be added for lilies and such other subjects as like it. Burnt earth can be added if desired; some gardeners declare that most bulbs grow more robustly when spent hops are used for top-dressings, and ultimately hoed in, but burnt earth seems admirable as a preventative of fungus trouble, which is such a danger to all bulbs. The elimination of insect pests from the border is a matter upon the necessity of which each planter must decide for himself.

A slight slope from the back of the ground to the front is beneficial, but must not be sufficient to render the edge portion damp; the back of a south border against a wall will invariably require much artificial watering as rains that reach it will be few. If the ground is edged by turf that should slope also; if by tiles or rockery there should be fissures left through which surplus moisture will pass through to flow into catch-drains in the path. A strip of turf is the edging that best shows off flowers. It should be freely watered with a solution of carbolic powder or liquid, not strong enough to harm the turf, but to keep it from harbouring leather-jacket grubs and wireworm.

The August plantings should include freesias, autumn and winter crocuses, colchicums, and liliums in great variety; also the spring star-flower, Tritelia uniflora, white, and T. violacea, blue, striped with violet, and Allium neapolitanum, which will form fine masses in earliest spring if got in early. Montbretias should be added to the border directly the clumps have done blooming, as divided bulbs planted then give far finer results than if removed later. Tritonia rosea, known as the pink montbretia, should not be forgotten.

There should be a splendid flower show in this portion of the garden during nine months of the year, and a fair one throughout the remaining three, for hellebores, winter aconite, snowdrops, dicentras, Roman and Italian hyacinths, hepaticas, Van Thol tulips, Schizostylis coccinea, Chionodoxa, Anemone fulgens, irises, Anemone appennina, and Anemone blanda, are all suitable.

While arranging for massed displays of such flowers as appear at inclement seasons the gardener should yet devote his care chiefly to the rare summer beauties that would not live in a spot less favoured. Ixias, babianas, and sparaxis are of noted attractiveness; arums of red, brown, purple, and greenish-white must not be omitted as they are very curious and handsome. Callas, falsely called arums, of yellow and of white, may be bedded out for summer, while varieties of agapanthus can be kept out altogether in some places.

Other beautiful bulbous plants that can be tried are albucas, the largest, A. Nelsoni, reaching a height of 3ft., and yielding spikes of almond-scented white blooms; A. canaliculata, yellow, and A. fastigiata, greenish-white, being 18in. growers. Alströmerias offer shades of orange, crimson, yellow, rose, and blush-white. Bloomeria aurea gives plentiful yellow blossoms on long stems, when the Scarlet Twin-flower, (Bravoa geminiflora), will also be gay. The Roman Squill (Bellevallia romana), blue, rose, and brown-shaded; Bessera elegans, with pendant bells of cerise; Anomatheca grandiflora, crimson; A. cruenta, scarlet-crimson; Butterfly tulips, the white Cooperias, Geissorhiza Rochensis, blue with crimson blotches; and Ixiolirions, are other charming novelties of medium height.

Gladioli, kniphofias, Hyacinthus candicans and innumerable irises will give tall, elegant growth. Pancratiums are exceeding beautiful, especially P. (Hymenocallis) Daphne. Crown Imperials are of yellow and orange-red. Eucomis punctata has white autumn flowers, marked with rose, on 2ft. stems. Three feet high are the stalks of Cypella platensis, one of the most genuinely azure - blue, yellow - centred flowers. Crinums rank with Lilium auratum among bulbous giants. For shade-loving bulbs, such as fritillarias and Dog's Tooth violets, nooks should be arranged between groups of tall subjects.

Mulching the bulb border with cocoanut-fibre refuse in earliest spring will do much to hasten and protect growth as well as to show off the blooms and prevent mud-splashes. Green-painted sticks only should be employed.

M. H.

---

**Ilex crenata.**—As a distinct little evergreen for a small garden, this Japanese species of holly can be well recommended. It forms a compact, freely-branched bush, very effective when not more than a yard in height. The leaves, only about half an inch in length, are ovate lanceolate in shape, with a decided point, and markedly serrate around the edges. They are of a very deep green tint. There is a variegated variety whose leaves are prettily marbled with gold, and another, Fortunei, with rounder leaves and a rather more vigorous habit of growth. Being perfectly hardy, Ilex crenata can be safely planted where space is limited.—W.

## PEGGING DOWN ROSES.

The subject of pruning roses is one that is too often insufficiently considered. It may seem a simple matter to cut off certain parts, often a considerable portion, of the vigorous young shoots of rose trees, but is this always necessary or desirable? For exhibition purposes it is necessary to encourage the production of a few good blooms. In the pruning of rose trees, however, which are grown for garden decoration, or to provide flowers for cutting, quantity, within certain limits, rather than quality, should receive consideration. Having watched the development of a vigorous growth, some five feet to six feet high, on that beautiful snow-white rose Frau Karl Druschki, for instance, the gardener would cut off three parts of such a shoot with feelings of regret.

While for the majority of varieties it is necessary to follow the orthodox methods of pruning, there are a considerable number of vigorous growing sorts, particularly in the hybrid tea section, which when planted in suitable positions produce a very much greater number of blossoms when grown on what is known, for want of a better term, as the "pegging down" system. Instead of considerably shortening the long growths of the vigorous varieties, they are retained practically their full length, merely removing an inch or more of the unripened tips. All thin growths and old wood is cut out, and the vigorous growths bent down to within some two feet to two and a half feet of the ground. The most simple means of holding the shoots down in position is with hooked sticks, either placing the shoots under the hooks, or tying them in position with tarred string. Failing a sufficient number of hooked sticks, ordinary straight stakes, with notches cut in them to hold the string, will answer the purpose. A more permanent method is to fix a few iron stakes in the ground, and by connecting them with fairly thick wire, construct a light framework some two feet high over the bed or border. This has the advantages of permanence, while wooden stakes will not last more than one, or possibly two, years. For preference, however, I should choose wood, for when manuring or forking over the ground, and cutting out old wood and surplus growths in spring, the iron supports and wire connections impede the rapid completion of such work considerably.

These vigorous-growing roses are also among the best subjects for clothing low wire fences two feet to three feet in height. It is a very good and convenient plan to commence the pruning of rose trees in March by starting with those which are grown on the "pegging down" system. To commence with, probably two-thirds of the shoot bent down the previous year will require removal, as most of the vigorous growths to be retained will start from within one and a half feet to two and a half feet of the base. Also remove all old wood with no vigorous young growths on it, and thin out weak growth.

The following twelve varieties are selected as very good examples in habit, growth, and flowering qualities to cultivate on the system described and illustrated.

Frau Karl Druschki.—A superb rose with snow-white blossoms, large, full, and well formed. Though classed as a hybrid perpetual variety, it possesses in a marked degree the continuous and free-flowering propensities of the hybrid tea varieties. Its one failing is lack of fragrance. The illustration of a large bed of this variety at Kew is sufficient evidence of its value when the shoots are bent down instead of considerably shortened.

Gustave Regis.—This is a very vigorous variety. The buds are nankeen yellow, changing as they expand to creamy-white or light yellow. The open flowers are large and semi-double, displaying the stamens. The flowers are fragrant, and almost, if not quite, as freely produced in September as July.

Gloire de Dijon.—It hardly seems necessary to do more than mention the name of this lovely rose. Though introduced some sixty years ago, it is as popular as ever. One of the hardiest roses grown, it is very vigorous, the first to flower, and only checked by frosts in late autumn. In fact, in sheltered positions, during a mild spell of weather, it is sometimes possible to cut good flowers at Christmas. The buff-yellow blooms with the copper or salmon-shaded centres, are very fragrant. The varieties Belle Lyonnaise and Bouquet d'Or belong to the same type, and are very similar in growth and colour.

Clio.—This is a very vigorous hybrid perpetual, introduced by Messrs. W. Paul and Son in 1894. A bed of this variety at Kew, some 20 feet across, grown on the system recommended, I have seen with fully 2,000 flowers open at one time; on one shoot alone I counted 50 blooms, all in good condition. The flowers are flesh colour, shaded with pink, large and globular in form. The growths are very spiny.

A FINE BED OF ROSE FRAU KARL DRUSCHKI AT KEW.

Illustrating the advantages of the Pegging Down system in the cultivation of strong-growing varieties.

William Allen Richardson.—The deep orange-yellow colour of the buds of this rose place it at once in the front rank for garden decoration and cutting. It is often grown as a climber on walls and fences. Bending down the vigorous long growths induces the production of quantities of blooms, which would not be possible were the plants subjected to much pruning.

Soleil d'Or.—When introduced by Pernet-Ducher in the year 1900, the distinct colour of this hybrid briar rose at once attracted attention. Subjected to the usual hard pruning comparatively few blooms are produced, and its true value is only seen when the vigorous young growths are retained their full length and bent down. The blooms are orange-yellow, shaded with gold and red.

Gruss an Teplitz.—This distinct and free-flowering hybrid tea variety is a garden rose of great beauty. The large clusters of scarlet-crimson blossoms are prettily set off by the red tint of the foliage. It is one of the best autumn roses.

Billiard et Barre.—This is a vigorous variety of the tea section, introduced by Pernet-Ducher in 1899. The flowers are apricot-yellow, suggesting those of the well-known variety William Allen Richardson. They are freely and continuously produced, being particularly pleasing when half expanded.

Lady Waterlow.—There is much to admire in this distinct and pleasing hybrid tea rose. The pale salmon-pink blooms are semi-double; in the bud state, or half expanded, the petals are prettily edged with rose.

England's Glory.—It is only when the vigorous young growths of this variety are retained their full length, and bent down, that the value of the variety is seen. The deep flesh-pink blossoms are several shades deeper in the centre than are the outer petals.

L'Ideal.—A very distinct and pretty rose, particularly in the bud, and notable for its strong fragrance. The colour is a metallic red, shaded with yellow.

Juliet.—As this variety was only introduced by William Paul and Son in 1910, it seems rather early to talk of its value when the vigorous growths are pegged down instead of shortened. Experiments made this year, however, lead one to the conclusion that Juliet will be a useful variety for the purpose. It belongs to the hybrid briar section, and has large old-rose blooms, the outer petals prettily shaded with gold.

Kew. A. OSBORNE.

---

**Schizanthuses.**—In your issue for September 14 (page 707) an interesting article on "Schizanthuses" appeared from the pen of Mr. E. C. Pooley. May I add one more to his list of varieties, viz., S. retusus Rosamonde? This is a most lovely variety, the colour being a pretty shade of pink; once grown I think this will be always grown, as it has a fine strong habit, and with us requires no stake. A batch of this in the conservatory last spring was a most beautiful sight.—R. H. LEGG, Melksham Hall Gardens.

## THE NEWER PERPETUAL CARNATIONS.

The immense strides lately made by English raisers in creating new perpetual carnations bids fair to further popularise this fine race of plants. At one time we were far behind the American raisers in securing first-rate varieties, but we can now quite hold our own with them, unless it be in new white and scarlet varieties. In these two sections we still have to depend largely upon Cousin Jonathan. But with the other colours some notable varieties have appeared from the hands of English growers.

Take the pink and rose shades. Here we note many good things. Empire Day, raised by Mr. Smith (who raised the well-known Britannia), is one of the best. It is a soft salmon-pink, with size, form, length of stem, and a sound calyx; a good cut flower variety. Lady Alington, already marked by growers as one of the finest varieties in commerce, is notable for its shade of salmon-rose, which closely follows the Leander colour. It is an easy grower, with well-filled, fragrant blossoms of the Enchantress type.

Gloriosa, one of the newer Americans, gives us once again the delightful pure pink colouring of the old Floriana. It possesses a free, quick growth, good stems, and first-rate blossoms of good size, decidedly a carnation for all growers. Baroness de Brienen, one of the loveliest varieties extant, is British, and has grand flowers of a glorious salmon-pink colour. It is essentially of the American type, with deeply fringed edges. Stem and habit are good, and the blossoms are very lasting. Rosette, a first-rate American novelty, gives a very well-finished blossom of a deep rose-pink colour, and if it retains its good character it bids fair to lead in the rose-pink shades for some time to come. Colossus is a massive rosy-cerise. It appears to follow Enchantress in growth and form, but is, perhaps, hardly so free as some of the other novelties. It is well worth a trial. Lady Northcliffe, an excellent salmon-pink, is as yet unknown to some growers, but these shades of pink are constantly being repeated in seedlings, so that this variety will have to fight for popularity.

Good scarlets are still few and far between, so the advent of the new St. Nicholas, from America, should be doubly welcome. It is well spoken of, larger than Scarlet Glow, with a good stem, and distinct lasting properties. Bonfire is not coming so well with British growers as with Americans, and we are still awaiting some really first-class things to fill up the vacancies in the scarlet shades.

Of crimsons the best is undoubtedly Engelmann's Triumph, which is good at all points, free, shapely, of good size, and pleasing in hue. Elektra, from the same raiser, will appeal to many, and, in my opinion, its good form and rich orange colour, relieved only by an edge of pink, makes it a distinctly pleasing novelty. Rosa, a seedling from Mrs. T. W. Lawson, is regarded very highly, and its promise to eclipse that favourite variety awaits fulfilment. On its merits it will have as a rival (and a strong rival, too!) the famous Mrs. C. W. Ward, which is grand when well grown. The only fault with Mrs. C. W. Ward is its comparative slowness in pushing up new growths after the first cut of blossom. If Rosa can prove itself better than its rival, carnation growers will be grateful to Mr. Engelmann for this novelty.

Salome and Sunstar are typical fancy varieties, and will doubtless find their way into all representative collections. They can hardly find the same popularity as more decided colours, although both are good in form, and pleasing. Salome is pink and heliotrope, Sunstar yellow, lightly marked with pink.

The French variety, La Rayonnante, a soft clear yellow in colour, has been boomed since its arrival here. This winter will prove its merits, but I would advise care in feeding, as there is a danger of the flowers bursting the calyx. It is a strong grower. Mandarin is an attractive fancy, with rose-pink markings upon an orange-yellow ground. The stem and calyx are good, while the blooms are bright enough to effectively contrast with other varieties.

White Wonder has been so largely in the public eye of late that there is no doubt of the place it is to occupy for some time to come, and the coming season will establish it in public favour. With the new giant Wodenethe the whites are further enriched, but this has yet to make its position as a continuous free variety. Of its size and purity we are assured, but more than that is required nowadays.

Wivelsfield Wonder should enhance the reputation of the Allwood Brothers; its fine form and size, and its colouring of pink flakes on a white ground, were quickly recognised by the Award of Merit granted by the R.H.S. last January. Benora, an American fancy, white, flaked with red, is quite distinct from the previous one, and merits a trial from all growers of fancy carnations. Fire Glow should be welcome for its rich colourings, its bright yellow ground, heavily marked with fire-red, making it very attractive.

I should value a first-hand opinion of the crimsons Pocahontas and Sultan, the former an American, the latter a British, novelty; also a note upon Princess Charming, as by some it is ranked above Enchantress, while others describe it as inferior. Coronation, the new silvery-pink, is full of promise, but one should not expect too much from Golden Ray and Golden Glory, two distinct shades of yellow, for yellows, unless exceptionally good, will not command the same popularity as pink and other shades.

P. S. Hayward.

## COLOUR SCHEMES AND HERBACEOUS BORDERS.

It is the fashion to point to the long herbaceous borders at Hampton Court and elsewhere, and to tell the enthusiastic amateur that he should take such as a model. It may be rank heresy on my part, but I venture to protest against such advice, and to assert that the Hampton Court border is no model for us! It is not a fair example in any way.

At the risk of being cried down as heterodox, I venture to say that colour schemes are "all my eye and Betty Martin," for Dame Nature does not make many mistakes, and a good old-fashioned mixture is the best for a border. Of course, there are a few difficult subjects, and it may be easy to produce a simply shrieking discord by the juxtaposition of, say, purple iris and Siberian poppy.

This year I had a fine idea for a pink and white border, and all went well until the antirrhinums and phloxes asserted themselves. They simply killed the idea I had in view, for the pink snapdragons created all kinds of discord, were warm of tint, and the phloxes made matters worse. Colour schemes!! I will have none of them. But really, a good jumble of almost every colour under the sun, with good masses and plenty of white and foliage, is the thing.

F. R. H. S.

## GARDENERS AND GARDENING.

### **Does Education Pay?**

Whilst appreciating the praiseworthy efforts of the British Gardeners' Association to raise the social status of the horticultural profession, I am reluctantly forced, by the various factors bearing on the case, to the conclusion that, from a monetary point of view at all events, higher education for the average private gardener does not pay.

I do not intend by this that young gardeners should not seek to improve their education beyond that which they obtain during their hours of labour, rather should they be encouraged to do so, as knowledge is power, and brings them into closer sympathy with their daily work, and is a pleasure unto itself. What I wish to convey is that the young man taking up a course of exhaustive study, such as would enable him to secure the proposed Diploma of Horticulture, would not be repaid for his labour when forced, as hundreds of good men are, to accept the average gardeners' position at a wage of something like 28s, or 32s. per week.

Like your correspondent "Nous Verrons" (page 608), I fail to see how the establishment of a criterion of ability is going to improve the position of the average gardener for, after all, it is the employer who pays, and I think it safe to say that in fifty per cent. of the gardens in this country the employer is satisfied to employ a purely practical man, and would not be induced to pay more on account of a man armed with a diploma setting forth the holder's capabilities in such subjects as botany, entomology, chemistry, meteorology, and land-surveying. Of course, I am fully aware that all these subjects have a more or less direct bearing on gardening, and the young men of the present day fully recognise this, and take up those subjects with no incentive other than that they will prove useful accessories in their endeavour to become first-class gardeners. There are also other strong factors bearing upon the success of the average private gardener, such as personality and tact, which are beyond the pale of a diploma of horticulture.

No doubt such a diploma (although more suited to horticultural instructors) would be a strong recommendation to the man seeking employment under public bodies or in very large establishments, botanical institutions, or trial stations, but in most cases the diploma would go to college-bred men, due to their better primary education, and, in consequence, we should have men holding prominent positions equipped with ample theoretical and scientific knowledge, but deficient in practical management.

Your correspondent, "J. C. W." (page 574), seems to think that the diploma would induce a different class of men to enter the profession. This may be so, but, after noting the general excellence—I might almost say perfection—of the exhibits at the recent International Exhibition, I would ask, what is wrong with the men already in the profession?

The youth of the present day has far greater opportunities of gaining a knowledge of scientific subjects appertaining to his profession than had the youth of twenty or thirty years ago. Technical classes, county council lectures, and excellent books on various subjects, written in a concise manner by specialists, are within his grasp, and the intelligent young gardener with the ordinary education of to-day can, and I am sure plenty do, acquire sufficient knowledge of these subjects without any incentive beyond the desire to know as much as possible for the proper performance of their duties, and in the hope that such knowledge so gained will serve them profitably as opportunity arises. A man so equipped and with a sound practical knowledge of garden management, is all that is required by the average employer.

I am inclined to think that if a diploma of horticulture was inaugurated, the competition for it would set up a system of cramming

### IRISES.

By W. Rickatson Dykes, M.A. (J. C. and E. C. Jack, 67, Long Acre, London). Price 1s. 6d. net.

Mr. Rickatson Dykes has achieved so high a degree of success as a cultivator and raiser of this large and beautiful class of flowers that he is not only recognised as an authority on all that relates to their cultivation, but is regarded as the natural successor to the late Sir Michael Foster in this branch of floricultural art. His book on irises, which is now before us, fully justifies the high estimation in which Mr. Rickatson Dykes is held as an authority, for within its pages is found conclusive evidence of his thorough acquaintance with the many species now in cultivation, and the conditions under which they can be grown to the highest degree of perfection. Written in a bright and pleasant vein, the book opens with a chapter on the structure of the plant and the distinctive characteristics of the groups into which the genus is divided, and this is followed by a chapter on the structure of the iris flower. In the succeeding chapters the several groups are passed under review, and the conditions essential to success clearly stated. The book, which is illustrated with coloured plates, is especially deserving the attention of those who are interested in the fascinating flowers to which it is devoted.

### MUSHROOMS AND HOW TO GROW THEM.

By John F. Barter. (John F. Barter, Lim., Napier Road, Wembley, Middlesex.) Price 1s.

The author of this book has long been known as one of the most successful of the growers of mushrooms for market in the vicinity of London, and it may be anticipated that those who are acquainted with his achievements as a practical cultivator will expect in a work from his pen to find ample information on all that relates to the production of abundant supplies of high quality. Those who have such expectations will not be disappointed, for in the course of the book Mr. Barter states concisely and clearly the course of procedure by which the most satisfactory crops can be obtained from beds both in the open and under cover. The preparation of the manure, the formation and spawning of the beds, gathering the crop, and packing and marketing the mushrooms, and other details essential to success are all dealt with in such manner as to render the advice of much value to those who are in need of assistance.

**Ligustrum Quihoui.**—This Chinese privet is worth including amongst the occupants of the shrubbery, for it is one of the latest flowering shrubs we possess, its normal blossoming time being September and October. When full grown it is seen as a bush 6ft. to 8ft. high, with rather stiff branches, somewhat sparingly clothed with small green leaves. The white flowers are borne in large, terminal inflorescences, and are at their best about the end of September. It may be grown quite as easily as any of the other privets, but it is not so well suited for shady places as Ligustrum ovalifolium, on account of its late flowering; in fact, the most satisfactory results are obtained from those plants which are exposed to full sun.—D.

## PLANT COLONISTS IN TROPICAL REGIONS.

The following extract from the paper read by Sir Everard Im Thurn at a recent meeting of the Royal Horticultural Society, and published in the society's journal, is of much interest, as showing how readily some of the plants that have their home in temperate regions readily adapt themselves to tropical conditions. It also affords further evidence of the fact that care is necessary in the introduction of plants to countries in which it will be difficult to keep them in check, should they become too aggressive. Sir E. Im Thurn said:

Before quitting the coast region, the traveller must notice one other very characteristic plant association. Every now and again he will come across a more open place where for some reason trees and shrubs have not succeeded in establishing themselves. In such places the black peaty-looking earth is almost free from plant-covering, except where at frequent intervals a tiny little island—like the "hag" in a Scotch moor—has been built up by the densely-matted roots of a coarse-growing fern, Acrostichum aureum, almost ubiquitous in the tropics, both in the east and in the west, and north and south of the "line"; and it is generally in such rather dreary-looking places that the beautiful white lily-like Crinum asiaticum finds its most congenial home.

When at last we turn away from the coast region and make for the Rewa River, our road takes us up and down hill, but mainly up, till, at a distance of nine miles from Suva, we reach the crest of the range of rugged hills which separate Suva Harbour from the wide delta through which the lower reaches of the Rewa flow. The nine miles through which we have passed was doubtless once forest covered, but much of it has at one time or another been cleared, either by natives or by Europeans, and most of this cleared part has again been allowed to fall back into bush or jungle. This tract affords a splendid opportunity for noticing the more prominent of the introduced plants which have taken almost too well to their new home, and have become more or less noxious weeds. Along the first part of this bit of road the most noticeable thing is the almost interminable "brakes" of "wild lemons," guavas and Lantana, all introduced plants, beautiful enough both in flower and fruit, now become noxious weeds, very difficult to eradicate, over very considerable areas of land.

The wild lemon is, of course, a "citrus fruit," but exactly what it is I cannot say. The fruit, which is very abundant and picturesque, is neither round like an orange nor lemon-shaped; nor is the skin of the colour or the texture of any other "citrus fruit" known to me. It is very irregular in shape, has a thick skin, much hard and almost woody white pulp, and little juice. It seems very unlikely that it is an indigenous species, and is more probably a reversion towards an original type of some form which has arisen by the natural crossing of two or more introduced species.

The fruit is rarely used—even, I think, by natives—though there is a considerable demand, both by Europeans and natives, for citrus fruits such as the "Tahiti" and Mandarin orange, the shaddock and the lime, all of which grow more or less freely in Fiji, but under slightly more domesticated circumstances. It should be added that the Fijians themselves habitually speak of the shaddock as the "moli n'dina" or "true orange."

The wild guava of these "brakes," though of a good enough variety, with a large and fairly luscious fruit, is little, if at all, used; nor, as far as I know, is it or any form of Psidium cultivated in Fiji. It seems almost as though the useful qualities of the guava were overlooked owing to a sort of illogical resentment against the plant because of the extraordinarily rapid spreading of the roots. Even small fragments of roots grow vigorously when the parent plant is destroyed, and even burning a guava scrub does not seem to kill it. There is no known way of eradicating a brake of this plant but to fence it in, and to keep a large number of goats in it till the unfortunate animals have eaten the last leaf which appears. Moreover, if one man does succeed in clearing his own land from guava, there is constant danger of new invasion from adjacent lands, either by root growth or by bird-carried seeds.

The common Lantana of our gardens has spread over probably every tropical area into which it has been introduced. But it is not very difficult to eradicate, and it certainly does not impoverish the land as does the guava. It is perhaps of horticultural interest that the Lantana which occurs in Ceylon is almost always yellow-flowered, with only an occasional pink, and very rarely a white, form; but that in Fiji its flowers are almost as varied in colour as are those bedded out in gardens at home. It seems almost certain that it was first introduced into Fiji as a garden plant, and at a comparatively recent date—i.e., after European horticulturists had guided it into a considerable variety of colour.

Another introduced plant very noticeable, not only along the road we are travelling, but in almost all parts of the island where the clearing of the ground from its previous growth has given the newcomer an opportunity of gaining a foothold, is Mikania amara, a weak-stemmed, almost succulent-looking South American creeper, of such tremendously rapid growth, during its active season, as to have earned for itself the popular name of "mile-a-minute." An isolated plant or two of this is pretty enough, by reason of its graceful habit, the exceptionally brilliant green of its leaves, and the infinite number of its tiny white and very sweet scented flowers. But, at least in tropical places, it is a dangerous enemy, because of the extraordinary rapidity of its growth, which enables it, if it once gets a chance, to smother herbage and bush and tree, till it lies over all other plant growth much as a heavy and much-drifted snowfall does in our own country.

I should have liked to say a good deal about the "sensitive plant" (Mimosa pudica), which has spread in Fiji, as in most similar places, almost as rapidly as the other "introduced weeds" I have mentioned; but I can only stop to point out that, whereas in its other new homes it is generally looked upon as an unmitigated pest, it is welcomed and encouraged in Fiji as a first-rate fodder plant. It is very remarkable, but I know from personal experience that it is true, that cattle eat it readily and with good effect, despite the large woody and curved thorns with which the adult plant is provided. The seed now fetches a high price for planting purposes, and an effort is being made to select a strain with the fewest possible thorns.

Nor must mention be omitted of two other introduced plants. Melastoma malabathricum L.—locally called "Kester's Curse," after the unfortunate planter, who is accused, I believe falsely, of having accidentally introduced it, with coffee plants from Ceylon—is now a pestilent weed in the cattle pastures, and has apparently no redeeming qualities. Again, over most of these introduced things, as well as over many of the native plants, a very familiar looking Dodder—very like our English plant—is rapidly spreading. It is the most difficult of all to eradicate; for the tiniest fragment of one of the threadlike stems is able to reproduce the plant in wonderful masses and at the shortest notice.

**Myrsiphyllums.**—When the trails of this useful twining plant attain a length of two or three feet they should be cut for use, so that fresh strings may be placed to receive the young shoots as they are produced. An endeavour should be made to obtain a wealth of nicely-developed trails during the autumn and winter, when they are most in request for decorations.—H. T. M.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

PREPARING FOR WINTER.—We must now take in hand seriously the work of placing plants in their winter quarters. Before this is done it is advisable to thoroughly cleanse the houses, both inside and out. The glass, woodwork, walls, etc., should be thoroughly scrubbed with hot water, to which some carbolic soft soap has been added, as this will effectually get rid of any insect pest lurking in crevices and other places.

TEMPERATURE.—By the end of the present month we shall again have reached that season of the year which necessitates the return to the winter treatment of the plants. The temperature for the different divisions was given in the first issue for the present year, and during the present month the warmth in the various departments should be gradually reduced, week by week, until the minimum degree is reached.

VENTILATION.—Owing to the beautiful weather experienced during the past week, it has been possible to admit air freely; and, with the increased light from the sun, the plants are ripening up much better than seemed possible a short time ago. Air should be admitted in all departments whenever possible. Orchids, in their native habitats, do not grow in glass cases, where fresh air cannot penetrate, and so it is desirable they should have a supply of fresh air daily. Care should be taken that cold draughts are not admitted, as these are as harmful to the plants as they are to the cultivator.

SHADING.—By the end of the month this may be entirely removed; but while the unexpected sunshine lasts, it is advisable, after the long spell of sunless weather, to use it with care.

ATMOSPHERIC MOISTURE.—With the reduced temperature it will be necessary to materially reduce the amount of atmospheric moisture; but on no account must a hot and dry atmosphere be maintained. If any house feels stuffy and oppressive, or cold and damp, rest assured the plants feel it in like manner.

WATERING.—The remarks under this heading made on September 7 are also applicable to this month. Water should now be administered with great caution. A wet, saturated compost is harmful to all orchids during the dull winter months, when evaporation takes place slowly. Those plants finishing their growths should have the supply of water at the roots gradually reduced, as it is a great mistake to cut down the water supply suddenly. Plants immaturely ripened only shrivel, and never produce a full complement of flowers.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

THE PRINCIPAL WORK which needs attention at the moment will be the selection and ordering of bulbs for winter and spring display. These should be potted up directly they arrive. Having already potted up batches of freesias, Roman hyacinths, and Paper White narcissus, other batches should be put in at intervals of a fortnight. It is necessary when ordering to select those varieties which have been already proved, and can always be relied on. Nevertheless, it is always advisable to try a few of the newer varieties in each section. Plump, weighty, and shapely bulbs should be chosen in preference to larger ones.

HYACINTHS.—These, with the exception of the Romans and the Italians, are best accommodated in 4½in. pots, one bulb in each. If a larger display is needed, six to twelve bulbs of each variety may be placed in pans or trays. Pans, however, of this description can always be made up by choosing a dozen of a variety with all the trusses developed alike, turning them carefully out of their pots and placing them close together in the pan and working some soil between them.

TULIPS.—These are invaluable, and should be grown in quantity; place four or five bulbs in a 4½in. pot. The Duc Van Thols, in several colours, are the earliest; they will be followed by the Pottebakkers, also in several colours. Some of the most reliable to follow in succession will be Rose Gris de Lin, Mon Tresor, White Swan, Rose Luisante, Yellow Prince, Brutus, Thomas Moore, and Keiser's Kroon. I do not advise growing May-flowering tulips in pots generally, but the following varieties I have tried and found them to succeed splendidly: Picotee, white, pink edge; retroflexa, light yellow; Inglescombe Yellow, deep yellow; Inglescombe Pink, Inglescombe Scarlet, and White Swan. These later varieties naturally take a much longer time to open, but if grown slowly and not allowed to become dry they develop splendidly at the end of March and early in April.

NARCISSI.—These should be grown in large quantities. A batch each of Paper White, Gloriosa, and Grand Monarque will be now rooting freely if potted up when advised, and other batches should follow these in succession. The varieties Emperor, Empress, Golden Spur, Mdme. de Graaff, and Queen of Spain are always reliable. The small trumpet or Leedsi sorts are always beautiful, and the best of these for pot culture will be Stella, Mrs. Langtry, Barri conspicuus, White Lady, and Lucifer. These, however, need to be grown in good-sized pots or pans where it is possible to place about a dozen bulbs together, as their habit of growth is tall. For cutting purposes they are most valuable if grown in boxes, fifty bulbs in each, and brought on gently. The white Pheasant's Eye (poeticus ornatus) may be lifted and forced in quantity in this way. All these bulbs will require a rich fibrous loam, with some leaf-soil and coarse sand added, and a good sprinkling of wood ashes. When potted they should all be well watered, and allowed to drain, and should then be stood in batches, keeping each variety distinct with a long label at the end of each; then they may be all covered with fine ashes to a depth of three inches. Some of them will be found to have rooted in about four weeks. They must be examined frequently, and when any variety is found to be well rooted, with the growth advancing from the top of the bulb, they must at once be removed or the leaves quickly become damaged.—Lewis Smith, Norwich.

## HARDY FRUITS.

SELECTION OF FRUIT TREES FOR PLANTING.—As the time for planting draws near, a selected list of good and well-tried varieties of the various kinds of fruits may be of some service. In the case of the grower of a small number of trees, the number of varieties of each kind may possibly be confusing, and I would suggest where there is any doubt in the matter, that the advice of a local nurseryman or fruit grower of repute should be sought as to those most likely to succeed in the particular district.

APPLES.—In order to obtain ripe fruits for dessert during the greater part of the year, the following varieties may be planted: Gladstone, Beauty of Bath, Langley Pippin, Lady Sudeley, Worcester Pearmain, Duchess of Gloucester, James Grieve, Mother, King of the Pippins, Cox's Orange Pippin, Ribston Pippin, Margil, and Allington Pippin, Adam's and Claygate Pearmains, and Sturmer Pippin. Of good culinary sorts the following can be recommended: Lord Grosvenor, Ecklinville, Warner's King, Norfolk Beauty, Bismarck, Lane's Prince Albert, Annie Elizabeth, Newton Wonder, Bramley's Seedling, and Alfriston. There are many good dessert and cooking apples omitted from the above list, but it is not advisable to plant too many with the idea that if one or more fails to crop some of the others will probably not do so; it is far better to plant fewer sorts, which are reliable croppers. The above list comprises varieties which succeed in most places.

PEARS.—The quality and flavour of many varieties of pears is largely influenced by the stock on which they are worked, and the position the tree occupies, and these various factors have to be considered by the planter. To afford a succession of dessert pears requires a number of varieties owing to the short season of many of the earlier ones. The season of some of the most valued pears, such as Doyenne du Comice, may be considerably extended by planting against walls with various aspects and in the open. Grown as cordons, several pears may be planted in a small space, and the fruit is usually fine and of good quality. The following will give an extended season: Beurre Giffard, Williams' Bon Chretien, Triomphe de Vienne, Mdme. Treyve, Louise Bonne of Jersey, Comte de Lamy, Durondeau, Beurre Hardy, Beurre Superfin, Emile d'Heyst, Marie Louise, Doyenne du Comice, Pitmaston Duchess, Glou Morceau, Winter Nelis, Josephine de Malines, Olivier de Serres, President Barabe, Beurre Easter, Bergamot d'Esperen, and Duchesse de Bordeaux. There are several pears of recent introduction that are of good promise, and which may, after further trials, become standard sorts.

APRICOTS.—The apricots worthy of cultivation are not numerous. The old favourite, Moorpark, is so liable to lose its branches, that it is not advisable to plant it in quantity. Grosse Peche is much more vigorous and healthy, and a richly-flavoured variety. Other good sorts are: Hemskirk, Shipley's, and Large Early Montgamet.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

CAULIFLOWERS.—The young seedlings should now be large enough to prick out. Cold frames or handlights are to be preferred for them, though no coddling must ever be attempted. The frames will be necessary when much wet and damp weather occurs, when the lights should be placed over. Plenty of air must be admitted at all times, excepting during sharp frost, when the frames must be closed, and matted if necessary, for the night. Use only just ordinary loam for the plants, as rich soil would tend to produce strong growth, which is not required till the spring arrives. Use a little burnt garden refuse when pricking off if the soil is heavy. Make still another sowing under glass in frames.

CABBAGES.—Continue to plant these out in various aspects for a continuous supply, not forgetting a batch of the most forward plants of an early variety on a warm border facing south; these have a happy way of turning in at unseasonable times, and from January onwards many dishes can be cut. Those planted on the maincrop onion beds are doing well; ply the hoe freely, and give a scattering of soot and burnt garden refuse to ward off slugs. Later on the plants should be moulded or earthed up to make the stems safe and cosy. Continue to plant out later batches, setting early varieties at fifteen inches apart, and the larger varieties two feet apart in the rows, and eighteen inches from plant to plant.

PEAS.—With the most favourable weather still continuing, these will remain a long time fit for use; they are even flowering at the moment as freely as in May. It must not be expected that the whole crop will finish, therefore means must be employed to gain as many as possible. Firstly, top each plant so as to throw all energy into the pods formed; secondly, give water, if necessary, to fill up the pods and hurry the growth of later pods and flowers; thirdly, if in exposed positions, shelter the rows, even leaving the older rows of sticks and bine on the cold side.

LETTUCES are in fine condition. Take care of all, even if it means lifting some, and storing them in cold frames. Prick off autumn-sown ones in various aspects for spring supplies, and work the hoe in all the quarters.

ENDIVE.—Take up and store the forward plants in rough frames, and hasten later plants.—Geo. Ellwood, Swanmore Park Gardens.

CROYDON CHRYSANTHEMUM
SOCIETY'S
TWENTY-FIFTH AUTUMN SHOW,
CENTRAL BATHS HALL, SCARBROOK ROAD,
WEDNESDAY and THURSDAY, Oct. 30 and 31.
Challenge Cups and Prizes over £100.

Entries close Oct. 24. Schedules from the Secretary,
F. OXTOBY,
The Cottage, Coombe Lodge, Coombe Road, Croydon.

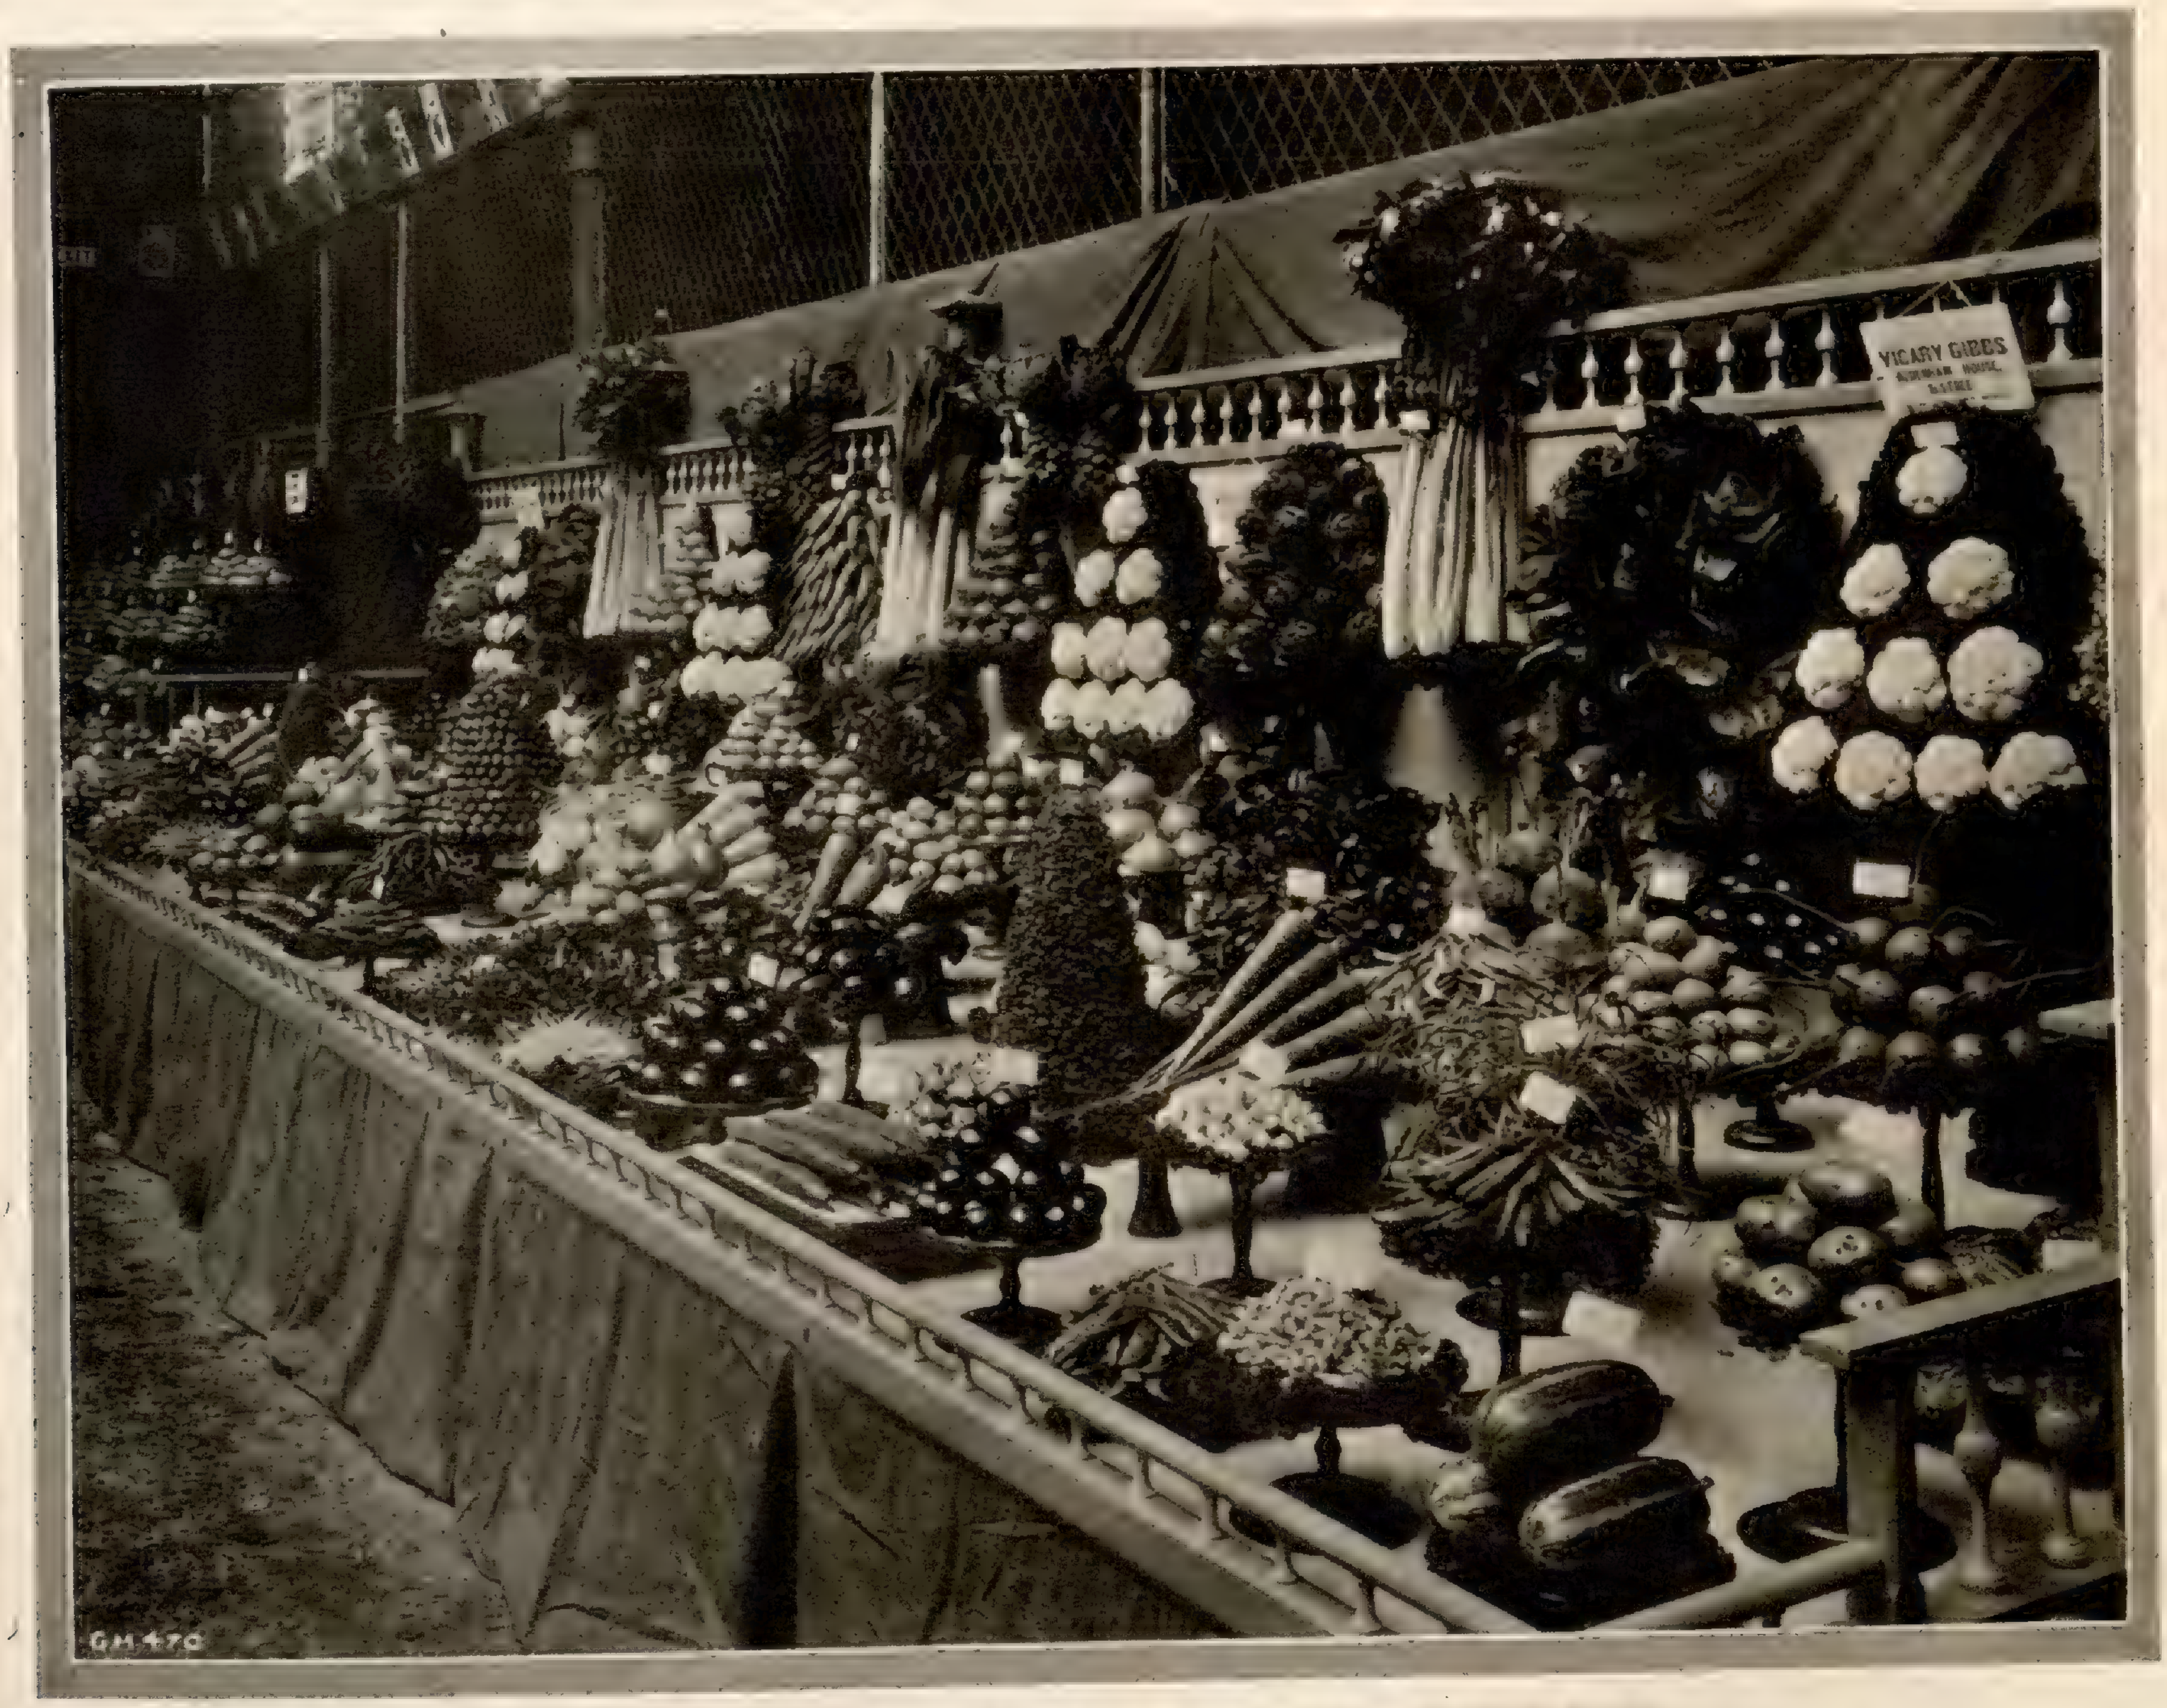
HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## National Vegetable Society.

The third annual exhibition of the National Vegetable Society was held in the Clarendon Hall, Watford, on Wednesday, October 2. This was the first show under the auspices of the society held out of London, and the fine hall chosen was in every respect admirably suited to the purpose. Both the body of the hall and the spacious galleries were filled with extremely well-grown produce, the whole exhibition demonstrating in an emphatic manner the high-standard to which vegetable culture has attained in Great Britain, and the purity and quality of the best selected stocks that are in commerce. The show was opened by the Earl of Clarendon, who expressed his great pleasure in welcoming the National Vegetable Society to Watford. The Noble Earl spoke of the vast importance of vegetable culture, providing, as it does, a large proportion of the food of the people, and he congratulated the Society on the good work already accomplished, and trusted its hands would be strengthened to greater efforts and achievements in the future.



LARGE GOLD MEDAL COLLECTION OF VEGETABLES.
Exhibited by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, at Watford.

### OPEN SECTION.

The principal class was for a collection of twelve dishes of vegetables, distinct kinds, there being four splendid entries. Mr. J. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, scored a capital win with a collection staged in his best form. Sutton's Superb Pink celery was beautifully blanched, as also were the leeks, but it may well be said that better Intermediate carrots, Black beet, and Student parsnips have rarely (if ever) been seen. The other dishes were Ailsa Craig onion, Eclipse tomato, Snowball turnip, Dwarf Gem sprouts, Superlative potato, Duke of Albany peas, and Autumn Mammoth cauliflower. Mr. J. Hudson, Grimson Road, Leicester, was a worthy second, showing cucumbers and scarlet runners in place of Mr. Gibson's peas and turnips. Mr. F. L. Pike, gardener to W. H. Henderson, Esq., Serge Hill, King's Langley, was third, the fourth going to Messrs. Lobjoit and Sons, Heston Farm, Hounslow. A collection was provided for nine kinds, the exhibitors in the former class being barred. Of the three entries staged that of Mr. W. Gaiger, gardener to H. T. Tatham, Esq., Kendall Hall, Elstree, was adjudged best. Mr. Gaiger had a beautifully finished lot of Ailsa Craig onions, not over large, but of high quality. His Early Giant cauliflowers and long Surrey carrots were splendid, the other dishes being also cleverly-grown produce, and nicely staged. Mr. T. Avery, gardener to J. Kerr, Esq., Loudwater, Rickmansworth, was second, losing slightly in carrots and tomatoes; still his was a fine collection. Mr. E. Woolf, gardener to C. H. Fritton, Esq., Grove Mill House, Watford, came in third.

A class for nine tomatoes was judged for flavour as well as shape and colour, and Mr. J. Hudson's first-prize dish were really beautiful fruits of fine smooth shape, with a grand colour and in a quite perfect condition. The second prize went to Mr. J. Gibson, and third to Mr. A. G. Gentle, gardener to Mrs. Denison, Little Gaddesden, Berkhamsted; there were eight entries in the class. Mr. T. Jones, Bryn Penylan, Ruabon, showed six magnificent leeks, for which first prize was awarded. The even symmetry of the well-blanched stems made them about perfect models of what leeks should be. Mr. Hudson followed with another nice set; third going to Mr. T. Fellowes, Vicarage Road, King's Langley.

### AMATEURS' SECTION.

In the society's classes open to amateurs only, the leading class was for six dishes of distinct kinds of vegetables. Mr. H. Keep, Aldermaston, near Reading, was chief winner, his cauliflowers, onions, and tomatoes being supported by fine Prizewinner carrots, Prizetaker leeks, and New Guardian potatoes; second prize in this class was awarded to Mr. W. Coleman, 4, Hunter Street, Buckingham, who had also splendid potatoes, Autumn Mammoth cauliflowers, Best of All tomatoes, and good onions, celery, and runner beans. Third prize winner was Mr. J. Cady, The Limes, Sudbury, Middlesex. There was another class for three varieties, in which Mr. H. Andrews, Berkhamsted, led with onions, celery, and cauliflowers; second going to potatoes, carrots, and tomatoes shown by Mr. T. King, New Road, Bromham, Chippenham; third prize winner being Mr. J. Day, Kitsbury Road, Berkhamsted.

First prize for three dishes of potatoes went to Mr. C. E. Hoad, 40, Church Road, Willesborough, Kent; Mr. Coleman, Hunter Street, Buckingham, taking second this gentleman also winning first for two dishes, followed in this class by Mr. J. Baker, Kingsman Street, Woolwich, S.E. Mr. H. Keep, Aldermaston, Reading, had the best six onions, and Mr. R. Green, Ashdon Road, Watford, the first-prize lot of shallots. Mr. J. White, Oxford, scored for carrots; Mr. T. Jones, Ruabon, for tomatoes; and Mr. Cady, Sudbury, for leeks. Mr. Jones was again at the top for celery, his being big, good-hearted sticks, blanched to perfection. Mr. Jones also won first for parsnips; Mr. E. Deakin, Birmingham, scoring for beetroot. There were numerous other single-dish classes in the amateurs' section, the prizes being largely distributed among those exhibitors whom we have already named.

### COTTAGERS' SECTION.

There was a good class for six dishes of vegetables, competition being confined to cottage gardeners and allotment holders in the county of Herts. There were no less than twelve entries, the quality right through being a credit to the Herts growers. First prize was secured by Mr. A. E. Dawes, 7, St. James Road, Watford, whose vegetables were of even quality, well finished, and staged in quite approved style. Mr. W. Humphrey, Wards Lane Cottages, Elstree, made a good second; Mr. Blake, Elstree, following close for third place. It would certainly be an advantage if it were made a condition in this class that each vegetable should have a label with the name of variety attached. Visitors, especially those who have an eye to competing another year, would benefit if this were the case.

Goldfinder. Royalty. Emperor. King Edward VII. Snowball. Excelsior.

FIRST PRIZE COLLECTION OF SIX DISHES OF POTATOES.

Exhibited by Mr. A. G. Gentle in Messrs. Clay and Son's Special Class at Watford.

### SPECIAL CLASSES.

The schedule was largely augmented by classes provided by various seed firms, who offered prizes for produce grown from their own seeds. We deal with these classes in the order in which they appeared in the schedule. The first of these were Messrs. Barr and Sons' classes. Here Mr. A. Evans, Moor Lodge, Presteign, Radnor, took first prize for a dish of Scottish Chief potatoes, being followed by Mr. T. King, New Road, Bromham, Chippenham, and Mr. A. Woodgate, gardener to Mrs. Austin, Capel Manor Gardens, Horsmonden. The winner for six Little Queen cabbages was Mr. J. White, Sandsford Cottage, Bampton, Oxford, who was followed by Mr. Gaiger, and Mr. R. Staward, Panshanger, Herts. Barr's Stump Rooted carrot made a good class, Mr. Evans winning first place over ten entries, second prize going to Mr. J. H. Gilmour, gardener to Sir C. J. Jessel, Bart., Ladham House, Goudhurst, and third to Mr. J. White, Bampton, Oxford. Mr. Gaiger's Crimson Globe onions were placed first, their colour being very rich. Leeks were best shown by Mr. E. Woolf, and tomatoes by Mr. Gaiger, who was at the head of the competitors.

Messrs. W. Cutbush and Son offered prizes for six Barnet Hero onions, and Mr. A. G. Gentle took the lead among five exhibitors. The onions were a fine type and good bulbs. Other prize-winners in this firm's classes were Mr. W. West, gardener to Mr. M. Knox, Holt Hatch, near Alton, Hants, for First and Best tomato. Mr. A. Basile, gardener to Rev. T. McMurdie, Woburn Park, Weybridge, led for leeks, and Mr. T. King, New Road, Bromham, Chippenham, for carrots; whilst Mr. Gentle scored for parsnips with roots of wonderful length and excellent finish. Beetroot were best won by Mr. G. Hatch, gardener to A. B. Goldschmidt, Esq., Caversham Park, Mildenhall, and Mr. Basile led for Alderman peas.

Messrs. Dickson, Brown, and Tait's classes included tomatoes, in which Mr. E. Woolf was the only exhibitor, securing first prize. Cucumbers were best shown by Mr. T. Jones, Ruabon. For cauliflowers, the successful exhibitors were Mr. A. R. Searle, Castle Ashby Gardens, Northampton, Mr. T. Jones, and Mr. Woolf. Mr. Searle staged some splendid celery, with which he won first prize, followed by Mr. J. White, Bampton, Oxford.

Messrs. Dickson and Robinson had a number of classes, the first being for two bunches of Moneymaker tomato, Mr. F. L. Pike, gardener to H. W. Henderson, Esq., Serge Hill, King's Langley, being the principal winner, the other prizes going to Mr. A. Basile and Mr. A. G. Gentle. This firm's Premier onion was largely shown, competition being very keen. Mr. T. Avery, Loudwater, had highest honours, his half-dozen bulbs being large, shapely, beautifully fine in skin, and well finished. Mr. H. Wheeler, Wenvoe Castle Gardens, Cardiff, was second, his bulbs being as clean as though produced from a lathe. Third place fell to Mr. H. Folkes, gardener to Rt. Hon. T. F. Halsey, Gaddesden Place, Hemel Hempstead. Peas, although so late in the season, were of good quality, Mr. T. Jones' winning dish of Hercules being very fine. Mr. Jones also led with Lancastrian, second in each case being Mr. Basile.

Mr. Basile also scored for leeks, second prize going to Mr. T. J. Broom, gardener to Miss Langworthy, Holyport, and third to Mr. E. Deakin, Hay Mills, Birmingham. Perfection Intermediate carrots were shown by eleven competitors, among whom Mr. A. G. Gentle stood easily first, his roots being splendid; second prize went to Mr. W. Coleman, Hunter Street, Buckingham; and third to Mr. Evans, Presteign. The winners for celery were Mr. T. Sparkes, gardener to Miss Allard, Wimblehurst, Horsham; Mr. A. Basile, and Mr. Gentle, in the order named. Messrs. Dickson and Robinson also had classes for their specialities in beetroot, parsnips, runner beans, lettuces, turnips, and cauliflowers, the principal prizewinners being the competitors whose names have already been mentioned. It may be added that entries in all these classes were strong, and the quality was of a high order.

Mr. W. E. Sands, the Irish potato specialist, provided classes for Irish Hero and Erin's Queen potatoes, first prize going to Mr. F. L. Pike, Serge Hill, King's Langley, for a grand dish of the former, a very choice-looking variety; Mr. Gentle took second with Irish Hero; and third prize went to Mr. R. Bloomer, gardener to the Misses Plunkett, Ballymascallon, Dundalk, Ireland, also for Irish Hero.

One of the best classes in the show was that for six dishes of potatoes, in which the prizes were provided by Messrs. Clay and Son, of fertilizer fame. Entries were about a dozen strong, and the tubers throughout the class were well-grown specimens, fully developed, without coarseness, and were remarkably free from blemishes. The chief winner was Mr. Gentle, who had as fine a lot as could be wished for. Snowball, Emperor (a fine coloured oval), King Edward, Royalty, Excelsior, and Goldfinder, were his varieties. Mr. M. Hoad, Hythe Road, Willesborough, Kent, came second, showing smaller, but still good, tubers; and third place went to Mr. J. Gilmour, gardener to Viscount Goschen, Seacox Heath, Hawkhurst.

Messrs. H. J. Lobjoit and Sons, Heston Farm, Hounslow, won in the Market Gardeners' class arranged for by Messrs. Watkins and Simpson, the vegetables being of good marketable quality, the sprouts being particularly fine. Another strong class was provided for three dishes of potatoes, the prizes being offered by Messrs. H. Lane and Son, Berkhamsted. There were almost a score of entries, Mr. A. G. Gentle leading with good examples of Royalty, King

Edward, and Snowball, all being very clean, smooth, and of nice colour. Mr. J. Gilmour, Hawkhurst, was second, and third place was taken by Mr. A. Humphrey, gardener to Sir Montague Turner, Bedford, Havering, Romford; Mr. J. H. Gilmour, Ladham House Goudhurst, being fourth.

The chief class provided by Robert Sydenham Limited was for nine distinct kinds of vegetables, and here the leading award was secured by Mr. T. Jones, Ruabon. He had Ailsa Craig onions in grand form, as well as celery, cauliflowers, sprouts, and other things of good quality. Mr. J. White was a good second, third prize being secured by Mr. D. W. Bedford, gardener to R. H. Ling, Esq., The Braes, Berkhamsted; and fourth by Mr. West, gardener to Mrs. M. Knox, Holt Hatch, near Alton. In another class for eight kinds the winner was Mr. E. Deakin, Hay Hall, Birmingham; the second-prize winners being Messrs. Lobjoit and Sons, Hounslow.

The Messrs. Sydenham had also numerous classes for separate vegetables, the winners for eight onions being: First, Mr. Wheeler, Wenvoe Castle Gardens; second, Mr. T. Jones; third, Mr. Basile; and fourth, Mr. R. Staward. Mr. E. Deakin took first place for tomatoes, followed by Mr. J. White and Mr. Basile, the latter exhibitor taking the lead for leeks and cauliflowers, Mr. T. Jones following in both cases. For six heads of celery Mr. Basile led, second prize going to Mr. T. Jones, and third to Mr. J. White. The winners for eight turnips were Mr. R. H. Ling, Mr. E. Deakin, and Mr. Basile. First prizes were also taken by Mr. J. West, for parsnips; Mr. J. White, for carrots; and Mr. E. Deakin, for beetroot; the quality and number of entries in all these classes being highly satisfactory.

NON-COMPETITIVE.

There were not quite so many exhibits from the seed firms as there have been at former shows, but those that were staged added considerably to the general effect of the show, there being great variety and general excellence in every stand. Pride of place among the non-competitive exhibits on this occasion must be accorded to Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. Mr. Beckett has, as everybody knows, put up scores upon scores of splendid collections of vegetables, but it is doubtful whether he has ever made a more attractive and interesting display than that he made on Wednesday. The exhibit was of great extent, and the variety of form and colour embraced in the collection was positively wonderful. Some of the capsicums, aubergines, yellow tomatoes, and Painted Lady beans were as bright and varied in colour as flowers could well be, and it is almost unnecessary to say that the more solid vegetables, such as the Ailsa Craig onions, the potatoes and beetroot, carrots and parsnips were of superb quality. Many quite uncommon subjects were staged, as well as those that, in most gardens, have long passed out of season.

Messrs. Dickson and Robinson, Manchester, brought a nice exhibit of their popular Premier onion, the bulbs being of good size and fine quality. The collection of vegetables arranged across the end of the hall by Messrs. Barr and Sons, King Street, Covent Garden, included excellent types and varieties of most of the leading vegetables. Barr's Long Surrey carrot was staged in grand form, length, smoothness and colour being very fine. A pile of Trebon's Selected onion showed capital quality, and the green-fringed salad lettuce was as beautifully crimped as an endive. Messrs. Dobbie and Co., Edinburgh, exhibited potatoes set up in baskets on a tiered staging. It was interesting to note the difference in skin and finish between Midlothian Early grown in Scotland and the same variety grown in Essex. The latter were considerably darker in colour, and had the rough skin admired by many growers, but the Scotch-grown were nevertheless an attractive sample. Dobbie's Exhibition Red Kidney was given a prominent place, its bright colour and true kidney form making it a pretty potato. Dobbie's Favourite, Mountain Ash, an extremely long tuber with purple skin, and Edina, were but a few among a host of varieties shown. The platform was tastefully decorated with groups of palms, ferns, and liliums, with a group of Michaelmas daisies in the front, the latter being quite representative of the finest varieties in cultivation. The exhibitors in this case were Messrs. M. Gleeson and Co., Watford.

Messrs. H. Lane and Son, Berkhamstead, put up a table of apples and pears, the fruits being of beautiful colour. A dish of the firm's new apple, named Oakland Seedling, showed good quality. It is a promising apple of the long-keeping class. Allington Pippin, Worcester Pearmain, and, of course, Lane's Prince Albert, were well represented.

### Bristol Gardeners' Association.

The monthly meeting of this association was held at St. John's Parish Rooms, Clifton, on September 26, and Mr. Baston presided over a large audience. A most able lecture was given by Mr. J. C. House on "Useful Perennials for Cutting Purposes." The lecturer gave a long list of various flowers, and also the best time to cut them. He only dwelt with propagation of a few varieties. The excellent lecture was followed by a good discussion.

The prizes for the evening, for four bunches of hardy perennials, were awarded as follows: Mr. Scott first, Mr. Woodward second, and Mr. Elkes third. Mr. House was awarded a special certificate for a collection of cut hardy perennials, and Mr. Garnish a certificate for two vases of chrysanthemums. A hearty vote of thanks was accorded on the motion of Mr. Shelton, seconded by Mr. Henderson.

Any of our Customers having failed to receive their copy owing to absence from home or removal, can have another copy sent on applying for same to
Benjamin R. Cant & Sons,
THE OLD ROSE GARDENS,
COLCHESTER.

RANSOMES'
LAWN SWEEPERS
have proved themselves most effective in use, and economical in time, as compared with the tedious process of sweeping by hand. The brushes sweep up the leaves, stones, fir cones, needles, worm casts, etc., all being gathered up in a rapid and satisfactory manner. The action of the machine has also a most excellent effect upon the appearance of the grass.
Easily worked by one man.
Width - 24 in.

HOW TO MAKE, PLANT, and KEEP a ROCKERY. An 8 pp. Booklet of much use to Rock-Garden Lovers. Post free, with catalogue. PHIPPS and IRELAND, F.R.H.S., 9, Barnham, Sussex.

GEMS FOR ROCKERY.—NEW.—Lithospermum Heavenly Blue, Saxifraga Bathoniensis, Dianthus Graniticus, Erinus Alp. Carmineus, Alyssum Citrinum, Potentilla Alp. Pyrenaica, Sedum Kamtschaticum, Arenaria Balearica, Phlox Lilacina, Gyp. Repens, Verbena Venosa, and Aubrietia H. Marshall. All named, for 5s., post free. PHIPPS and IRELAND, F.R.H.S., 9, Barnham, Sussex.

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

---

AMERICAN GRAPES.—S. F. D., Penarth: I shall be much obliged for a little information, through your valuable paper, on the method of dealing with two Canadian vines which I have, Concord and Niagara. One of them is white, and the other black. I do not know which is which. They are planted in an outside border, where they get the sun all the best part of the day; planted about a year, but have never fruited. At the back of the border is a long tomato house. The previous owner of the garden looked for grapes, but I wonder whether the vines are worth keeping. Your assistance will be much esteemed.—The vines have not as yet had an opportunity of showing whether they will bear and ripen a crop under the conditions that obtain in your garden, especially as the past summer has been exceptionally wet and cold. We should be inclined to allow them to remain during the summer of 1913, and if they do not bear a crop worth gathering, root them out in the autumn.

DWARF BRITISH FERNS AT GLASGOW.—With reference to the question raised by Mr. C. Pattison in our issue of September 28, Mr. C. T. Druery writes: In reply to Mr. C. Pattison's enquiry in your issue of September 28, the only varieties to which the term "dwarf" is properly applicable are those of particularly small dimensions when full grown as compared with the normal, and not such species as are normally small. As regards the several varieties referred to, Lastrea pseudo-mas crispa cristata angustata, Polystichum angulare congestum grandiceps, and Scolopendrium vulgare spirale corymbiferum are the only ones properly belonging to the dwarf section; the others, Polypodium vulgare trichomanes cristatum, Blechnum spicant serratum ramo-cristatum, and Asplenium trichomanes incisum, should not rank as dwarfs. I know of no truly dwarf Polypody except a very small-growing normal which I have found in Wigtonshire, which persistently dies under cultivation, and all the varieties of trichomanoides, or rather, cornubiense, with which I am acquainted, under favourable circumstances attain fair normal size. Asplenium trichomanes incisum assumes full size under like conditions, and so does Blechnum spicant. True dwarf varieties are comparatively rare. The best ones are Lastrea pseudo-mas above cited, raised by Messrs. Sang of Kirkcaldy, and often called, for brevity's sake, Sangi. In the same sub-species we have L. p. m. crispo-gracile, Lyelli, and ramulosissimum, all very dwarf and good. In Blechnum a true dwarf form is B. s. crispissimum Hartley, only three or four inches high; in Scolopendrium we have several spirale forms with very small leathery fronds and twisted habit; also S. v. Kelwayi densum, like a ball of moss; and the several conglomerate forms Kelwayi, Coolingi, Baxteri, and Wardi, may legitimately be included in the section. A number of Mr. Lowe's crossed forms only attain very small dimensions, but few of them are fit for exhibition purposes, being far more curious than pretty. From Mr. H. Stansfield we have recently received a very dwarf S. v. crispum and a grandiceps form of same. In the Polystichums we have but few true dwarfs belonging to the congestum section; parvissimum, despite its name, often forms foot-high fronds, but could scarcely be considered ineligible on account of its name and compact habit. In the Lady Ferns there are some very beautiful true dwarf forms, A. f. f. congestum minus, A. f. f. c. m. cristatum, and grandiceps are charming forms, rarely exceeding six or seven inches. Messrs. May have recently raised a particularly pretty crispy form from that section. A. f. f. crispum is a dwarf rambling form, very distinct, and there are several forms of stipatum which are very dense, imbricate, and compact, which dwarfs them considerably and brings them fairly within the line. The above list comprises certainly the best of the "dwarfs." In conclusion, I must emphasise the principle that small-growing normal species, like some of the spleenworts, if introduced into a group specified as dwarfs, would inevitably disqualify it if judged by experts.

[We are much obliged to Mr. Druery for his reply to the question, although we are not at all inclined to agree with him in his definition of "dwarf" British ferns, and we think that but few of our readers will readily accept it. Evidently, if an expert like Mr. Druery would exclude the spleenworts from a collection of dwarf British ferns, the time has come when the British Pteridological Society should make definite regulations for governing such competitions. —Ed. "G.M."]

HEATING A GREENHOUSE.—B. T., Swindon: I have a pit measuring 16ft. in length, 9ft. in width, and 8ft. in height, at the centre of the span-roof. I have two flow pipes and one return, all two-inch piping. There are 42ft. of piping altogether. Would this be sufficient to keep out frost?—A good deal depends upon the construction of the side walls and the capacity of the boiler; if the latter is already fully taxed in other directions, the piping might not suffice in severe weather. It would be better if there were two return pipes, and better still if the piping was 4-inch instead of 2-inch, as the larger radiating surface would reduce the need for severe firing, with its attendant evils of stuffiness and unpleasant atmosphere.

STANDARD ROSES.—C. D., Bath: Please tell me which you consider the best roses for standards. I should like to know at once so that I may visit a nursery and see the varieties ere they finish flowering.—If you refer to larger-flowering roses, then the following is an excellent selection of varieties for standards: Captain Hayward, Caroline Testout, Frau Karl Druschki, Hugh Dickson, J. B. Clark, La Tosca, Suzanne Marie Rodocanachi, White Maman Cochet, Lady Ashtown, Killarney, Augustine Guinoisseau, Gustave Regis, and Gustav Grunerwald.

STOPPING PERPETUAL CARNATIONS TO SECURE LARGE BLOOMS.—F. M., Hants, asks: Would you or some of your readers who are carnation experts be good enough to consider the subject of stopping perpetual-flowering carnations to produce large blooms? In certain catalogues some of the hints given to amateurs appear rather misleading; and I want to know whether such comparatively small-flowering varieties like Mrs. H. Burnett and Black Chief would produce larger flowers if only stopped once. —Will some of our readers kindly give us their opinion on this matter? We believe the increase in size would be relatively small, and would not be sufficient to outbalance the reduction of the crop.

KEW BULLETIN.—S. J., Leeds: Kindly tell me where I can obtain the "Kew Bulletin," and what is its price.—The "Kew Bulletin" is published by his Majesty's Stationery Office, and can be obtained through any bookseller or direct from Messrs. Wyman and Sons, Fetter Lane, E.C. The price is 4d. per issue.

HOPS AS MANURE.—M. W., Watford: I have been told that spent hops from the brewery are valuable as manure for garden crops, and shall be grateful if you will advise me on the matter. Are they a good manure for roses, bush fruits, and vegetables? And, if so, when is the best time to use them?—Spent hops are of considerable value on heavy clay soils, because they help to lighten the soil and supply humus. There is no advantage in using hops on rich old garden soil, but in the case of a recently-formed garden a good dressing may be dug in at this time of the year, or spread as a surface mulch in spring. The chemical properties of spent hops are of little account, but Wakeley's Hop Manure, which is composed of brewers' hops impregnated with suitable chemical fertilisers, is an excellent food for the subjects you name, and, in fact, for all garden produce. It is about the best substitute for animal manure we know.

## NAMES OF PLANTS.

M. E. J., Hexham.—1, Primula floribunda; 2, Helianthus decapetalus; 3, H. sparsifolius.

B. C., Birmingham.—1, Aster versicolor; 2, Chrysanthemum uliginosum; 3, Solidago virgaurea; 4, Leycesteria formosa.

F. R. C., Woodbridge.—1, Caryopteris mastacantha; 2, Sequoia sempervirens; 3, Taxodium distichum; 4, Garrya elliptica.

W. D., Durrington.—1, Cupressus Lawsoniana albo-spica; 2, Prunus Pissardi; 3, Rosa rugosa Blanc Double de Coubert; 4, Datura suaveolens.

G. S., Ryde.—1, Acanthus mollis; 2, Sedum Sieboldi variegata; 3, Abelia triflora; 4, Echinops ruthenica; 5, Spiræa ariæfolia; 6, Aster ericoides.

C. G. C., Northampton.—1, Bougainvillea glabra; 2, Tradescantia zebrina; 3, Panicum plicatum; 4, Aralia Chabrieri; 5, Panax Victoriæ; 6, Dracæna Sanderiana.

B. M. T., Exmouth.—1, Helenium autumnale; 2, Sibthorpea europæa; 3, Cotyledon umbilicum; 4, Echeveria secunda glauca; 5, Arbutus Unedo; 6, Clematis Davidiana.

## NAMES OF FRUITS.

M. N., Chelmsford.—Beurre d'Amanlis.

W. J., Redhill.—Probably Souv. de Congrès.

J. B. C., Llandudno.—1, Sturmer Pippin; 2, Lane's Prince Albert.

K. T. E., Brighton.—1, Dr. Jules Guyot; 2, Bergamotte d'Automne; 3, Beurre Capiaumont.

S. R., Bath.—1, Comte de Lamy; 2, Doyenne Boussoch; 3, Beurre Clairgeau; 4, Emile d'Heyst.

E. D. E., Skipton.—1, Bramley's Seedling; 2, Dumelow's Seedling; 3, Bismarck; 4, Lane's Prince Albert; 5, Catillac.

W. O., Dorking.—1, Beurre Bosc; 2, Durondeau; 3, not recognised, probably a small Styrian; 4, Worcester Pearmain.

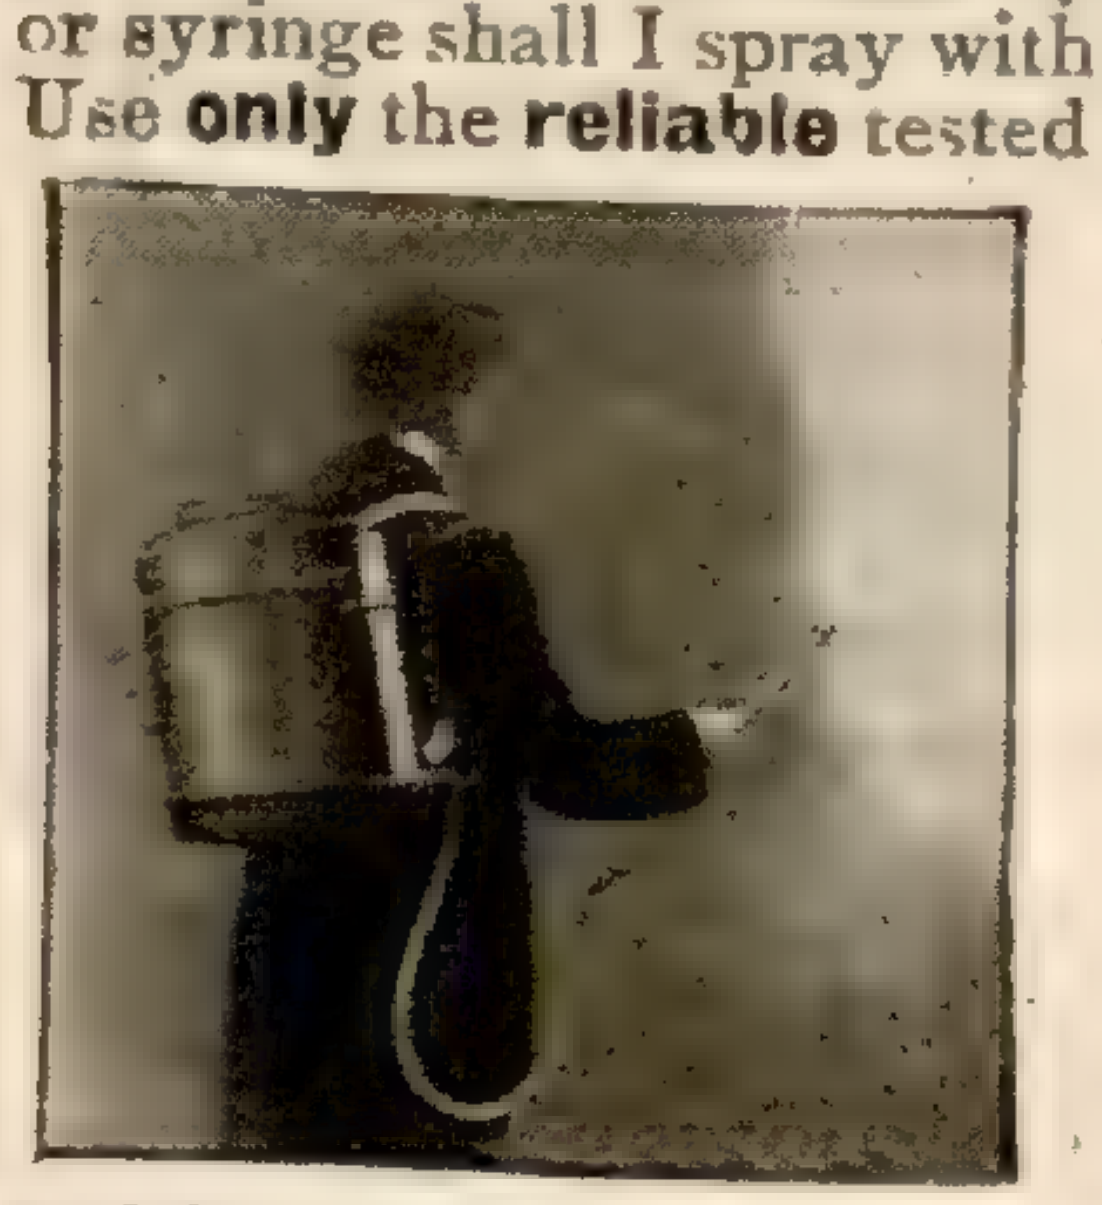
W., Weybridge.—1, not in character, send again; 2, Beurre d'Amanlis; the apple is Peasgood's Nonsuch; and the grape is Gros Colmar.

F. T. J., Dorking.—1, Bergamotte Bufo; 2, Beurre Diel; 3, not recognised; 4, Beurre Diel; 5, Bergamotte d'Automne; 6, a small Calebasse.

R. A. H., Surbiton.—1, Ribston Pippin; 2, Emperor Alexander; 3, Ribston Pippin; 4, Fearn's Pippin; 5, Lane's Prince Albert; 6, Norfolk Beefing.

T. S., Kingston Hill.—1, a malformed fruit, not recognised; 2, Schoolmaster; 3, evidently a Cellini, but very pale in colour; 4, Cox's Pomona; 5, send again; 6, Hawthornden.

L. J. W., Rochester.—1, Bismarck; 2, Lady Henniker; 3, Stirling Castle—fine, clean specimens, and if all we received were of the same excellence our task of identifying varieties would be comparatively easy.



Spraying

The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested "FOUR OAKS" which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-.** No rubber valves. WHY BUY FOREIGN DOORS?—We make all kinds of woodwork to compete against foreign. Timber, portable houses, woodwork for United Kingdom or export. Send 1s. 6d. (export 3d. extra) for illustrated list (264 pages) to include 4-fold, brass-jointed, boxwood rule. Will return money in exchange if not worth 2s. 6d.

C. JENNINGS and CO., Timber Merchants, General Woodworkers, 916, Pennywell Road, Bristol.

# OBITUARY.

◆

## MR. WM. BAYLOR HARTLAND.

On September 15, Mr. W. Baylor Hartland passed away, at the age of 76 years. During the whole of his long working life he was associated with the nursery and seed trade in Cork and entered business on his own account in 1878. Mr. Hartland will probably be best remembered for his efforts to popularise daffodils and raise new varieties. In 1882 he published a complete list of known daffodils, and in 1896 issued his tulip list. He was a great lover of flowers, a stalwart, handsome, genial Irishman, admired and loved by all who knew him well.

# GARDENING ENGAGEMENTS.

Mr. Frank Birkinshaw, a member of the gardening staff of the Royal Gardens, Kew, has been appointed, on the recommendation of Kew, Assistant Agricultural Superintendent in St. Vincent, West Indies.

Mr. Henry Fenner, for the past nine years gardener at Bethlem Royal Hospital, Southwark, has been appointed gardener at Bethlem Hospital and King Edward's School, Witley, near Godalming.

Mr. E. Smith, late gardener to A. Seligman, Esq., Shapswell Manor, Etchingham, Sussex, has been appointed gardener to J. F. Mason, Esq., M.P., Eyneham Hall, Witney.

| Lincoln | per ton | 80 0 | | 95 0 |
| Blacklands | per ton | 70 0 | | 85 0 |

# CATALOGUES RECEIVED.

D. PRIOR AND SON, COLCHESTER.—Roses occupy the larger part of this firm's autumn catalogue, and the section is freely illustrated. Fruit trees, ornamental trees and shrubs, and border plants are also listed.

EDWIN MURRELL, SHREWSBURY.—This is a capitally arranged catalogue of roses, most comprehensive, and containing numerous fine illustrations.

MESSRS. BENJAMIN R. CANT AND SONS, OLD ROSE GARDENS, COLCHESTER.—A catalogue wholly devoted to roses; the varieties are admirably described, and grouped in their respective sections. The firm's new rose, St. Helena, is figured, as are many other good roses.

DANIELS BROTHERS, NORWICH.—An autumn catalogue that covers a wide field, and includes bulbs, roses, trees and shrubs, fruit trees, sundries, etc.

R. H. BATH, LIM., WISBECH.—A descriptive and illustrated catalogue, with cultural notes, of choice bulbs, roses, pæonies, carnations, fruit trees, etc.

MESSRS. J. VEITCH AND SONS, ROYAL EXOTIC NURSERY, CHELSEA.—Purchasers of bulbs will find much to interest them in the catalogue of bulbs issued by this firm. The lists evince much care in preparation, and the illustrations should be found useful as suggesting to cultivators methods of arrangement that cannot fail to prove satisfactory.

WM. PAUL AND SON, WALTHAM CROSS.—In every respect a fine catalogue, dealing entirely with roses. The firm's new varieties figure largely, and are well illustrated, coloured plates being devoted to the varieties Mrs. Charles Hunter and Nevissa. No useful rose is omitted, the descriptions are good, and the varieties are grouped under their respective sections, while the order form provides a capital alphabetical index.

CHARLES TURNER, THE ROYAL NURSERIES, SLOUGH.—The admirably-prepared catalogue of bulbs from Slough contains select lists of varieties of the several kinds of bulbous plants in general request, and will be found useful to cultivators generally.

LAXTON BROTHERS, BEDFORD.—An interesting catalogue of new strawberries and other soft fruits; freely illustrated.

HALLAMS, MOSELEY, BIRMINGHAM.—A neat pocket catalogue of selected bulbs, sundries, sweet peas, etc.

FRANK DICKS AND CO., 110, DEANSGATE, MANCHESTER.—A catalogue in which bulbs occupy the chief place, but which is also devoted to other flowering roots, roses, and sundries.

THOMAS S. WARE, LIM., FELTHAM.—A valuable and interesting catalogue of rare as well as popular bulbous plants, with descriptive lists of choice, hardy plants such as carnations, pæonies, violas, phloxes, etc., and roses.

WILLIAM BARRON AND SONS, ELVASTON NURSERIES, BORROWASH, NEAR DERBY.—From this firm we have received a special list of selected varieties of fruits; a neat little rose catalogue; a useful catalogue of herbaceous and alpine plants; and a larger catalogue of hardy trees and shrubs.

WILLIAM DUNCAN TUCKER AND SONS, LIM., CANNON STREET, E.C., AND TOTTENHAM.—A quite new and finely-illustrated catalogue of horticultural buildings, glass-houses of all descriptions, frames, and heating apparatus. The illustrations represent work executed in various parts of the Kingdom by the firm.

DOUGLAS LEIGH, ARDEN NURSERIES, HAMPTON-IN-ARDEN.—Roses occupy the larger part of this catalogue, but trees, border flowers, and sundries are also included.

**FREESIAS, SUTTON'S HYBRIDS.** The shades range from yellow to bronze, bronzy-pink, orange and deep rose, making a delightful colouring. Per doz., 3s. 6d.; per 100, 24s.

**SUTTON AND SONS, THE KING'S**
SEEDSMEN, READING.

**A PERENNIAL GARDEN MEANS** PERENNIAL PLEASURE, if composed, in whole or in part, of Kelway Artistic Colour Borders. Quotations for any area by return of post, with full particulars. A copy of "Gardens of Delight" for 6d. (post free). Now is the time to plan.

From ——, Esq., Leeside, Berwick-on-Tweed.

"I obtained from you in October last plants for an Herbaceous Border, which has turned out a great success, and on the faith of the kind advice and help you were then good enough to give me I am venturing to ask your views and counsel."

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

**KELWAY'S PÆONIES.**

NOW IS THE TIME TO PLANT Pæonies—the best time in the whole year. No garden is complete without the new Pæonies. Kelways recommend the following collection (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden.

COLLECTION OF PÆONIES.—Agenoria, Amalthea, Czarina, Duc de Wellington, Formosa, Lottie Collins, Nycletius, Princess Maude, Splendida, Tessa, The Lancaster, Zephyrus.

36s. the dozen; good plants, true to name. Immediate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

**"WORTH ITS WEIGHT IN GOLD."—** Such is a Reader's opinion of THE ENCYCLOPÆDIA OF GARDENING, by T. W. Sanders, F.L.S. Price 3s. 10d., post free, from the Publishers 148-9, Aldersgate Street, London, E.C.

**RICHARDSON'S for GLASSHOUSES and** HEATING APPARATUS, for full advertisement see page viii, Darlington.

**NEW ROSES.—Edward Mawley, 2s. 6d.; Mrs.** Foley Hobbs, 2s.; Mrs. H. Stevens, 1s. 6d.; Juliet, 1s. 6d.; Lady Pirrie, 1s. 6d.; Aviateur Bleriot, 1s. 3d.; Jonkheer J. L. Mock, 1s.; Souv. de Gustave Prat, 1s. 6d. The eight for 12s., carr. paid. Sent for List. LEIGH, Rose Grower, Arden Nurseries, Hampton-in-Arden.

**THE POPULARITY OF XL ALL SPE**CIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are RICHARDS' XL ALL WINTER WASH for dormant Fruit Trees and Bushes; XL ALL GARDEN FERTILISER; XL ALL LAWN SAND, etc.

Don't forget to ask your Nurseryman or Seedsman for my small pink list.

G. H. RICHARDS, Manufacturer,
234, Borough High Street, London, S.E.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Spring Flowers.

One of the distinctive peculiarities of the work of the garden is the length of time that necessarily elapses between the commencement of the preparatory details and the attainment of the desired result; and this peculiarity is brought into special prominence in connection with displays of spring flowers. To have the garden highly attractive from within a short period of the winter, with its frosts and snows, passing away, until the closing days of the season of spring, the plants must be in their positions immediately the breath of autumn has passed over the summer flowers, and bereft them of their beauty. The initial steps, such as the raising of seedlings and the rooting of cuttings, have to be taken at a much earlier period; but to these we need not refer otherwise than briefly. For our present purpose it will suffice to say that to obtain really satisfactory results in spring gardening the planting of both bulbous and fibrous-rooted plants must be commenced forthwith, and be proceeded with as rapidly as the condition of the soil and other circumstances will permit. It is essential to the bulbous plants attaining a high degree of development that they be planted early enough to become well rooted before the commencement of the winter season; and it is still more important in the case of those with fibrous roots that they should be well established in their new quarters before wintry weather is experienced. Not only do late-planted arabis, silenes, and other subjects of a similar class fail to bloom satisfactorily when they have not time to become established in the course of the autumn, but they are unable to make sufficient growth to cover the soil with a carpet of greenery. Moreover, they sometimes suffer severely from inclement weather, and as a result the beds present a more or less patchy appearance, thereby losing much of their charm for a considerable period. To make a judicious selection from the spring-flowering plants suitable for massing in the flower garden is not less essential to success than to fill the beds and borders comparatively early in the autumn. Bulbs are now cheap and good, and should be planted freely; but they ought not, as is sometimes the case, to be grown to the exclusion of other subjects. The merits of other suitable kinds should be carefully considered, and if this be done it will be seen that it is an immense advantage to include fibrous-rooted plants flowering in spring in due proportions, and grow them in separate beds or in association with bulbs that will be in harmony with them. Crocuses, daffodils, hyacinths, and tulips, to mention but few kinds, should be planted with some degree of liberality; but in making purchases of these it should be remembered that the same number of bulbs give a finer effect over a much larger area when arranged in association with other classes of plants than when they are grown alone in solid blocks. In the former case the bulbs can be planted farther apart without a suggestion of thinness, and the soil is covered with a green carpet, which is no small advantage, more especially when the beds are within view of the windows of the dwelling-house. On the other hand, beds that are wholly devoted to bulbs have a bare appearance from the time they are planted in autumn until the new growth has made considerable progress in the spring. Carpeting the surface is not the only advantage derived from the use of fibrous-rooted plants. The effect is greatly enhanced if due attention is paid to the harmony of colours, and the attractiveness of the beds extends over a much longer period than would otherwise be the case. The fibrous-rooted plants commence flowering well in advance of the bulbs, and they continue in bloom until the beds have to be prepared towards the end of May for their summer occupants. The passing of the flowers of the daffodils, hyacinths, and tulips need not be a disfigurement, for they can be readily removed when they have lost their freshness and beauty in such manner that nothing but the leaves remain. The most useful of the fibrous-rooted plants for beautifying the flower garden early in the spring are Arabis albida, in its single and double forms; Alyssum saxatile, of which there are compact-growing and lemon-coloured varieties; aubrietias in variety; forget-me-nots, polyanthuses, primroses, Silene pendula compacta, violas in great variety, and wallflowers, of which there are numerous colours, all more or less attractive. All these may be freely utilised in carrying out colour schemes on a large scale, and when the area is limited a selection should be made from them according to the taste of the planter and the special purpose for which they are required. To achieve a full measure of success in the use of these plants it is necessary they should be strong and well rooted when the beds are filled. To obtain stock of this description, it is necessary to propagate the respective kinds from seeds or cuttings, as the case may be, early enough for them to become well furnished with roots. For example, wallflowers should be raised from seed sown early in the spring and twice or thrice transplanted, and not, as sometimes happens, be raised from summer-sown seed and transferred direct from

MR. JAMES W. BARR.

the seed beds to those in which they are to produce their richly-coloured and delightfully-fragrant blooms. Arabis, alyssums, and aubrietias should be raised from cuttings soon after the season of flowering is past; and violas, which are best grown from cuttings rooted in summer, should be given sufficient time to become well rooted and furnished with healthy growths before the planting season. In like manner, forget-met-nots and silenes, which require a comparatively short period of growth should have the time necessary for acquiring the requisite degree of strength. There is one other point that should have attention, and that is the importance of the young plants having sufficient room to enable them to make their growth without overcrowding.

---

**Mr. James W. Barr,** one of the three brothers who carry on the business of Messrs. Barr and Sons, King Street, Covent Garden, is very popular in the horticultural world. He is the nurseryman of the family, the other members of the firm being chiefly identified with bulbs and seeds and the office management respectively. Mr. J. W. Barr had a practical training under his father, the late Mr. Peter Barr, but he is as conversant with Dutch and other Continental methods as with British ones. He was for many years manager of the firm's nurseries at Ditton, near Surbiton, and upon him fell the greater part of the responsibility of transferring the stock of hardy plants and bulbs from Ditton to the newly-acquired, large, and very suitable nursery at Taplow. It is in connection with hardy alpine and herbaceous plants, and tulips, that Mr. J. W. Barr is best known, and a life-long study of these subjects has made him a leading authority upon them. Few people know more about daffodils than he does, but we fancy his own tastes are more in favour of late-flowering tulips, irises, and the florists' varieties of hardy flowers, such as phloxes, pyrethrums, Michaelmas daisies, etc. Mr. J. W. Barr is a member of the Royal Horticultural Society's Floral Committee, and he takes a close interest in the horticultural charities. He is a hard worker, enthusiastic, and tremendously energetic, and music is at once his hobby and recreation.

**Carpenteria californica** grows and flowers remarkably well at Melksham Hall, Melksham. Mr. R. H. Legg sends us a photograph of a large specimen carrying, apparently, about two hundred clusters of bloom, but unfortunately the photograph was not suitable for reproduction. This example was planted eight years ago in a narrow border, against the west front of the house. Here it has flowered well several seasons, but this year, owing doubtless to the hot summer of 1911, it has been a wonderful sight. Mr. Legg considers that Carpenteria californica should be more largely grown in warm sheltered positions, and in this matter we entirely agree with him.

**Proposed Park for Lewisham and Forest Hill.**—We understand from the "City Press" that the Lewisham Borough Council has opened negotiations with the Leathersellers' Company for the purchase of twenty acres of the Guild's trust estate at Forest Hill, with a view to converting the land into a recreation ground. Part of the Leathersellers' estate in this part of London is built upon, and the remainder is for the most part grass land. The negotiations are as yet only in a preliminary stage, and nothing has been definitely settled. Dealing as they are with trust property, the Court of the Company must perforce treat the matter as a business transaction, though they would naturally prefer a recreation ground to more houses.

**Presentation to Mr. C. S. Fuidge.**—The celebration of the Southampton Horticultural Society's Jubilee has entailed an immense amount of extra work upon the secretary, Mr. C. S. Fuidge, his exertions resulting in two exhibitions, the Rose Show and Jubilee Show, of which any society might have been proud. Unfortunately the local public were either not interested, or did not realise the extent and excellence of the shows, as the attendance was most disappointing, resulting in a loss on the two shows of over £100. Consequently the council of the society had no funds from which to adequately compensate the secretary, and, therefore, decided to hold an evening fête for his benefit; although the fête itself was not very successful, the subscriptions to the benefit fund enabled the chairman, at a meeting of the council on Monday last, to hand to Mr. Fuidge a cheque for a substantial sum, together with a gold medal, as a memento of the jubilee year. Mr. E. K. Toogood, in making the presentation, remarked that Mr. Fuidge had been "connected with the management of the society since 1867: five years as a committeeman, and forty years as secretary, a very rare service, which should entitled him to the V.M.H."

**Birmingham's New Park.**—We learn that Mr. Smith Ryland, of Barford Hall, has presented about four and a-half acres of land to the Birmingham City Council, to be used as a public park. The land is situated in the Brighton Road, Birmingham.

**Watering Plants.**—In his recent lecture on the scientific aspects of watering Professor Bayley Balfour, V.M.H., stated in his opening remarks that mistakes in the watering of plants in cultivation caused more disasters in gardening than all other causes together. The water problem is essentially an air problem. Water itself cannot kill directly, but does so when in excess by inhibiting the air supply to the roots, and thereby causing suffocation. No code of rules for watering plants is possible because of the complex conditions that obtain, but guidance may be obtained through a knowledge of the method of intake and of outgo of water from the plant, and of the adaptations presented by plants to the factors affecting these. Water is necessary to the plant as a vehicle of food-material and for the maintenance of turgescence, and it should be remembered that when the latter is lessened the plant wilts. The soil, and not the atmosphere, is the source from which the plant draws its water, although irresponsible suggestions that the latter is the source are sometimes made. Osmosis through the root-hairs of the water-films enveloping the soil particles gives the plant water, and the effectiveness of the process is influenced by the bulk of the films, the soil temperature, the density, and chemical quality of soil water, and, above all, by air in the soil. These latter factors may so operate that a soil saturated with water gives no abundant supply to the plant, which, therefore, finds itself in conditions practically dry. Understanding these circumstances of intake, the cultivator can control with reason his watering. He will recognise, for instance, that adding water to a cold soil is not to supply the roots, but to drive out air, and so induce suffocation. A knowledge of the conditions of the escape of water from the growths is of considerable practical importance, and it should be understood that the functions of the stomata, in giving off water as vapour and liquid, are closely related to the supply of water from the root. They are also affected by cosmic factors—the sun's rays, wind, temperature, dampness, and dryness of the air. The plant is in health when the balance between shoot outgo and root intake is maintained. As the cultivator can influence intake by watering, so also can he influence outgo by spraying and other means.

**Fruiting of the Loquat.**—Messrs. Robert Veitch and Son, of Exeter, write: "Rather an unusual case of a half-hardy shrub fruiting in the open has occurred near Exeter recently. At Culver, the seat of Atherton Byrom, Esq., about five miles south-west of Exeter, is a nice specimen of the Loquat (Eriobotrya japonica), and this year the specimen has produced several fruiting sprays with ripe fruit on them. The loquat is growing under a south wall, and the foliage is of noble proportions, and the fruit about the size of a greengage plum."

**The Squirrels in Regent's Park** are always a great source of attraction, because of their tameness, pretty appearance, and rapidity of movement. Unfortunately about a hundred and fifty squirrels have disappeared from the park during the last six months, and as the general impression was that most of them had been stolen, a close watch was kept. Eventually a young German was seen to make three unsuccessful attempts to catch a squirrel, but his next attempt was successful. He was brought before Mr. Paul Taylor, at Marylebone, and fined the full penalty of £5, or a month's imprisonment.

**National Sweet Pea Society.**—As already announced in these pages, the annual meeting of the National Sweet Pea Society will be held at the Hotel Windsor, Victoria Street, Westminster, on Thursday next, the 17th inst. The meeting will, as usual, be followed by a conference and dinner. The dinner has been arranged for 6 p.m. at the Hotel Windsor, and the conference—also at the same place—will commence at 7 p.m.; and Major C. C. Hurst, F.L.S., will give a lecture on "Rogues in Sweet Peas."

**The Influence of Atmospheric Impurities on Vegetation** was the subject of an important lecture given by Dr. Charles Crowther at the afternoon meeting of the Royal Horticultural Society on Tuesday. For several years past Dr. Crowther has devoted a considerable share of his attention to the investigation of the effect of atmospheric impurities on vegetation in and around Leeds, which, as in the case of other centres of industrial activity in the Midlands, is remarkable for its smoke cloud. With the aid of admirable lantern slides, Dr. Crowther was able to convey to his audience a clear idea of the immense volume of smoke that is given off by the factory and domestic chimneys of the town. He then proceeded to state that, according to investigations which had been made, 250 tons of soot to the square mile were annually deposited. At Glasgow the annual deposit of soot per square mile was said to amount to 820 tons, but these figures he considered, required verification. It was generally believed that some trees had greater power of resisting the deleterious effects of atmospheric impurities than others, and this was, no doubt, the case up to a certain point; but it was found that in the smoke-laden atmosphere of Leeds trees of all kinds suffered more or less from the impurities contained therein. In proof of this, slides from photographs taken in adjacent woodlands were thrown on the screen, and in these oak, ash, and several other forest trees were shown in a leafless condition or in a dying state as a consequence of the injury they had received. Of interest was the section of a Scots fir which had grown vigorously until some twelve years since, when certain works were started within a short distance of the wood in which it was growing. Until the starting of the works the annual rings of the trunk of the tree were of the usual thickness; but subsequently they had greatly decreased, until the tree succumbed to the injurious influences to which it was exposed. In discussing the products of the combustion of coal, Dr. Crowther directed attention to the high percentage of carbon and tar, and showed in a graphic manner how greatly these percentages were influenced by the manner in which the coal was consumed. Thus, in the soot obtained from burning coal in a kitchen range the percentage of tar was 12.5, whereas in the soot derived from coal of similar quality burnt in the grate of the dining-room of the same house the percentage was 34.9. The injury done to vegetation by atmospheric impurities was due to the great reduction in the light, the blocking up of the breathing pores of the leaves, and the acid that is washed down to the roots. There may not be much that is new in this statement, but it is satisfactory to have access to facts that are based on careful investigation. With regard to the reduction in the light, the injury done to the plants was in part due to the impurities that adhered to the leaves, and in part to the cloud of smoke. In 1907 the hours of bright sunshine recorded in the industrial area of Leeds during the year were 1,157, as compared with 1,400 a few miles out.

**Window and Flower Gardening at Battersea.**—With a view to encouraging the cultivation of flowering and other plants by the occupants of their houses and tenements, which number 351, the Battersea Borough Council annually offer a series of prizes for window and flower gardens, to be competed for by their tenants. As in previous years, the Council obtained the aid of the Battersea Amateur Chrysanthemum and Horticultural Society in making the necessary arrangements for the competitions, and for judging the entries. The society arranged the competitions as follows: (1) Upstair window-sill gardens; (2) indoor window gardens; (3) back gardens—central; (4) back gardens—side of house. The number of entries in the four classes was 43, and the awards made by the society were as follows: (1) three prizes and certificates, (2) one prize and certificate, (3) seven prizes and certificates, and (4) seven prizes and certificates. A meeting will be held at the small hall, Latchmere Road Baths, Battersea on October 22, at 8 p.m., when the Mayoress (Mrs. A. B. Runeckles) will present the prizes and certificates to the successful competitors.

**English-grown Tulip Bulbs.**—At the recent meeting of the Hythe Gardeners' Society Mr. C. Duruz, a nurseryman of Hythe, exhibited some tulip bulbs in a high state of development, for the purpose of showing that the bulbs of tulips can be as successfully grown in England as in Holland. The bulbs, he said, were of large size and well ripened, because they had received good cultivation. Mr. Duruz also stated that large quantities of bulbs are annually sent from this country to Holland, where they are bought by English growers who are afraid of buying English-raised bulbs. The statement with regard to the sale in Holland of bulbs grown in England may be in accordance with fact, but it needs confirmation. Cultivators who know anything about tulip bulbs are in no way afraid of those grown in this country, but prefer them, and buy them direct from English houses.

## NOTES FROM KEW.

### Antigonum leptopus alba.

The antigonums are all climbing plants belonging to the polygonum family; and, though very beautiful in some parts of the Tropics, are not often seen in this country. The typical A. leptopus, introduced from Mexico in 1868, has small, bright pink flowers, plentifully borne in loose racemes towards the ends of the shoots; while in the variety alba, which is in flower in the succulent house, they are white. This form has now been known for about ten years.

### Achimenes coccinea.

Though this, the oldest of all the achimenes, has long been recognised at Kew as a delightful basket plant, it is probably, from the small size of its blossoms, often passed over where collections of these beautiful flowers are grown. In the T. range some baskets bearing a profusion of its bright scarlet flowers are particularly noteworthy.

### Columnea gloriosa purpurea.

From its distinct character and showy blossoms this South American gesnerad forms one of the most striking features in the intermediate portion of the T. range. It is planted on the top of a piece of dead tree fern stem, and the strictly pendulous shoots hang down for a considerable distance. The leaves, which are arranged in a regular, opposite manner, are, as well as the shoots themselves, decidedly hoary and of a pronounced purplish tinge. The flowers at once arrest attention, the main feature being the large upper segment, which is of a peculiar hooded shape, as much as three inches in length, correspondingly broad, and of a soft scarlet colour. The lower segment is small, and almost hidden by the large upper one. The columneas, which are little known plants, are somewhat in the way of the æschynanthuses—to which, indeed, they are nearly allied.

### Hippeastrum reticulatum.

This species of hippeastrum would not attract much attention if it flowered in the spring and early summer, when so many of the garden hybrids are at their best. Blooming, however, in the autumn, it is, of course, more useful. A native of Brazil, Hippeastrum reticulatum is said to have been introduced as long ago as 1677. It is in all stages of growth readily distinguished by the dark green strap-shaped leaves, having a clearly-defined ivory-white midrib. The flowers, about three inches in diameter, are of a pleasing yet varied shade of pink, with darker veins of so pronounced a character as to gain for it the specific name of reticulatum. Hybrids have been raised between this species and some of the others, but they are not in general cultivation. In flower in the "T" range.

### Ipomœa Leari.

In the intermediate portion of the "T" range there is an example of this Cingalese members of the convolvulus family, which, trained to a rafter, well shows its suitability for this mode of treatment. The large, delicate flowers are of an intensely bright shade of blue, a tone of colour which is very generally admired.

### Begonia Dregei and Plumbago rosea.

These form an exceedingly pleasing combination in the greenhouse, the white flowers of the begonia and the rosy-scarlet ones of the plumbago harmonising well. These little groups form quite a feature of the scheme of decoration as carried out in the greenhouse, where some delightful combinations may often be noted.

### Browallia viscosa.

This species of browallia has been brought prominently forward during the present year, some well-flowered examples in 5in. pots having been shown at two or three of the meetings of the Royal Horticultural Society. It has been grown for greenhouse decoration at Kew for some time, and this season it is planted out of doors in a circular bed near the succulent house. It has in this way proved very satisfactory, its deep blue flowers, with their conspicuous white eye, being borne in great profusion. This is an old species, but it is only of late that it has been generally met with. The "Dictionary of Gardening" refers to it as an annual, but it can be as readily propagated from cuttings as the better-known Browallia speciosa major.

### Lilium nepalense.

A group of this striking and distinct lily is now to be seen in the greenhouse. When it was first introduced, over twenty years ago, L. nepalense created quite a furore, it being so widely removed from any other species. Since then, thanks to importations from Upper Burmah (for it does not increase readily in this country), it has become fairly well known. It is a plant of slender growth, while the regularly-reflexed blossoms have the topmost portion of the segments yellowish-green or greenish-yellow, and the basal portion purple, thus forming a large dark-coloured centre to the flower. As a rule, freshly-imported bulbs stand some time before they commence to grow, and it must be assigned a place among the late-flowered lilies. In a general way it can only be regarded as a greenhouse kind.

### The Water-lily House.

The structure near the Palm House, which was originally built for the accommodation of the Victoria Regina, is given up to a collection of tropical water-lilies and various moisture-loving plants. Many of them are in flower, among them being the Egyptian Nymphæa Lotus, represented by both white and rose-coloured forms; the blue N. zanzibarensis, and its rose variety; N. stellata, N. pulcherrima, and others. Nelumbium speciosum, which in a cut state has attracted a good deal attention at some of the recent meetings of the Royal Horticultural Society, is flourishing in the mud in the corner tanks. A portion of the roof, too, is draped with many quaintly-shaped members of the gourd family, which from their uncommon appearance are very attractive to visitors. The large cannas, just standing in the water, are now past their best, but some bold masses of hedychiums are very fine. Besides the gourds there are many other pretty and distinct climbers, such as one rarely meets with.

K.

**Shrubby Veronicas.**—The numerous garden forms of Veronica speciosa are exceedingly valuable for decorative purposes early in the autumn. Good examples may be grown in five-inch pots, but at the same time fair-sized bushes may, if desired, be obtained. Cuttings readily root in the spring, and the young plants grow away freely afterwards. They should be stopped once or twice in order to lay the foundation of a bushy specimen. There is now a wide range of colour to be found among the different varieties, varying as they do in tint from pure white to deep purple and crimson, numerous intermediate shades of blue, lilac, lavender, and violet being also represented.—S. W.

## PLANT LIFE ON THE FOREST FLOOR.

When one enters the depth of some grand old wood, the first consideration which impresses itself upon one is the great and varied change that follows upon the conversion of the bare moor into a forest. Instead of the wind on the heath which blew from the four quarters of heaven there is shelter and stagnant air. Where once the sun shone straight down with burning ray there is now reflected and diffused light and heat, making a feeble effort to reach the ground. The rains are different, too, and come in great drops reluctantly to the earth; but when they fall their influence stays behind, and it is long ere the moisture is dispersed again into thin air.

The nature of the soil itself is greatly modified. It is full of vegetable matter; the dead leaves make a veritable hot-bed for numerous parasites and semi-parasitic plants. These, and the gloom-loving herbs, comprise the two great forest classes, and form a study of surpassing interest. When we consider the disadvantages which the gloom of the woods must entail, it seems astounding that either in individuals or in species their denizens could be so numerous. The wind is absent; where, then, are the bearers of the pollen from flower to flower, and where the wafters of the seeds to new habitats? The sun is never seen; where, then, the gay flies that sport in his beams and stop every now and then in their gambols to give the life-giving touch to the essential organs of the flowers? Truly, from the carpet of heather, bent, and moss, interspersed with whin and harebell, to the soft grasses, wood rushes, scattered ferns, and layers of pine needles on the forest floor, there is an evolution which will amply repay study by all who wish to approximate to correct notions of how the garment of old Mother Earth is woven.

Struggling for existence, but never in internecine strife, there are three or four plants to be found on the floors of all our woods. The trientalis, with its pearly-white and clean-cut petals, starlike in their setting, bespangles the forest floor; and near it, but in masses, will be found the lovely wood sorrel. Communities of goodyera lie upon their beds of pine needles, and lift up white spires of flower and villous leaves so remarkable among orchids—above the soil. Rarer, but, happily, becoming year by year more plentiful, is the beautiful twinflower, Linnæa borealis—so dear to botanists. The large trailing evergreen masses of this romantic plant, with its coriaceous leaves in pairs, its wiry stems, and flesh-coloured shoots, arrests the attention of the verious lout before it is crowned in July with its pair of nicely-balanced bell-like flowers, that perfume with their faint vanilla odour the surrounding gloom. Although not what may be called free, yet it may be found in this country from Yorkshire to Ross-shire, but it is in Scandinavia where it seems to find its most congenial home, and where its flower and fruit are plentiful. Named after the great Karl von Linné, who assumed it on his coat of arms, this plant was first discovered as a native in Scotland in 1795, in the woods of Fettercairn, Kincardineshire, by Professor J. Beattie. Its fruit, however, is rare in this country. An incident which came under the writer's observation concerning the plant may bear recapitulation here. Some years ago a great windstorm left a gap in a wood close to a patch of Linnæa borealis. After the light, with its attendant flowers and insects, obtained access, blossoms became plentiful, and seed, if not in abundance, was at least not rare. But although the admission of light clearly assisted the reproductive organs of the plant, it was the reverse with the vegetative ones. Year by year the patch dwindled, and on a recent visit it was difficult to gather a few specimens. What was life for the fruit seemed to be death for the plant—not a new law in biology.

But there are other associates of the forest floor, all, in their way, notable, and all of which will amply repay close and continued study. Here may be studied the transition from honest and self-supporting planthood to greenwood robbery and semi-parasitism. I refer specially to the Goodyera repens, whose very visage betrays guilt. Its felted roots spread far and wide among the leaf-mould to take in food prepared on sunlit twigs, and the smile on its cream-white perianth is a sickly reflections. Its seeds are of most minute dimensions, so light, in fact, that it takes 50,000 of them to weigh a dram. Needless to say, the slightest breath of wind suffices to waft them to the nearest humus bed, where germination will be successful. Then we also find on the forest floor Oxalis acetosella, or wood sorrel, which adapts itself in various ways to its surroundings. The seeds are not of the microscopic dimensions of the goodyera, but they secure a like end by other means. The seed capsule has an elastic, dehiscent, fleshy coat, which, when ripe, suddenly gives way, and projects the contents to a considerable distance in all directions. It is pleasing to see the amusement children derive in playing with the ripe fruit of the wood sorrel. A slight pressure on the top causes the seeds to squirt in their faces, causing much fun. We are told that the leaves of this plant sleep during the night, and in the darkening which accompanies showers. But old Dame Nature has an object in this movement—which is affected by variations on the turgidity of the pulvinus, or cushion, at the base of the leaf-stalk—for it is done to prevent the radiation of heat from the leaves. The flowers are dimorphic, and exhibit that curious second string to their bow which is known as cleistogamy, where a failure to set seed by the usual assistance of insects is supplied by the plan of producing late unopening flowers that are self-fertilised.

And there are several other plants found in our woods which we may just touch upon. There is the Trientalis europæa, so unhappily named the chickweed winter green, and the pyrolas. Truly the study of plant life in the forest brings home to one very keenly conviction in the belief that the plant is even more than man a child of circumstance. The trientalis, of doubtful etymology, is another northern flower, and it is such a true dryad that nothing will induce it to live beyond the forest fence. If transplanted to a garden it will survive only a short time, even though a lump of peat in which the roots are embedded be transplanted with it. One can only explain this fact by supposing that the organic compounds produced by the decay of vegetable remains on moors and in woods are essentially different from those evolved by similar matter under the changed conditions of temperature and moisture occurring in a garden usually at a lower level. Evidently—and practical gardeners tell us so—the peat and black graphitic soil from the slopes of our snowy mountains turns sour in gardens. In all probability the humic acids produced under altered circumstances are different. W. K.

## GARDENERS AND GARDENING.

Under the above heading many interesting letters have appeared in recent issues of the Gardeners' Magazine. Whatever may be the result of such correspondence very few of us can tell. Young gardeners who are unfortunate in not serving under such types of a "chief" as your correspondent Paul T. Moore (whose sentiments I must strongly support) have my sympathy. As a young gardener good fortune favoured me in this respect, and I often recall the valuable information gained from those with whom I have had the honour of serving. I am also sorry that the absolute management of some of our best private establishments is now under those who have not the interest of, or sympathy with, those under them.

I am often in conversation upon various subjects not in any way connected with horticulture, with men of various types, and on many occasions I have been deeply impressed by the conservative methods which nearly every professional man adopts to preserve the etiquette of his profession. I often wish that gardeners could be educated to the necessity of some such sense of honour in maintaining the position of our profession. We should then soon see evidence of a higher standard.

As an example, take the firm stand which the medical men have adopted against what they consider an injustice to their profession. Taking doctors as a whole, considering their station in life, and the expenses of the training necessary to become qualified, it is questionable whether they are better paid than ourselves. I am well aware they have individual grievances in reference to remuneration. Most of our large cities can produce medical experts who may earn anything from one thousand to twenty thousand pounds per annum, but at the same time, they are working harmoniously with men who do not exceed a couple of hundred pounds per year. Yet these men stand firmly together for one common cause, and their example is one we may profit by.

There is, I believe, an old proverb that before one deserves assistance he must first learn to help himself. I am of opinion that we shall never derive much benefit until more energy and a determination to succeed is infused into the majority of young gardeners. Every such man ought to have a fixed determination to qualify for any and every position he may or may not be called upon to fulfil, from that of the humble but important crock-boy to the dignified position of head gardener to the King, or chief officer of the London Parks; and if such men were found to exist in large numbers we should produce men who would yet solve the difficulty of protecting our time-honoured, but almost worn-out, profession.

Another most essential item is to cultivate sociability with those with whom one comes into contact. While I advise everyone to resent any interference from outsiders, and to make a firm resolve to stand up for certain well-known liberties, such as ordering goods, and the management of one's own men. I would also advise the young gardener to obey his employer to the letter, and at the same time devote attention to those immediately connected with such employer. A little diplomacy will often make an end of what appear to be great troubles. We must always remember that most of our employers have other matters besides gardens to think of, and at times these undermine their otherwise good intentions.

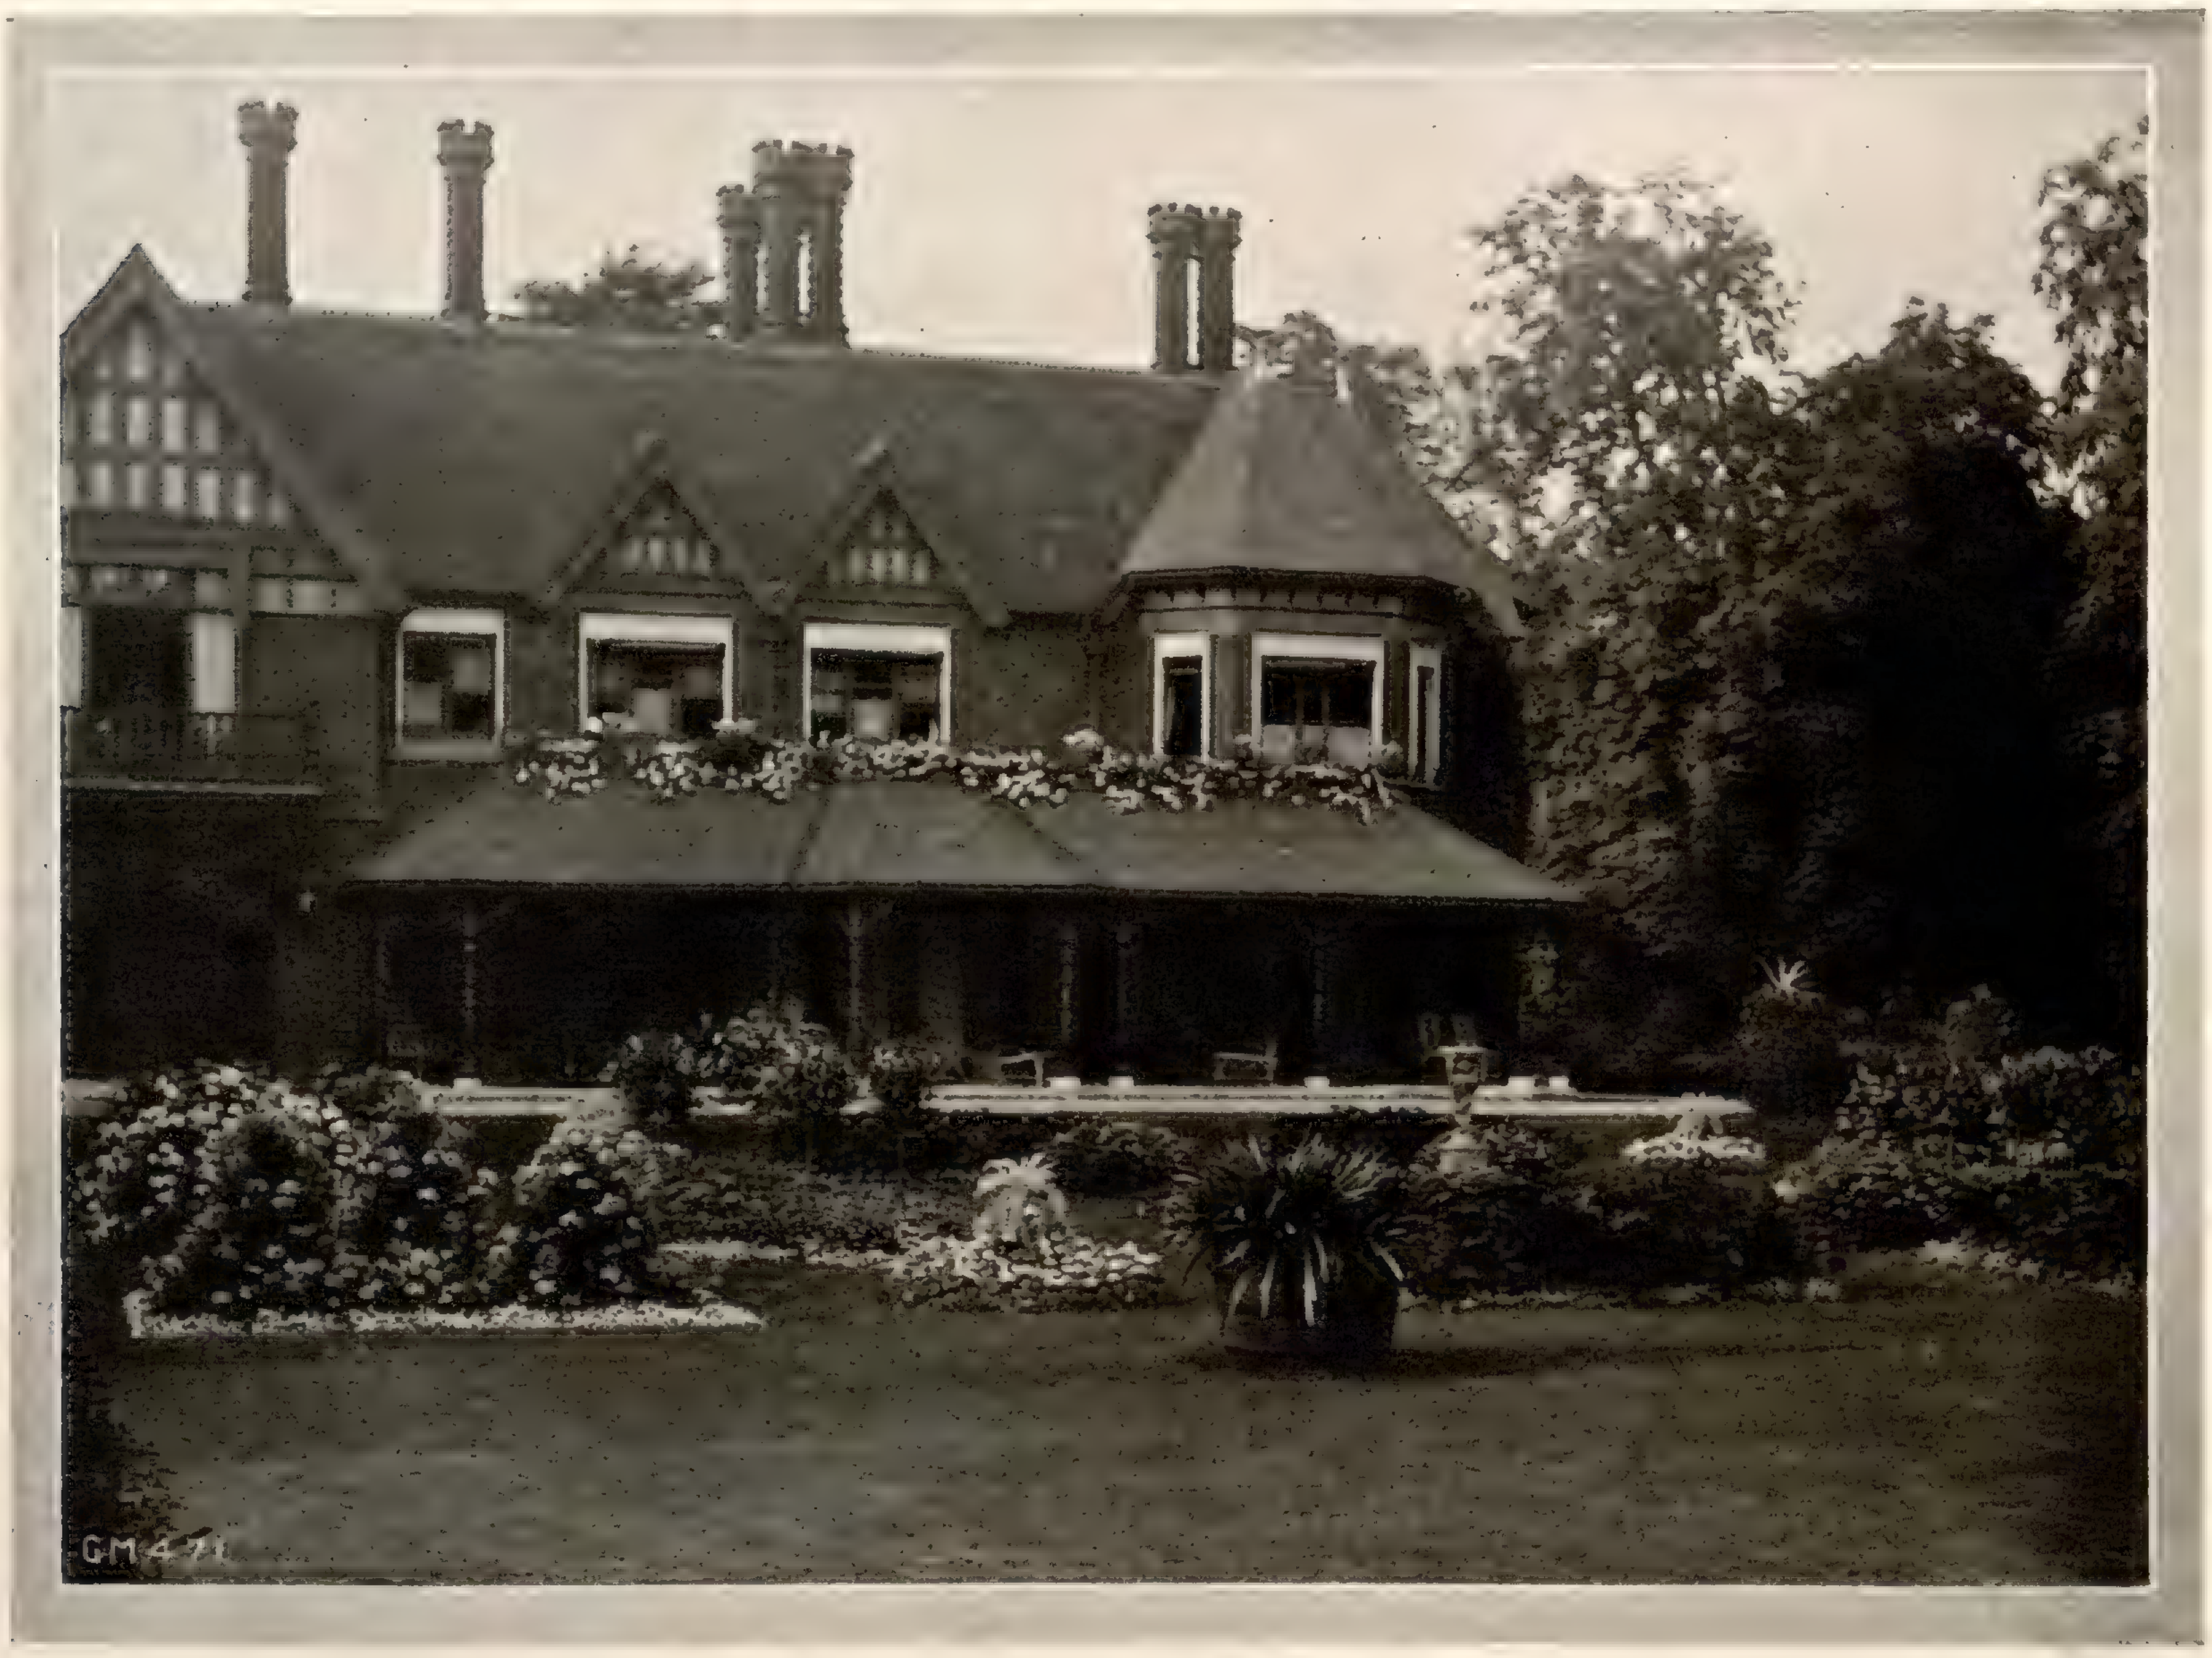
I do not believe that any hard and fast rule can be applied for the education of gardeners. Diplomas will assist, but they are not of much value in private gardens. When those engaged in the horticultural trade and in private gardens learn the art and value of organisation they may demand greater consideration, and receive their due reward.

John Donoghue.

Bardon Hill Gardens, Leeds.

# THE FRIARY, OLD WINDSOR.

Among the many beautiful gardens along the banks of the Thames, there may perhaps be some better known than those of The Friary, at Old Windsor, but it is doubtful, for a garden of its size, whether there is one where gardening is better or more intelligently carried out than here. Unlike some of its near neighbours, the house and grounds do not stand on an eminence overlooking the river, but are very pleasantly situated just out of reach of the floods, which, during the winter and spring months, often play havoc with the low-lying houses and gardens on the banks of our chief river.



GARDEN FRONT OF THE FRIARY, OLD WINDSOR

Though between the towing paths, on the one side, and the main road on the other, the mansion is well screened from both by the well-timbered grounds. The house was built about the middle of the eighteenth century, and was occupied by Princess Elizabeth, who used it chiefly as a fishing temple. The Friary has been in the occupation of Francis Ricardo, Esq., for the past forty-eight years, and he has rebuilt the house and stables, remodelled the grounds, built a glass department, and added to the size of the estate as he was able to acquire the surrounding land. The whole property now forms a very beautiful riverside estate, with a quite good-sized home farm.

As may be assumed from the accompanying illustrations, flower gardening is one of the chief features of the Friary gardens, both Mr. and Mrs. Ricardo taking especial interest in this particular branch, and at the time of my visit, early in September, the set of beds on the south front formed a fine feature, the colour arrangement of the whole set of thirty beds being exceedingly good, and seldom has it been my pleasure to see so much bloom on a set of beds planted at the end of May, and allowed to stand the whole summer.

At many "show places" the beds are often refilled once or twice during the season, as the various occupants lose their freshness, but here no such methods are practised, and the excellent display produced reflected great credit on the gardener, Mr. G. West, who has had charge of the gardens for the past seven years.

The fairly light and porous soil, with water at no great distance below the surface, is certainly favourable to the growth of the soft-wooded bedding plants, and I have never seen ivy-leaf pelargoniums flowering in such profusion as here, though one might naturally think the very wet time experienced for five or six weeks previous to my visit would have tended to minimise the amount of flower on such quick-growing plants.

The beds cover a space of about 90ft. by 70ft. The four corner beds were planted with ivy-leaved pelargonium Souvenir de Charles Turner in pyramidal form, the surface being carpeted with the same variety, and edged with a good breadth of Alyssum minimum. The middle bed at either end was planted in a similar manner, but with Madame Crousse pelargonium, and edged with Lobelia Royal Purple.

The four large beds surrounding the sundial were planted with Paul Crampel pelargonium, with an edging of the silver-leaved Veronica Andersoni variegata. The central raised beds in each half of the display contained good standard plants of Fuchsia Mrs. Marshall, under which were fine masses of Heliotrope Madame de Bussey, many of the trusses of bloom measuring quite a foot across. The small, round, intermediate beds between those already mentioned were filled with tall Centaurea maritima, as dot plants, among the little-known zonal pelargonium Verona; this variety is quite unique, the foliage being of the colour and brilliancy of the cut-leaved golden elder, and the flowers a beautiful shade of shell-pink. The whole was splendidly set off with an edging of the double blue Lobelia Kathleen Mallard. The two crescent beds immediately around the sundial contained Begonia Phosphoresence, with a groundwork of Leucophyton Browni. These beds are surrounded on two sides by the house, and on the other two sides, at a greater distance, by large horse chestnut trees, and so the flower garden stands out well, especially so as all the rest of the pleasure grounds, some five acres bordering the river, is more or less covered with fine specimen trees, consisting chiefly of planes, chestnuts, elms, and birch, among the deciduous trees, and of cedars, thujas, retinosporas, cupressus, etc., among the Coniferæ, while some very fine standard Portugal laurels are to be seen on the North Terrace.

On the opposite side of the road are the glasshouses and fruit and vegetable gardens. The latter are fairly extensive, and a fine herbaceous border, about 100 yards long, leading to the rose garden, is a very fine feature. The herbaceous plants kept company with good bold clumps of antirrhinums, asters, nemesias, clarkias, schizanthuses, alonsoas, etc., which at the time I saw them were making a fine display, in conjunction with helianthuses, heleniums, rudbeckias, perennial asters, phloxes, anemones, achilleas, gladioli, solidagos, etc., each represented by the best varieties.

The rose garden consists of beds of mixed varieties, and it struck me this would prove much more effective if planted in beds of separate colours or varieties. The beds are intersected by a well-furnished pergola, with American Pillar, Tausendschon, Lady Gay, Dorothy Perkins, Hiawatha, Madame Abel Carriere, Blush and Tea Ramblers, Alberic Barbier, etc., were all in good health, and showing evidence of having provided a good display during the summer.

Remarkable crops of apples and pears were to be seen in the walled-in garden, and also in the orchard. This abundance is not general in the Thames Valley, and many fruit gardens that I have seen this season have been only thinly cropped. Indoor fruit is well managed, and though the peaches and nectarines were practically over, the trees looked in excellent order for carrying a good crop next year. Of the four vineries the only house not cut was one of Alicantes, and this was carrying a fine crop of good-sized and particularly well-coloured bunches. The plant houses also are of considerable interest, the large house of winter-flowering carnations promising well for a good display all through the winter. Mr. West excels in the cultivation of these plants, and his exhibits of perpetual carnations at the autumn show, and of his Malmaisons at the summer show, of the Windsor and District Horticultural Society, are always much admired.

Calanthe Veitchi is also a feature, as also is Begonia Gloire de Lorraine, these latter being cultivated in comparatively small pots, though the plants often reach a yard in height. Single chrysanthemums are extensively grown both for cutting and grouping, and the fine groups of these put up at Windsor Show have from time to time been favourably commented on, and, in one instance, illustrated in the Gardeners' Magazine.

The whole place bears evidence of good management, the enthusiastic efforts of an energetic and skilful gardener being backed up by a generous and sympathetic employer. Thomas Stevenson.

VIEW IN FLOWER GARDEN OF THE FRIARY.

## POINTS ABOUT GREASE BANDING.

Just now apple growers are busy picking apples, storing or marketing the same, but at harvest time in the orchard and fruit plantation thoughts turn in the direction of next season, and the moment is opportune for taking early precautions to prevent the ravages of insect pests in the future. The leaf-eating caterpillar of the winter moth is one of the worst pests that fruit growers have to deal with, and unlike some other insects, for it is broad in its tastes, as it feeds on the young foliage of apples, pears, plums, and cherries, in orchards and fruit gardens, lacerates the leaves on hedgerows, and plays havoc with the leafage of oak trees in the woodland.

It is no wonder that a pest capable of doing such widespread damage is difficult to cope with, and in providing ways and means this is one of the cases in which science has come to the aid of the cultivator. Fruit growers might have been contented to include the winter moth along with other pests under the comprehensive heading of "blight," but the scientist studied the habits of the pest, found that the dull grey little moth that flits through the evening air in the autumn is the male and that the female has only rudimentary wings, and is unable to fly. Nature prompts her to lay her eggs in the branches of trees and near to the shoots on which the young caterpillars will feed, so she crawls up the stems in order to deposit her eggs in crevices on the limbs and near the ends of the shoots. Towards the end of March hatching begins, and the looper caterpillars, first a dirty grey and then green with pale lines, devour an amount of leafage that is quite out of proportion to their size, until they are about an inch long, and when full fed they let themselves down to the ground and remain in a pupa stage until the moths emerge in the autumn.

In dealing with insect pests prevention is better than cure, so the idea suggested itself that if means were adopted to capture the female moth as she journeyed up the tree, egg-laying would be prevented. This led to fastening bands of grease-proof paper round the stems of the trees and smearing them with a sticky kind of grease, and in practice it must be said that the process answers. There are, of course, some people who are sceptical about grease-banding, but the proof of the pudding is in the eating, and they may not have seen, as I have, grease bands so thickly covered with both male and female moths that dead bodies made bridges for live insects to crawl over. Neither can the sceptics have been in that splendid fruit-growing district in the Vale of Evesham, where every grower grease-bands his trees as a matter of rule, and where, by adopting this co-operative plan, winter moth infestation has been reduced to a minimum in the locality. The Evesham fruit grower does not spend time and money on grease banding for amusement—he is out to make his business pay, and adopts this operation as a means to that end.

Many people fail to obtain the full benefit from grease banding because they are not persistent enough. Perhaps they put bands on one year and do not catch many moths, for the simple reason, probably, that the pests were not so numerous as usual that season. Not having caught many moths one year, they give up banding, whereas if they had continued they might have captured thousands the next. As a matter of fact, this spasmodic grease banding is no good, and if it is to be efficacious it must be done as a matter of rule and in anticipation of what may happen.

Secondly, there is the mistake of putting the bands on too late, and many a pound in time and money have been wasted on putting on grease bands after the moths were safe in the trees. Grease banding should be started at the end of September, and should certainly be finished early in October, if the first of the moths that go up the trees are to be captured. In short, it is no good thinking that grease banding is a job that can be done at any time when other work is not pressing, and more than one grower has condemned it as being useless when the fault has been his own, through being too late.

Thirdly, it should not be thought that grease banding is proof against the attacks of every insect pest that fruit-tree life is heir to. It can only be a remedy for insects that crawl up the trees, and it only needs the exercise of a little common sense to realise this, so it is no good blaming the grease bands if the trees in the spring are attacked by pyslla or aphis.

Lastly, there is the matter of the grease. It is often recommended that ordinary cart grease will do, and so it will, so long as it keeps sticky; but it dries too quickly, and becomes useless if the whole work of smearing is not gone over again. My advice is to do the thing well by using one of the excellent prepared greases that are now on the market, and remain sticky as long as the bands are on the trees. I am opposed to the custom of smearing the grease directly on the bark, because paper bands are cheap enough; they are easily attached, can be just as easily removed, and there is no possible danger of damage being done to the bark. Grease banding is not so efficacious on bush trees close to the ground as on standards with clean stems. The bands should be in position by the time I have stated, and it may be necessary to do a second smearing after Christmas to capture any moths that go up in the early spring. If a high-class grease is used, not much is required, and if it is plastered on so that it runs down the trees this is wasting the material.

Let me say, in conclusion, that grease banding is one of those operations in which you must take so much on trust. In a season or district when or where winter moths are not prevalent, and few insects are captured, so much the better, but the risk is always there, and why take it, when for a small outlay one has at hand the best-known remedy for preventing the ravages of the winter moth caterpillar? H.

HERBACEOUS BORDER IN THE FRIARY GARDENS.

---

## NEW ZEALAND BURS OR ACÆNAS.

Carpeting plants are very useful, as well as highly ornamental, and among the perennials which have come into favour for covering bare spaces, such as those which are left after the foliage of spring-flowering bulbs has died down, are the acænas, or New Zealand burs. These are, as a rule, rapid-growing plants, covering the ground with neat leaves, of the characteristic form of the rosaceæ, the natural order to which they belong, and afterwards bearing numerous heads of inconspicuous flowers, some of them having pretty spines. These, by the way, are the cause of the name of "bur," and they prove pests indeed in the sheep-farming districts of New Zealand, by clinging to the fleeces of the animals, and being practically impossible of removal without leaving the little hooks in the wool, which is considerably reduced in value by their presence.

A large number of acænas are now in cultivation, but, with the exception of one, A. Buchanani, which cannot well be omitted because of the beauty of its pea-green foliage, only those are named that can be procured in the form of seeds. This species also may possibly be purchased in seeds, but the writer has not seen them offered. A pretty New Zealand bur is Acæna argentea, said to be a form of A. microphylla, with charming, silvery-green foliage and little burs. It is a good grower and to be recommended. A. inermis is another good one, this having nice green leaves, and is a good carpeting for the border or the rockery.

In A. microphylla we have another pretty acæna, and one that has for long been a general favourite. It has pretty foliage, moss-like in its general appearance, and with burs which have showy little scarlet spines. In a mass these give a really beautiful effect, and the writer well recollects one mass of several yards square in a low, moist spot in a famous garden, where this was remarkably pretty. A. sanguisorba is a very free grower, and useful on the rockery.

These acænas are really very easy to cultivate, and will grow almost anywhere, in sun or in shade, in dry soil or a moist, peaty one, in the border, on the rockery, or between stones in paths and flights of rough steps. They are increased by cuttings off the trailing stems, which root as they grow, or by means of seeds, which can be bought and sown under glass in spring, or in drills in the open garden in May. These are quite hardy everywhere almost in the United Kingdom. S. A.

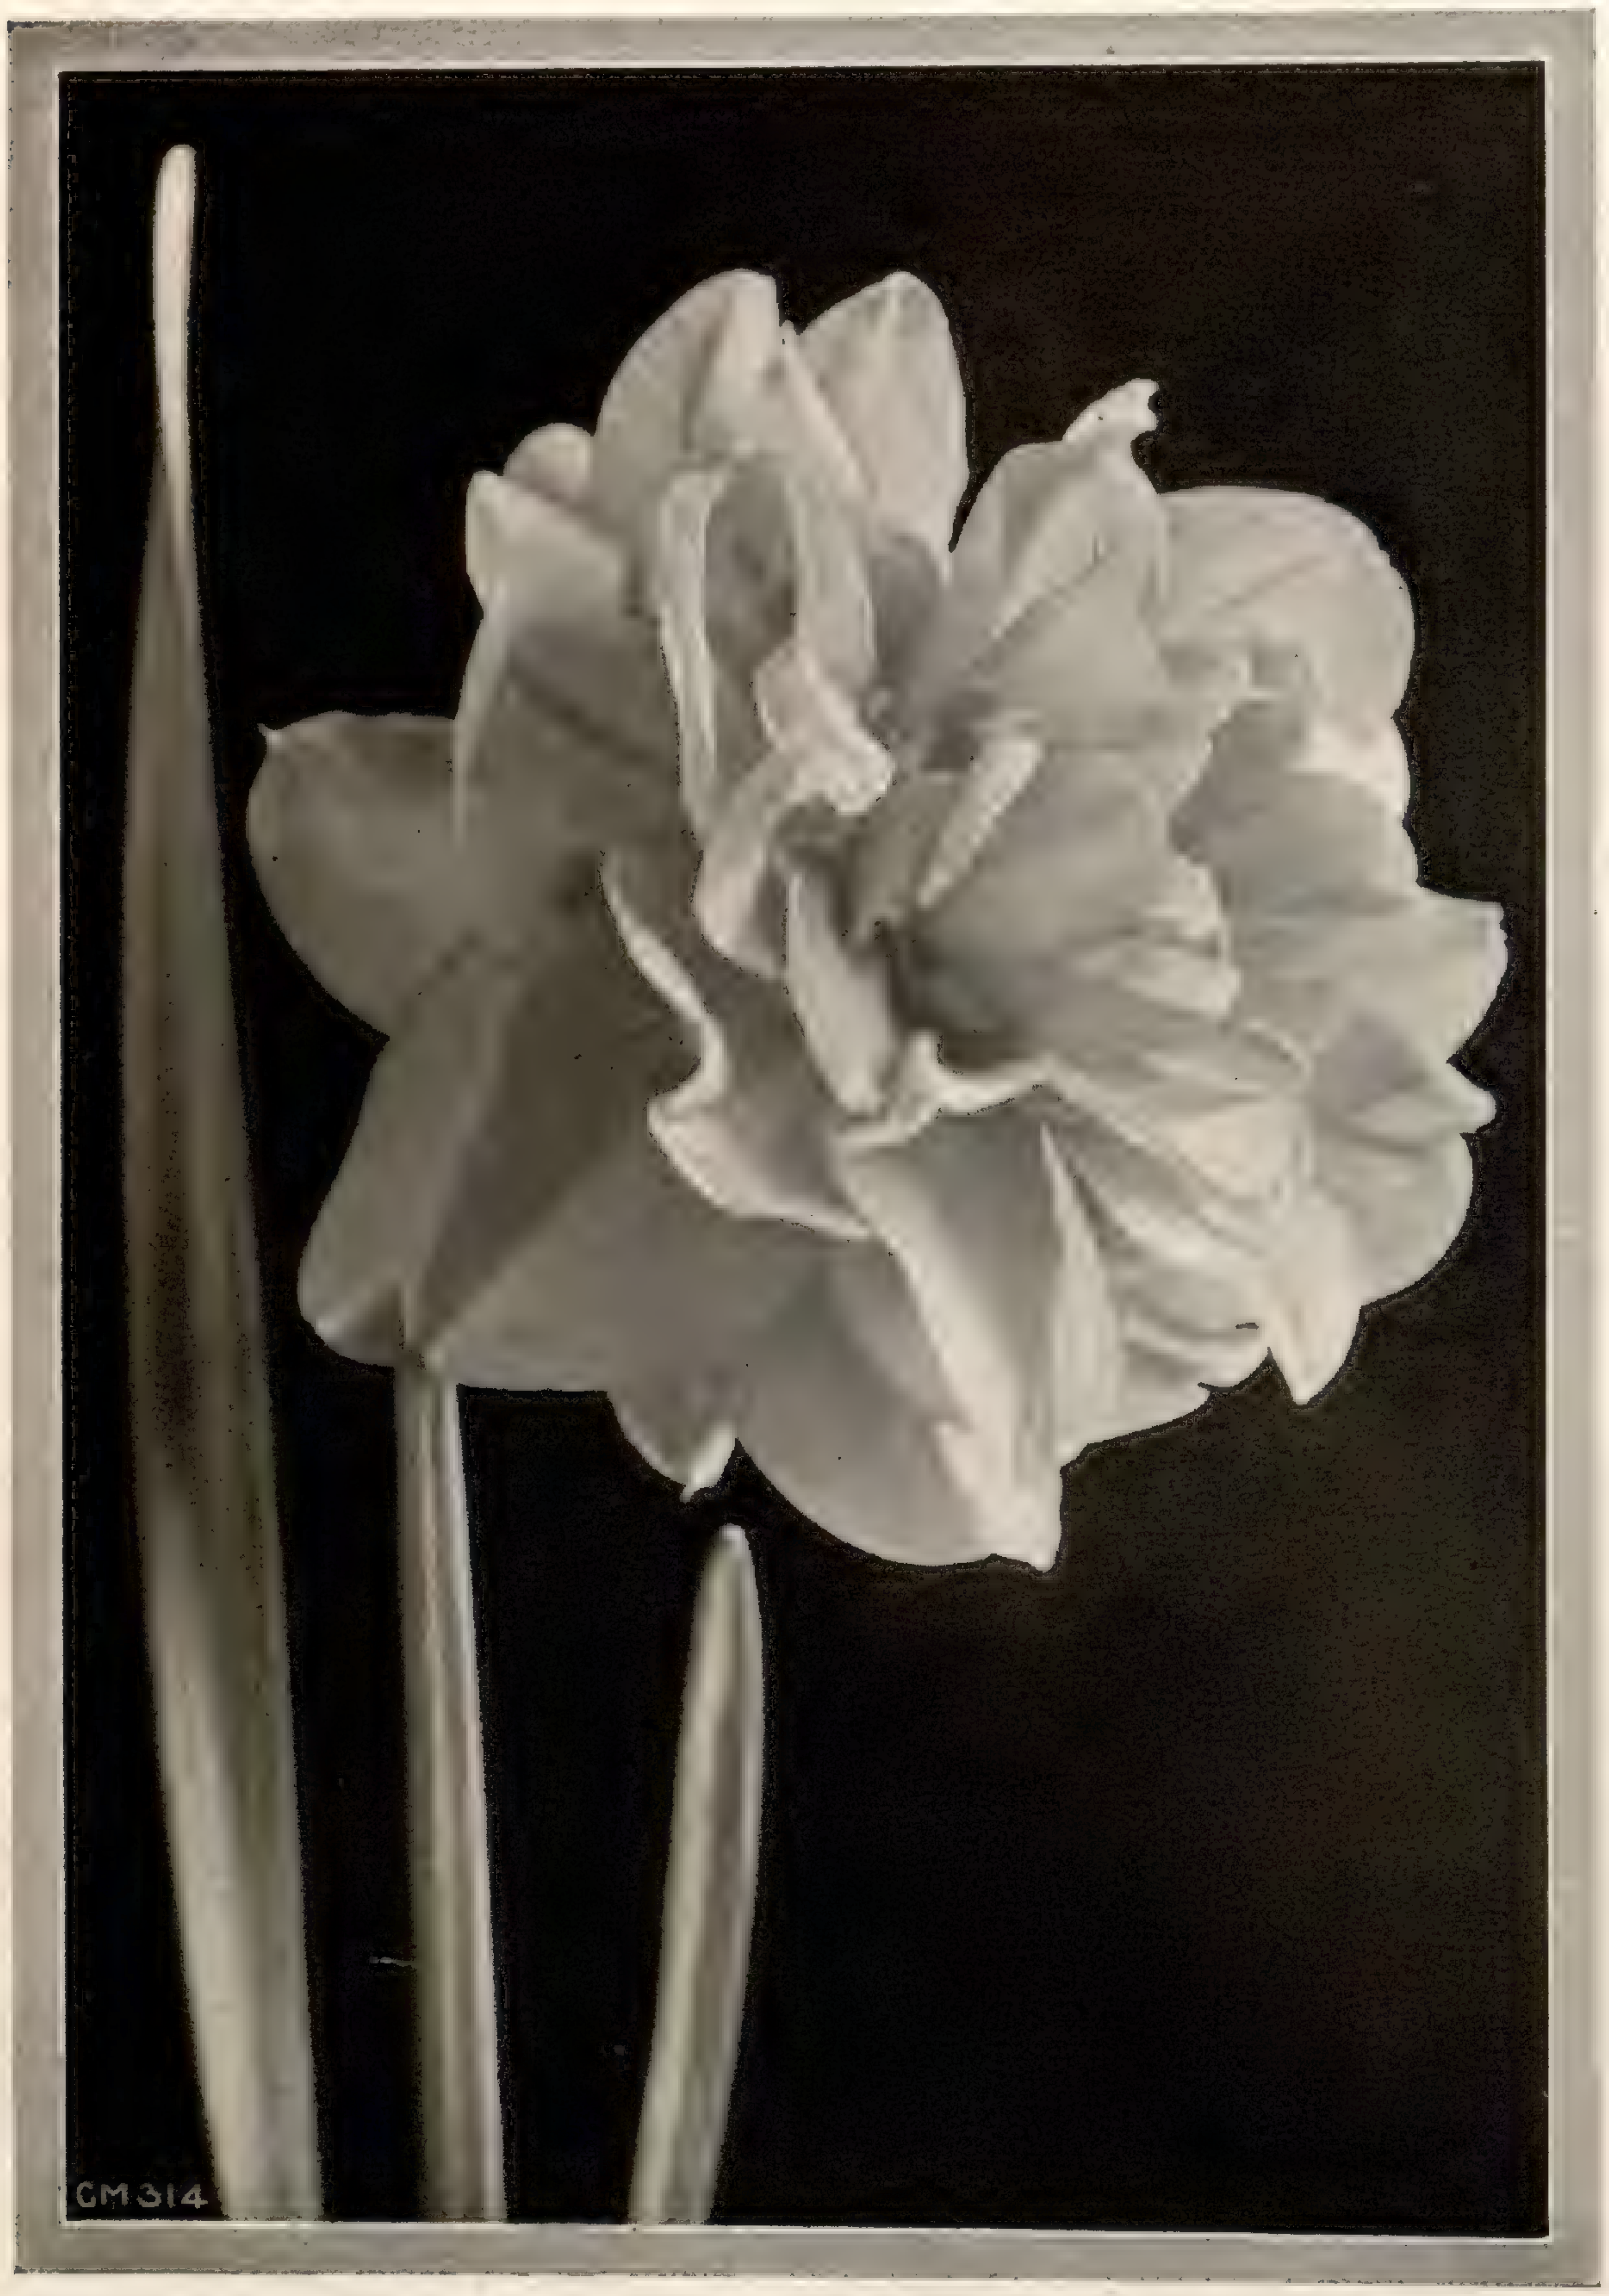
CHRYSANTHEMUMS.—For full instructions on the Culture of Chrysanthemums in beds or borders for garden or greenhouse decoration, read the Second Edition of **CHRYSANTHEMUMS FOR GARDEN AND GREENHOUSE**, by D. B. Crane, price 2s. 6d. net; or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

## DOUBLE DAFFODILS.

Double flowers of any and every kind are anathema to some people, but, usually, those who declaim against the development of double blooms at the hands of the florists are generally found to have a weakness for at least some one kind of double blossoms. It may be the carnation appeals to them, or the big chrysanthemum arrests their attention, or the brilliance of double begonias dazzles them. Time and again one has heard folks objecting to double daffodils, and pouring out scorn upon the old double yellow Telamonius plenus; but when shown fine flowers of Argent, Inglescombe, Plenipo, Apricot, Phœnix, or Primrose Phœnix, then they have to confess that there are good points about double daffodils.



NARCISSUS PRIMROSE PHŒNIX.
A beautiful, bright primrose-yellow double daffodil.

All this goes to show that tastes are as different as temperaments among the flower-loving public, and that raisers should not be too conservative in their estimate of floral fashion. Double daffodils have been with us for so long a time that their position is assured, even though they may not be universally liked. Old Gerard evidently loved the double forms, as he figured several and wrote, "The double yellow Daffodil hath small, smooth, narrow leaves, of a darke green colour; among which riseth up a naked hollow stalk of two hands high, bearing at the top a faire and beautiful yellow floure, of a pleasant sweet smell."

It is probably not generally understood that there are about two dozen distinct double daffodils, varying in size from the little minor plenus, or Rip Van Winkle, up to the large and bold Phœnix varieties. The colour, too, ranges from the pure white of the double Poet's daffodil, through shades of cream, primrose, and yellow, to the deep orange-scarlet hue found in the centre of the new Volcano. All the double daffodils are useful for pot or bowl culture, some of the smaller sorts are suitable for the rock garden, and most are valuable for naturalising, though at present some are too valuable for use in this way.

Volcano is the most expensive double daffodil now being offered, and it carries very large, soft yellow flowers, each with an orange-coloured centre; it is a fine, bold variety. Another newcomer is Inglescombe, and, like other things that bear this name, it is good; here, also, the flowers are large and very double, but in no sense coarse, and the colouring is a distinct shade of very bright primrose-yellow. Not so new, and therefore less expensive, is Primrose Phœnix, and its character may be gathered from the accompanying illustration; the flowers are very shapely and large, and the colour shade is rich primrose-yellow. This variety is a very strong grower, often rising to a height of twenty inches.

Argent is a particular favourite of mine; it is not so double as the rest, but its rich yellow central petals, surrounded by broad creamy-white ones, render it very attractive everywhere. This variety, as well as Plenipo and Dubloon, have been raised by crossing the old Telamonius plenus with Poeticus or Poeticus ornatus. Plenipo is a sturdy grower, and its large double blooms are very attractive in their garb of white, primrose, and yellow. Dubloon is bright yellow, with dark yellow centre, and is a good grower.

Using Gerard's language, "Besides these former there are foure or five double yellow daffodils, which I cannot pass over in silence." For instance, the beautiful buff-coloured Apricot Phœnix, its colour paling almost to white at the circumference, is a great beauty; but its price is a trifle high yet. Butterfly, yellow and cream, is well within the mark, and is quite good at about half a crown a dozen bulbs. Then there are the good old sorts, Butter and Eggs, yellow and orange; Codlins and Cream, white and sulphur-yellow; and Eggs and Bacon, white and orange-yellow. The last two are also known respectively as Sulphur Phœnix and Orange Phœnix. The late flowering, fragrant, white, and beautiful double Poeticus occupies a foremost position among double daffodils; it is a fine garden plant, charming for indoor decoration, and is grown by the million in market gardens all up and down the country. The little Irish Capax plenus, with its lemon-yellow flowers, and Cernuus plenus, a native double white variety, fine for every purpose, are two others that cannot be lightly regarded by those who wish to cultivate the very best of daffodils. Which of the double Jonquils is the best is not an easy matter to decide. All three are first-rate pot plants, and so there can be no mistake in growing Jonquilla flore pleno, odorus Campanella plenus, and odorus plenus. C. H. Curtis.

---

**Cleaning Orchids.**—After the houses have been thoroughly cleaned, and are dry, the plants should also be thoroughly examined. The cleaning of orchids is often considered a difficult matter, and undoubtedly under the old regime of sponge and clean water this was the case. There is no reason why orchids should not be cleaned with insecticides like other plants, providing it is done intelligently, and with proper precautions. If any plants are infested with insect pests, I never hesitate to have them dipped overhead in a solution of insecticide mixed up to the proper standard. This is always used in a fairly warm state, and I can say without hesitation orchids will stand water much hotter than is anticipated without doing them any harm. If one can keep the hands comfortably in the hot water the thick-leaved orchids, such as lælias, cattleyas, cypripediums, and others, will stand it without any harm resulting. As most orchid growers obtaining plants from different sources will meet with some that are infested with pests of some description, and as it is not always possible to isolate them, it is a wise precaution to thoroughly clean them before allowing them to be placed with the general stock. As plants infested with parasites cannot thrive, cleanliness is essential.—J. T. B.

## EARTHING-UP WINTER GREENS.

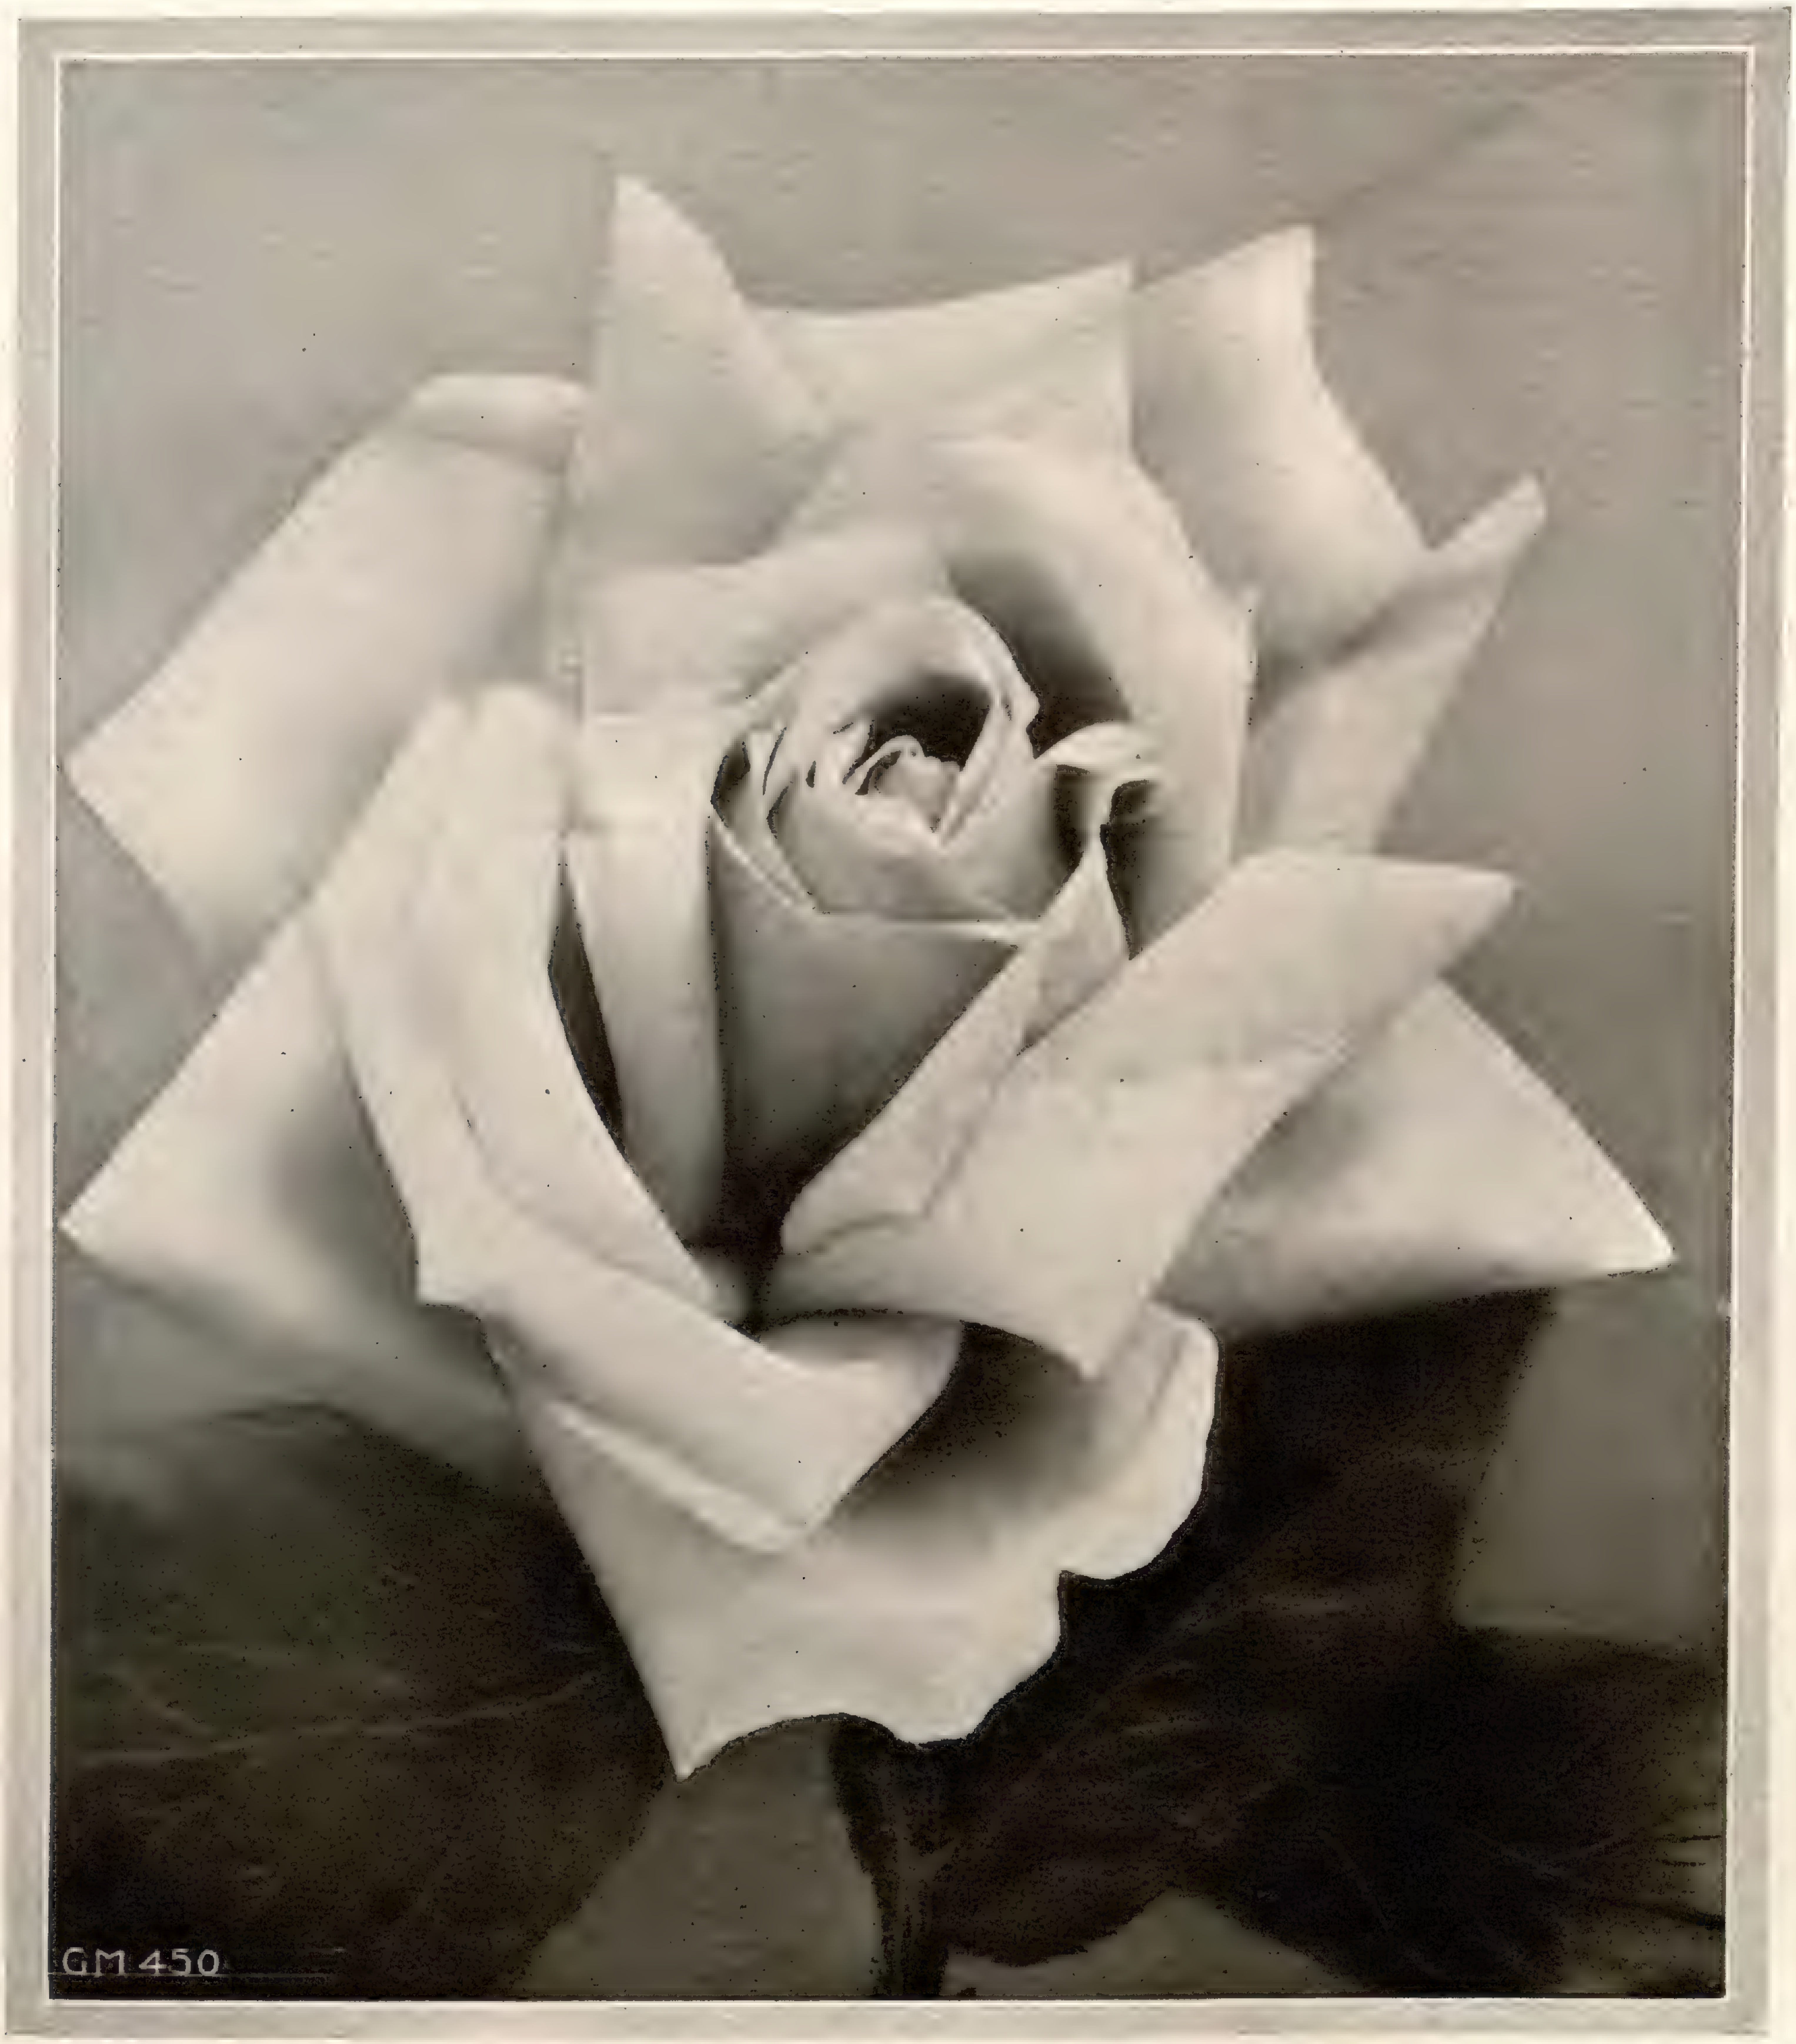
Severe frosts spoil broccoli, cause savoy heads to split, and the stems of all kinds of greenstuffs to split and decay just under the lower leaves.

I have found that the bad effect of frost is more marked on plants grown in a clayey soil than in a light one. The softest part of the stem is that portion immediately below the leaves, but, in cases where the greens have been planted some considerable time, the whole of the stem is hard enough to withstand ordinary frosts; it is when we experience exceptionally severe frosts that our plants suffer so much. Owing to the prolonged rainy weather in August, the plants have made gross growth, and thousands of them will have sappy stems this year, so that they should be guarded against frosts.

I once suffered much loss through having the stems frozen, so afterwards I had the rows of plants well earthed-up. This work must be done before the plants occupy the whole of the soil with their surface roots, otherwise drawing up of the soil will lay bare the roots. I have found that plants, so treated, have improved very much afterwards, the roots freely permeating the soil drawn up to the stems. The soil must be drawn up so that it almost touches the lowest leaves on the stem; it prevents the loosening of the latter in the ground during strong winds. Where light soils obtain, it is advisable to press the earth to the stems with the hands after it has been drawn up; but in the case of heavy loams and clay soils such pressure is not necessary, or, indeed, desirable. **Geo. Garner.**

## ROSE DUCHESS OF NORMANDY.

It is often said that "comparisons are odious," but it not seldom happens that descriptions fail unless we can compare the flower described with one that is familiar. In the case of the new hybrid tea rose named Duchess of Normandy, readers will at once obtain a good idea of its form and merit when the variety is compared with Dean Hole. All good rosarians know this last-named rose, and so, bearing that in mind, and altering its colour to soft salmon-flesh, overlaid with glowing salmon-yellow, paling a little to cream at the margins, one can imagine the beauty of Duchess of Normandy. The accompanying illustration will also help to indicate the form, substance, and beauty of this rose from



NEW H.T. ROSE DUCHESS OF NORMANDY.
A beautiful hybrid tea, introduced by Mr. Philip le Cornu, and remarkable for its attractive colouring.
Card of Commendation, N.R.S., June 26 last.

the island of Jersey. Mr. Philip Le Cornu, The Jersey Nurseries, Jersey, who is distributing this new rose, tells us that the flowers last particularly well when cut, and that if cut when just expanding the yellow glow deepens as the blooms open out. Duchess of Normandy was well shown at Southampton on June 26 last, at the exhibition of the National Rose Society held on the Pier, and it was then granted a Card of Commendation.

## BEAUTIFUL FLOWER BEDS AT BOURNEMOUTH.

In contrast to last summer very little watering has been necessary this year. Those who have been responsible for the filling of flower beds will have had varied experiences. In some gardens plants have made too much growth, and flowers have been scarce. In others the plants have grown unevenly. There are many instances where zonal pelargoniums have been badly diseased

While the result of the year's labours are before us, it is well to take close note of it for future guidance. A wise man will always learn much from his mistakes.

In the Bournemouth Public Gardens the flower beds have been very gay all through the summer; they are so at the present time (the end of September), and look like retaining their brightness until very late in the season. No doubt many readers of the Gardeners' Magazine will appreciate a few notes on these beds, which Mr. Stevenson, the able superintendent, has altered somewhat during the past few years. I will not go into detail with reference to the occupants of the various beds, but simply give the names of the plants used.

I may say here that the principal beds are cut in the grass on both sides of a fine, broad path leading from the square —the centre of the town—to the sea front, at the pier entrance. Alternate beds are round, the others being square, and, as they are all large and boldly filled, the general effect is really very charming and in good keeping with the surroundings.

The contents of the principal beds are double white marguerite Mrs. Sander, with acacias as dot plants. Dwarf Alyssum maritimum as a groundwork, with scarlet tuberous begonias, and kochias as mixed dot plants; the double edging being composed of blue lobelia and golden pyrethrum. These beds (they are mostly in pairs) were very striking. Fuchsias and yellow arum lilies as dot plants in a groundwork of mimulus, were also unique and charming. Zonal pelargonium Golden Harry Hieover, with blue lobelia as a ground plant, and an edging of white alyssum, completed another beautiful pair of beds. Scarlet salvias, abutilons and acacias as dot plants, with a row of single white asters, and an outer one of blue ageratum, were used in another bed.

Beds of heliotrope with dot plants of fuchsias looked charming, while the beds filled with cannas and edged with single asters, with an outside ring of Gazania splendens were very striking. This gazania is not used in flower gardens as much as it deserves to be. A clump of centaurea in the centre, then a band of pink fibrous-rooted begonias, and a bordering of white alyssum suitably filled other beds. Two large beds were very attractive; Flower of Spring pelargonium was planted as a groundwork; intermixed with these were Iresine Lindeni and Lobelia cardinalis, with fuchsias and an edging of Golden Harry Hieover pelargonium.

Geo. Garner.

## WARGRAVE PLANT FARM, LIMITED.

The announcement of a new nursery is in these days of ever-increasing activity in the horticultural world by no means a rare occurrence. Some of the new ventures are certainly short lived, and it has frequently been remarked that the Trade is overcrowded. We have always held the opinion, to which we still adhere, that there is yet room for really good nurseries, the essential qualifications being that they must be founded on a combination of business aptitude and capital, and that a definite line must be struck in some particular branch of horticulture. It may at once be said that the subject of these notes, the Wargrave Plant Farm, Limited, fulfil these conditions, and, despite the fact that less than twelve months have elapsed since the business was started, evidence is abundant that the firm is on the track that makes for success. It need only be said that the head of the firm is Mr. Bernard Crisp, whose father, Sir Frank Crisp, of Friar Park, has long been a prominent patron of horticulture, to show that it is in capable hands, while Mr. Richardson, the head foreman of the nursery, is a man of wide and sound experience and a plantsman to his finger tips.

The line in which this new nursery is specialising is hardy perennials and alpine plants, the growing popularity of which is so marked a feature of present-day gardening. As a matter of fact it was an admirably-prepared and up-to-date catalogue of hardy border and rock plants which the firm has published that claimed our interest and induced us to visit the nursery, and see for ourselves the collection that has been formed. Larger catalogues than this one exist, but few are so entirely devoted to really the best of the hardy flowers. Indeed many extremely rare subjects are offered both for the herbaceous border and the rock garden. As our readers may obtain copies of the catalogue for the asking, it is unnecessary to occupy space reviewing it. We prefer to deal with the plants themselves as seen at the nursery. Even before one enters the gates a brilliant display of colour presents itself to view. Fine borders of hardy flowers, backed with rows of first-rate dahlias, have been arranged on either side the drive which runs from the gates across the nursery. Our visit was paid on October 4, a bright, cheerful day, but Jack Frost had laid his finger on the fine mass of dahlia blossoms the night before, and had just left his mark upon them. It was still evident, however, that all the varieties grown were of the best, and from a distance the show of colour was still bright and pleasing. Among the perennials in the borders many plants engaged our attention. There were good phloxes still in bloom and pentstemons carrying an abundance of brilliant flowers. Heleniums were flowering profusely, H. autumnale Riverton Gem standing out conspicuously as one of the finest autumn-flowering plants we have. It is an immense improvement on H. grandicephalum striatum. Just as beautiful in its way is Rudbeckia Herbstouni, with broad-petalled flower of a clear canary-yellow, with thimble-like green-tinted cones. There were Michaelmas daisies, embracing the best of those in cultivation, one that showed up remarkably well being Aster Novæ Belgi Viscount Garnault, a compact-growing variety, bearing perfect masses of bright, rosy-mauve flowers. Gypsophilas of sorts still carried loose panicles of starry flowers, and a brilliant dash of colour was provided by Dianthus cruentus still in bloom. The newer hybrid Verbascums receive at Wargrave the attention they merit, and spring-propagated plants were flowering splendidly. Polygonums, veronicas, the crimson flowers of Phygelius capensis, and several sidalceas added their quota to this interesting display of autumn flowers, and when it is remembered that many of these have been in bloom for weeks or months it is small wonder that the cultivation of herbaceous plants has made wonderful strides in British gardens.

Passing from the borders to the alpine and rock plants one realises in a moment that at the Wargrave Plant Farm there is no ordinary collection, for the choicest and rarest of alpines are seen in the plunge beds, which occupy a very large area in front of the packing sheds and offices. Let it be aubrietias or saxifragas, primulas or linarias, the varieties seen were the very best of their respective kinds. There is apparently no room for the common or indifferent, but one could not name many really choice forms that were not to be seen, and the whole collection evidenced skilful cultivation and watchful care. Wahlenbergia serphyllifolia major, carrying its rich purple flowers, which are of remarkable size for so tiny a plant, was a subject that we greatly admired, and we also appreciated the charms of the dainty little Linaria origanifolia, Gypsophila dubia with its slender red stems and glaucous foliage, and the remarkably free-flowering Polygonum vaccinifolium. Margyricarpus setosus is a plant of quite unique aspect and great beauty. Its closely-set, awl-shaped foliage, its quaint green flowers, and pretty little white berries have an individuality about them, and make this plant highly desirable where the aim is to possess a really choice collection.

An old favourite, but somewhat scarce plant that was both growing and flowering freely is Ceratostigma plumbaginioides. Flowers of a real pure blue colour are at any time valuable in the garden, and during September and October, when this may be had in bloom either in the border or on the rockery, its rich colour is unsurpassable. Hardy primulas are largely grown at Wargrave, the newer Chinese introductions being included in a good collection. Primula capitata was flowering beautifully, the plants being less than a twelvemonth old. This is a delightful primula, other good forms being P. Cockburniana, P. Littoniana, and P. Bulleyana, all of which are numbered among the Wargrave collection. Arabis Sturi is a little gem that has quite a distinct character, its compact rosettes of deep green foliage more closely resembling an androsace or a saxifraga than most of the other members of its own family. Its white flowers are very attractive, being large in proportion to the size of the herbage.

There are excellent propagating houses on the nursery, and in them young stock is still being produced, such plants as Lithospermum prostratum, Fremontia californica, Romneya Coulteri, and other choice subjects being worked up for spring demand. A very useful subject is Santolina incana nana, it being much dwarfer and more compact than the ordinary type. Cistus and helianthemums, shrubby potentillas, white lavender, and the ever-useful Nepeta Mussini are all to be seen growing away in perfect vigour, and throughout the place there seems to be nothing but highly desirable plants, for which a ready sale should be found with the greatest of ease. Twyford Station, on the Great Western main line is about one and a-half miles from the nurseries, and it is worth the while for any hardy plant enthusiast to run down and see this newly-formed, but extremely interesting collection. The firm's head office and shop is in The Arcade, Liverpool Street, London, and here a seed and bulb trade is conducted, and a seasonable display of cut bloom maintained, as well as collections of alpines for the benefit of those who are unable to visit the nursery.

**Clerodendron nutans.** — The clerodendrons are indeed a variable race, and they differ in so many and strongly marked features one from the other. Clerodendron nutans is an old plant, which forms rather a loose-growing shrub clothed with dark green, ovate-lanceolate leaves. The flowers, borne in drooping racemes, are about an inch across, and pure white; while, as in many other members of the genus, the calyx is large, and being of a reddish tint, it forms a conspicuous feature. This species is a native of the East Indies, and requires a stove for its successful culture.—S. W.

# ALYSSUMS, OR ROCK MADWORTS.

As spring comes round we look for the resumption by our plants of the Rock Madwort of that wondrous display of small golden flowers which have bestowed upon it the other popular name of "Gold Dust," one distinctly descriptive of the appearance of the flowers. Individually small, in a mass they give us a wealth of gold, and with the aid of other spring flowers render the garden as gay in spring as at any period of the year. Alyssum saxatile is a truly fine plant for covering mounds and rocky banks, as well as for massing in the borders, and it must always be remembered that it is ineffective as small plants, compared with its appearance when boldly massed and well shown by its situation.

It is pleasing at any season with its greyish foliage, but it is when this is literally covered with the small golden flowers that it is at the zenith of its usefulness for the garden.

## Alyssum saxatile and its Varieties.

What is known as the typical Alyssum saxatile is a good plant with greyish-green leaves and small yellow flowers, and forms a rounded bush a foot or so in height, or in dry situations a few inches less. It is valuable, but, useful though it is, it is inferior for horticultural purposes to the variety called Alyssum saxatile compactum. This is from six to nine inches high, and flowers with as much, or even more, freedom than the typical plant of gardens. In masses in the rock garden or the borders devoted to spring gardening, associated with snow-white arabises and purple aubrietias, an effect of the highest kind is produced, especially in April and May.

It has a rival with less golden flowers in Alyssum saxatile citrinum. This assumes more of the compact habit of A. s. compactum than that of the type, and is prized by many for its soft, citron-yellow flowers. It looks well associated with the arabises and with a dark purple aubrietia, after the shade of Dr. Mules or Prichard's A.1.

Still dwarfer than any of the foregoing is Alyssum saxatile Tom Thumb, a true miniature, only attaining a few inches in height, but not so free-flowering by any means as one would like. It is a pretty grey-foliaged plant for the rockery, but its flowers are sparsely borne, and it has little effect, so that it may well be dispensed with.

A very good form of the Rock Madwort is Alyssum saxatile fl. pl., which is a variety of the larger form with double flowers, of the same brilliant golden hue as those of the original. The habit is also the same, but the doubling of the flowers gives the blooms greater endurance, and it is to be recommended to many, although I consider from my experience of it that this double variety is a little stiff in its growth.

Finally, we have Alyssum saxatile variegatum, a variety with leaves margined or variegated with creamy-yellow. It is not a plant which appeals much to me, inasmuch as the variegation is not too bright, and its presence appears to have the effect, so frequently found in variegated-leaved plants, of reducing the freedom of flowering. It cannot, therefore, be recommended where a display of bloom is desired, and has not any outstanding points of real merit to commend it.

## Propagation.

These Rock Madworts can all be propagated by means of cuttings, the best time for which is immediately after the flowering is past for the season. This is the only method by which such varieties as the double form, Tom Thumb, and the variegated one will come true. Compactum sometimes comes fairly true from seeds, but is apt to become a little stronger than it should do when thus propagated. Some utilise as cuttings the smaller branches, and take them off at the base and root in light soil in a frame, or under a handlight in the open, or in pots under glass. The stronger branches will also strike well if taken off with a heel, and put in light soil in a frame or greenhouse, or under a handlight or bellglass in the open.

ALYSSUM SAXATILE CITRINUM.
A lemon-coloured form of a beautiful spring-flowering plant.

The typical A. saxatile may be raised from seeds, and certain strains of compactum and citrinum come almost true from seeds also. Where a large number of free-flowering plants are required, this is an excellent way of procuring a stock. The seeds can be sown under glass from February onwards in the same manner as ordinary perennials or half-hardy annuals, or in late April, May, and June in little drills of sandy soil in the open. When they can be handled, the seedlings ought to be pricked out three or four inches apart and transplanted to where they are to bloom early in the autumn.

## After-Treatment.

Large plants of A. saxatile do not move well, and young ones should be employed. A great improvement is effected by cutting over the plants after they have bloomed to retain them in shape, and prevent them becoming leggy. In a short time young shoots will make their appearance, and will thicken up the plants and assist in and will thicken up the plants and assist in giving a better display the following year.

The Rock Madwort looks best on a mound or rockwork, and should be planted there in a group of several plants together, so as to make a more brilliant show. A dry soil is preferable, and the foliage will be lighter in colour and of a more silvery appearance if a little lime is in the soil. A sunny position is the best, and with a dry soil it is certain to please all by its brilliance in its season. S. Arnott.

---

**Clerodendron fallax.** — Though this may be had in bloom at different seasons of the year, its richly-coloured blossoms are perhaps seen to best advantage during the late summer and autumn months. It readily responds to liberal treatment.—W.

## SWEET WILLIAMS.

Sweet Williams (Dianthus barbatus) rarely receive the attention they deserve in the autumn time. The plants are quite hardy, and flower very freely, looking charming in the mixed border. When a little extra attention, however, is given to them they grow vigorously, and yield great numbers of flowers.

Very often the plants are allowed to remain in the seed beds until the spring, and are then lifted and transferred to their flowering quarters. Now, clumps so treated will not yield a plentiful supply of really good blossoms. I have seen remarkably strong clumps, lifted in spring, which have drooped badly, and not recovered their normal condition again for a long time. By the time spring comes sweet williams should be well established in their flowering-beds, and the way to ensure this is to transplant them at the end of September or early in October.

The sweet william is a grand plant for a clayel soil. Some of the best specimens I have ever seen were grown in a stiff, clayey loam; transplanting had resulted in the formation of numerous fibrous roots in addition to the rather long tap-root, and the leaves were large and of great substance. A soil in which water lies stagnant, however, will not suit them; the lower leaves turn yellow and then shrivel up, and the whole plant becomes stunted, not branching out as one would wish.

Where the ground is on a low level, and thorough drainage is difficult to accomplish, the beds should be raised, and some road-grit mixed with the soil. Transplant the clumps while the soil is fairly dry, and, while in this condition, make it moderately firm around the roots. Slugs are very fond of them, eating out the tender young centres. Use dry soot or dust lime, and also sprinkle sifted ashes on the surface around the plants as a preventive.

G. B.

## SAMBUCUS CANADENSIS.

Regarded from a flowering standpoint, this is a very striking elder. Its huge cymes of creamy-white flowers are considerably later in expanding than those of the common kind. Furthermore, it is much less of a tree than Sambucus nigra, forming as it does, a bold bush from six to ten feet in height or thereabouts. It is very effective when planted in close proximity to water. The date of introduction is given as 1761, but it is only within the last few years that attention has been generally directed to its high ornamental qualities. As Sambucus pubens maxima a good deal of interest was centred in it about ten years ago.

Of the other elders that we have in our gardens, our own native species, Sambucus nigra, is remarkable for its extreme variability, as the several varieties differ from each other in foliage, habit, flower, and fruit. Among the more uncommon kinds is a double-flowered form of a pretty pinkish tint. The ordinary kind, when in full flower, is certainly very handsome, and, in addition, it blooms when the bulk of our flowering shrubs are past, while it will flourish even in hard, stony soils.

The red-berried elder, Sambucus racemosa, is remarkable, not only because of the colour of its fruits, but also because of the distinct leafage of many of its varieties, which, in their finely-cut foliage, suggest some of the Japanese maples.

S. W.

## HÆMANTHUSES.

The genus hæmanthus comprises, according to Nicholson, about thirty species. Several new hybrids have, however, been raised since the publication of that work, but possibly the number of distinct kinds in general cultivation may be reduced to a dozen. Some of the best are H. Cinnabarinus, red; H. insignis, orange-scarlet; H. Kalbreyeri, bright crimson; H. Katherinæ, bright scarlet; H. multiflorus, bright red; H. natalensis, orange; H. punicens, orange-scarlet; H. sanguinens, scarlet; and H. Andromeda, orange-scarlet.

It is somewhat surprising that these really handsome plants are not more generally cultivated, for it is the exception, rather than the rule, to find them grown. They are not, perhaps, so striking as the amaryllis, to which order they are allied, but, nevertheless, a batch of well-grown plants of any of those mentioned would hardly fail to appeal to the average observer. Even when not in bloom their handsome, rich green leafage invariably commands attention.

Cultivation consists mainly in producing active growth, followed by a decided rest. Propagation is by seeds, which set freely, or offsets, which are generally plentifully produced. The seven plants of H. Andromeda which secured the Award of Merit at a recent meeting of the Royal Horticultural Society were grown from offsets taken, with ten others, from one bulb in the spring of 1910. These were potted into four-inch pots in a compost of sandy loam and peat in equal proportions, and placed in a fig-house where the temperature was high, and the atmosphere moist. Here they soon got over their severance from the parent bulb, and made rapid progress, and, after about two months were removed to a position of less heat, but always kept growing strongly with fairly moist surroundings. Plenty of water, with frequent weak stimulants, were given until signs of rest were apparent by the leaves turning yellow, then the amount was gradually reduced until the foliage died down, when, as in the case of other classes of bulbous plants, water was withheld for a time to ensure their enjoying a thorough rest.

During the resting period a temperature of about 40 to 50 degrees was given, and the soil kept perfectly dry. On the first signs of new growth in early spring they were given a good soaking of water, shaken out of the old soil, and placed in six-inch or seven-inch pots, using a similar compost to that described, with the addition of bone-meal and soot. In these pots they flowered. The previous year's treatment was repeated as nearly as possible, excepting that they did not receive such a high temperature to enable them to recover after potting. This season a slight top-dressing only was given, and the plants were grown as before until the flower spike was well advanced. A removal to a dry, airy greenhouse was then necessary, as it is important that no water touches the blooms.

Hæmanthuses remain in bloom for six weeks, and are found useful for house decoration. Tables fitted with receptacles for holding about five plants make a striking feature. Having once brought the bulbs to flowering size, they may be cultivated under ordinary greenhouse treatment, but they prefer a higher and more humid atmosphere while growing freely. With established bulbs, every other year will be quite often enough for repotting.

Arthur Cobb.

Duffryn Gardens, near Cardiff.

## THE SCOTTISH FRUIT CROPS.

### Apples.

This very important crop, in the northern parts of the country, is developing much more kindly than was at one time anticipated. Taking productiveness generally, it must be admitted that the bulk of crop varies considerably. In some districts the fruit is plentiful, and good in quality, while in others the ruling is quite the reverse —a state of things that is by no means uncommon in other parts of the United Kingdom.

The brilliant weather which prevailed throughout the greater part of September was of great assistance in bringing the earlier kinds to maturity; while later-keeping sorts have increased in size at a rapid rate, and really large, well-coloured specimens are now in evidence—a pleasing contrast compared with the estimate formed a short time ago. One great peculiarity of the apple crop this season has been that of the fruit dropping from the trees, even in its quite incipient stage. Some varieties, as may be imagined, were more addicted to this failing than others, but scarcely any seemed quite free from the defect.

So prevalent was this with some that summer was so reduced that but few remained upon the trees to mature. In like manner, and for a similar reason, crops of midseason fruits are now being gathered to save them from loss by being bruised in falling from the branches, which assuredly would be the case should a storm of wind arise. Even the latest varieties that are seldom gathered until the middle of October must shortly be placed in store, as it is becoming too risky to leave them much longer upon the trees.

With the wet, dull summer that we have had one naturally thought that the ingathering of crops could profitably have been deferred for a longer period than in previous years. Such, however, is not the case, and it applies with equal force to most other fruits besides apples. This premature falling of apples is not the result of attack from the codlin moth, as the fruits are perfectly sound, and, when size permitted, were readily made use of. Furthermore, pests of this kind are but little in evidence in Scotland at any time.

### Pears.

These have developed one of the best crops in recent times, most varieties contributing to this result. The early dessert kinds have already ripened off well, while those succeeding are equally promising. Upon the whole the colouring of the respective sorts leaves little to be desired, and size and quality of the individual fruits is equal to that experienced in more propitious seasons. The above refers more especially to the best of the dessert kinds, which in this part require the protection afforded by a wall to develop their best qualities.

Commoner kinds, as Hessle, Swan's Egg, and Crawford's Early, together with such well-known and popular sorts as Williams' Bon Chretien, Louise Bonne of Jersey, and a few others of the first rank, that will succeed in bush or standard form in the open, were, or still are, laden with fruits, most of which are above average size. The great amount of sunshine last year was probably the principal factor in this, which the excessive rainfall during the growing period this year did not materially affect, except that the liberal amount of moisture in the soil assisted the fruits in attaining a larger size than usual.

Galloway House, James Day.
Wigtownshire.

# OBSERVATIONS ON THE TREATMENT OF HARDY FLOWERS.

The effectiveness of a well-planned perennial border depends to a great extent on the components of which it is formed; blending of colour, the extent of each group and manner of arrangement, all influence the final effect produced, so that wherever planting is being done these conditions should be given judicious consideration in the initial planting. The possibilities of this branch of garden decoration are not readily defined. As a general rule, masses of colour give the most impressive effects, of which perennial phloxes, lupinus, monarda, and campanulas afford useful examples, yet the principle is one offering great latitude, being specially applicable where broad effects are necessary, otherwise, under these conditions, a degree of indecision and spottiness would be our only reward.

To extend this principle, without restraint, into the smallest garden, would not materially lessen its value as a practical guide; in substance, the masses need not attain to the same dimensions as in a larger sphere, while by exercising the selective element we naturally incline to the use of plants yielding the greatest display over the most extended season. Some modification of this system would be here admissible, otherwise we exclude many subjects that, having regard to their proportion, could not readily be accommodated in quantity where space is restricted. Yet, if introduced in appropriate positions, these, by the law of contrast, emphasise the characteristics of less commanding subjects, while, at the same time, their boldness assumes additional value, it may be the foliage chiefly, as in Senecio clivorum, or, again, the flowers, as in Spiræa aruncus, but in either case, single specimens of these, when fully matured, may always be introduced to advantage in small gardens, and thereby redeem a composite planting from any charge of being commonplace.

The relative contrast and harmony that all plants exhibit in their general characters is an aspect of good gardening not usually recognised, and given the importance it warrants in practice, and probably wherever it attains its highest development, it will be found, as a rule, that leaf contrast produces the best effects, as flowers most fittingly express their beauty in harmony. This is simply illustrated by the sword-like foliage of irises, montbretias, and gladioli, which invariably offer a marked contrast to plants bearing leaves in the form of flattened plates; again, there are others whose decisiveness during the vegetative period is never great, as in some bupthalmums, heleniums, and campanulas of the persicifolia type, which, when contrasted with plants of the iris type, or with those having pinnate or compound leaves, as galega, thalictrum, and Papaver orientale, add considerably to the general effect, and also offer a definite amount of pleasure to be drawn from comparison of the various leaf-types.

As to how far harmony of colour in border planting can be successfully carried into practice, is probably most readily answered by broadly reviewing some of the larger genera with which we are most familiar, as for example, in pæony, pyrethrum, phlox, and iris, where we find almost a complete gradation of colour within themselves, so that, planted separately, we find that, in practice, a bed, border, or even a garden devoted to one of these subjects invariably affords a pleasing and satisfactory result from a colourist's point of view. We must, however, recognise one serious drawback to an unrestricted use of the massing system, a danger that directly affects gardens of every extent, in that large groups of early-flowering subjects leave a distinct gap when the flowering period is over. Poppies of the oriental class are well-known offenders in this respect, yet to exclude plants of this class from the hardy border would be a serious less to many gardens. Instances such as this must be frankly met and overcome, either by intergrouping with some later-flowering subject or in relegating them in a body to a position by themselves, the latter preferably, even if it can only be practised on a small scale.

We are much too conservative at times in our methods of gardening, and by rigid adherence to stereotyped custom we do not invariably secure the best results, for an arrangement that applies to one garden will not of necessity be the best for all. Hence it is only by experiment that we may eventually attain to the fullest knowledge of the conditions that affect us locally, while an interchange of ideas has at least distinct value in enabling us to institute comparisons between methods that approximate to our requirements, and between subjects that are most likely to succeed under our conditions and yield the desired results. Thomas Smith.

Coombe Court Gardens.

# GARISH DAHLIAS—A PROTEST.

To the admirers of floral beauty, as exemplified in symmetry of make and delicate beauty, it must be a matter of regret that the general exhibitions of dahlias nowadays should be so largely alloyed by the newly-introduced pæony section, in which great size and glaring colours are associated with huge bunches of coarse petals, loosely and irregularly arranged without even a suspicion of that orderly and symmetrical grouping which is considered an essential feature in all the other classes, but one, of the beautiful dahlia tribe. In the old-fashioned globular flowers, both in the full-sized ones as in the dwarf pompons, we see this symmetrical arrangement to perfection, and in the cactus section it is also a sine quâ non, and it is really a feast to the eye to see these at their best as recently exemplified at the Royal Horticultural Hall. Each flower is a gem, and, although the colours may be brilliant and even dazzling, their association with perfectly-formed flowers with regular petals, often delicately graded in tints, makes them irreproachable.

With the ragged-looking "pæony" forms, however, the very brilliancy of their colours is an added offence, attracting, as it does, the eye to their manifest imperfections. In no other popular flower that we know of could such productions be deemed acquisitions, much less improvements, and no one, we think, imbued with true horticultural taste, could tolerate them as garden embellishments. The exception to the general beauty of the other sections, to which we have alluded, is the so-called collarette section. Here, indeed, we may have a fine section in the making, but, so far, in all the flowers, the possible, evenly-made collar or coronet of enlarged central florets, is invariably irregular, like a bad set of teeth, and this, to our mind, alsolutely spoils the simple charm of the beautiful singles whence they spring. In this direction we would by no means discourage the raiser's efforts to obtain ideally perfect flowers, but with regard to the flambuoyant pæony section, we consider them to be of far too coarse a nature to promise anything worth having. C. T. D.

# THE IMPROVEMENT OF ROSE SOILS.

With the planting season close upon us, the making of new beds and the improvement of rose soils will need some consideration.

For instance, suppose we have a clayey, and consequently heavy, soil, in which much plant food is needed. If such a soil is turned up to the air, and, maybe, frost, as roughly as possible, much good will be done. A little lime is also wanted upon this class of soil. I would like to turn such soil up as soon as possible, and let the air and lime do a great deal of their work before adding any animal or other manures, or planting in any way. If very wet it should be drained in some form. Burnt earth is a good thing for a clayey soil, and may be added freely to the lower spit when trenching or taking out holes for specimen plants. A little basic slag at the proportion of 6 to 8 ozs. to the square yard will also be a help. Powdered chalk at the same rate is another good ingredient for clayey soils. But we need some manures as well as these materials, which are really applied to help bring the soil into better working order rather than as food to the roses themselves. The best all-round fertiliser is thoroughly rotten manure from the stockyard. This is really suitable for any class of soil provided we add the other ingredients, as above, upon those of a distinctly clayey character.

Turf edgings, the sweeping and scrapings of untarred roadways, as well as decaying vegetable matter, are all helpful upon stiff and poor soils. After pruning, a liberal dressing of manure, and this slightly forked in, is a great stay to the plant all through the summer.

A sandy or gravelly soil will not grow roses to perfection, and must be supplemented with rich and stiff loam, and farmyard (preferably from horned cattle) manure added. The aim is to render the soil much stiffer and more retentive. No one need despair of growing roses satisfactorily if they attend to the making up of their soils. We do not want extremes; a soil a little inclined to be stiff is, however, the most suitable. If ours is not naturally of such physical condition we should strive to make it as nearly so as circumstances will allow.

It is an excellent plan to replant rose bushes at least each fourth season, unless they are in definitely fixed positions, such as over buildings, arbours, porches, etc., when, if we make due use of the opportunity, and enrich the lower strata, the newly-planted roses will be renovated, and show a decided improvement.

Rosarian.

**Leycesteria formosa.** — This shrub, which is said to form such a notable feature of its Himalayan home, is in our climate decidedly less attractive than it is where it occurs in a state of nature, but even here it is well worth planting for ornament, the flowers being borne in the latter part of the summer, when so many shrubs are over. Botanically, it is a new relative of the honeysuckles, and forms a free-growing shrub, whose shoots are clothed with a green bark. The flowers, which are borne in drooping racemes, are white with a purplish tinge. A prominent feature of the inflorescence, consists of large purple leaf-like bracts which subtend the flowers. Here these bracts are said to be much less brilliantly coloured than when growing wild in the elevated regions of the Himalayas. —K.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

VANDAS.—The end of the present month or the beginning of next is the best time of the year to thoroughly overhaul all plants of V. tricolor and V. sauvis, especially if any disturbance at the roots is necessary. When done at this season there will be far less loss of foliage than when the operation is performed at any other time. These plants do not appreciate strong sunlight at any time, and now that the sunshine is daily decreasing in power, and the external air is cool and heavily charged with moisture, a suitable atmosphere can easily be maintained for them at the cool end of the cattleya or intermediate house. A shaded position is of the greatest assistance towards the re-establishment of the plants without loss of foliage. These vandas, when allowed to lose their leaves, are among the most unsightly objects possible, therefore it is necessary to take every precaution against loss of foliage.

REPOTTING at this season is favourable both to the production of fresh roots and the retention of the lower leaves. It is principally those leggy specimens, which have become unsightly by the loss of leaves, that will need repotting, and in the case of plants in that condition, it will be necessary to remove the old potting material and drainage. When taking the plant from its pot, the roots which are clinging to the sides should be carefully detached. If the base of the stem can be cut off, to enable one to bring the lowest leaves down to the same level as the rim of the pot, so much the better, providing there are sufficient roots left on the stem to maintain the plant until new ones are made. Keep the stem of each plant in the centre of the pot, and carefully work the lowest roots around the bottom, intermixing with them clean crocks to half the depth of the pot. Over these place a layer of sphagnum moss; spread the other roots carefully over the surface, and work amongst them some clean, picked sphagnum moss.

TOP-DRESSING.—Plants that are furnished with leaves to the rim of the pots should not be disturbed, but the old potting material, which has become sour and decomposed, should be carefully removed down to the drainage, and be replaced by fresh material.

WATERING.—For several days after potting no water at the roots will be necessary, as the moisture from the moss will be sufficient for them. When the moss turns white, and appears quite dry, a thorough watering will be necessary. As the moss on the surface becomes dry it should be sprayed as often as is necessary to keep it in a healthy growing condition. Vandas of this section should be placed on a stage, covered with some moisture-retaining material such as crushed coke. These vandas, although not seen to such advantage as formerly, are very handsome plants, and when several are in bloom the perfume from the flowers pervades the whole house.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

CURRENT WORK.—In this department we have not the anxiety of having the plants housed before sharp weather sets in, but, at the same time, there is need to see that everything is in order to withstand the changing conditions. Many species of warm-house plants, that in normal seasons would be better for a longer sojourn in pits and frames, must now be removed to warmer and drier quarters. Although I do not recommend a high, close temperature for such winter-flowering plants as poinsettias, eranthemums, Plumbago rosea, and the like, at this time of year, yet, if allowed to remain in their summer quarters too long a severe check may result which cannot be remedied. Cold nights and sunless days must be guarded against, or the roots will become chilled. It is a good plan to rearrange the whole of the occupants of the plant stove about this time, taking advantage of the opportunity to thoroughly cleanse the glass and woodwork of the structures, both inside and out, and clean the plants themselves. This procedure will ensure the admittance of the maximum amount of light to the plants, and this is essential to their well-being during the dull, dark days of winter.

POTTING SOILS.—No time should be lost in preparing the various composts required for another year. First and foremost is good fibrous loam, and this can usually be dug from an old pasture. The required number of turves should be cut, not more than three inches thick, and stacked in a compact heap, sprinkling plenty of lime and soot between the layers as the stacking proceeds. This will answer a double purpose, viz., kill the insects and their larvæ, besides making the soil sweet and friable for potting by the time it is wanted for use. The best leaf-soil is obtained from decayed oak or beech leaves, and, assuming these were collected last season and have been turned over occasionally, they should by now be in good condition for use. Before mixing this with the compost, pass it through a sieve to keep back decaying sticks, which are harmful to the roots of plants. Charcoal is of inestimable value, and on estates where plenty of hard wood is to be had, some should be made into charcoal during bad weather.

TEMPERATURE.—All structures containing stove plants must now be kept at the proper temperature by the use of more fire-heat; at the same time, let this be judiciously applied in accordance with the conditions prevailing outdoors. Admit air on all favourable occasions, and close early in the afternoon in order to store as much of the warmth from the sun's rays as possible, thus necessitating less fire-heat at night. Heavy syringings should now cease; at the same time, maintain a fair amount of humidity in the atmosphere to keep down insect pests, such as red spider and the like. Above all things, do not overwater at this season, especially those plants that are ripening their growths preparatory to going to rest for the winter.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY PERMANENT VINES.—Where it is intended to commence forcing vines in the early house by the middle of next month, the laterals should now be pruned back to two or three good buds; this will enable the vines to have a complete rest before forcing operations are commenced. In advocating the retention of two or three buds when pruning, it should be borne in mind that this will allow the choice of the best growths when the embryo bunches are showing. Rub off the loose bark from the rods, but on no account should they be scraped with a knife or peeled closely; give the vine rods a good wash with insecticide, working it well into all the crevices, and around the buds with a stiff brush. This will not injure the vines in any way, but it has the effect of destroying all insect pests and mildew. Whitewash the walls with freshly-slaked lime, to which some flowers of sulphur has been added. Tie the vines into position, and remove a few inches of the surface soil from the borders, and give a good top-dressing of fibrous yellow loam, with plenty of bone-meal, lime-rubble, and some approved chemical fertiliser added. If the soil in the borders is dry, a thorough soaking with clean water should be given, and this is usually sufficient water at the roots until the young growths make their appearance.

EARLY PEACHES AND NECTARINES.—The leaves of the earliest trees will have fallen, and pruning the trees should be taken in hand forthwith. Where careful disbudding and forethought has been exercised in laying in the young growths, very little pruning with the knife will be necessary. In any case remove all wood that is not required with a sharp knife, as the work of pruning proceeds. Cut the ties, and detach all the wood from the trellis; it will be necessary to secure some of the main branches temporarily to the trellis, or otherwise they may be broken. It often happens that too much young wood has been tied in during the current growing season, but do not hesitate to thin it out sufficiently to allow plenty of room for the development of good fruit next season, and for laying in next season's young growths. When the pruning is finished, wash the trees with soft soap and warm water, scrub the main stems and branches with a stiff scrubbing brush, and the young growths with a small tooth brush, taking great care not to injure the buds. If the trees are infested with scale, this can easily be dislodged by brushing them off with a dry tooth brush before washing commences. Tie the branches into loose, convenient bundles, and give the glass, woodwork, and walls a good scrubbing with soft soap and hot water; afterwards wash the whole structure down with clean water applied forcibly with the garden engine. Whitewash the walls with lime and sulphur, and set out the main branches into their respective places; then commence to tie in the young growths, so that they will form a good, evenly-balanced, fan-shaped tree. When the work is finished remove a few inches of soil from the borders and top-dress with good loam, lime-rubbish, bone-meal, and wood ashes well mixed.—Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

SPRING BEDDING.—The work of preparing the beds for their spring occupants should be proceeded with at once. It is essential to thoroughly cultivate the soil and enrich it with well-rotted manure. Endeavour to carry out this work when the soil is not too wet, and while wheeling and removing material avoid damaging the walks or cutting up the grass around the beds. It is an advantage to have all spring-flowering subjects planted before the end of the month, so that they can become thoroughly established before the advent of inclement weather. Wallflowers, myosotis, arabis, and polyanthuses should be taken up with plenty of soil attached to their roots. When planting, press the soil firmly around them, and give a good watering when the work is complete. Some of the newer varieties of sweet william are very charming subjects. Pink Beauty is especially delightful, and it should be planted at the present time. The various bulbs required for spring display should be also planted at once.

ORNAMENTAL CONIFERS.—Many gardens are lacking in good conifers, and there are so many handsome species in cultivation that there is no excuse for not making more use of them. When well placed, conifers are generally admired, and during the winter months they give colour to the pleasure-grounds. Cedrus atlantica glauca forms a very attractive object when it has attained fair proportions, its silvery-grey foliage being very effective. Abies pungens glauca, A. concolor, and A. lasiocarpa are extremely showy, and are ideal for planting as single specimens on the grass. Abies nobilis, A. Pinsapo, A. bracteata, A. magnifica, A. Mariesi, and A. homolepsis are all exceptionally handsome trees to plant, and have attained a large size in these gardens. Cupressus Lawsoniana Allumini is a distinct and handsome tree, and its glaucous foliage renders it especially attractive. C. L. lutea is probably the most effective of all, and when well grouped for distant effect is very telling. C. L. intertexta is a distinct form, and C. macrocarpa lutea is quite an acquisition. Juniperus chinensis aurea, J. drupacea, J. japonica aurea variegata, and J. Sabina Knap Hill variety all deserve a place.

LIBOCEDRUS DECURRENS, Sequoia sempervirens albo-spica, and Taxodium distichium are all desirable trees. Retinospora filifera, R. pisifera, and R. plumosa are especially attractive, as are their golden forms. R. squarrosa forms a delightful tree.—J. Gardner, Batsford Park Gardens.

# NORTHERN COUNTIES FRUIT CONGRESS.

I have recently received a command from the Rev. J. Bernard Hall, secretary of the North of English Horticultural Society, to fix up a Congress on Fruit or Fruit and Potatoes for the four northern counties of England, to be held in 1914; and further, a request that I should appeal to the Durham County Council for funds to meet various expenses.

I am wondering if I may have the assistance (in the first instance) of your valuable paper to ventilate this scheme, and as regards the Congress to come into touch with horticulturists and others in the North, who would intimate their willingness to work with me to run the said Congress. The Northern Fruit Congress, so called, of the past years, has been, more or less, a one-man scheme, and a financial failure. In 1910 Captain Cuthbert had to pay a deficit balance of £50. In 1911 the Rev. J. B. Hall was responsible, and had to meet a deficit of £30. In 1912 the Rev. J. B. Hall and Professor W. B. Little were conjointly responsible at Carlisle, and they have come out looking rather blue; still, they are going to keep running and organise a conference at Kendal in 1913. This procedure seems to me very unwise. If a congress on fruit, or a horticultural congress in any form is wanted, why should there not be a proper representative congress committee or council to carry on such a movement on similar lines to which any other congress is managed, and make it peripatetic—annual meetings in different centres? The request for me to approach the Durham County Council or any other county body for cash—and more particularly the Council in question, as not one of the members are horticulturists—is not the right course to take. Mr. Hall argues that the Yorkshire Agricultural Society arrange and provide many years in advance; they and other allied societies have the interests of the work at heart, understand and provide in advance; not so a county governing body. To ask a County Council to organise a show or prepare a scheme amongst whom no one is enthusiastic, two years hence, and out of the rates, is not the proper course to take. If a body of ladies and gentlemen can be found to work together I will gladly work hard with them.

Whilst writing in connection (although indirectly) with the North of England Horticultural Society, it may not be out of place to note the progress of this northern society since its inception. One wonders sometimes if it is wanted. The secretary often states that existing societies and others must invite them to come out if they are to visit a centre. The mission of the North of England Horticultural Society should be to tell societies that they ARE COMING to their town on a given date, create interest, and partially finance the concern. If this is done horticulture will advance. The old custom to wait for folks to send for you is dead.

Judging from the Monthly Magazine (which now does not appear on the first of the month), no progress has been made; whereas at first the Fellows and others were given some good original reading—lately it is generally copy, and begging, and advertisements. The main question which is raised by numbers of people suggests that Leeds is not a good centre; at any rate it is not suitable, and the system of management may have been good twenty-five years ago, but that system is now obsolete. It would be a good thing to have fewer ideals manufactured, and fewer commands sent forth.

JOHN SMITH,
Fellow of the N.E.H.S. and Horticultural Lecturer for County of Durham.
Shire Hall, Durham.

CRYSTAL PALACE.
THE GREAT AUTUMN SHOW
of
CHRYSANTHEMUMS
will be held by the
NATIONAL CHRYSANTHEMUM SOCIETY,
at the
CRYSTAL PALACE,
on
OCTOBER 29, 30, 31, 1912.
No extra charge to view this magnificent show.
Schedules and all particulars to be obtained Post Free from the Secretary,
Mr. T. RICHARD A. WITTY,
72, Savernake Road, Gospel Oak,
London, N.W.

THE WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.
President: H.R.H. The Princess Louise, Duchess of Argyll.
THE 6th ANNUAL SHOW of FARM and GARDEN PRODUCE will be held on Wednesday, October 23rd, at the ROYAL HORTICULTURAL HALL, Vincent Square, Westminster.
Flowers, Fruit, Vegetables, Garden Designs, Table Decorations, Honey, Preserves, etc. Trade Exhibits invited. Entries close October 16th. Schedules obtainable Secretary, 45 (6th floor), Queen Anne's Chambers, S.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

There was a remarkably fine exhibition at Vincent Square on October 8, the Royal Horticultural Hall being packed from end to end, each annexe containing a number of bright exhibits. The newer trees and shrubs, bamboos, Michaelmas daisies, chrysanthemums, dahlias, orchids, and fruits were all present in great force. There were a number of good novelties and a large attendance of visitors. The collection of heaths from South Africa, sent by Lady Grey, gained the high appreciation of the Floral Committee.

### FLORAL COMMITTEE.

Lady Grey, 22, South Street, Park Lane, contributed a particularly interesting collection of heaths, all Cape species, and the specimens had been exhibited at an exhibition of wild flowers held at Caledon, Cape Colony, on September 14. There was a protea at the back (possibly P. cynaroides), and then there were about forty vases of flowers, and probably three dozen distinct species were represented, but, alas, not one was labelled. Some few had a familiar look, but the majority were unknown to most people who saw them. Two kinds attracted general attention; one with slender growth and a profusion of small golden-yellow flowers; and one with dense clusters of tiny ventricose, greenish-cream flowers. A most interesting exhibit that won the appreciation of the Floral Committee.

Messrs. W. Cutbush and Son, Highgate, filled a large corner with great mounds of Michaelmas daisies, Liatris pycnostachya, Kniphofia tricolor, K. Glow, and the quaint Phytolacca decandra. Among the Michaelmas daisies Desire, Peggy Ballard, St. Egwin, Climax, Delight, Chastity, and Amethyst were specally good. In every case the height of the variety was stated on the label. In another corner Mr. James Box, Lindfield, had a fine exhibit of hardy flowers. Solidagos, heleniums, and Michaelmas daisies, in tall stands, made a fine background for masses of early chrysanthemums. Perle Chatillonaise was very fine, Gladiolus princeps, G. America, Helianthus sparsifolius, Watsonia Ardernei, and phloxes, the latter very good for so late a date.

Messrs. Cragg, Harrison, and Cragg displayed grand bunches of such fine market chrysanthemums as Juliet, Crandfordia, Moneymaker, Mrs. Roots, Phœbe, Miss Collier, H. W. Thorpe, and Cranford Yellow. Messrs. Barr and Sons, Covent Garden, exhibited a selection of early-flowering chrysanthemums and Michaelmas daisies, with a quite good lot of spikes of Dr. Hulot, America, La Luna, The Dawn, and Afterglow gladioli. In the same exhibit there were a few nerines and little batches of flowering plants of Acidanthera bicolor, and Schizostylis coccinea. Messrs. Carter Page and Co., London Wall, were represented by violas and Michaelmas daisies.

A large collection of graceful bamboos, exhibited by Mr. L. R. Russell, Richmond, gave a very fair idea of the elegance and beauty of these plants; Phyllostachys aurea, P. Quilloi, P. nigra, P. Boryana, Arundinaria nigra, A. auricoma, A. fastuosa, A. Simoni, Bambusa palmata, and B. quadrangularis, were among the most attractive kinds. The ferns from Messrs. H. B. May and Sons, Edmonton, consisted largely of the newer nephrolepises and choice adiantums and davallias.

Messrs. James Veitch and Sons, Chelsea, presented some charming varieties of greenhouse rhododendrons, a batch of Nerine Fothergilli major, the lovely old Amaryllis reticulata, and collections of bouvardias and abutilons. This firm had also a large exhibit of choice trees and shrubs, filling the whole side of the hall opposite the entrance. Berried plants were very largely shown, and some of the most attractive of these were Cratægus Lelandi, Symphoricarpus occidentalis, Hippophæ rhamnoides, Eleutherococcus Henryi (with clusters of black fruits), Stanæsia undulata, the bright coral red Berberis Stapfiana, B. Wilsonæ, Cotoneaster bullata, C. acutifolia, C. rugosa Henryi, and Pyrus Veitchi. Other fine things were Libocedrus macrolepis, a graceful conifer; Eleagnus pungens aureo-maculata, bright with golden variegation, Eucalyptus coccifera, the crimson-leaved Nandina domestica, Cupressus macrocarpa lutea, Viburnum rhytidophyllum, Ilex Pernyi, scarlet oaks, silvered ivies, "blue" abies, crimson and purple-leaved vitis, and a host of other good things.

Mr. W. E. Ingwerson, Harewood Road, South Croydon, showed a collection of Michaelmas daisies raised by Mr. E. Ballard, of Colwall; Glory of Colwall, a new large double form; Nancy Ballard, Rosy Morn, Moonlight, and Peggy Ballard were the varieties staged. The first-named attracted a good deal of attention. Messrs. J. Love and Son, Westbury, Bristol, showed a new variegated form of Galega officinalis named Lovei. Maxime Kovalesky is a splendid light scarlet zonal pelargonium, and one well shown by Messrs. H. Cannell and Sons, Swanley, who also displayed the fine late sunflower, Helianthus sparsifolius.

Roses were delightfully shown by Messrs. William Paul and Son, Waltham Cross, the firm using tall bamboo stands as well as the familiar round baskets for the display of their flowers. Varieties of special beauty were Richmond, Lyon, Sulphurea, Pharisaer, Juliet, Florence Haswell Veitch, Liberty, Ophelia, Corallina, and Madame Abel Chatenay. Messrs. Benjamin Cant and Sons, Colchester, exhibited roses finely, as though the fogs and frosts of early autumn counted for nothing. The varieties Hugh Dickson, Lady Hillingdon, Papa Gontier, Irish Elegance, Jessie, St. Helena (very fine), La Tosca, Gustav Nabonnand, Lyon Mrs. W. Christie Miller, and the bright Alexandra Zarizi.

A pretty group of roses came from Messrs. Frank Cant and Co., Braiswick, Colchester, and this firm showed beautiful bunches of Comtesse de Cayla, Lyon, Queen Mab, Madame Jean Dupuy, Frau Karl Druschki, Gustave Regis, Lady Hillingdon, A. R. Goodson, Papa Gontier, and Dorothy Page Roberts. The roses from Messrs. W. and J. Brown, Stamford, were reminiscent of summer time, and the exhibit contained beautiful blooms of Lyon, Liberty, La France, Juliet, Duchess of Wellington, Sunburst, and other fine varieties. Messrs. E. Jackman and Son, Woking, were represented by roses, the best of the autumn bloomers being set up in good bunches; with the roses were Michaelmas daisies, early chrysanthemums, and a finely-berried set of pernettya sprays.

Nerines were well displayed by Mr. Frank Lilley, Guernsey. N. Fothergilli, N. Salmon Queen, and N. Bowdeni were in capital condition. Perpetual carnations were quite largely shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, the firm showing Baroness de Brieneri, Mikado, Carola, Frank Galsworthy, Washington, and the new Rosette in good form. The chrysanthemums shown by Messrs. W. Wells and Co., Merstham, contained wonderful blooms of the new Mrs. Lloyd Wigg (A.M.), the single decorative yellow Celia (A.M.), October Gold, Delones, and the huge Frances Joliffe.

Michaelmas daisies were sent by Mr. G. Reuthe, Keston, who also showed Meconopsis integrifolia, Desfontainea spinosa, nerines, etc. Linaria triornithophora, in various colours, was conspicuous in the rockwork display from Mr. Reg. Prichard, West Moors, Wimborne. Messrs. G. and A. Clarke, Dover, had a lovely vase of Cimicifuga simplex, its graceful white tassels of bloom standing out well among Michaelmas daisies, pentstemons, kniphofias, and other autumn flowers.

Dahlias were displayed by Messrs. Dobbie and Co., Rothesay, who confined their attention to collarette varieties, and showed fine, clean blooms of Princess Louise, Queen Anne, Gallia, Goldstein, Prince de Venosa, Joseph Jongon, Victoria, etc. Messrs. W. Fells and Son, Hitchin, were large exhibitors of Michaelmas daisies, heleniums, and solidagos. Large-flowered chrysanthemums, in a great variety of colouring, were staged over ferns by Messrs. J. Peed and Sons, West Norwood; the brilliant golden-yellow variety David Ingamells was very conspicuous. Messrs. Price and Fyfe, Grove Park Nursery, Lee, staged bright chrysanthemums, and showed David Ingamells and Golden Glow in good form.

In the collection of Michaelmas daisies submitted by Mr. H. J. Jones, Ryecroft, Lewisham, we noted Maidenhood, White Swan, Ringdove, Roddy, Chastity, May Crum, and Mrs. T. Hayward as good sorts among the small-flowering, graceful varieties.

A very bright lot of dahlias, chiefly cactus and pæony-flowered varieties, from Mr. J. T. West, Brentwood, gave a fine patch of colour to the show; Brentwood Yellow, Pride of Essex, Harold Peerman were particularly bright yellow sorts, while Firefly, among the "pæonies," was vivid crimson-scarlet. Messrs. T. S. Ware, Lim., Feltham, contributed a goodly set of Michaelmas daisies and early chrysanthemums, but more gay than these were the double and single tuberous begonias arranged on boards; the flowers were very good and the colours beautiful.

Very noble and beautiful were the splendidly healthy specimens of Asplenium nidus avis, from Messrs. J. Hill and Son, Lower Edmonton. There were several dozen large, finely-grown plants in perfect condition.

Over a groundwork of dwarf polyantha roses Mrs. W. Cutbush and Jessie, vases of Mrs. L. Mackinnon, Countess of Lathom, Edna, Miss Winnie Hey, and Goldfinch carnations were staged by Messrs. W. Cutbush and Son, Highgate.

## ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, put up a beautiful and very interesting group of orchids. Cattleyas, lælio-cattleyas and oncidiums were chiefly in evidence. Cattleya Hardyana Royal Sovereign, C. fulvescens, C. Freya, C. Iris, L.-c. Phœnix var. Glory, and Brasso-cattleya Mariæ were all notably good. Smaller thaings were Cirrhopetalum Roxburghi, Saccolabium acutifolium, Pholidota imbricata, and Catesetum Russellianum. Messrs. Stuart Low and Co., Enfield, had a very bright exhibit, in which Oncidium varicosum Rogersi was very gay; Cattleya Iris, C. Gaskelliana Hodgkinsoni, C. Caducia, C. Mrs. Pitt, and the lovely little Sophro-lælia Gratrixæ were all well shown.

Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, put up a good exhibit of very choice orchids. Sophro-lælio-cattleya Elissa, with four good blooms in a 60-sized pot; Cattleya Iris King Edward VII., golden-fawn coloured; C. Phœbe, C. fulvescens, and the fine Odontoglossum Nellie Blanches were a few of the best plants. M. Charles Maron, Brunoy, France, submitted Cattleya Fabia alba, and C. Olympia, both very beautiful.

Mr. G. H. Davidson, Borlases, Twyford, exhibited a number of good forms of Cattleya labiata, L.-c. Virginia, and the deep chocolate-red Odontoglossum Eric. Messrs. J. Cypher and Sons, Cheltenham, displayed Cattleya Euphrasia, C. Kelosia, C. Mantini nobilior, Cypripedium Gaston Bulteel, and the fine C. Felicity. Mr. H. Alexander, grower to Sir George Holford, Westonbirt, Gloucester, exhibited fine specimens of Lælio-cattleya Berthe Fournier, Fascinator, and L.-c. Priam, the latter carrying seven grand rosy-lilac flowers.

Catasetum Imperiale, from M. Firmin Lambeau, Brussels, was striking, and Cattleya Mrs. Pitt, Charlesworth's var., from Mr. R. Le Doux, Marefield, West Derby, gained an A.M.; it has a fine golden glow on the rose-coloured lip, and deep reddish-rose sepals and petals. A few choice orchids from Messrs. Charlesworth and Co., Haywards Heath, included Cattleya Fabia alba, C. Colmaniana, Dendrobium Sanderæ, and Stanhopea oculata Shuttleworthi.

From Sir Trevor Lawrence's collection at Burford Lodge, Dorking, came Miltonioda Harwoodi (A.M.), with pink-carmine tinted flowers, and a good plant of Cypripedium Rolfei Peeter's var. Messrs. J. and A. McBean, Cooksbridge, showed a few good odontoglossums, and a richly-coloured form of Odontioda Charlesworthi named Orchid Dene var. (A.M.).

Mr. Thurgood, gardener to H. T. Pitt, Esq., Stamford Hill, put up a nice group of orchids, composed chiefly of odontoglossums, cattleyas, lælio-cattleyas, miltonias, etc. Cattleya Undine, C. intermedia, C. Fabia, C. Mantini, and C. Iris were well represented. Cattleya Harrisiana (C. Fabia alba x C. Frau Melanie Beyrodt), F.C.C., with white sepals and petals, and a gold-veined purple lip, was shown by Mr. C. J. Phillips. M. Maurice Mertens, Ghent; Mr. F. H. Godman, Mr. R. G Thwaites, and others also contributed orchids.

## FRUIT AND VEGETABLE COMMITTEE.

A wonderfully fine exhibit of a hundred and eighty varieties of apples and about forty varieties of pears, was staged by Messrs. James Veitch and Sons, Chelsea. The fruits were in splendid condition, clean, bright, full-sized, and in quantity, almost every variety being represented by a heaped-up basket of splendid fruits. The apples were grand and the variety Rev. W. Wilks was unusually fine. First-rate sorts that attracted special attention were Cox's Orange Pippin, Golden Noble, Beauty of Stoke, Emperor Alexander, Peasgood's Nonsuch, Bramley's Seedling, Newton Wonder, Ribston Pippin, Chelmsford Wonder, Annie Elizabeth, Lane's Prince Albert, Bismarck, Rival, Allington Pippin, Lord Derby, Schoolmaster, Washington, Charles Ross, Blenheim Pippin, Cox's Pomona, Dumelow's Seedling, Bow Hill Pippin, Margil, Mother Apple, Baxter's Pearman, and a grand dish of Lamb Abbey Pearmain. Standards of Cratægas Aronia, C. punctata, and C. orientalis, smothered in fruits, were placed down the centre of the long table. In our estimation this was the finest exhibit of fruits that the Chelsea firm has ever staged, and that is saying a good deal.

The Barnham Nurseries, Lim., Barnham, Sussex, exhibited a particularly brilliant exhibit of fine apples, all staged in baskets and decked with autumn foliage Gascoigne's Scarlet, Coronation, Barnack Beauty, Rival, Charles Ross, Peasgood's, Paroquet, Cox's Pomona, etc., were all most vividly coloured, and large examples.

Mr. Staward, gardener to Lady Cowper, Panshanger, Hertford, exhibited a very fine collection of well-grown onions, showing a great variation in size, shape, and colour; Ringleader, Ailsa Craig, Webb's Coronation, Brown Globe, Giant Rocca, Webb's Surprise, Cocoanut, Red Globe Tripoli, and Deptford were among the most notable varieties.

Mr. Thomas Smith, gardener to the Marquis of Ripon, Coombe Court Gardens, Kingston Hill, exhibited about fifty dishes of good apples and pears.

## CERTIFICATES AND AWARDS.

First Class Certificate.—To Cattleya Harrisiana, from Mr. C. J. Phillips, The Glebe, Sevenoaks.

Award of Merit.—To Pyrus Veitchiana, to Cotoneaster bullata, and to Berberis Stapfiana, from Messrs. James Veitch and Sons, Chelsea; to Chrysanthemum Mrs. Lloyd Wigg, from Messrs. Wells and Co., Merstham; to Chrysanthemum Celia, from Messrs. Cragg, Harrison, and Cragg, Hounslow, and Messrs. W. Wells and Co., Merstham; to Cotoneaster Zabeli, and to C. salicifolia rugosa, from the Hon. Vicary Gibbs (gardener, Mr. E. Becket, V.M.H.), Aldenham House, Elstree; to Adiantum cuneatum micropinnulum, from Messrs. H. B. May and Sons, Edmonton; to Cattleya Hardyana Herbert Goodson, from H. S. Goodson, Esq., Putney; to Miltonioda Harwoodi, from Sir Trevor Lawrence, Bart., Barford Lodge, Dorking; to Odontioda Charlesworthi Orchid Dene var., from Messrs. J. and A. McBean, Cooksbridge; to Cattleya Mrs. Pitt Charlesworth's var., from Mr. R. Le Doux, Marefield, West Derby, Liverpool.

## MEDALS.

Gold.—To Messrs. James Veitch and Sons, Chelsea, for fruits; and one to the same firm also for trees and shrubs.

Silver Gilt Knightian.—To the Barnham Nurseries, Barnham, for fruit.

Silver Gilt Flora.—To Messrs. Sander and Sons, St. Albans, for orchids.

Silver Gilt Banksian.—To the Marquis of Ripon (gardener, Mr. Thomas Smith), Coombe Court, Kingston Hill, for apples; to Lady Cowper (gardener, Mr. Staward), for onions.

Silver Flora.—To Messrs. Stuart Low and Co., Enfield, for orchids; to H. T. Pitt, Esq. (gardener, Mr. Thurgood), Stamford Hill, for orchids; to H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney, for orchids; to Mr. E. H. Davidson, Borlases, Twyford, for orchids; to Mr. James Box, Lindfield, for hardy flowers; to Messrs. W. and J. Brown, Stamford, for roses; to Messrs. B. R. Cant and Sons, Colchester, for roses; to Messrs. William Cutbush and Son, Highgate, for roses and carnations; to Messrs. J. Hill and Son, Lower Edmonton, for a group of Asplenium nidus-avis; to Mr. L. R. Russell, Richmond, for bamboos.

Silver Banksian.—To Messrs. Barr and Sons, Covent Garden, for hardy flowers; to Messrs. Frank Cant and Co., Colchester, for roses; to Messrs. Dobbie and Co., Edinburgh, for dahlias; to Messrs. G. Jackman and Son, Woking, for hardy flowers; to Mr. H. J. Jones, Lewisham, for Michaelmas daisies and chrysanthemums; to Mr. Frank Lilley, Guernsey, for nerines; to Messrs. Stuart Low and Co., Enfield, for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Messrs. William Paul and Son, Waltham Cross, for roses; to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers; to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Mr. J. T. West, Brentwood, for dahlias; to Mr. H. Woodgate, Worcester Park, for apples; to Messrs. James Cypher and Sons, Cheltenham, for orchids.

Bronze Banksian.—To Messrs. T. Cannell and Sons, Swanley, for pelargoniums.

## SCIENTIFIC COMMITTEE.—September 24.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Dr. A. B. Rendle, M.A., F.R.S., Messrs. R. A. Rolfe, J. Fraser, W. Hales, R. H. Curtis, A. W. Hill, J. G. Wilson, J. O'Brien, and F. J. Chittenden (hon. secretary).

LILIUM CANDIDUM DOUBLE.—Mr. Bowles exhibited a remarkably vigorous specimen of the double form of Lilium candidum.

GALL ON WILLOW.—Mr. J. Fraser showed a rather small example of the gall on Salix fragilis produced by the mite Eriophytes salicis, collected on the bank of the Brent, near Ealing. Mr. W. Marshall, V.M.H., also sent an example of this gall collected on the bank of the Dart, Kent. It is only a few years since the first specimen recorded as British was shown before this committee, but several specimens have since been received from various parts of South-East and East England.

"WHEAT-EAR" SWEET WILLIAM.—Mr. J. Fraser also showed a specimen of Sweet William with the bracts multiplied as in the "Wheat-ear" carnation.

CIRRHOPETALUM MINIATUM.—Mr. Rolfe drew attention to a Cirrhopetalum exhibited by Messrs. Sander and Sons, St. Albans, as having been introduced from Annam with Dendrobium Bronckarti. It strongly recalled C. gracillimum, Rolfe, especially in its caudate, almost thread-like lateral sepals, and in the strongly ciliate dorsal sepal and petals, but differed in having vermilion-coloured flowers, with the hairs of the dorsal sepal and petals yellow. His first knowledge of the plant was in September, 1910, when it was sent to Kew for determination from the Royal Botanic Garden, Glasnevin, with the information that it had been purchased from Messrs. Sander and Sons as a plant imported with Dendrobium Bronckarti. It was then named and described as Cirrhopetalum miniatum, Rolfe. Afterwards a painting was received from M. Maurice Valcke, a collector for Messrs. T. Pauwels and Co., Meirelbeke, Belgium, who stated that he met with the species at Haut Laos, between Siam and Cochin China.

ERICA CINEREA MALFORMED.—Mr. A. W. Hill showed a specimen of Erica cinerea malformed in the same way as those exhibited by Dr. Rendle on a previous occasion, this time from wild plants collected in South Devon.

GREEN-BERRIED ELDER.—Mr. J. Bennett Poë sent specimens of the albino form of the elder in which the ripe fruits are greenish (as in white grapes). Some members of the committee thought them sweeter than the black form.

ARISTOLOCHIA CLEMATITIS FRUITING.—Mr. Bowles showed fruits of Aristolochia clematitis from his garden at Myddelton House, Waltham Cross, containing ripe seeds.

FRUIT OF PYRUS NIEDWETZKYANA.—He also showed, on behalf of Canon Ellacombe, fruits of Pyrus Niedwetzkyana, in which the flesh is deeply coloured, as are all parts of the tree.

VERBASCUM WITH GALLS.—He also showed the curious proliferations which are sometimes noticed at the base of verbascums, and have previously been shown before the committee, but which were, in the present examples, growing some distance up the stem.

ALBINO FORMS OF GERANIUM ROBERTIANUM.—Mr. Bowles also showed the two albino forms of Geranium Robertianum, one with a red stem, the other with a green, which have maintained themselves for a long time in his garden. Almost all the plants of the latter form appear to be traceable to one or two sources, and the committee would be glad to hear of its occurrence in a wild state.

HELENIUM CUPREUM VIRESCENT.—Mr. J. Hudson sent a specimen of a virescent and proliferous form of Helenium cupreum from the gardens of Gunnersbury House.

ALPINE PLANTS ATTACKED BY DODDER.—Miss Willmott, V.M.H., sent an interesting series of alpine plants attacked by a species of dodder, including Sedum album, S. elongatum, Daphne alpina, a mossy Saxifrage, Thymus serpyllum, Campanula rotundifolia, Thalictrum minus, Phlox subulata, and Dianthus deltoides.

"REVERSION" IN BLACK CURRANTS.—Mr. E. A. Bunyard sent an interesting series of specimens illustrating his idea that the "reversion" to which the attention of the committee was recently directed was the result of the development of lateral branches after injury to the terminal bud. Among the specimens sent (which did not appear to be all of one variety) were shoots showing mechanical injury, shoots probably injured by the shoot-cutting weevil, and shoots injured by "big bud," all exhibiting the reverted foliage, with normal shoots for comparison. The hypothesis, the committee considered, hardly accounted for the persistence of the "reversion," so that whole bushes were affected season after season.

PLANTS DISEASED, ETC.—Numerous specimens of diseased plants and plants injured by hail were also exhibited.

## Reading Gardeners' Association.

The first autumn meeting of this society took place in the Abbey Hall on Monday last, when Mr. F. G. Drew (chairman of committee) presided over a large assembly of members. The lecturer for the evening was Mr. W. Camm, of the Gardens, Cliveden, Taplow, and his subject was "Common Sense in the Cultivation of the Apple." He said that his system, or, as some might think it, lack of system, in the cultivation of apples was adopted by him some years ago when taking his first complete charge at Battle. He had seen too often in many gardens methods generally pursued that only resulted in a crop of "flower stakes" each year. His idea was to strike out a line of his own which would produce crops of fruit instead, although, perhaps, his trees were less trim than those of his neighbours. The latter scoffed when he first started, but when he began to beat them on the exhibition stage, they altered their minds, thinking that there was something in the system. He pointed out that the rule of thumb method of pruning lateral shoots to the orthodox two eyes had to give way to a system, the practice of which was based on the natural habit of the tree, its method of fruit bud production and its general environment. Before it was possible to decide as to the best system to apply to any particular tree these points had to be observed.

Mr. Camm exhibited shoots of different varieties of apples, showing how in some varieties fruit buds were produced freely on the current year's wood in a manner resembling the peach, with others fruit buds were formed chiefly on short stubby spurs along the sides of the unshortened shoots of the previous year. He pointed out how any material cutting back of these shoots induced growth instead of fruit bud formation. Shoots of other kinds typical of a number of our best apples were also shown where the fruit buds were largely produced at the termination of short lateral growths. Any shortening of these removed the greater part of the crop. Mr. Camm advocated a system of thinning rather than pruning, and stated that, although fruit buds might be formed on old spurs, the fruit was rarely equal to that produced on young straight growth in which there was no interruption to the flow of sap. The old gnarled spurs had the disadvantage of harbouring the eggs of insect pests and the spores of fungi to a degree impossible on young wood.

The lecturer was careful to point out that his method of pruning and thinning applied to developed trees, and not to trees in the adolescent stage, whose chief business it was to grow, not to produce fruit, with which more severe methods of pruning were necessary in order to form a framework on which the fruiting wood was to be borne.

A question with reference to summer pruning elicited the answer that the lecturer had neither time for it nor any faith in the practice. It might answer a useful purpose on young trees in a warm, dry soil. On older trees and heavy land it was generally detrimental.

A collection of single dahlias (from seed) was staged by Mr. H. C. Loader, The Gardens, Erlegh Park, who also exhibited vases of magnificent asters, Sutton's Shell Pink. Ten new members were elected.

## Croydon Gardeners' Society.

The keen interest exhibited towards this society by its honorary members was exemplified on Tuesday last, when Mr. A. R. Dickinson, Rydal Mount, Croydon, a vice-president of the society, provided a capital lecture on the use of artificial fertilisers for flower, fruit, and vegetable culture. The bad weather was the cause of a smaller attendance of members than would otherwise have been the case, but those who braved the elements were well repaid with what they heard.

The lecturer, Mr. H. H. B. Shepherd, F.I.C., F.C.S., was followed throughout his discourse with appreciative interest. Illustrated with lantern slides, a thorough grip of the subject was obtained. The forethought of Mr. Dickinson in having printed copies of the lecture to distribute among the audience was a distinct advantage, as quiet study could be given to the details raised, enabling each one to grasp technicalities accruing from a lecture of this description.

Time would not permit a lengthy discussion, but Mr. Shepnerd's kind invitation to all to send written questions to him when he will answer them in similar form was very acceptable, and a subsequent meeting of the society will provide the means of hearing both questions and answers.

The members were unanimous in expressing their warmest thanks to Mr. Dickinson, and to the lecturer, before their departure.

The room was decked with exhibits of different kinds. Mr. T. W. Hayden contributed a collection of Michaelmas daisies; Mr. A. Edwards had a similar exhibit, with the addition of vases of outdoor chrysanthemums; Mr. M. E. Mills showed a big collection of Michaelmas daisies; Mr. W. G. Graves staged a brace of vegetable marrows; and Mr. E. Mann put up a dish of Autocrat peas and a dish of Blenheim Orange apples.

## Bournemouth Gardeners' Association.

A very good display of vegetables, fruits, and plants was staged at the last meeting of the members of this association. There were competitive classes in addition to the usual ones for the "points prizes." For three kinds of vegetables, the President, J. R. Ralph Smythe, Esq., was awarded the first prize. He had very fine cauliflowers, large runner beans, and good beet. Mr. Lansley was a close second with perfect onions, plump Brussels sprouts, and fairly well filled peas. Third honours went to Mr. B. Marlow, who had a nice even lot of potatoes, Brussels sprouts, and onions. Mr. E. G. Cox staged the best three dishes of fruit—Alicante grapes, Pitmaston Duchess pears, and large, well-coloured Peasgood's Nonsuch apples. Mr. G. H. Heath was second with Black Hamburgh grapes, Pitmaston Duchess pears, and striped Beefing apples.

In competition for the "points prizes," Mr. Heath had a beautifully-grown coleus; Mr. Evans, a finely-coloured croton; Mr. Pearce, three lovely ferns; and Mr. Pavey, large sticks of celery.

Mr. E. T. King, of Higham Gardens, Bournemouth, gave a very interesting lecture on "Vegetables: How They should be Prepared for Table." He is a strict vegetarian, and advocated the eating of both vegetables and fruit in their proper seasons, and retaining the skins as much as possible, all being first thoroughly cleansed from any contaminating matter. Instead of boiling, steaming was recommended; and instead of slicing up vegetables, he said they ought to be cooked whole, as then the nourishment and distinctive flavour of each would be retained. A vegetable stew for one person, said the lecturer, should consist of four kinds of vegetables and four ounces of each kind, with pearl barley added.

A free discussion followed, and Mr. King replied to many questions. Both the lecturer and Mr. Smith, the chairman, were accorded hearty thanks at the close of the meeting.

### Woolton Mutual Improvement Society.

The winter's work of this society commenced on the 1st inst., when the secretary, Mr. R. G. Waterman, gave an excellent account of the Royal International Horticultural Exhibition of 1912. The lecturer having held the responsible positions of county secretary for Lancashire, and member of the jury, had opportunities of submitting details that proved interesting and instructive. The lecture was much appreciated, both by those who visited the great show, and those who were unable to do so. A discussion followed in which visitors emphasised and enlarged upon the information of the essayist. A hearty vote of thanks was accorded to Mr. Cromwell, who occupied the chair, and to Mr. Waterman.

### Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 1st inst. Mr. Massie, the president, was in the chair, and there was an attendance of 105 members. The Secretary, Mr. A. D. Richardson, gave a lecture, illustrated by a large number of lantern slides, on "Edinburgh's Park and other Trees." He pointed out that, though Edinburgh was very much behind some of the other cities in the United Kingdom as regards street planting, there was a very considerable variety of trees which grew well in the city, and, even in the most central parts, many good specimens occurred in the parks and gardens. Some of the pyruses, such as P. intermedia, P. aria, P. pinnatifida, and P. rotundifolia did well, and thorns and laburnums also withstood the smoke-polluted atmosphere very well. But the tree which succeeded best in the city was Platanus acerifolia, the so-called "London" plane, though, owing apparently to some unintelligible prejudice against its use as such, it had been very little planted as a street tree. Amongst the old trees, the ash, elm, beech, sycamore, and lime were the principal species, and there were still some fine specimens of the oldest of them. The beech was gradually disappearing, however, and it would never be replaced by the same kind of tree. Curiously enough, many of the oldest elms were not the Scotch species (Ulmus montana), but the English elm (U. campestris) and forms of it, and young trees of the latter species were thriving well. Amongst the soft-wooded, broad-leaved trees, the White or Huntingdon willow (Salix alba) gave most promise of becoming a good tree, and the white poplar (Populus alba) seemed to deserve more attention than it got. On the motion of Mr. Todd, the secretary received a very hearty vote of thanks.

The President gave a short but interesting account of a visit to Normandy last month. The agriculture there, he said, was very similar to our own, excepting that a considerable area was devoted to the cultivation of buckwheat and Indian corn for fodder. The methods of cultivation, however, were very primitive as compared with ours.

The exhibits were: New collarette, cactus, pompon, dwarf bedding, pæony-flowered and double fancy dahlias, and early-flowering chrysanthemum Cynthia, exhibited by Messrs. Dobbie and Co. Each of the following was awarded a certificate of merit: Collarette dahlia Princess Louise, pæony-flowered dahlia Kakadee, dwarf bedding cactus dahlia Marianee, and chrysanthemum Cynthia. New Michaelmas daisies Glory of Colwall and Nancy Ballard, exhibited by Mr. Ernest Ballard, The Court, Colwall, Herefordshire, were each awarded a first-class certificate. Kniphofia Marie Dickson, exhibited by Messrs. Dicksons and Co., Edinburgh (awarded a certificate of merit); large collection of sprays of foliage (many with fruit) of hardy trees and shrubs, exhibited by Mr. D. W. Thomson, Edinburgh (highly commended). Mr. Thomson also showed some fine spikes of pentstemon Mrs. F. Fulford. The President exhibited magnificent fruits of Pitmaston Duchess pears, each fruit weighing about 1½lb., and Messrs. Todd and Co. showed a fine vase of Michaelmas daisy, Beauty of Colwall.

At the meeting on November 5 Messrs. A. Eddington, F.J.I., and James Hay, F.R.P.S., will give papers on Villa Gardening and Window Gardening respectively.

### Bolton Horticultural Society.

The winter session of this society opened on the 3rd inst. at the Spinners' Hall, Bolton, by Mr. R. G. Waterman, the Woolton secretary, who gave his "Impressions of the Royal International Exhibition of 1912." Mr. H. Shone was voted to the chair in the unavoidable absence of the chairman, Mr. R. Smith. There was a fair attendance, and the lecture was thoroughly enjoyed.

## CATALOGUES RECEIVED.

MESSRS. H. CANNELL AND SONS, SWANLEY, KENT.—In the autumn catalogue recently issued from the "Home of Flowers" will be found carefully-prepared lists of the finest of the bulbs in general cultivation, with short lists of greenhouse plants, etc.

MESSRS. DICKSONS, CHESTER.—The catalogue of bulbous plants issued by this firm is remarkable for its comprehensive character, the admirable descriptions of the varieties of the various kinds, and the clear, yet concise, information relating to their cultivation.

MR. A. F. UPSTONE, CHURCH STREET, ROTHERHAM.—A short and well-prepared list of bulbous flowers.

P. BERNAIX FILS, VILLEURBAUNE, LYONS.—A useful and freely-descriptive list of roses, new and old. In every cases the size and form of the flowers is indicated.

CHRISTOPHER BOURNE, BLETCHLEY.—In addition to his daffodil list Mr. Bourne has issued a neat little catalogue of tulips, hyacinths, etc., containing useful cultural hints.

JAMES MURRAY AND SONS, DEPTFORD.—In this bulb list the collections of hyacinths and tulips offered are especially extensive.

MESSRS. J. CARTER AND CO., RAYNES PARK, S.W.—The catalogue of bulbs that is being issued from Raynes Park is comprehensive in scope, admirably arranged, and attractively illustrated.

GEORGE PRINCE, LONGWORTH, BERKS.—An important catalogue of roses, illustrated and briefly descriptive.

H. A. ELLISON, WEST BROMWICH.—A catalogue of bulbs, seeds for autumn sowing, ferns, etc. Bulbs are sent on approval if necessary.

F. C. HEINEMAN, ERFURT.—An illustrated list of seed novelties for 1913.

J. R. PEARSON AND SONS, LOWDHAM, NOTTS.—An admirable and descriptive catalogue devoted to fruits and roses, subjects the firm specialises in.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

DISEASED CARNATIONS.—O. R.: Would you please inform me, through the "G.M.," what is amiss with the carnations I am sending? I have not seen the disease before, but have recently purchased a new variety, and found it was similarly affected. What must I do to cure the disease? An early answer will oblige one of your oldest readers.—The carnations are suffering from debility and disease, which came first we cannot say, probably the former. Cuttings and layers should never be taken from plants that show the least signs of disease, or which are not first-class as regards robustness and freedom of flowering. A weak plant and a weak cutting are predisposed to disease. Layering was not commenced sufficiently early to produce the best results. Young plants like those sent will never become good specimens, and should be burned at once. Others, with only slight signs of disease, should be sprayed with a solution of sulphide of potassium after all the rusty and badly marked leaves have been cut away, and burned. If the plants are to be kept in frames during the winter, stand them on a well-drained base, well apart, and so ventilate the frame that an ample circulation of air can be provided among them. Ventilation over the tops of the plants is not sufficient. Water sparingly, and when it is necessary to give water apply it early on fine days.

CONSTRUCTION OF COW HOUSES.—C. G. G., Minehead: Some time ago a correspondent asked for information concerning the erection of cow-houses, and I believe you referred him to a government publication. I cannot find the answer, so perhaps you will be good enough to say where I can get the needed information.—Apply to the Secretary of the Board of Agriculture, 4, Whitehall Place, London, S.W., for Leaflet No. 241, dealing with "The Construction of Cow Houses." You need not stamp the letter or enclose any sum for the pamphlet.

HORTICULTURAL LECTURES AND LANTERN SLIDES.—R. D., Templecombe: A question frequently asked in connection with gardeners' associations is: Where can lantern slides be obtained for illustrating horticultural lectures? If you could say where such slides can be purchased or hired at a moderate rate you would, I am sure, be helping many of your readers.—Those qualified to lecture on horticultural subjects and who are in some demand as a consequence, usually provide their own lantern slides. A good set of slides illustrating any given branch of horticultural study or activity is generally accumulated in the course of many years, the slides being made from photographs of suitable subjects that come under the notice of the lecturer. We have in mind a popular lecture that is illustrated by about eighty slides. Some of these slides were made about a score of years ago, but rarely does a year pass without the addition

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill, London, N.E.

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

Name..........................................................

Address......................................................

of new slides and the elimination of old or out-of-date ones. All this means time and expense, and such a set could not be either hired or purchased. There is not, so far as we know, any firm that supplies sets of slides of this character, but the Royal Horticultural Society has a set of printed lectures, some with lantern slides, and these are available for circulation at a small fee among societies affiliated with the R.H.S. You may obtain full particulars on application to the secretary, R.H.S., Vincent Square, Westminster, S.W., but we may say that the chief of these lectures, with lantern slides, are "Annual Flowers," "Apple Culture," "British Wild Flowers in the Garden," "Early-flowering Chrysanthemums," "Commoner Birds of our Gardens; their Habits and Food," "Flowering Trees and Shrubs," "Gardens by the Lake of Como," "Hardy Nymphæas," "Plants for Terrace Gardening," "Plants in Congenial Positions," "Royal Horticultural Society," "Some Beautiful Shrubs," "Spices," and "The R.H.S. Wisley Garden."

HARDY CYPRIPEDIUMS.—R. E. N., Sherborne: Kindly tell me whether you think hardy cypripediums would be a success in this district; and, if so, the kind of soil that would best suit them, and the kinds to plant.—Given a sheltered position, moist, but not stagnant, and soil composed of loam, mixed with plenty of leaf-mould and peat, most of the hardy cypripediums should do very well with you. Partial shade is desirable. Good kinds to grow are Cypripedium acaule, C. arietinum, C. Calceolus, C. candidum, C. guttatum, C. japonicum, C. macranthum, C. parviflorum, C. pubescens, and C. spectabile. The last-named is one of the finest of the set. All should be planted in little colonies, and the present month is a capital time for planting.

SPIGELIA MARYLANDICA.—M. A. S., Glamorgan: We have plenty of peaty, boggy soil, where heaths, rhododendrons, and the like grow freely, and it has been suggested that we should grow Spigelia marylandica in quantity in semi-shady, moist places. Will you please tell me what kind of plant this is, whether you think our soil would suit it, and how it can be propagated?—Spigelia marylandica is a pretty herbaceous perennial that thrives in moist, peaty soil, and should be quite at home in your garden. It hails from North America, as its name suggests, and it grows about a foot high, sometimes reaching eighteen inches, and sometimes being less than a foot, according to variety and conditions. The angular stems, produced in dense tufts, are clothed with stalkless leaves, and carry spikes of bright flowers. The latter are about 1½ inches long, red outside, yellow within. Spigelia marylandica belongs to the order Loganiaceæ, that includes the well-known Buddleias. It is propagated by division in spring, and flowers in the summer. There are many species of Spigelia, but S. marylandica is the only one of any value for cultivation out of doors.

## NAMES OF PLANTS.

Under this heading we can only undertake to name species and well-marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

S. S., Chelmsford.—Centranthus ruber.

S. F. W., Chislehurst.—1, Cattleya labiata; 2, C. Harrisonæ.

J. J., Alnwick.—1, Statice spathulata; 2, Silphium perfoliatum.

C. W. H., Stafford.—1, Cimicifuga simplex; 2, Tilia platyphylla.

A. B. N., Bideford.—1, Plumbago rosea; 2, Erythrina crista-galli; 3, send again.

R. L. J., Steventon.—1, Silene pendula; 2, Thuia gigantea; 3, Laurus nobilis; 4, Quercus Suber.

M. S., Haslemere.—1, Buxus sempervirens myrtifolia; 2, Empetrum nigrum; 3, Cotoneaster horizontalis.

H. R. C., Derby.—1, Solidago canadensis; 2, Senecio pulcher; 3, Aster diffusus horizontalis; 4, A. multiflorus.

H. A. R., Wimbledon.—1, Cestrum elegans; 2, Exacum affine; 3, Ardisia crenulata; 4, Hippeastrum aulicum.

## NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

J. R. D., St. Albans.—Peasgood's Nonsuch.

M. M., Faringdon.—1, Catillac; 2, Beurre Rance; 3, Beurre Bosc.

S. E. B., Hellifield.—1, Yellow Ingestrie; 2, Hawthornden; 3, Emperor Alexander.

L. E. A., Lewisham.—1, Summer Pearmain; 2, Yorkshire Greening; 3, Golden Noble.

L. P. A., Folkestone.—1, Adams' Pearmain; 2, Durondeau; 3, Beurre Diel; 4, Sturmer Pippin; 5, Lane's Prince Albert.

SCHOOLMASTER, Bucks.—The seedling apple does not possess merits likely to place it ahead of, or even on an equality with, other apples already on the market. We expect your variety is a seedling from King of the Pippins, as the peculiar flavour of the latter can be detected in it. The fruits are not attractive, nor is the flavour likely to commend the variety.

## FORTHCOMING ENGAGEMENTS.

MONDAY, October 14.—United Horticultural Benefit and Provident Society.

WEDNESDAY, October 16.—North of England Horticultural Society; Meeting at Leeds; Lecture on "Apple Culture," to be delivered by the Rev. J. Bernard Hall.

## NOTE OF THE WEEK.

### Horticultural Evolution.

Some year or so back much interest was evoked at one of our great chrysanthemum shows by the concurrent exhibition, side by side with the finest specimens of the cultivated forms, of the insignificant single wild species from which undoubtedly the whole series of enormous and variously tinted flowers had been produced by simple and long-continued selection, and indepen- wonderful contrast between the small, daisy-like blooms of the original wild progenitor and those of its offspring brought home to the spectators in the most striking fashion the possibilities which lie within even the simplest flower of being developed by selection into not merely a practical infinity of forms, but these also of the most varied and brilliant hues. dent of any hybridisation. The Such comparative exhibits, we think, might well be extended in scope. The begonias, for instance, would lend themselves equally well thereto, although in their case it is true much of the variety has been induced by hybridisation, as more than one species have been concerned in their production. If, however, a prominent position were awarded, for instance, to the two small flowering species which gave the start to the now brilliant array of the tuberous section, the contrast would be immense, and to many people a common origin would appear almost incredible. So, to a less extent, with the dahlias, and many other of the most striking examples of horticultural triumphs, if the original parents could be shown. Even in culinary vegetables, the exhibition of a plant or two of the still common coastal weed Brassica oleacea, the wild cabbage, in conjunction with some of the best types of cabbages, Brussels sprouts, cauliflowers, kales, and kohl rabi, would certainly enhance the interest in the group, if, as is requisite in all such cases, a plain explanatory notice were to accompany it. In short, a special exhibition, announced as being an evolutional one, would, on the lines indicated, convey to a large number a mass of instructive information on a subject which at present is only grasped by a very few. Wild fruits could also be included and shown, by way of contrast to the finer developments of apples, pears, plums, cherries, etc., hoc genus omne. In this connection, interest would be further increased if some idea could be given of the appriximate date at which what may properly be termed horticultural evolution began—i.e., when these normal wild plants came under the influence of human selection. In this way, the relative rapidity in improvement or development by man, as compared with purely natural selection would be clearly shown, particularly in many of the later floral developments—the begonias, for example, in which the whole of the work covers but a few decades, though that of the chrysanthemum covers centuries. Even centuries, however, are insignificant periods as regards the natural selection of the raw material as fashioned by the selective action of the insect world, or other unintelligent agencies. On the other hand, however, we cannot fail to marvel at the floral developments produced in so many cases by Nature alone as rivals even to man's best productions. The rose has been converted by his aid from simple flowers to indescribably ornate ones; but the rival queen of the floral world, the lily, is found in a wild state in its full beauty, and practically defies improvement of its natural charm. So with the gloriosas, daturas, lapagerias, and a host of other magnificent flowers, which, though the outcome of purely natural selection, are practically perfect, and lend themselves but little, if at all, to cultural improvement. In many cases, indeed, it may be argued that man's intervention has not led to improvement at all, but has only succeeded in destroying simple natural beauty, and replacing it by substitutes of infinitely less charm. All this, however, is largely a matter of taste, and it must not be forgotten that the selective florist is guided by the fact that flowers are used for many other purposes than merely garden decoration. Cut flowers, to wit, need unnaturally long stalks, and hence, as with carnations, the natural dwarf or even dense habit of its family (the Dianthus) is sacrificed entirely to meet the need aforesaid, so that in this case the end justifies the means, even though Nature be outraged.

MR. WALTER IRVING.

**Mr. Walter Irving**, who has charge of the collections of herbaceous and alpine plants at the Royal Gardens, Kew, is a well-known authority on what are generally considered as "hardy plants." It is interesting to notice that gardeners group plants in curious fashion, and so "hardy plants" exclude trees and shrubs, fruits, and vegetables in the common language of the garden. Mr. Irving has about 7,000 species of plants under his care, and these are planted in and around the Herbaceous Ground and the Rock Garden. His gardening career commenced at Easton Park, near Wickham Market, Suffolk, where his father was gardener. Later on he gained experience in several gardens and nurseries, including a stay at Old Windsor with Sir Charles Murray, and some time in the old Hammersmith nurseries of Messrs. Lee and Son. Subsequently Mr. Irving went to Belvoir Castle, where, under the late Mr. Ingram, he obtained a wide knowledge of hardy flowers and their use in garden decoration. From Belvoir he came to Kew, in 1890, and in 1893 he obtained his present position, succeeding the late Mr. D. Dewar, who went to take charge of the Glasgow Botanic Gardens. Under Mr. Irving's care the Rock Garden at Kew is being re-made, and in some measure re-modelled, although the general idea of the dry bed of a Pyrenean stream still remains. Large portions of the Rock Garden have been entirely remade, and great success has followed the work. At the present moment another large portion is being dealt with, and the old methods of forming a rock garden are being revealed as great masses of sandstone, hitherto completely buried, are being brought to light. These are being set aside, and for the new work many tons of old, weathered stone, brought from Cheddar, are ready to hand.

**Flowering Trees and Shrubs.**—Owing to our persistent advocacy during the past twenty years of the merits of the trees and shrubs remarkable for the beauty of their flowers, and our efforts in giving prominence to the finest of the several kinds, they have now attained to a high position among the various forms of arborescent and ligneous vegetation available for furnishing the garden. Their attainment to a high degree of popularity has given rise to many requests for further information on the all-important questions of selection and planting, and, with a view to render our readers the fullest possible assistance, we have arranged to devote our next issue (the 26th inst.) chiefly to trees and shrubs with attractive flowers. Chief among the contents of the issue will be a monograph of the ornamental crabs, and articles on flowering trees and shrubs suitable for lawn specimens and spacious borders; hardy azaleas; trees and shrubs of slow growth, specially adapted for small gardens; the newer buddleias; and flowering shrubs that may be successfully utilised in furnishing rock gardens. The issue will be freely illustrated, and the illustrations will include several new and little-known kinds.

**Conference of Horticultural Societies.**—In accordance with the custom that has obtained for several years past a conference of the gardeners' associations and horticultural societies in affiliation with the Royal Horticultural Society was held at the Horticultural Hall on the second day (October 11) of the exhibition of British-grown fruits. Sir Daniel Morris, K.C.M.G., V.M.H., presided, and about 120 delegates were present, a considerable increase upon the numbers present at any previous conference. With an ideal chairman, a programme including several subjects of considerable importance, and a large gathering of horticulturists from various parts of the country who are deeply interested in the work and the welfare of the various organisations engaged in the advancement of the gardening art, a brilliant success was anticipated by not a few present. That their expectations were not fully realised was unfortunate, and due to the fact that too much was crowded into the two hours set apart for the conference. In addition to the four subjects arranged for discussion, the programme included an exhibition of colour photography, by Dr. G. G. Hamilton, the honorary secretary of the Bournemouth Gardeners' Society. Dr. Hamilton had a large number of slides showing roses, orchids, hardy flowers, old-world gardens, and scenes in the New Forest, in their natural colours, from photographs taken by himself. These were by far the finest set of slides representative of the garden and its occupants from direct colour photographs that we have as yet had an opportunity of seeing. The slides represented much artistic taste as well as manipulative skill of a high order, and the colours of the several subjects evinced a remarkable fidelity to nature. The colours were not only true, but they were characterised by extreme clearness, in which respect they differed materially from many of the lantern slides from colour photographs. It was an interesting, instructive, and delightful exhibition, which all the delegates enjoyed to the full. The exhibition must have extended over nearly an hour, and when, at its close, the Chairman reminded the delegates that there was less than an hour in which to discuss the four subjects on the agenda, some of them at once saw the difficulty they would have in discharging their duty to the societies which they represented. The inclusion of the exhibition of colour photography in the programme was of much value, as it gave the delegates an opportunity of becoming acquainted with the best of all methods for illustrating lectures. The proper course would have been to have arranged two meetings—one in the forenoon, for the consideration of matters relating to the work of the societies that were represented at the conference; and the other in the afternoon, for the exhibition of colour photography. The questions arranged for discussion were—attracting young men to meetings, the admission of lady gardeners to meetings of mutual improvement societies, garden clubs, and the judging of bottled fruits. At the close of the conference Dr. Hamilton and Sir Daniel Morris were accorded hearty votes of thanks.

**City of London Rose Society.**—We are informed by Mr. Ernest Protheroe that a general meeting of this newly-formed society will be held on Wednesday, October 30, at 5 p.m., at the Cannon Street Hotel, for the purpose of framing the rules and the election of committee and officers. Mr. Protheroe's address is 67 and 68, Cheapside, E.C.

**The Senses of Plants.**—All students of vegetable life must have sometimes considered the wonderful adaptability of plants, their behaviour under certain circumstances, their arrangements for securing the largest amount of light, and the various methods of climbing and twining, resisting drought, etc., etc. So many of these things seem to point to sense or instinct, and when we find the Fly Trap (Dionæa muscipula) exercising great cunning in the capture of insects for food, we begin to wonder where the plant's brains are. Anyhow, the whole subject is vastly interesting, and no one can make it more interesting than the Rev. Professor G. Henslow, M.A., V.M.H., who is to lecture on "The Senses of Plants," at the Royal Horticultural Hall, on Tuesday, October 22, at 3 p.m.

**London's Surplus Bedding Plants** will be distributed at the various parks and gardens managed by the London County Council, on Saturday, October 19. The distribution commences at 9 a.m., and closes at 11 a.m., and personal application must be made for the plants. Children under 14 will not receive plants unless they present a note from a teacher or other responsible person.

**Young Gardeners and Horticultural Associations.**—In raising the question as to the best means of attracting young gardeners to the meetings of mutual improvement societies, the Loughborough Society followed the course that has usually been taken at previous conferences. Instead of a delegate stating the views of the society on the question in a carefully-prepared paper or well-reasoned speech, the question was merely asked whether something could not be done to attract young gardeners to the meetings in larger numbers than was at present the case. A short discussion followed the raising of the question, and widely divergent views were expressed. Some of the delegates thought the annual subscription was often more than young gardeners could afford, but from the statements made by the speakers it appeared that not more than half-a-crown is usually charged them. If this be really the case, the annual subscription is not so high as to prevent any considerable proportion of the young men who are being trained as gardeners from participating in the advantages that result from the attendance at meetings of mutual improvement societies. In some instances the subscription was said to be only one shilling, and yet the attendances of young men were not satisfactory. Several delegates stated that with an annual subscription of half-a-crown they had no difficulty in obtaining young gardeners as members, but they made their meetings as interesting and varied as possible by arranging at frequent intervals during the session lectures illustrated by lantern slides, and for the most part by men occupying prominent positions in the world of horticulture. Probably if this practice became general there would be less difficulty in securing good attendances, but the change would necessarily involve additional expenditure. However that may be, an endeavour to increase the interest and usefulness of meetings rather than a reduction of the subscriptions is likely to produce the most satisfactory results.

**Aids to Colour in Fruit.**—Mr. G. P. Berry considers that although eminent authorities state there is always much more iron in the soil than is necessary for the colouring of fruits, there are certain districts and certain soils where colouring is very marked. At the Carlisle Fruit Congress he instanced the great variation of colouring found in the East of Scotland, from Berwick to Kincardine. He always added four stones per acre of sulphate of iron when preparing for fruit planting, and in nine plantations under his care, in different counties, he found that in the sections fertilised with potash there was earlier maturity and finer colour than in the case of the phosphate and nitrogen plots. He advocated the application of 1½cwt. of sulphate of potash per acre as a good average dressing to secure good colour in fruits.

**The Kent Commercial Fruit Show,** to be held at Maidstone on October 29 and 30, is chiefly for the purpose of showing how well apples can be grown in Kent, and how skilfully they can be graded and packed for home distribution or export. The exhibition of 1911 laid the foundation of an export trade to the Argentine and South Africa, and good prices resulted. This year it is anticipated that about 20 tons of apples will be staged, representing fruit from Hereford, Worcester, Devon, Cambridge, Norfolk, Suffolk, Surrey, and Sussex, as well as Kent, these former counties having now come into the movement.

**Lady Gardeners and Mutual Improvement Societies.**—The question raised by Mr. Bullen, of the Guildford Society, as to "the desirability of admitting lady gardeners to mutual improvement societies," was of considerable importance, and it was evident the discussion would have been brisk and interesting had time permitted. Mr. Bullen, who championed the cause of the ladies, was not particularly fortunate in presenting his case. At first the delegates were under the impression that Mr. Bullen had a mandate from the Guildford Society asking for the admission of lady gardeners as members to all mutual improvement societies, but he had not proceeded far before it became evident that this was not the case. Subsequently Sir Daniel Morris elicited the fact that when the matter was discussed at Guildford there was a majority of two only in favour of admitting ladies. This close voting was of more than usual interest from the fact that the society has for its president a lady not less remarkable for her charming personality than for the keen interest in horticulture. Mr. Bullen had prepared a written statement of his case, but owing to the low tone in which it was read there was a difficulty in catching its purport, but it appeared to have been prepared for reading at the Guildford meeting rather than at the conference. The few delegates who had an opportunity of speaking expressed opinions strongly in favour of the admission of ladies, and they had no difficulty in giving instances where the lady members are a source of much strength.

**Proposed Addition to Wandsworth Park.**—As Lady Hensley has intimated her willingness to accept £3,000 for Glenton House and grounds, a proposal is on foot for the acquisition of the property at this low figure as an extension of Wandsworth Park. A public meeting has been called to fully consider the matter.

**"The Botanical Magazine"** for October contains illustrations and descriptions of several interesting plants. Chamædorea glaucifolia, a slender and elegant South American palm, and one that has been in cultivation at Kew for about 40 years, is figured, and so are Ceropegia Thorncrofti, a climbing Asclepiad from the Transvaal, with white, purple-marked flowers; Osmanthus Delavayi, a useful hardy shrub, evergreen, and bearing white, fragrant flowers in terminal clusters during March; Elsholtzia Stauntoni, an aromatic, hardy Chinese shrub, that bears dense Veronica-like spikes of small, rose-purple flowers; and Furcræa elegans, a Mexican plant closely allied to the agaves, and one that carries its green flowers on branching spikes that may be as high as 25ft., and 6in. thick at the base.

**Potato Lifters on Strike.**—A few days ago about 1,000 workers empoyed in lifting the potato crops in East Lothian demanded a rise of 2s. per week, or a wage of 20s. At the time of writing the matter remains unsettled. The demand of the workers does not seem extravagant.

**The Late Mr. Alexander Dean, V.M.H.**—We learn that the late Mr. A. Dean, whose will has been proved, left £2,071.

**The Largest Vine in Scotland.**—In answer to our request for information concerning the oldest vine in Scotland, a correspondent has sent us a cutting from a Boston (U.S.A.) paper, referring to the famous vine at Killin, Loch Tay, Scotland. This vine is about 80 years old, whereas the one at Bearehill is 135 years old. In point of size, however, our Transatlantic contemporary states that "the vine owned by Lord Breadalbane, and to be seen at Killin, Loch Tay, Scotland, has now eclipsed in size every other vine in Europe. Planted in 1832 in a modest conservatory measuring only 15ft., its glass-house has now grown to 172ft. by 25ft., the outer branches being some 80ft. off the main stem, and both vine and its little crystal palace are still adding to their inches, the latter having been extended 28 years ago. The trunk measures 6ft. in height and 2ft. 10in. in girth. The 1912 yield numbered 2,075 bunches, but it was thought best to allow only 500 of them to mature. They have a delicious flavour, and are of the Black Hombnrg variety. Like everything connected with this vine, the watering is done on a large scale, 7,000 gallons being given to it at one time, and the performance repeated only twice, or, at the most, three times in the year. By far the most interesting feature of the vine, however, is the determined way in which it has, through many decades, sought and found freedom for itself through the roaming of its roots. They have been traced to a spot some 750ft. away from where the main stem is confined in an artificially-heated atmosphere, and its branches trained along wires, and tied every few feet. Free and wild, the roots have worked their way in the direction of the virgin soil, where the rich yellow loam, uncultivated for some 200 years, lies on either side of some running water, which the roots are found to have crossed. So Nature continues to care for her offspring, independently of what the friendly hand of man may think it is accomplishing."

# EDUCATION AND TRAINING OF YOUNG GARDENERS.

## First Essentials.

It matters not into what sphere of life one's thoughts are directed at the present time, as contrasted with what existed, say 50 years back; everything points to an immense advantage in favour of lads at the present day, when laying the foundation, so to speak, of their future career. Education has advanced by leaps and bounds, this being supplemented by continuation classes and technical training also. Thus, a lad who starts his career as a gardener at the present time has everything in his favour, as contrasted with what obtained even under the best conditions half a century back. Speaking personally, let me state here that it is just over fifty years since I left school and first started in my gardening career. I have watched the progress of events from that time onwards, and have often wished that I had, at that time, the same advantages that a young man has at the present day. In saying this, I would explain that, in practical work there has not, in my opinion, been such a great advance as there has been on the scientific side of horticulture.

In stating this I will give an instance to support my argument. Sixty years ago, when the Chiswick gardens were in their heyday of popularity, young men were taken into them to be trained as practical gardeners. I had a brother there at that time who received 10s. a week in wages, and who, during the busy season of the year, had to start work at four o'clock in the morning and do a course of lawn mowing with the scythe. There were not then for the young men the immense advantages that now obtain at Wisley, with the laboratory and other means of scientific research. Then, the young gardener had to exercise his limits of ingenuity and perseverance if he wished to excel in his profession. It was then more a question of "self-help" than otherwise. To instance this, I must still follow my brother's career for two years after he left Chiswick. He was fortunate enough to obtain a position as under-gardener at Dalkeith, when Mr. McIntosh was head gardener there. Noting his abilities, he took my brother into his office to assist in the preparation of the plans for McIntosh's "Book of the Garden"—a standard work at that time, the reason being his knowledge of geometry. On the other hand, the then Duchess of Buccleuch preferred to have him do the indoor decorations rather than any other. I instance this to indicate two distinct phases of gardening, and the advantages that accrued thereto in my brother's case.

## The Last Year (or Two) of School Life.

I have contended for many years past that a lad's last year (or two) at school should be directed into grooves that will best aid him in after life. The present-day methods of large classes, I admit, does not often favour this. Thus, when a lad has made up his mind what shall be his future career, and the better will it be for the lad if he does this, I speak from experience, his energies should be concentrated on what will be most likely to assist him in after life. In my own case, I applied myself to learning French and other branches of education likely to assist me in gardening or estate work. This embraced the elements of geometry, and a good grounding in land surveying, followed up after I left school by practice in the last-named, as well as in timber measuring and estate work generally. I owe all these acquirements to my father, under whom I first worked. A lad who starts actual work with some technical knowledge to assist him has an advantage over his fellows. This gathers rather than diminishes as years go by. The lad should be grounded in what I have already stated, and also have some elementary knowledge of botany and chemistry.

Subsequently, when he can, in his spare time aftermards, follow up these aids to his future success in his profession, he will find it easier to apply himself thereto. One other great essential—in fact, there are two, writing and spelling. Every young gardener should take a pride in his writing, and do his best both to write a letter plainly, and the plant names upon labels so that they can be easily read. Correct spelling is also most essential, but methinks that sufficient attention and care is not given to this, or to writing either. Composition will also stand a lad in good stead, and will possibly, with good writing, secure him a position in after life against competitors who fail in these essentials. I know this to be a fact.

## The First Start in Garden Work.

A great misconception exists as to the best way of commencing a gardening career. Many think that it is better to start in some well-known garden of repute. With this view I totally disagree. It is much better to make the start in a small but well-kept garden, such, for instance, as where only three or four hands are employed for all the work. Here a lad will have to assist at almost everything that has to be done, and in a manner, so to speak, have to rough it. This will be a good training for him. In support of this, I well remember being told, when a young man myself, by a gardener who had won his position, that he owed more than he could express to the insight into general garden work that he gained when employed as garden boy, with only one man. Here he had, I know, to walk two miles to his work every morning, and the same back to his home at night.

A little of everything, and that well done, is infinitely better than a superfluity, and that badly managed. A lad can grasp the several points in a well-kept small garden better than in a large one. In the latter he must, necessarily almost, be confined to one department of work. Later on this will follow as a matter of course, but it should be when he is better equipped. A young gardener should never be ashamed to own that he started his career in a small garden where he may have had to do what might be termed menial work. In later life he will assuredly value all the useful hints he gained in his early career.

## The Advantage of an Early Training.

I have outlined somewhat the line that should be followed from the last year at school. I found this in my own case to be invaluable. As a comparison in another sphere of life I would quote the case of the expert mathematician, one who has taken high honours at his college or university. This fits him for taking up the higher grades of physics and of science generally. So it is in the case of a young gardener, not on quite the same lines, of course, or in such a high degree. A young gardener who is well equipped in the theory, as well as in the practice of horticulture, has a far better chance of success when he enters for any of the examinations now provided for young and aspiring gardeners. The mere fact of reading up for these examinations is a great boon, and greater still will it be if he passes them successfully. (I speak, Mr. Editor, from experience in this.) It will broaden his mind and thus also his reasoning powers. He may not see it in that light at the time, but it will dawn upon him later in life.

Jas. Hudson, V.M.H.

(To be continued.)

# AMONG THE ALPINE FLOWERS.

> "Sun that burned out of season
> With the old magnificent flame
> May-time knew. . . ."
> —*Professor J. W. MacKail.*

After a long and dreary time, little broken by the brightness of the usual autumn days, we are again revelling in the bright sunshine, and our flowers still respond to its advances, even though the days have grown short and the frosty feeling of the evening and the morning tells us that the dreaded winter is drawing nigh, when we shall be living on the memory of the past and on the hope of the future.

Yet this need not hinder us from drinking in the enjoyment of the present, even though it is mingled with "taking thought for the morrow," for the gardener must lay his plans and perform work for future realisation.

Many of our alpine flowers seem now to be giving us a fresh bloom, as if the rest of the long, dull days had stimulated them to a fresh desire to give us delight now that the sun once more shines upon us, and the dreary, rainy days have passed for the time.

## The Alpine Poppies.

In the moraine we have a little group of alpine poppies, delightful little flowers, members of a gorgeous race, which the hand of the florist has tutored into almost endless varieties, many of the greatest beauty. Strangely susceptible to his influences have proved many of these flowers of Lethe, and but few of the species have been passed by. One would have expected, however, that the dainty Papaver alpinum, a charming miniature, so to speak, of the Iceland poppy, would have escaped his notice. It is a gem for the rock garden; one of these exquisite little flowers whose beauty seems perfection. Of the most exquisitely graceful foliage, with leaves as if wrought by some most skilled craftsman out of the finest frosted silver, and with dainty stems bearing fragile blossoms of varied colours, from white, through yellows to almost scarlets, the alpine poppy stands as one of our bonniest of rock plants and as the most beautiful of the race for the alpine garden. Only a few inches high, it may be planted almost anywhere. Not always a long liver, Papaver alpinum will generally reproduce itself from seeds if given a spot where the seeds may find a resting-place until they germinate and yield their dainty plants. The sunny rock garden in light soil will suit them, but they appear to delight in the moraine, where they flower earlier and look happier than in the other parts of the garden.

One of the latest developments of this alpine poppy has been the production of varieties with finely laciniated petals, which are very beautiful in their way. Yet I am not sure that I enjoy these as much as the older forms, which have dainty little cups of all colours. Possibly it is prejudice on one's part, but the fact remains that I prefer the smooth-edged flowers, beautiful as are the laciniated forms of Papaver alpinum. Charming, indeed, are these flowers, however, though among the choicest indeed, are the Pyrenean forms, sold in seeds as Papaver alpinum pyrenaicum. Those who wish to own these lovely little flowers may best obtain them in the shape of seeds.

## Colchicum autumnale major.

Those who have grown the common meadow saffron, Colchicum autumnale, are deterred from buying the variety major, thinking that it is but little better than the typical C. autumnale, whose long, weak tube renders it so useless in the border in a wet autumn, the flowers soon falling down and looking most unhappy unless spearing through some plant which will hold them up. But C. autumnale major is a superior thing indeed. Of much greater substance and with larger and finer flowers, it is in every way a desirable subject. It has not the deep colouring of Colchicum speciosum, but its soft purple and white blooms are very satisfactory companions to the bigger and more deeply hued "showy meadow saffron." C. autumnale major is really vastly superior to the typical autumnal colchicum or meadow saffron. It is a capital bulb for the lower parts of the rock garden, preferably in a moist, rather rich soil, though heeding but little its character, except that in poor soil it gives smaller blooms.

## Astrantia gracilis.

Through the kindness of a good friend, as deeply devoted to alpine flowers as myself, I am the happy possessor of a dainty little astrantia, which is called Astrantia gracilis, and seems to be quite overlooked by the usual cultivators of rock plants. It is an undeserved neglect, as it is a charming little plant of its kind. These astrantias, or masterworts, do not appear to be general favourites, probably because they have not the charm of bright colouring to attract the eye of the garden-lover. Yet they grow wonderfully on one, and soon become quite fixed in our affections.

The little Astrantia minor well deserves a place in the rock garden, though it is now less frequently seen than some years ago. Still more deserving is A. gracilis, which resembles minor much in the appearance of its elegantly-formed white flowers of a creamy tinge. It is, however, neater in its growth, and the stems are more in proportion to the size of the flowers and foliage. The stems are shorter; the flowers are as neat, and the foliage is larger and less finely divided than that of A. minor. In a low part of the rock garden, near a stone pathway and in light soil, this choice little masterwort is thriving and assuming pleasing dimensions. That it is only nine or ten inches high will show that it is a good plant for many positions, while the fact that it blooms for months renders it doubly acceptable.

## Other Flowers.

There are still many flowers in the rock garden. There are tunicas, silenes, violas in plenty, erodiums, geraniums, campanulas of various sorts and sizes, dianthuses, autumnal crocuses, colchicums, dwarf asters, veronicas, ambitious arabises which scorn to bloom in spring alone, with many other flowers of beauty and charm. Then there are mounds and taller groups of many-hued leaves, all adding to our pleasures in these fast-running days which soon close our garden year.

S. ARNOTT.

---

**Stenotaphrum glabrum variegatum.**—The green form of this is known by the specific name of americanum as well as that of glabrum. It is also popularly called the Australian Buffalo Grass. The apparent contradiction between these two names is to be accounted for by the fact that it occurs in many of the warmer portions of the globe. The variegated-leaved variety is a very pretty basket plant, as when suspended the spreading stolons hang down for a long distance. The grass-like leaves are disposed in tufts along the entire length of these pendulous stolons, are bright green, prettily striped with white. Under favourable conditions it will grow like a weed.—T.

# PYRUS CRATÆGIFOLIA.

The various species of pyrus have, on the whole, been seen at their best during the present autumn; and certainly we rarely have the opportunity of seeing this particular species in better condition. It is very distinct amongst other species, as its leaves resemble those of a cratægus rather than a pyrus; while its bushy habit hardly suggests its correct family. A native of Northern Italy, it belongs to the aria group of the genus, thus having as close relatives the white beam (P. aria) and the wild service (P. torminalis).

Growing into a good-sized bush, it is showy in May by reason of its white, rose-flushed flowers, which appear in quantity. Later on another attraction is present in the yellow-and-red fruits, which are small and glossy. Then a few weeks before they fall, the leaves take on a dark red hue, which makes them very conspicuous. As the plant grows satisfactorily in loamy soil, and does not readily outgrow its position, it might well be used more often in places where a fast-growing tree would be out of the question, whilst it is quite worth a prominent position as a specimen bush.

W. D.

---

# THE LIBERTIAS.

Less than half a dozen species go to make up the family of Libertias, but all possess considerable beauty and decorative value. Further, they lend themselves to a variety of purposes, being suitable for the herbaceous border and the rockery, whilst they form delightful subjects as pot plants.

In common with a host of other plants whose native habitat is an equable and warm climate, the Libertias have been successfully acclimatised, and are fairly comfortable in our English gardens. It is usual to afford slight protection in the shape of bracken or cocoanut-fibre around the crowns during severe periods, and when it is stated that these plants hail from Chili and New Zealand, it will be understood that warm and sheltered spots should be selected in which to establish groups or colonies. Another important detail is to afford a light and sandy soil, and where the natural soil is heavy and tenacious, a nine-inch layer of drainage must be placed 3ft. deep.

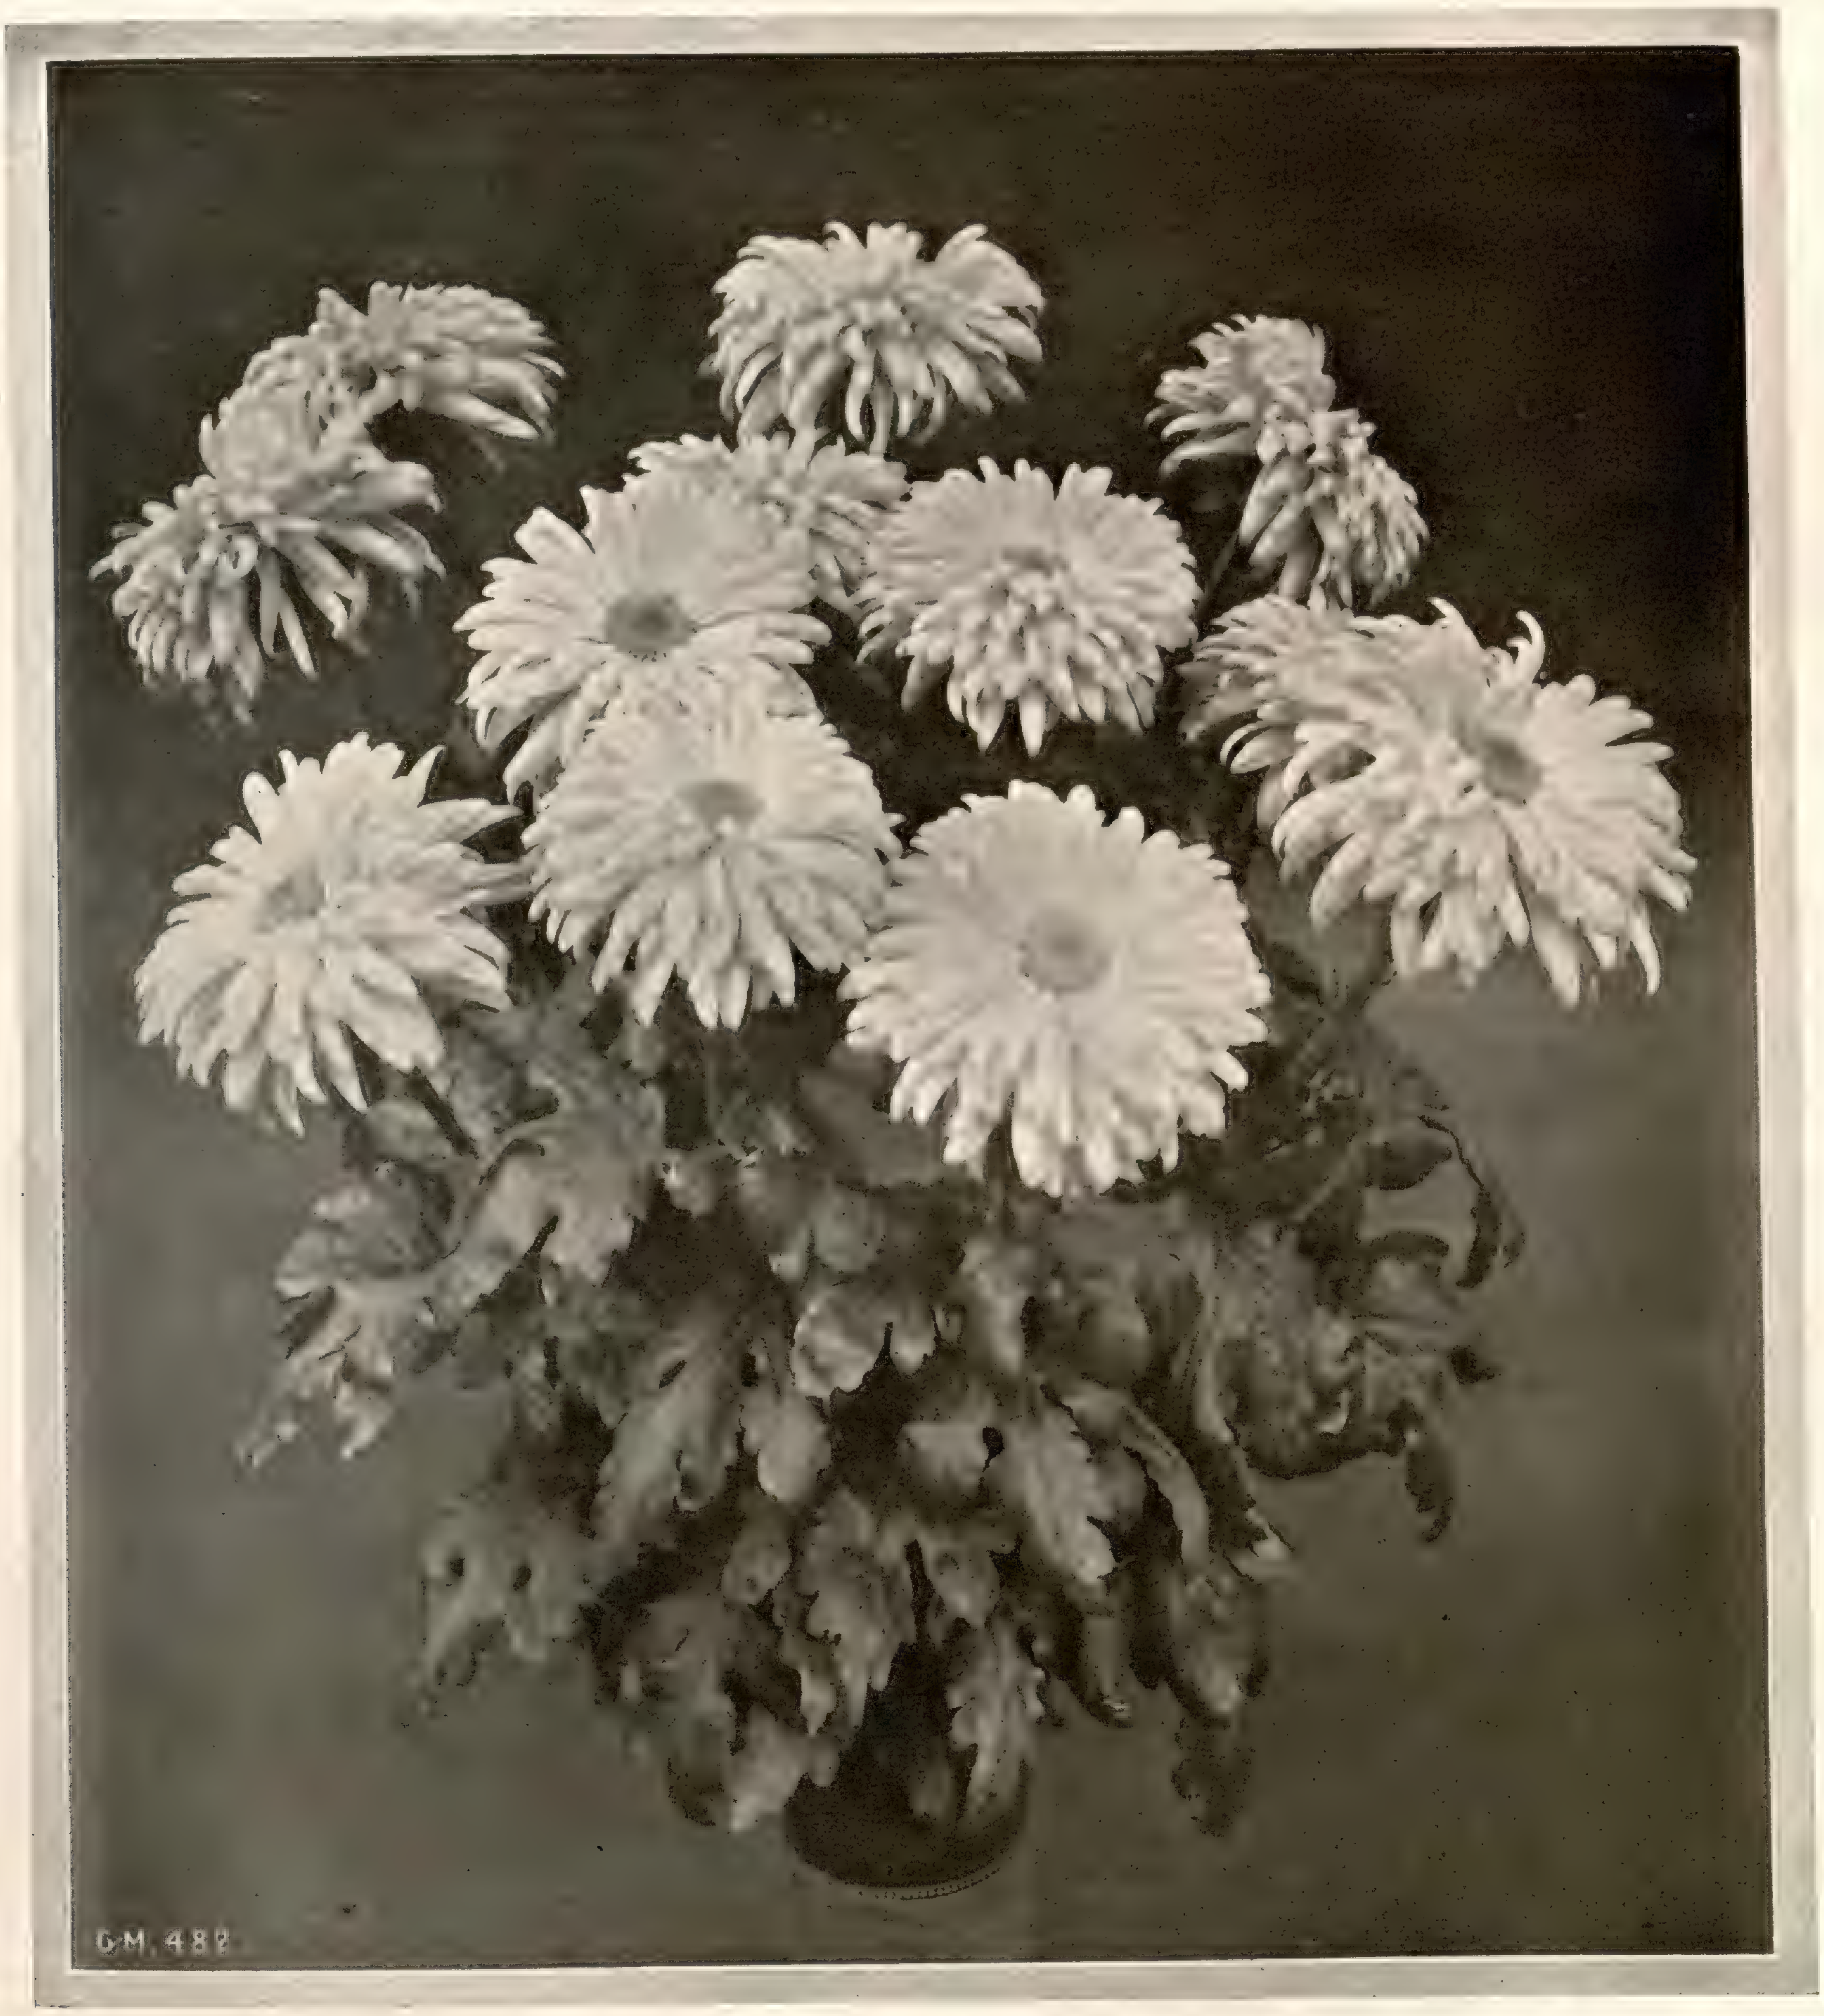
Propagation is easily and readily effected by means of seeds and division, and if the last-named method be adopted the best time to carry out the work is immediately after the plants pass out of flower. With regard to seed-sowing, if seeds are sown in a gentle hotbed in March, and the seedlings are duly grown on in a frame, they may be planted out on a south border, and first-rate plants result by the end of the season. It is inadvisable to transfer to permanent quarters until another season, and, to be on the safe side, they should be given the protection of a frame or frame-light.

L. tricolor is an attractive species, with variegated leaves, after the style of Zea quadricolor, and white flowers. It seldom exceeds 2ft. in height. L. grandiflora is worthy of its name, and towers up to 3½ft., while the flowers are similar to those of the foregoing. L. formosa is content to rise 18in., the leaves being arranged in dense tufts. The panicles of white flowers form elegant material for vase decoration, etc. Pale blue colouring is seen in L. cærulescens, which, together with the last-named, claims Chili as its home. Then we have L. pulchella and L. ixioides, which, perhaps, are the least desirable in this small group of plants. WALTER H. AGGETT.

## NEW PLANTS, ETC.

### CATTLEYA HARRISIANA.

This is a provisional name for a hybrid between C. Fabia alba and C. Warscewiczi Frau Melanie Beyrodt. It is a beautiful orchid with large white sepals and petals, and a very large lip. The latter has a rich purple apex and margins, and is heavily veined and shaded with gold in the throat. F.C.C., R.H.S., October 8. Mr. C. J. Phillips, The Glebe, Sevenoaks.



CHRYSANTHEMUM CELIA.

Flowers semi-double, bright yellow. A.M., R.H.S., October 8. Messrs. Cragg, Harrison, and Cragg, Heston.

### CATTLEYA MRS. PITT, CHARLESWORTH VAR.

A beautiful orchid, the rounded, stiff flower showing markedly the influence of C. Harrisonæ. The colour is rich reddish-rose, with a golden glow over the greater part of the lip. A.M., R.H.S., October 8. Mr. R. Le Doux, Marefield, West Derby, Liverpool.

### MILTONIODA HARWOODI.

This very pretty bigeneric hybrid, derived from Miltonia vexillaria and Cochlioda Noetzliana, has charming pink flowers, tinted with carmine, and in shape these have a striking resemblance to Calanthe Veitchi. A.M., R.H.S., October 8. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

### CATTLEYA HARDYANA, VAR. HERBERT GOODSON.

A handsome variety with white sepals and petals, and a very showy purple lip veined and shaded with golden-yellow. A.M., R.H.S., October 8. H. S. Goodson, Esq. (gardener, Mr. E. Day), Fairlawn, Putney.

### ODONTIODA CHARLESWORTHI, ORCHID DENE VAR.

A particularly good form of this lovely orchid; the flowers are shapely and of good size, and the colour is bright crimson-red. A.M., R.H.S., October 8. Messrs. J. and A. McBean, Cooksbridge.

### BERBERIS STAPFIANA.

An erect, bushy species with small deciduous leaves. The stiff, slender growths are freely furnished in autumn with coral-red berries that are more or less transparent and suggestive of pale red currants, though they do not hang in racemes. A new Chinese species. A.M., R.H.S., October 8. Messrs. Jas. Veitch and Sons, Chelsea.

### CHRYSANTHEMUMS.

Mrs. Lloyd Wigg.—A very large exhibition Japanese variety, with long, drooping florets of a soft light yellow shade. Should become very popular for show purposes. A.M., R.H.S., October 8. Messrs. W. Wells and Co., Merstham.

Celia.—A fine rich yellow variety that must be classed as single, though it has several rows of florets. The disk is greenish-yellow. When disbudded and the blooms are upwards of four inches across, this is a very decorative variety. A.M., R.H.S. Messrs. Cragg, Harrison, and Cragg, Hounslow; and Messrs. Wells and Co., Merstham.

### PYRUS VEITCHIANA.

A small tree of free growth, and quite hardy. It fruits freely, and as the fruits are about half an inch in diameter, and of a deep crimson colour, the tree is useful for autumn effects. A.M., R.H.S., October 8. Messrs. Jas. Veitch and Sons, Chelsea.

### COTONEASTER SALICIFOLIA RUGOSA.

This evergreen shrub has long, drooping branches furnished with elongated willow-like leaves. Along these branches the scarlet berries are borne in clusters. An attractive species that should find favour for autumn effects. A.M., R.H.S., October 8. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.

### ADIANTUM CUNEATUM MICROPINNULUM.

A beautiful fern, even more graceful and with smaller pinnules than A. c. gracillimum, from which it has descended. The young fronds are prettily rose-tinted, so that the plant has many good features. A.M., R.H.S., October 8. Messrs. H. B. May and Sons, Edmonton.

### ASTER NANCY BALLARD.

This double Michaelmas daisy has flower heads over an inch across, and of a purplish-mauve colour. The growth is stiff, and the flower are borne erect as in the case of the parent variety, Beauty of Colwall. A.M., R.H.S., October 8. Mr. Ballard, The Court, Colwall, Herefordshire.

## GREENHOUSE CLIMBERS AT KEW.

The greenhouse (No. 4) is just now particularly gay with flowering subjects of all kinds, not the least attractive feature being furnished by the climbing plants, of which there is an extensive and well-chosen collection. Of the different climbers that especially appeal to one may be mentioned Abutilon insigne, a very distinct species with large rugose leaves, and flowers more widely expanded than in the garden forms; they are of a deep crimson colour, with darker veinings; Abutilon megapotamicum variegatum, a slender-growing kind with yellowish flowers and prettily-mottled leaves; Abutilons Boule de Neige and Golden Fleece, two popular varieties, with white and yellow flowers respectively; Bougainvillea glabra, of which there is a particularly richly-coloured form in good condition; Clerodendron Thomsoni, usually grown in a warmer structure, but in the greenhouse the pretty red flowers protruding from large white calyces are very attractive; Clerodendron ugandense (or cærulea), prominent among clerodendrons because the flowers are of two shades of blue; Fuchsia simplicicaulis, a beautiful Peruvian species of lax growth, and bearing clusters of very long, rosy-scarlet coloured flowers; Ipomœa rubro-cærulea, an annual species whose flowers are at first of a charming shade of blue, with later on a reddish suffusion; Jasminum grandiflorum, a Himalayan species, with white, highly fragrant blossoms that have a reddish tinge on the exterior; Lantana salviæfolia, more generally known as L. delicatissima, is a popular bedding plant, but its great merits as a greenhouse climber are not so generally recognised; Lonicera sempervirens minor, with bright red and yellow flowers, borne throughout the entire summer and well on into the autumn; Passiflora cærulea alba, also well known as Constance Elliott; Plumbago capensis, a well-known plant with a profusion of light blue flowers; Plumbago capensis alba, a white counterpart of the preceding. K.

## HARVEST IN ORCHARD LAND.

By Orchard Land I refer to that part of the West Country where every rural homestead has its grass orchard, containing a heterogeneous collection of apples and pears, with perhaps plums, and a few odd damson and prune trees in the hedgerows; and where the filling of the domestic cider hogsheads is an essential item of the fruit harvest.

Strange records have been established in Orchard Land this season, and the other day a small holder informed me that for the first time in his life he had picked his plums from a punt. A curious experience, you say. Just so; but, then, what was the man to do? For he lived by the side of the Severn, which overflowed its banks when the plums were ready to pick; and it was either a question of utilising the punt for the purpose or leaving the plums to spoil, which was out of the question when they were fetching five or six shillings a pot down in South Wales. So our friend paddled his boat underneath the trees, and picked the fruit in the manner described. I admit, by the way, that this was an exceptional instance; but it actually happened in August, when miles of land in the Vale of Severn were under water.

Climatically speaking, it was not a happy time for plums, and the variety that stood the best—the one that could be picked when it was fine or when it rained, and fetched its money when it got into the market—was a local plum, not unlike a miniature Victoria, that is known down the Severn Vale as the Blaisdon Red. It originated, so the story goes, in the tiny village of Blaisdon, in Gloucestershire, and it occupies the position in the Severn Vale that is held in Worcestershire by the Yellow Pershore, or Egg Plum. Little by little the Blaisdon Red has been distributed from the place of its origin, and propagation is an easy matter, because it grows readily from suckers, until it has found its way into most of the orchards round about; and, though other commercial and reputedly better varieties have been introduced from time to time, the local growers tell you that, taking one season with another, there is no plum that crops so heavily, stands unfavourable weather so well, or brings in more money than the Blaisdon Red. One wonders if it would do so well if it were taken away from its native district.

A strange thing is that this season, in spite of the wet and the lack of sunshine, the apples are colouring well, and a pretty sight is a typical West Country orchard on one of the beautiful September days we are enjoying at the moment of writing. As a rule, the West Country apple crop is fairly good this year, and as you pass a typical orchard you see almost as many varieties as there are trees; and reddest of all are the little cider apples, which are pretty to look at, but deceptive if you come to taste. An air of harvest ripeness is stealing over the orchard just now, and amongst the leaves changing from green to yellow you see fruits of a lemon tint on this tree, and others deepening to purple-crimson on the next. It is ten to one that most of the varieties are strangers to you, but the farmer knows them by curious names that were never seen in any nurseryman's catalogue, for the simple reason that they were raised by some local celebrity in the district in days gone by. In a general way, the farmer turns his attention to the orchard after harvest, picking what he calls the table fruit for market, and gathering the rest in heaps as it falls to feed the cider mill later on. This year he finds himself "all anyhow," so to speak, and the apples in many cases are being neglected, which is not surprising considering that September this season finds everybody busy haymaking.

But there is disappointment in many an orchard as I write, and there are dozens of trees laden with apples; but they are small, scrubby, and not much bigger than hazel-nuts. Why didn't they swell, and come to maturity, as they ought to have done? asks the farmer, as he quaffs a cup of cider with a neighbour, and discusses the prospects of the coming vintage. They can't make much of it, and put it down in a general way to the season. But they do not remember about last May-time, when the apple trees were crippled and infested by the apple aphis—blight it is called in the West, in common with every other pest that attacks fruit trees—but the swelling fruits were doubtless checked by the pests in question, which sucked the juices from the leaves round the trusses, and, owing to the unfavourable conditions of weather that followed, the apples were never able to recover.

The crop of the year, however, is pears, and this generally miserable summer has suited them, for the fruit is particularly fine and clean. In many orchards there are a few trees of really good varieties that have been planted from time to time, and the farmer has a few pots to sell; but the low price he gets causes him to grumble. "What is the good of growing pears?" he says; "they fetch no money." And when you ask him how many he has sent to market, you find that it is only a matter of a few baskets, and perhaps it is several years since he sent any before.

But the pears that figure most conspicuously in West Country orchards are not eating varieties at all, but Perry pears, which in some seasons are worth sending to market to sell from costermongers' barrows. But this year the demand will be small, even if it exists at all. Fine old specimens of trees are these perry pears—the Blakeney Reds, Barlands, and the rest—and enormous is the weight of fruit that a single specimen will produce in a year like this, when every branch is simply roped with pears. What will be done with them? They will fall in due course, or be shaken from the trees; a quantity will be ground up for perry, or be mixed with the apples to make cider; while some, perhaps, will be sent to market.

The big centres of population in South Wales take a lot of the fruit direct from West Country orchards, and a lot goes to the Midlands and the North. But when there is anything like a crop, the prices of apples in local markets about this time are rarely very high. The reason of this is not far to seek, for the farmer, as a rule, has a great idea of getting the fruit into market as soon as possible—perhaps because he wants the money, or perhaps because he has no proper means of storage; or maybe he considers the loss and shrinkage that storage entails. But it would really be a wonder if much of the orchard produce realised good prices when you see the mixed medley of varieties that makes up a consignment from one farm—the big, little, and medium samples all jumbled together, or not infrequently with the former on the top, and the generally untidy and unattractive appearance of the packages. As a rule, there are plenty of buyers at the auction who know how far to go; and perhaps, in an ordinary way, they give as much as the fruit is worth; but not infrequently it is a price that would send the farmer to bankruptcy if he had to depend entirely on his orchard for a living.

G. H.

## BULBOUS FLOWERS OF AUTUMN AND WINTER.

Gardeners who fail to make judicious plantings of bulbs during July, August, and September miss one of the chief opportunities of the whole year; the preparation of beauty that will cheer the pleasure grounds during the dull months is, in too many places, infinitesimal. Because flower beds and borders full of bloom in November, December, January, and February are rare objects, certain to attract admiration—that non-jealous delight which soothes both soul and eye—especial pleasure should be taken in creating such displays in front gardens, whether of small or vast proportions.

The common deterring idea is that a perfect climate and dry, warm soil is needed, and that without them time, labour, and money will virtually be thrown away. Now this does not apply to the culture of colchicums, autumn crocuses, and winter crocuses at all, while even the exquisite winter-blooming irises can easily be accommodated with low rockeries made up of suitable compost, and so planned as to concentrate south sunshine and shut off cold winds, the large slabs of stone being laid so as to protect the roots from stagnant moisture, their one foe.

It may be doubted if Colchicum autumnale is to be found in one front garden out of a hundred, and when it is grown it is generally as an isolated group or two, far in the shrubbery. This hardy bulb will bloom well under trees, or close against the objectionable privet and other hedges that destroy the healthfulness of so much border soil, but it is entitled also to better treatment. An edifying display was made last year in the east border against a villa front; during summer begonias were gay, in September Colchicum autumnale was added, one bulb between each begonia, so that during November, after the tender plants had been stored, the ground was one flush of peach-mauve. Small golden shrubs were added, in the places of the begonias, as soon as the meadow saffrons failed.

This plan could have been improved upon, however, by the use of a fine collection of colchicum species instead of the employment of one, as all the mauve, rose, crimson, and purplish colours tone excellently; while later blossom might have been given by the winter and early spring species that are so little known. From November to January Colchicum Decaisnei can be had in perfection, and this is a flesh-coloured kind. Nor can its cost, which is about four shillings a dozen bulbs, be reckoned extravagant for a perennial addition of such merit. Colchicum brachyphyllum, pinky-white, blossoms in December and January; several others begin in early February, notably C. luteum, orange-yellow; C. hydrophyllum, purplish-rose; C. cilicicum, rosy-crimson; and the violetlined White C. crociflorum, two more expensive gems. Yet for making bold bank sides or summits of peach colour the common C. autumnale can be cordially recommended, or use may be made, for other effects, of its varieties, roseum, roseum plenum, purplish-crimson, and plenum, pale lilac.

There are aristocrats, too, among these autumn saffrons, notably Colchicum Bornmülleri, rosy-peach, white centred; C. byzantinum, rose; C. Parkinsoni, lilac and white; C. Sibthorpi, red-purple; and C. speciosum rubrum, crimson.

A bed filled with golden euonymus, eighteen inches high, and the autumn Crocus speciosus, a really bright blue, will be a delight. A belt of the winter Crocus, C. Imperati, violet, buff, and black-purple; or C. biflorus, white, marked with lilac, might be added; and finally a broad edge of the early spring Crocus Tommasinianus, a peculiar amethyst-blue shade; this would blossom before the ordinary mixed crocuses of our gardens.

Golden winter crocuses can be well massed around green or silvery shrubs. Crocus Susianus is most used, but C. ancyrensis is deep orange-yellow, therefore vastly superior, and costs only a penny a bulb. An effective species is Crocus Sieberi, mauve with yellow base. The autumn Crocus longiflorus is soft mauve, and deliciously fragrant.

In considering the possibilities of the winter iris we may give Iris stylosa, Iris reticulata, I. histrio, and I. histrioides first place in order of merit for January blossoming, but a charm all its own belongs to the small azure Iris Vartani, which comes from the Holy Land, and is said to be always open by Christmas.

The deep blue Iris verna of early spring is tolerably hardy in any sunny open border of the southern counties, and the March Iris Sindjarensis will give azure and white blooms on stems a foot tall. The beautiful Iris reticulata, violet and yellow, and the blue, white, and violet Iris Bakeriana, both gifted with the perfume of violets, flower freely in borders against south walls.

If more use were made of bulbous and other plants that flower in dreary months of the year our gardens would gain immensely in interest. The old-fashioned hepaticas, double and single; the tall single nodding snowdrops, and the gold star-like winter aconite, should all be included in beds and borders, the best results being ensured by early planting.

M. H.

## LILIUM LONGIFLORUM.

This occupies a foremost place among the most popular of all lilies, and deservedly so, for whether its beautiful silvery trumpets are borne out of doors during the summer, or under glass throughout the entire year, they are admired by everyone. Though it will flower well for one or two seasons after planting in many gardens, it is only occasionally that it can be permanently established, in the sense that Lilium candidum and L. croceum may be.

Bulbs of this lily must nowadays be imported into our country by millions, for in many commercial establishments they are flowered in a wholesale manner. The bulk of them are sent here from Japan, but we also receive large quantities from South Africa, and also from Bermuda. From this last-named island the first bulbs were sent about thirty years ago under the name of L. Harrisi, which name is still retained, though it is really but a form of L. longiflorum. These Bermuda-grown bulbs "caught on" at once, as in the first place they attained a development to which we were at that time quite unaccustomed; and next, owing to the early period at which they ripened, they reached here long before it was possible to obtain dormant bulbs of L. longiflorum from any other source, for the retarding system which has now attained such dimensions was at that time undreamt of. It was, I remember, considered to be a most noteworthy fact when we obtained flowers of Lilium Harrisi at Christmas; while now, thanks to retarding, they may be had in plenty at that season. A popular name for L. Harrisi was that of the Easter Lily of Bermuda, on the ground that the silvery trumpets were available for Easter decorations, but as a matter of fact they could be induced to flower a good deal earlier than that.

The bulbs which are now retarded in such a wholesale manner come chiefly from Japan, the first consignments reaching here, as a rule, about the end of October. The greater number consist of the variety Wilsoni, a superior form to the typical L. longiflorum, but large quantities of the vigorous-growing giganteum and the dark-stemmed Takesima are also sent. All of the Japanese bulbs are splendidly ripened, and even the comparatively small ones will flower well, while the larger ones yield a magnificent display. A variety sent to this country in very limited numbers is foliis albo-marginatis. In this, each leaf has a clear and decided edging of white; and when well grown it is, from a foliage point of view, equal to a dracæna.

Prior to the advent of these Japanese bulbs, we used to obtain our supplies of L. longiflorum from Holland, but we do not draw many from that country now. The longiflorum of the Dutch has shorter flowers and leaves than the Japanese form. This retarding, not only of lilies, but also of such things as spiræas, lily of the valley, etc., has been in vogue about a dozen years. At all events, my first introduction to this method was a group contributed by Mr. T. Rochford, of the Turnford Nurseries, when the meetings of the Royal Horticultural Society were held at the Drill Hall, Buckingham Gate, on October 23, 1900. The exhibit at that time aroused a great deal of attention.

Where Lilium longiflorum is cultivated for sale, the bulbs are usually either potted singly in 5in. pots, or three bulbs are arranged triangular-wise in pots 6in. in diameter. In common with all lilies that flower in a perfectly satisfactory manner the first season after they are moved, Lilium longiflorum pushes out a considerable number of roots from the base of the stem, and these convey a large portion of nourishment to the flowers. For this reason many cultivators, when potting the bulbs, leave a space of a couple of inches or so to allow of a top-dressing of good soil when the stem roots are ready to take possession of it. Apart from this, as the pots get full of roots, an occasional dose of liquid manure is very beneficial.

When Lilium longiflorum and its varieties are grown under glass it is very necessary to keep a sharp look-out for aphides or green-fly, as these are very apt to collect in the tender, unfolding leaves, and may do a great deal of damage before their presence is suspected. They attack the buds while quite small, and cause the flowers to become deformed. Dipping the points of the shoots in an insecticide, or vaporising, is the best way to get rid of them.

Planted out of doors the Japanese bulbs may be depended upon to make a grand display the first season, but, as above stated, unless exceptionally situated, they are likely to deteriorate afterwards. The conditions most favourable to this lily are a free, sandy, well-drained soil, and a sheltered position. The bulbs are none too hardy, hence a good plan is to cover the ground in the winter with some protecting material such as leaves, bracken, or coconut fibre refuse.

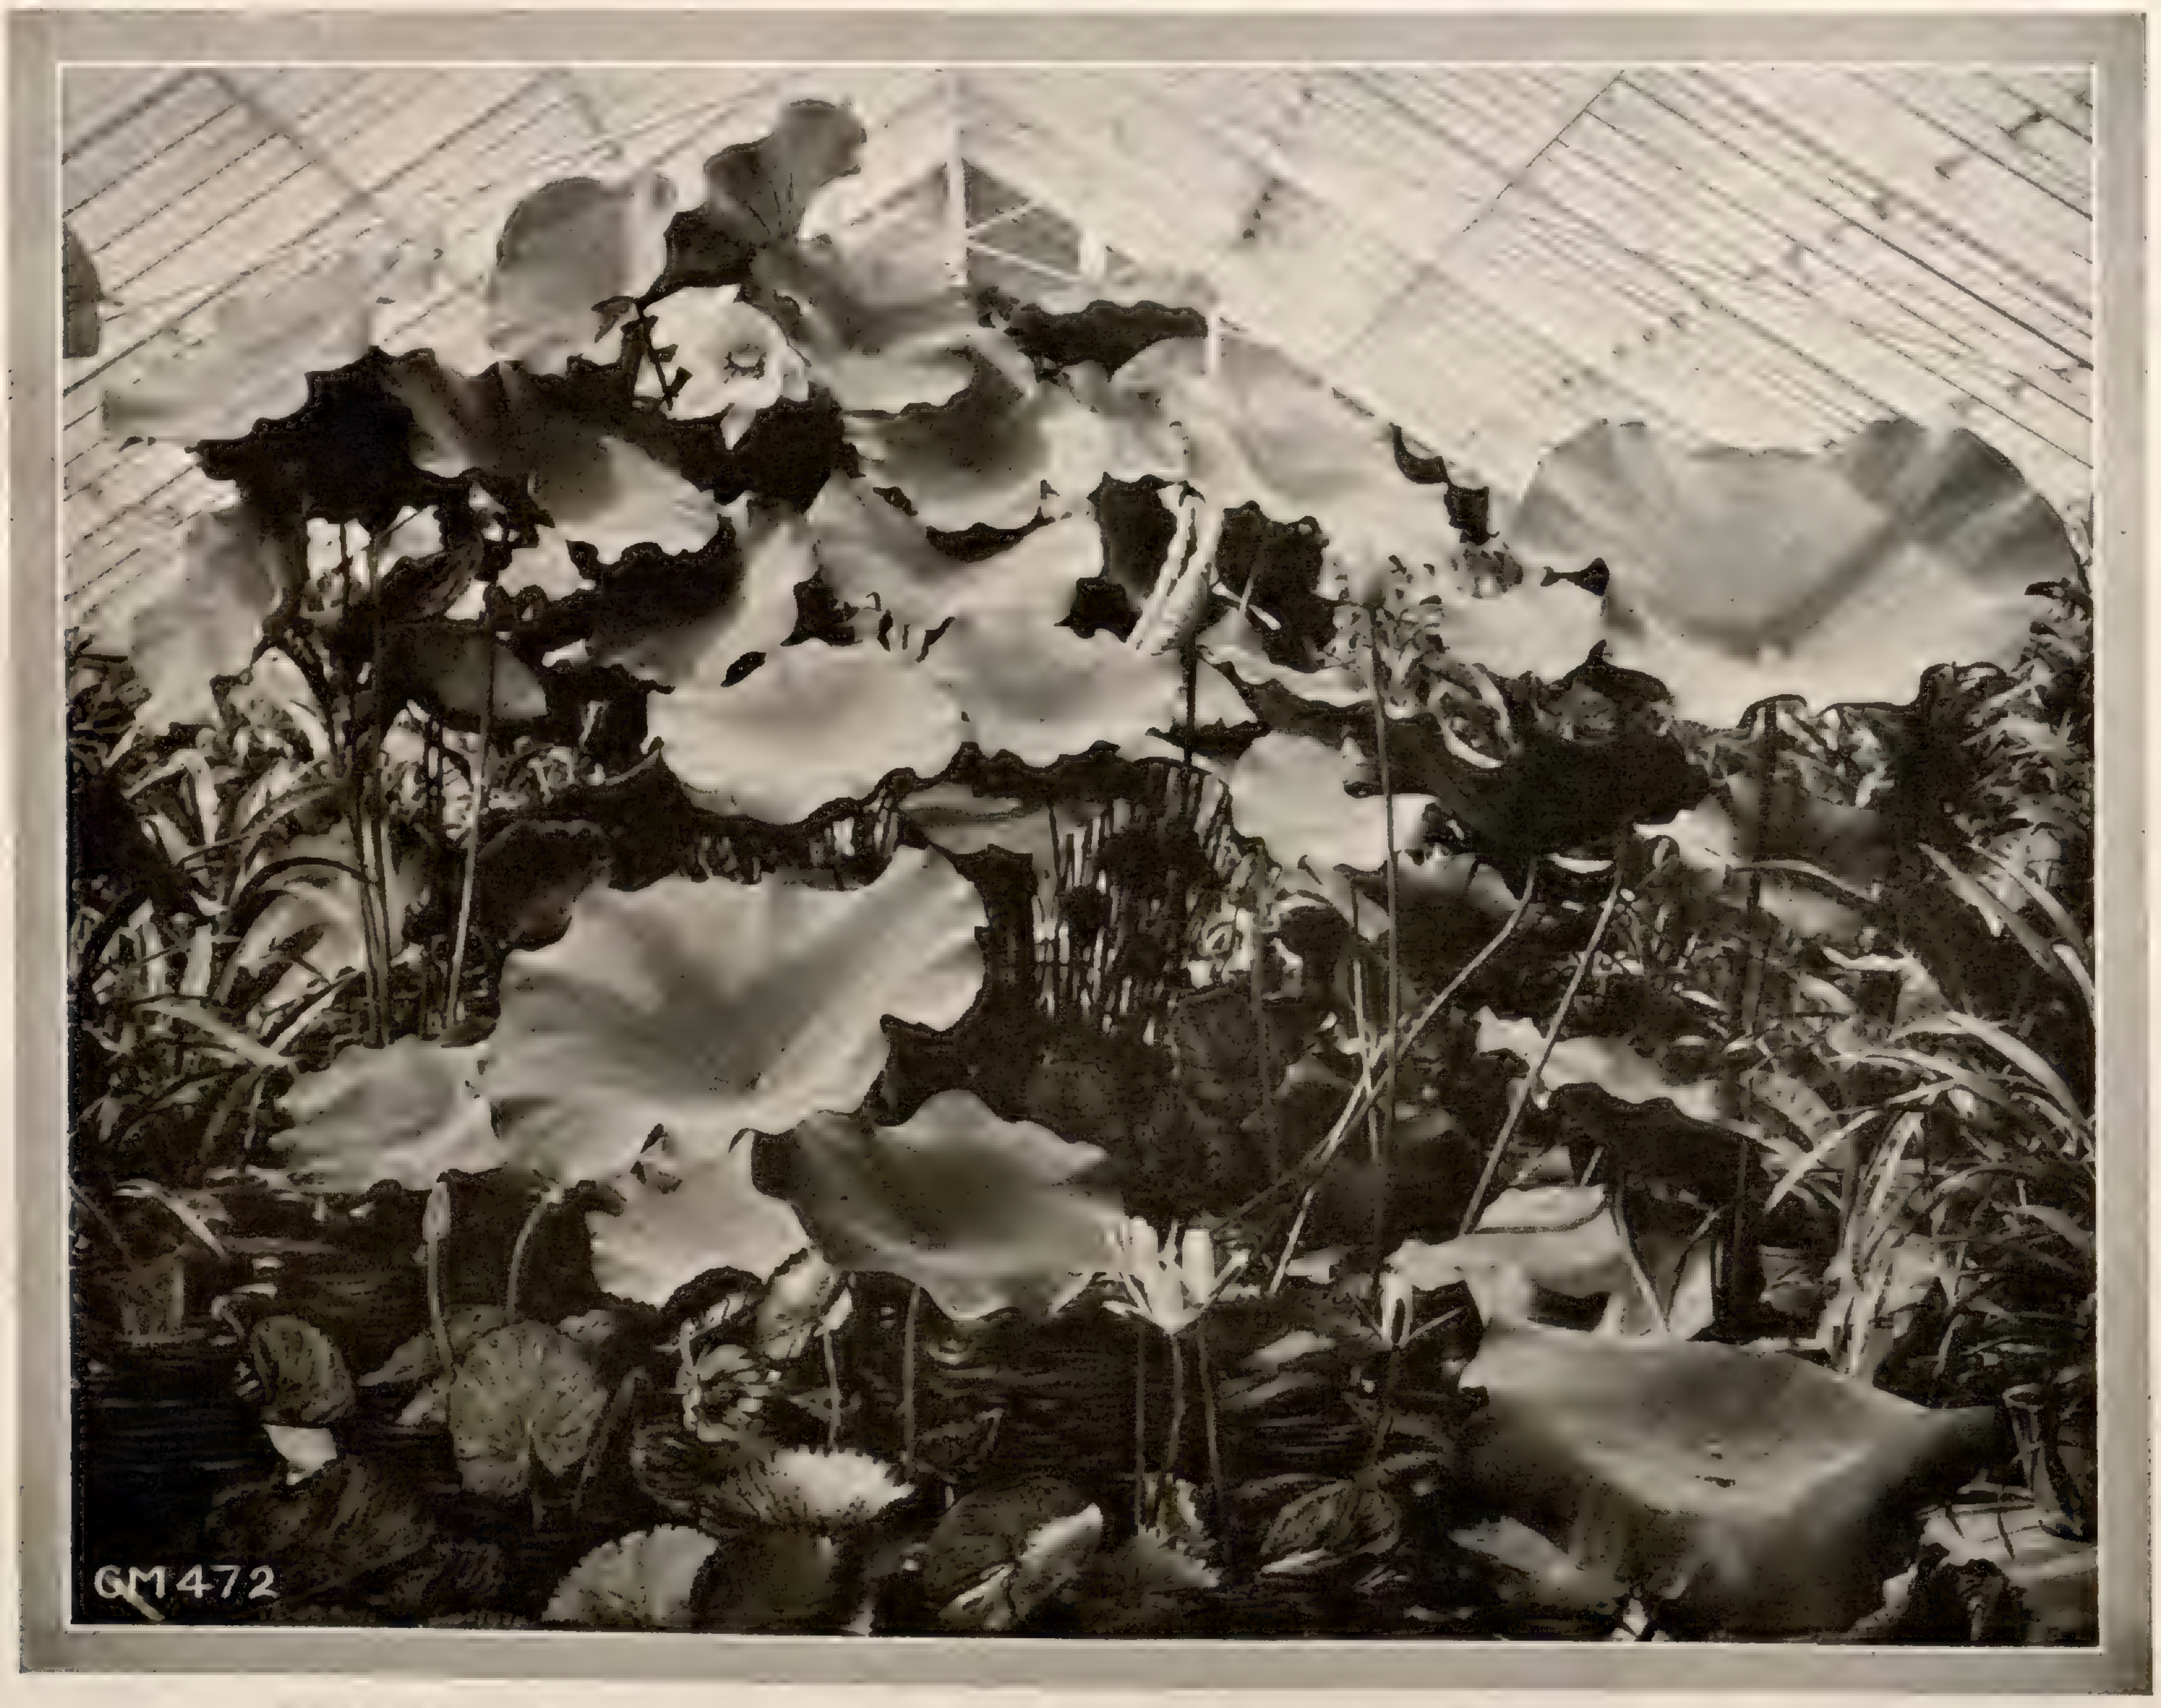
S. W.

**Wistaria sinensis for Forcing.**—The forcing of hardy flowering shrubs for greenhouse decoration has made considerable headway within recent years, a great number of different subjects having proved amenable to that treatment. In making a selection of the best, the wistaria must on no account be passed over, for, grown as standards, it will flower freely, and is quite distinct from its associates.—T.

## NELUMBIUM SPECIOSUM.

We have heard a great deal lately about the decorative value of the flowers and leaves of nelumbiums, and an effort is being made to popularise them, chiefly by means of imported flower buds that are expanded when they reach this country. We are apt to forget that nelumbiums were popular when Moses was undergoing his military training in Egypt, and when Joseph was Prime Minister in the land of the Pharoahs.

Where space can be afforded Nelumbium speciosum is an especially attractive aquatic for cultivation under glass. It is a most interesting and noble, as well as beautiful, subject, and now that so many of the popular "market" plants are grown in batches in almost every garden, the cultivation of the nelumbium would relieve the monotony that so frequently exists.



NELUMBIUM SPECIOSUM AND NYMPHÆA DEVONIENSIS AT BISHOP'S HALL.

At Bishop's Hall, Romford, the residence of Colonel Lockwood, a house is set apart for tropical aquatics. A tank 22ft. long, 8ft. wide, and 3½ft. deep, is provided, and one four-inch pipe runs all round the inside, this being ample for maintaining a temperature of 70 to 75 degrees in the water. Crotons are the only plants grown in the house, besides the nelumbiums, Nymphæa dentata, and N. Devoniensis. The crotons occupy the side stages. The house is never shaded.

During the first or second week in March, each year, the tank is cleaned out, the tuberous roots of the nymphæas and the creeping rootstocks of the nelumbiums being collected as the old soil is removed. As quickly as possible these are placed in new soil. For nelumbiums a compost of two parts turfy loam, one part leaf-soil, and one part dried cow manure is prepared. For the nymphæas a similar compost, minus the manure, is used; the nymphæas are placed in tubs, and the nelumbiums in a large tub. Water covers the whole to a depth of four inches.

The house is kept very warm, and when the foliage of the aquatics appears it is syringed two or three times a day in warm, bright weather. Under no consideration are the ventilators opened, so as to communicate directly with the outside air, but the doors at either end of the house, leading into other houses, are opened in the hottest weather, but these are invariably closed at two o'clock all through the summer. Late in autumn, when the plants show signs of going to rest, the temperature is greatly reduced, and during winter a night temperature of from 55 to 60 degrees is found sufficient.

Mr. George Cradduck, Colonel Lockwood's gardener, states that the nelumbium leaves are carried 6ft. to 6½ft. high, on stout stems, and the largest leaves have a diameter of 26 inches. The flower stems rise about 5ft. high, and the blooms are about a foot, or a little more, across, and of a beautiful soft rose colour.

---

**Oncidium spilopterum**, with large yellow labellum and violet-coloured crest, is now flowering. It is of easy culture, growing well in the cool house during the summer months, but is best wintered in the intermediate house as advised for the other species. Many of the oncidiums do not lend themselves very readily to cultivation, but by closely observing their manner of growth, and their requirements, there is no reason why these difficulties should not be overcome. A mistake often made in the cultivation of all oncidiums is growing them in deep receptacles, and with too much compost about their roots.—J. T. Barker, The West Hill Gardens.

## CELOSIA PYRAMIDALIS.

This graceful plant has come markedly to the front within recent years, not only as a desirable subject for summer bedding, but also as a valuable one for the decoration of the greenhouse and conservatory. For this latter purpose it is, as a rule, most appreciated when the beauty of the outdoor flowers is over. A remarkable feature of this celosia is the intensely vivid colours of many of the inflorescences, so that they are looked upon as crude by some, and those of that way of thinking often contemptuously refer to them. There is, however, no question about their telling effect when judiciously disposed, as they serve to lighten up the more sombre-tinted foliage plants most effectually.

In order to have these celosias at their best they need to be grown straight away from the seedling stage without any check, using for the purpose light rich soil. The month of May is quite early enough to sow the seeds to produce plants for autumn flowering. There is now a considerable range of colour in the different forms. According to the "Dictionary of Gardening," this celosia, which is a native of India, was introduced in 1820. Another species very much older is the Cockscomb (Celosia cristata), which, by the same authority, is said to have been introduced in 1570. Many object to this celosia because of its lumpy habit, but it is really very showy, and a decided favourite of mine. W. T.

---

**Tetranema mexicana.** — This uncommon Mexican plant is of a pretty, neat growth, and flowers continuously. It belongs to the Scrophularia family, but in its rosette of leaves it almost suggests one of the primulas. The purple flowers are borne in clusters.—K.

# GREAT EXHIBITION OF BRITISH-GROWN FRUIT.

Although the fine fruit show held at the Royal Horticultural Hall, Westminster, on October 10 and 11, was not the best of its series it must rank quite high, especially when the peculiarities of the season of 1912 are taken into full consideration. Apples were abundant and good, and the colouring fine, while pears were of particularly high quality. The choice dessert fruit classes, and the grape classes, brought out keen competition, but disqualification for the use of Washington as a dessert apple in the chief of the former classes caused not a little disappointment, but as this variety is listed as a cooking apple, the Council could do no other than disqualify it. Most folks would class Washington as a dessert apple, and say the list is wrongly compiled, but that does not help matters for the moment, and it adds further emphasis to the need on the part of competitors for a careful consideration of the schedule. The nurserymen's exhibits made a remarkably fine display, and Messrs. Gaskain and Whiting's set of twenty baskets of apples in the market growers' class was of exceptional excellence.

R.H.S. FRUIT SHOW.—GOLD MEDAL COLLECTION OF HARDY FRUITS.
Exhibited by Messrs. G. Bunyard and Co., Maidstone.

The effectiveness of the display as a whole was marred by the arrangement of all the trade displays in one-half of the hall, and the single dish and other flat exhibits at the other end.

### CHOICE DESSERT FRUITS.

Four competitors entered in the class for a collection of nine dishes of ripe dessert fruits, and the leading award was made in favour of Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, who staged Gros Maroc and Muscat of Alexandria grapes, Pitmaston Duchess and Doyenne du Comice pears, Chas. Ross apples, Late Devonian and Barrington peaches, Pineapple nectarines, and Countess melon. It must have been a tough fight between Mr. Mullins and Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, who was placed second, though many of the visitors who "judged the judges," placed him first. He had Appley Towers and Muscat of Alexandria grapes, the latter not so good as Mr. Mullin's; Hero of Lockinge melon, splendid Pitmaston Duchess and Doyenne du Comice pears, good dishes of Washington and Cox's Orange Pippin apples, Golden Eagle and Salway peaches. Mr. Barker evidently lost ground on his grapes. Third prize fell to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, who had beautiful bunches of Madresfield Court grapes, and grand dishes of Cox's Orange Pippin and Washington apples, and Golden peaches.

Subsequently both second and third sets in the foregoing class were disqualified, to everyone's regret, and the disqualification occurred because both Mr. Barker and Mr. Goodacre showed Washington apples, and the R.H.S. lists include this as a cooking, and not as a dessert variety. Mr. T. Pateman was awarded the second place, as a result of these disqualifications. Extra prizes were awarded by the Council to Mr. Barker and Mr. Goodacre.

Six competitors came forward with collections of six dishes of ripe dessert fruits, and here Mr. W. H. Cooke, gardener to Lord Belper, Kingston Hall, Derby, led with Gros Colmar and Muscat of Alexandria grapes in good condition, Cox's Orange Pippin and Charles Ross apples, Pitmaston Duchess pears, and a fine dish of the pale Gladstone peaches. Mr. G. Shelton, gardener to Lord Hillingdon, Wildernesse, Sevenoaks, secured the second prize, and showed Pitmaston Duchess and Doyenne du Comice pears finely, and also had a good dish of Cox's Orange Pippin apple; Mr. J. Vert, gardener to Lord Howard de Walden, Audley End, Saffron Walden, third.

### GRAPES.

Mr. S. Barker won the silver cup for a collection of five varieties of grapes, two bunches of each. There were five competitors. Mr. Barker displayed heavy, well-finished bunches of Gros Colmar, Muscat of Alexandria, Black Hamburgh, Buckland Sweetwater, and Madresfield Court. Mr. J. H. Goodacre was a good second, and his selection of varieties was Madresfield Court, Muscat of Alexandria, Muscat Hamburgh, Golden Queen, and Gros Maroc.

For four varieties of grapes, selected from Madresfield Court, Mrs. Pince, Muscat Hamburgh, Muscat of Alexandria or Canon Hall Muscat, Mrs. Pearson, and Dr. Hogg, Mr. J. Shelton led with Madresfield Court, Mrs. Pearson, Muscat of Alexandria, and Mrs. Pince; Mr. G. Richardson second.

The popular Black Hamburgh grape was shown by six competitors, and the best pair of bunches were those set up by Mr. A. Heald, gardener to Rev. W. Beecher, Wellow Hall, Newark, whose small clusters were finely berried and of excellent colour; Mr. S. Barker second, and Mr. J. H. Goodacre third. Only one exhibit was staged in the class for a collection of hardy fruits, arranged on a space 12ft. by 3ft., and this was from Mr. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone. Lady Palmerston and Sea Eagle peaches, damsons, Monarch and Wyedale plums, nuts, figs, cherries, and a fine selection of apples and pears were put up, and the first prize was worthily awarded.

The best pair of bunches of Mrs. Pince came from Mr. G. Richardson, gardener to H. St. Maur, Esq., Stover Park, Newton Abbot, and were large clusters; Mr. J. Kidd, gardener to G. Miller, Esq., Newberries, Radlett, second. Eleven competitors came forward in the class for two bunches of Alicante, and grand bunches from Mr. H. Brown, gardener to Mrs. W. G. Raphael, Castle Hill, Englefield Green, secured the first prize. Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, second; and Mr. Howe, gardener to Lady Tate, Park Hill, Streatham, third; while Mr. W. H. Allen, gardener to L. Currie, Esq., Minley Manor, Farnborough, was highly commended for finely-berried bunches.

In the Madresfield Court class, Mr. J. H. Goodacre scored with beautifully-finished, medium-sized bunches, and he was followed in order by Mr. J. Doe, gardener to Lord Savile, Rufford Abbey, Ollerton; and Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop. Mr. Doe was first for Prince of Wales with rather ungainly bunches of wonderfully fine berries; Mr. H. J. Alderman, gardener to H. H. Konig, Esq., Ardenrun Place, Blindley Heath, second. In the any other black class, there were thirteen entries and first prize fell to Mr. R. Learmouth, gardener to J. Liddell, Esq., Sherfield Manor, Basingstoke, for large-berried examples of Appley Towers; Mr. H. Brown second with Lady Downes. Some enormous bunches of Gros Guillame were staged in this class by Mr. S. Barker.

About a dozen competitors staged a pair of bunches of Muscat of Alexandria, and first prize was given to Mr. J. Simon, gardener to W. W. Mann, Esq., Ravenswood, Bexley, whose large-berried bunches were a trifle shrivelled; Mr. A. R. Allan, gardener to Lord Hillingdon, Hillingdon Court, Uxbridge, second with longer, fresher-berried bunches. For any other white grape, Mr. T.

Pateman, gardener to C. A. Cain, Esq., The Node, Welwyn, led with large bunches of Mrs. Pearson, followed in order by Mr. A. Gooding, gardener to W. B. Bird, Esq., Eartham House, Chichester; and Mr. E. C. Wickens, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, both of whom showed Mrs. Pearson.

### MARKET GROWERS' CLASSES.

The best twenty baskets of apples, culinary and dessert varieties, shown by market growers, was unquestionably the set exhibited by Messrs. Gaskain and Whiting, Dargate, Faversham, and probably no finer twenty baskets could have been selected from the whole of the exhibition. The fruits were of grand size, even, clean, and bright—a perfectly splendid collection. The varieties were Newton Wonder, Gascoyne's Scarlet, Blenheim Pippin, Annie Elizabeth, Bismarck, Allington Pippin, Lord Derby, Rival, Cox's Orange Pippin, Warner's King (grand specimens), Peasgood's Nonsuch, Chas. Ross, Stone's, Ribston Pippin, American Mother, Lady Henniker, Cox's Pomona, King of the Pippins, Bramley's Seedling, and King of Tompkin's County. Second prize fell to Mr. Bolton Smart, Superintendent of the Hollesley Bay Labour Colony, Suffolk; Blue Pearmain, Royal Snow, Newton Wonder, Allington Pippin, and Chas. Ross were good in this set.

For a dozen baskets of apples, representing six each of cooking and dessert sorts, Mr. A. E. Mason, Rectory Farm, Hampton Hill, was a good first with beautiful, even sets of Chas. Ross, King of the Pippins, Ribston Pippin, Cox's Orange Pippin, Yellow Ingestre, Jas. Grieve, Lane's Prince Albert, Newton Wonder, Bismarck, Bramley's Seedling, Beauty of Kent, and Dumelow's Seedling. Mr. J. Holloway, gardener to H. Lumley Webb, Esq., Tunstall House, Sittingbourne, second.

### AMATEURS' COLLECTIONS OF APPLES.

Mr. T. Pateman, gardener to C. A. Cain, Esq., The Node, Welwyn, for sixteen dishes of cooking and eight dishes of dessert apples, won the Hogg Medal, with a good set that included good samples of Warner's King, Emperor Alexander, Peasgood's Nonsuch, Lane's Prince Albert, Washington, Cox's Orange Pippin, Chas. Ross, Jas. Grieve, and Wealthy; Mr. W. H. Bacon, gardener to Sir Marcus Samuel, Bart., Mote Park, Maidstone, second.

There was but one entry of twelve dishes of cooking and six dishes of dessert apples, and this, staged by Mr. F. G. Gerrish, gardener to J. G. Williams, Esq., Pendley Manor, Tring, gained a first prize. Lady Henniker, Warner's King, Peasgood's, Newton Wonder, Cox's Orange Pippin, Chas. Ross, and Allington Pippin were finely shown.

In the class for a set of eight cooking and four dessert apples, Mr. R. Learmouth led with a very fair set. Mr. Pateman scored for six dishes of cooking apples with good specimens of Peasgood's Nonsuch, Bramley's Seedling, Warner's King, Emperor Alexander, Lane's Prince Albert, and Queen; Mr. Mullins second, and Mr. W. H. Bacon third. Mr. Mullins took the lead for six dishes of dessert apples with bright, even dishes of Jas. Grieve, King of the Pippins, Rival, Wealthy, Cox's Orange Pippin, and Ribston Pippin; Mr. W. H. Bacon came second.

### AMATEURS' COLLECTIONS OF PEARS.

A fine set of eighteen dishes of pears from Mr. G. Davison, gardener to Colonel Petre, Westwick, Norwich, gained first prize and Hogg Medal, attracted much attention, and gained a great deal of admiration. The fruits were of wonderfully fine size, the varieties being Charles Ernest, Glou Morceau, Pitmaston Duchess, Souv. de Congrès, Pres. d'Osmonville, Beurré Baltet père, Emile d'Heyst, Durondeau, Doyenne due Comice, Conference, Beurré d'Avalon, Marie Louise, Bergamotte d'Esperen, Marguerite Marillat, Beurré Alexander Lucas, Triomphe de Vienne, Easter Beurré, and Nouvelle Fulvie. There was a fine competition, six exhibitors coming forward. Second prize fell to Mr. Pateman, and third to Mr. R. Learmouth.

For a dozen dishes of dessert pears, Mr. J. W. Bards, gardener to A. P. Brandt, Esq., Bletchingley, Surrey, was awarded a second prize, and was the only exhibitor. Mr. W. A. Cook, gardener to Sir Edmund Loder, Bart., Leonardslee, Horsham, came first for six dishes of pears with Doyenne du Comice, Beurré Baltet père, Marie Benoist, Duc de Nemours, Beurré Hardy, and Louise Bonne of Jersey; Mr. T. H. Bolton, gardener to the Earl of Devon, Powderham Castle, Exeter, second; and Mr. W. H. Bacon third.

A grand three dishes of stewing pears secured a first prize for Mr. G. Davison, who showed magnificent specimens of Uvedale's St. Germain, Catillac, and General Todleben.

### OTHER FRUITS.

Mr. James Vert, Saffron Walden, secured first for three dishes of plums with President, Coe's Golden Drop, and Vert's Violet — a handsome fruit with a violet line down each; Mr. James Hill, Kingston Lacy, Wimborne, second. Mr. Gerrish, gardener to J. G. Williams, Esq., Tring, scored for damsons and bullaces, and also led for a dish of Morello cherries.

### DISTRICT COUNTY CLASSES.

As usual, there was a series of distinct county classes, two classes in each division, one for six dishes of apples and one for six dishes of pears. In each case the first prize was 20s., and third class return rail fare; and second prize 15s. and return rail fare.

Among Kent growers Mr. J. Coleman, gardener to Captain S. G. Reid, The Elms, Yalding, led for apples with fine dishes of Bismarck, Lord Derby, Peasgood's Nonsuch, Warner's King, Cox's Orange Pippin, and Ribston Pippin; Mr. J. Bond, gardener to W. E. S. Erle Drax, Esq., Wye, second. In this division Mr. J. Coleman led for pears with Doyenne du Comice, Pitmaston Duchess, Durondeau, Marie Benoist, Conference, and Beurre Superfin in fine form; Mr. J. Bond second; three entries.

In the division open to Surrey, Sussex, Hants, Dorset, Somerset, Devon, and Cornwall there was a capital competition. Mr. Brock, gardener to the Duke of Richmond, Goodwood, Chichester, scored for apples with very handsome fruits of Peasgood's Nonsuch, Lord Derby, Warner's King, Allington Pippin, Charles Ross, and Lane's Prince Albert; Mr. J. Capp, Ferndale, Teignmouth, second out of eight competitors. The best pears in this division were good dishes of Beurré Baltet père, Beurré Bachelier, Doyenne Boussoch, Charles Ernest, Durondeau, and Doyenne du Comice, shown by Mr. T. Turton, gardener to F. J. Digby, Esq., Sherborne Castle, Dorset; Mr. A. Tidy, gardener to C. H. Combe, Esq., Cobham Park, Surrey, a good second.

The counties of Wilts, Gloucester, Oxford, Bucks, Berks, Beds, Herts, and Middlesex were grouped together, and here Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, scored for apples, and staged a nice dish of Ribston Pippins.

R.H.S. FRUIT SHOW.—SILVER-GILT KNIGHTIAN MEDAL COLLECTION OF HARDY FRUITS.
Exhibited by Messrs. J. Cheal and Sons, Crawley.

Mr. A. R. Allan, Hillingdon Court Gardens, led for pears, and showed Charles Ernest and Durondeau finely; Mr. J. Coleman second.

The next grouping found Essex, Suffolk, Norfolk, Cambridge, Hunts, and Rutland associated, and here the premier award for apples fell to Mr. Andrews, gardener to the Right Hon. W. Lowther, Campsea Ash, Suffolk, who showed very good examples of Peasgood's, Lord Derby, Belle de Pontoise, Bismarck, Cox's Orange Pippin, and Ribston Pippin; Mr. A. Humphrey, gardener to Sir Montagu Turner, Havering, Romford, second. Pears in this division were best staged by Mr. W. Allan, gardener to Colonel Harbord, Gunton Park, Norwich, who was followed by Mr. W. Messenger, gardener to G. H. Berners, Esq., Woolverstone Park, Ipswich.

Lincoln, Northampton, Warwick, Leicester, Notts, Derby, Staffs, Shropshire, and Cheshire formed the next group, and here Mr. J. Taylor, gardener to F. Bibby, Esq., Hardwicke Grange, Shrewsbury, led both for apples and for pears, and he showed finely in each case, some of his best dishes being of Warner's King, Stirling Castle, Cox's Orange Pippin, Marie Louise d'Uccle, and Souv. du Congrès. Mr. H. Collier, gardener to Sir Oswald Mosley, Bart., Rolleston Hall, Burton-on-Trent, second for apples and also for pears.

Curiously enough there was only one exhibit in the class open to Worcester, Hereford, Monmouth, Glamorgan, Carmarthen, and Pembroke, and this was of pears from Mr. W. E. Hyde, Old Post Office, Trumpet, Ledbury; a second prize was awarded.

The six Northern Counties and the Isle of Man sent four exhibits. Mr. J. C. McPherson, gardener to Baron de Forest, Londesborough Park, Yorks, scored for apples; and Mr. W. Chuck, Brodsworth Hall, Doncaster, came second. For pears the same exhibitors filled similar positions.

Scotland sent three exhibits, one of apples and one of pears from Mr. Staward, gardener to R. M. Pilkerton, Esq., St. Fort House, Newport, Fife; he was awarded a second prize for apples, and a first for pears, and his varieties in the latter case were Thompson's, Clapp's Favourite, Beurre Diel, Marechal de la Cour, Chas. Ernest, and Bergamotte d'Esperen. Mr. J. Duff, gardener to Colonel Gordon, Threave House, Castle Douglas, was a capital first for apples, and showed Peasgood's, Gascoyne's, Scarlet, Worcester Pearmain, The Queen, Jas. Grieve, and Cox's Pomona.

Among Irish growers Mr. T. E. Tomalin, gardener to the Earl of Bessborough, Bessborough, Piltown, led for brightly-coloured apples, with Mr. C. B. Broad, Aghern, Conna, co. Cork, second. There were no pears from the sister Isle, and no exhibits at all from the Channel Islands.

### DESSERT APPLES: SINGLE DISHES.

Over two dozen classes were provided for single dishes of specified dessert apples, and in each class the first prize was 7s., and the second 5s. We give the first prizewinner in each instance.

Adam's Pearmain, eleven entries, Mr. J. Bond. Allington Pippin, eighteen entries, Mr. C. Wotton, gardener to the Earl of Westmorland, Woodcock Park, Sittingbourne. American Mother, seven entries, Mr. C. Page, Dropmore, Maidenhead, a finely-coloured set. Belle de Boskoop, four entries, Mr. G. Richardson. Ben's Red, two entries, Mr. C. B. Broad, Conna, co. Cork. Blenheim Orange, seventeen entries, Mr. A. Tidy. Charles Ross, ten entries, Rev. W. H. Bull, Westgate-on-Sea. Christmas Pearmain, two entries, Mr. J. Brock, Goodwood. Claygate Pearmain, one entry, no award. Coronation, three entries, Mr. J. Brock. Cox's Orange Pippin, twenty-two entries, Mr. J. Smith Kelly, gardener to the Duchess of Albany, Claremont, Esher—a fine dish. Duke of Devonshire, four entries, Mr. J. Copp, Ferndale, Teignmouth.

Egremont Russet, six entries, Mr. J. Bond. Houblon, three entries, Mr. J. Copp. James Grieve, seven entries, Mr. J. Copp. King of Tomkins County, nine entries, Mr. T. E. Tomalin, Bessborough. Lord Hindlip, two entries, Mr. T. E. Tomalin. Margil, eight entries, Mr. J. Coleman. Rival, six entries, Mr. J. Brock. Ribston Pippin, seventeen entries, Mr. W. Allan. Edmund's Pippin, one entry, Mr. W. Allan. Wealthy, eight entries, Mr. W. Messenger. Any other early variety, thirty entries, Mr. H. Markham, gardener to Viscount Enfield, Wrotham Park, Barnet, with Ellison's Early Orange. Any late variety, not previously named, twenty-four entries, Mr. W. Allan, first with Winter Ribston.

### COOKING APPLES: SINGLE DISHES.

In this division single dish classes were provided for a large number of specified varieties with prizes as for dessert apples.

Annie Elizabeth, seven entries, Mr. J. Bond. Beauty of Kent, four entries, Mr. A. Basile, Woburn Park Gardens, Weybridge. Bismarck, eight entries, Mr. A. Andrews. Blenheim Orange, nine entries, Mr. P. B. Awcock, gardener to D. A. Seligman, Esq., Iden Manor, Staplehurst. Bramley's Seedling, six entries, Mr. C. Wotton. Byford Wonder, two entries, Mr. J. Copp. Dumelow's Seedling, nine entries, Mr. J. Skelton. Ecklinville, five entries, Mr. C. Page. Edward VII., one entry, Colonel Bullock, Chiddingfold, Surrey. Emmett Early, one entry, Mr. J. R. Smith, gardener to J. Lewis, Esq., Bedgebury Park, Goudhurst. Emperor Alexander, ten entries, Mr. G. Richardson. A grand dish of fruits that was probably the best of the set had no class card, and was therefore not judged. Gascoyne's Scarlet, ten entries, Mr. J. Vert; here, too, there was a splendid dish of fruits without a class card, and therefore not judged.

Golden Noble, eight entries, Mr. J. Bond. Grenadier, two entries, Mr. C. Page. Hambling's Seedling, ten entries, Mr. J. Bond. Lady Henniker, five entries, Mr. J. R. Smith. Lane's Prince Albert, twelve entries, Mr. T. A. Tomalin. Lord Derby, four entries, Mr. J. Coleman. Mere de Menage, three entries, Mr. G. Richardson. Newton Wonder, eight entries, Mr. J. Bond. Norfolk Beauty, six entries, Mr. A. Andrews. Peasgood's Nonsuch, eleven entries, Mr. F. Brock—a grand dish. Pott's Seedling, two entries, Mr. G. Longhurst. Rev. W. Wilks, three entries, Mr. T. E. Tomalin. Royal Jubilee, two entries, Mr. J. Brock. Stirling Castle, two entries, Mr. C. Page. The Queen, seven entries, Mr. T. E. Tomalin. Tower of Glamis, five entries, Mr. B. J. Meyer, Wierton Place Gardens, Maidstone. Warner's King, nineteen entries, Mr. C. Wotton. Any variety not included above, twenty entries, Mr. Tomalin, with Loddington in fine form; indeed, Mr. Tomalin's fruits were very fine, and his numerous successes should prove distinctly favourable to the steadily-growing fruit industry in Ireland.

### CHOICE DESSERT PEARS.

About forty classes were provided for specified varieties of choice dessert pears, and in each class prizes of 7s. and 5s. respectively were offered. In these classes we give the first-prize winner only.

Beurré Alexander Lucas, nine entries, Mr. T. Turton. Beurré d'Amanlis, one entry, a second prize to Mr. G. Longhurst.

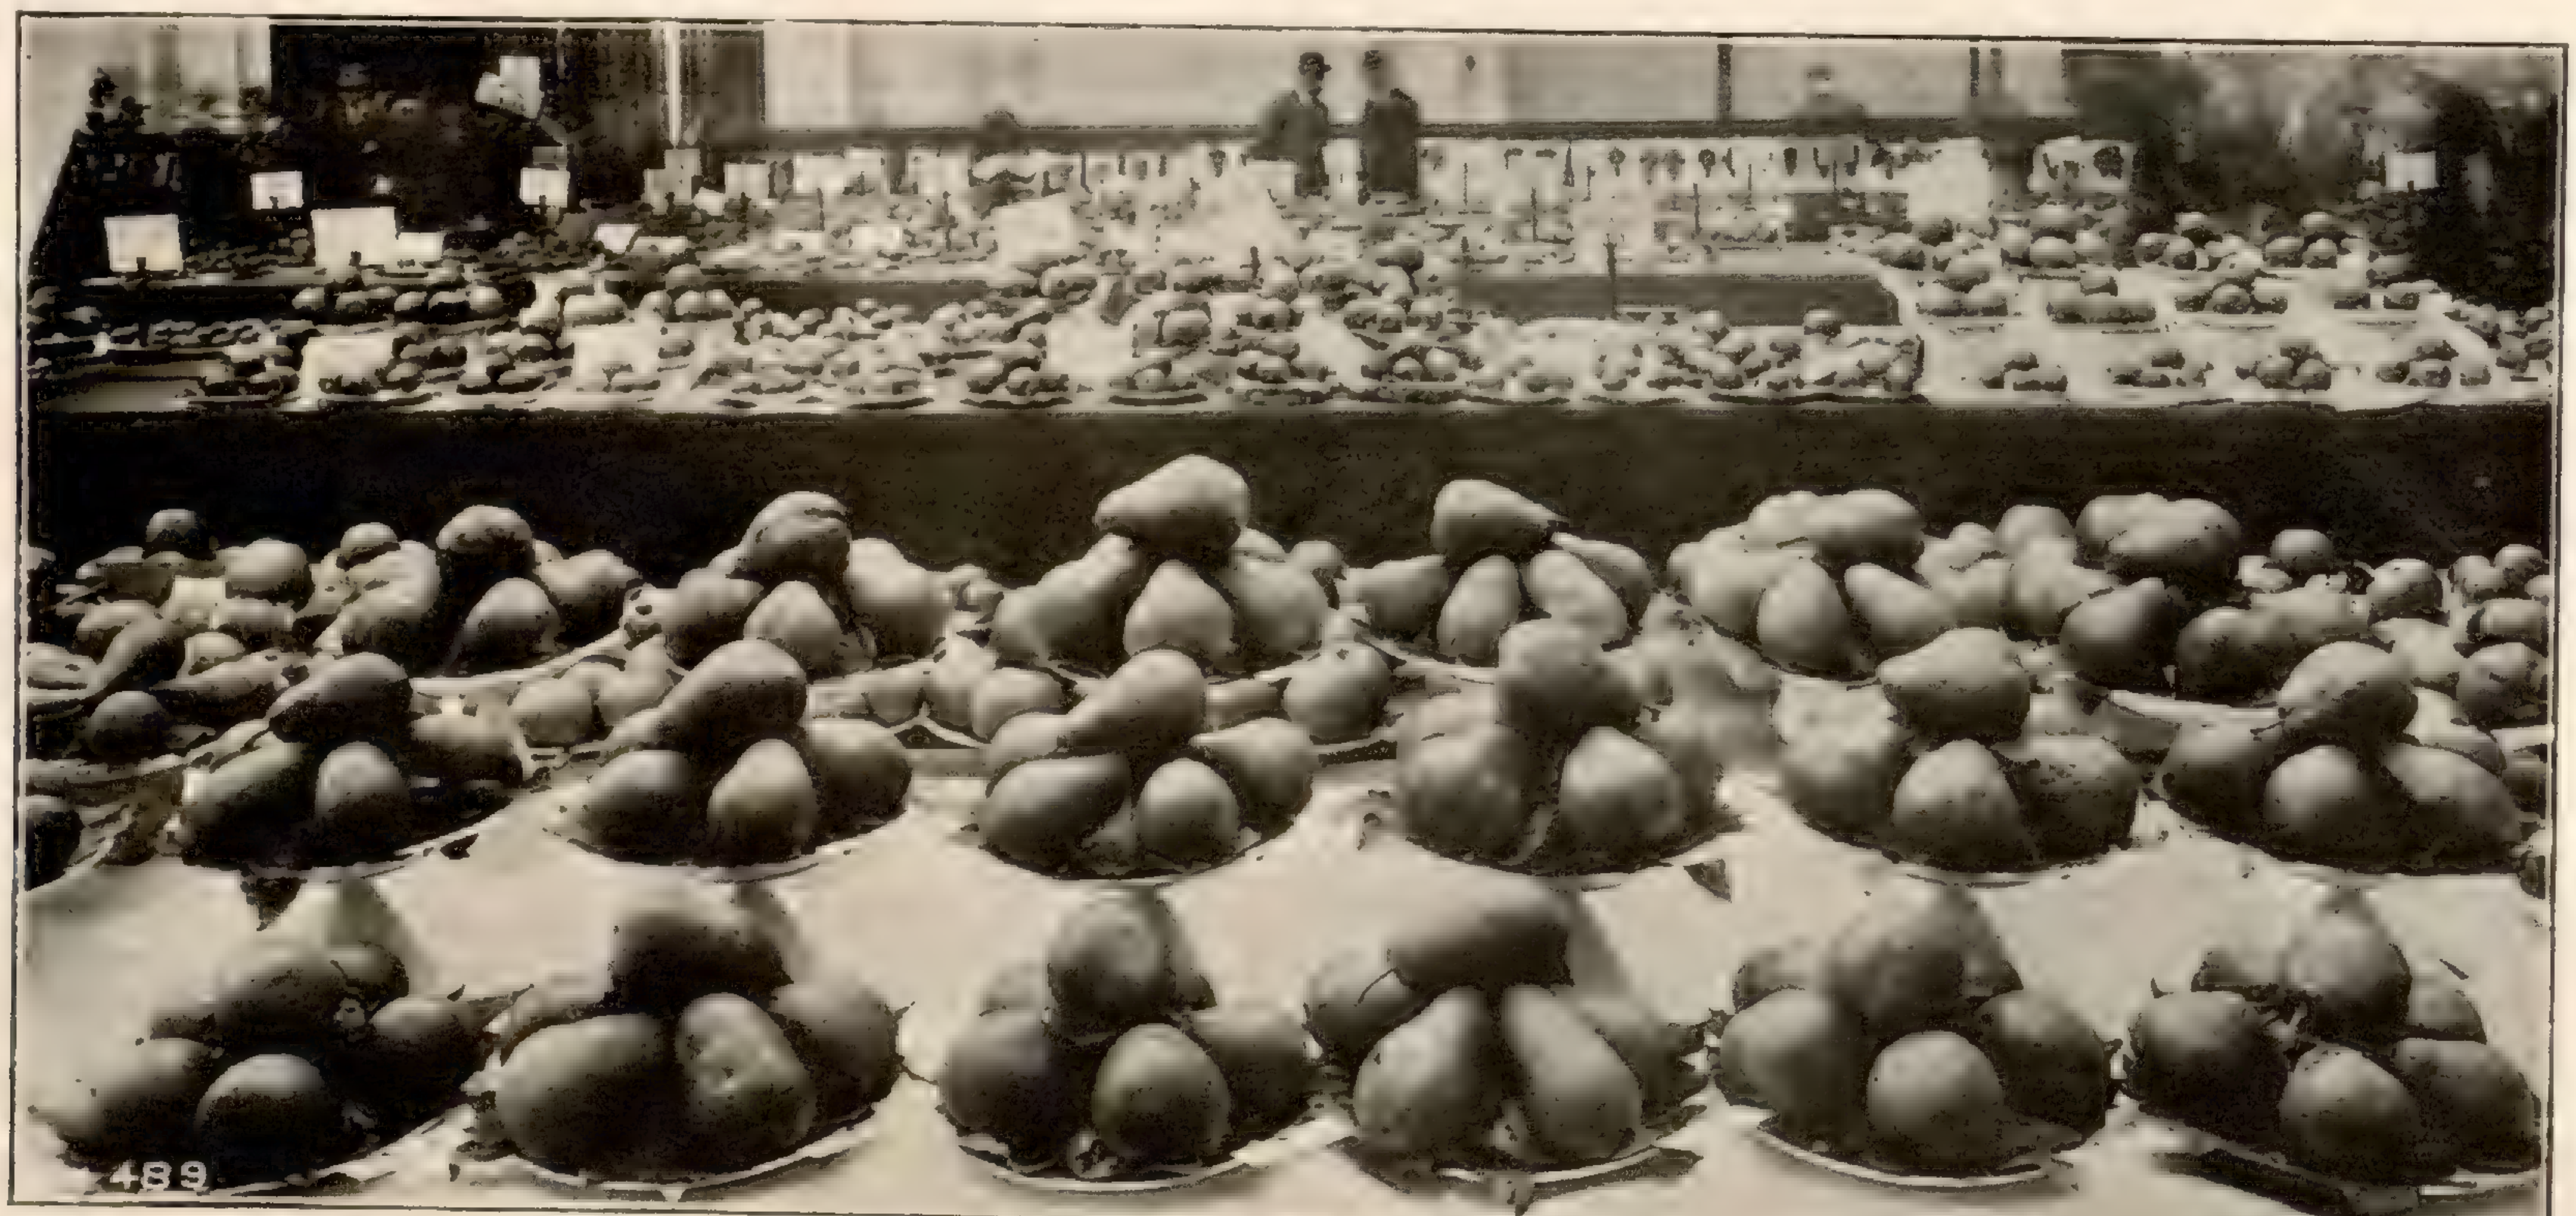
Back row.—Bramley's Seedling, Peasgood's Nonsuch, Mère de Ménage, Lord Derby, Barnack Beauty, Emperor Alexander.
Middle row.—Beurré Alexandre Lucas, Doyenne du Comice, Pitmaston Duchess, Beurré Baltet père, Conference, Marie Benoist.
Front row.—Charles Ross, Blenheim Pippin, Ribston Pippin, King of the Pippins, Wealthy, Cox's Orange Pippin.

R.H.S. FRUIT SHOW.—FIRST PRIZE COLLECTION OF APPLES AND PEARS.

Exhibited by the Ipswich Gardeners' Society in the Affiliated Societies' Class.

Beurré d'Anjou, four entries, Mr. C. Page. Beurré Bosc, eleven entries, Mr. T. Turton. Beurré Dumont, two entries, Mr. A. Basile. Beurré Hardy, sixteen entries, Mr. A. Basile. Beurré Perran, one entry, Mr. T. Turton. Beurré Superfin, eight entries, Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone.

Blickling, one entry, Mr. W. Allan. Charles Ernest, eight entries, Mr. T. Turton. Comte de Lomy, eight entries, Mr. A. R. Allan. Conference, five entries, Mr. T. Turton. Doyenne du Comice, eighteen entries, Mr. T. Turton. Durondeau, eleven entries, Mr. T. Turton. Easter Beurré, seven entries, Mr. A. R. Allan. Emile d'Heyst, eight entries, Mr. T. Turton. Fondante d'Automne, five entries, Mr. A. Basile. Fondante de Thirriot, four entries, Mr. Messenger. Glou Morceau, fifteen entries, Mr. E. Colman, gardener to B. E. Richardson, Esq., Hill House, Stanstead Abbotts. Gratioli of Jersey, two entries, Mrs. M. P. Mead, St. Mary's, Teddington. Josephine de Malines, twelve entries, Mr. T. Turton. Le Brun, two entries, Mr. A. Basile. Le Lectier, ten entries, Mr. J. Vert—very fine fruits. Louise Bonne of Jersey, six entries, Mr. J. Taylor, Shrewsbury. Marie Benoist, seven entries, Mr. T. Turton. Marie Louise, twelve entries, Mr. J. R. Smith, Goudhurst. Nouvelle Fulvie, nine entries, Mr. T. Turton, Olivier des Serres, eleven entries, Mr. A. R. Allan. Pitmaston Duchess, eleven entries, Mr. F. King, gardener to the Rev. H. A. Bull, Westgate-on-Sea. President Barabe, three entries, Mr. W. Allan. Souv. du Congrès, three entries, Mr. A. Basile. Thompson, seven entries, Mr. A. R. Allan—a beautiful dish. Triomphe de Vienne, two entries, Mr. J. Skelton. Winter Nelis, seven entries, Mr. A. E. Gardner, gardener to Lord Foley, Ruxley Lodge, Esher. Any other early variety, sixteen entries, Mr. A. Basile, with Marguerite Marillat. Any other late variety, twenty entries, Mr. T. Turton, with fine examples of Beurré Baltet père. In these two latter classes eight fruits had to be staged "for the judges to be able to taste two of them." Evidently the judges had more faith in names and sight than in flavour, as not a single example was cut in all the thirty-six dishes.



Back row.—Charles Ernest, Glou Morceau, Pitmaston Duchess, Souvenir du Congrès, President d'Osmonville, Beurré Baltet père.
Middle row.—Marie Louise, Beurré d'Avalon, Conference, Doyenne du Comice, Durondeau, Emile d'Heyst.
Front row.—Bergamotte d'Esperen, Marguerite Marrillat, Beurré Alexander Lucas, Triomphe de Vienne, Easter Beurré, Nouvelle Fulvie.

R.H.S. FRUIT SHOW.—FIRST PRIZE EIGHTEEN DISHES OF PEARS.

Exhibited by Colonel J. B. Petre (Mr. G. Davison, gardener), Westwick, Norwich.

## NURSERYMEN'S CLASSES.

The chief of the several classes provided for nurserymen only was for a display of hardy fruits, grown out of doors, arranged on a space 30ft. by 6ft. Here there were three competitors. Messrs. George Bunyard and Co., Maidstone, secured a gold medal for a very fine display of capital fruits set up in dishes and baskets, with a few tall stands and some palms to prevent any appearance of flatness. Some of the finest apples shown were Beauty of Stoke, Twenty-Ounce, Norfolk Beauty, Newton Wonder, Rival, Peasgood's, Blenheim Orange, Lord Derby, King of the Pippins, Withington Fillbasket, Bramley's Seedling, Bow Hill Pippin, James Grieve, New Hawthornden, Gilozie, and Tower of Glamis. Especially good pears were Duchess d'Angoulême, Beurré Alexander Lucas, Pitmaston Duchess, Conference, Emile d'Heyst, Doyenne du Comice, Beurré Clairgeau, and Charles Ernest.

Messrs. J. Cheal and Sons, Crawley, secured a silver-gilt Knightian medal for a very handsome exhibit and a well-arranged one. Particularly good were the large baskets of Encore, James Grieve, Stirling Castle, Lane's Prince Albert, Cox's Orange Pippin, Charles Ross, Warner's King, Rival, Beauty of Stoke, Alfriston, Lord Derby, Chelmsford Wonder, and Bismarck apples, and the new Beurre de Naghan, and the old Catillac pears. A silver-gilt Knightian medal fell to Messrs. H. Cannell and Sons, Swanley, for excellent fruits, all well staged in pyramids on dishes and baskets. The apples were uncommonly good, especially such sorts as Bramley's Seedling, Annie Elizabeth, Charles Ross, Brabant Belle Fleur, Alfriston, Mrs. Barron, Allington Pippin, Warner's King, Emperor Alexander, Bertigheimer Red, Norfolk Beaufin, Wealthy, and King of Tomkins County.

In the next class the space allowed was 20ft. by 6ft., and here there were five entries. Mr. R. C. Notcutt, Woodbridge, was awarded a gold medal for an exhibit of some of the brightest fruits in the show of Ribston Pippin, Lord Stradbroke, King of Tomkins County, Cox's Orange Pippin, Emperor Alexander, The Queen, Baumaunn's Red Reinette, Gascoyne's Scarlet, Fearn's Pippin, Mère de Ménage, Charles Ross, Annie Elizabeth, King of the Pippins, Hollandbury, and Rival apples; he had splendid and brilliant fruits. Messrs. S. Spooner and Sons, Hounslow, gained a silver-gilt Knightian medal for a fine display wherein Castle Major, Pott's Seedling, Newton Wonder, Bow Hill Pippin, Hambling Seedling, and Warner's King apples were good, and there was a fine stand of Uvedale's St. Germain pears.

The Barnham Nurseries, Barnham, Sussex, also secured a silver-gilt Knightian medal for a very well-displayed set of well-grown fruits. Among apples the popular sorts were capitally represented, and we noted good dishes of Egremont Russet, Winter Quarrenden, Dumelow's Seedling, Bow Hill Pippin, Winter Ribston, Sandringham, and King's Acre Pippin and King's Acre Bountiful.

Messrs. W. Seabrook and Sons, Chelmsford, were awarded a silver Knightian medal for their exhibit of large baskets and dishes of twenty apples and pears. Allington Pippin was in fine form, as also were Bismarck, Cox's Pomona, Peasgood's, The Queen, Cox's Orange Pippin, Lane's Prince Albert, and Royal Jubilee apples.

Messrs. Laxton Brothers, Bedford, were awarded a silver Knightian medal for their contribution of clean, bright fruits. Their Cox's Pomona, Lane's Prince Albert, The Queen, Thomas Rivers, Newton Wonder, Jas. Grieve, Schoolmaster, and Allington Pippin apples were particularly good.

In the smaller class, the fruits arranged on a space 12ft. by 6ft., Mr. Chas. Turner, Slough, won a silver-gilt Knightian medal for very fine fruits arranged over red oak leaves. The new Arthur Turner apple that recently gained an award as Turner's Prolific; Chas. Ross, Peasgood's Nonsuch, Lord Derby, Ribston Pippin, Lady Henniker, Cornish Giant, and Bismarck apples. Messrs. G. Cooling and Sons, Bath, were awarded a silver-gilt Banksian medal; they had a fine dish of Pitmaston Duchess pears. Messrs. J. Peed and Son, West Norwood, secured a silver Knightian medal, and Messrs. Paul and Son a silver Banksian medal and each firm had a good exhibit.

## AFFILIATED SOCIETIES' COMPETITION.

First prize in the Affiliated Societies' competition fell to the Ipswich Gardeners' and Amateurs' Association, Mr. F. W. Salmon, Brooks Hall Road, Ipswich, secretary. This exhibit contained especially good dishes of Bramley's Seedling, Mère de Ménage, Lord Derby, Ribston Pippin, King of the Pippins, Cox's Orange Pippin, Peasgood's, Annie Elizabeth, and Bismarck apples, and Conference, Doyenne du Comice, Pitmaston Duchess, Durondeau, Glou Morceau, and Beurré Baltet père pears. The East Anglian Horticultural Society followed closely for second place, and the Colchester Gardeners' Association was third with a meritorious collection. The Affiliated Societies' challenge cup went to the Colchester Society, as both the Ipswich and East Anglian Societies have won it during the last three years.

## ORCHARD HOUSE FRUITS.

The premier award for orchard house fruit and trees, a gold medal, was won by Messrs. T. Rivers and Sons, Sawbridgeworth. This firm staged wonderfully-cropped pot trees of King of Tomkins County, Buckingham, Peasgood's Nonsuch, Belle de Pontoise, Cox's Orange Pippin, and Ribston Pippin apples, of Marie Louise, Conference, and Beurré Bachelier pears, and several figs. Wonderfully fine in size and colour were the picked fruits of such handsome and useful apples as King of Tomkins County, Gascoyne's Scarlet, Jas. Grieve, Blenheim Orange, Cox's Pomona, Ribston Pippin, Washington, Cox's Orange Pippin, Emperor Alexander, Reinette Descadoc, Egremont Russet, while Pitmaston Duchess, Durondeau, Doyenne du Comice, and Magnate pears were very fine.

A silver-gilt Banksian medal was awarded to The King's Acre Nurseries, Lim., Hereford, for their exhibit of orchard house trees and fruits. Their trees of Gascoyne's Scarlet, Wm. Crump, King's Acre Pippin, Cox's Orange Pippin, Beauty of Kent, and Bismarck apples carried good crops of finely-coloured fruits, and in the dishes of picked fruits there were splendid examples of Gloria Mundi, Emperor, Alexander, Washington, Cox's Pomona, Sandringham, Allington Pippin, and Rival apples.

R.H.S. FRUIT SHOW—GOLD MEDAL COLLECTION OF TWENTY BASKETS OF APPLES.
Exhibited by Messrs. Gaskain and Whiting, Faversham, in the principal class for market growers.

Only one exhibit of nine vines in pots was put up, and this, from Messrs. T. Rivers and Sons, Sawbridgeworth, secured a silver Knightian medal. The vines were fairly well fruited, and the varieties were Gros Colmar, Golden Queen, Alicante, and Melton Constable.

---

**Montbretias.**—These charming bulbous plants, of which the newest form, Star of the East, attracted so much attention at the recent meeting of the Royal Horticultural Society, may, under the above name, be sought for in vain in some works of reference. Both in the Kew Hand Lists and in the "List of Plants Certificated by the Royal Horticultural Society," the montbretias are included in the genus Tritonia, though the certificates and awards have been made to them as montbretias.—K.

## THE ARTISTIC USE OF CLIMBERS.

There are few gardens that do not owe much of their beauty to climbing plants, for, however charming a place may be made with ordinary flowering plants and shrubs, it cannot be considered complete unless advantage is taken of some of the more desirable climbers that are capable of producing such delightful effects. Climbers can be used in a great variety of ways, but it is often those that are made use of in an unusual and original manner that add the greatest charm. At this season of the year many climbers are seen at their best, and it is well to note the positions in which they succeed and create the most artistic and pleasing effects.

In the case of some of the stronger-growing kinds, they can very well be utilised for spreading their elegant growths over the forest trees and shrubs in the pleasure grounds, a method that might be more largely practised than at present. Several ornamental vines succeed admirably in this way, especially Vitis Cognetiæ and V. Thunbergi. When well established these create charming effects in the autumn with their richly-coloured foliage, especially when growing over hawthorns and hollies. Such plants require little attention, beyond being kept free from grass and weeds around their roots; but a top-dressing of well-rotted manure is often a help in promoting vigorous growth. Varieties of Rosa polyantha succeed in this way, and so does Clematis vitalba, masses of the latter producing a beautiful display at the present time. Clematis montana rambles freely over large shrubs, and C. Jackmanni grows rapidly among trees like Acer negundo variegata; while in contrast with Liquidambar styraciflua in the autumn, the effect must be seen to be realised. The common honeysuckle and Jasminum officinalis are worth planting among the trees for their scent alone.

There are a great variety of subjects suitable for clothing rustic summer-houses, pergolas, and similar ornamental erections. Ceanothus azureus Gloire de Versailles is one of the most desirable plants for this purpose, as its lovely azure-blue flowers make a display for a long period. Aristolochia sipho commonly known as the Dutchman's Pipe, with its large green leaves, is very attractive. Bignonia radicans, with its rich orange-scarlet flowers in September, demands attention; but a fairly sheltered position is essential to grow it well. Wistaria sinensis and W. multijuga grow freely on pergolas, but are more at home planted to clothe a warm balcony. Periploca græca, Photinia serrulata, and a large variety of the climbing roses, are well adapted for this purpose.

Climbing roses and clematis of the Jackmanni type should also be grown on poles in the shrubberies. Subjects like Escallonia macrantha, E. Langleyensis, Caryopteris mastacanthus, Cratægus pyracantha, Garrya elliptica, Magnolia grandiflora, Chimonanthus fragrans, and cotoneasters in variety, are suitable for planting against terrace walls.

Fences can often be made exceedingly gay with climbers, rendering them unusually attractive; but it is not recommended to plant against hedges, owing to the difficulty in trimming them. Roses of the Wichuraiana type are very suitable for fences, but besides these, clematis, vitis, and some of the variegated ivies may be used. Many more subjects might be enumerated, but those named include most of the more desirable climbers for the purpose, the object being to indicate where, and in what manner, they may be used. Thorough preparation of the ground is essential before planting, for if the plants receive a good start they are sure to be a success, and a source of satisfaction in the future.

Batsford Park Gardens. J. Gardner.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

MAXILLARIAS.—This large genus contains many species which, on account of the small size of their flowers, are not worthy of cultivation as decorative plants. The following species comprise the best and most generally grown: M. Sanderiana, M. splendens, M Turneri, M. venusta, M. luteo-alba and the old and useful M. grandiflora. The last-named is very desirable for blooming at the present season, and its fragrant flowers are always acceptable. These species are all of evergreen habit, and are easy to cultivate, and, as a rule, rarely fail to produce flowers. A well-ventilated, cool intermediate house meets their requirements the year round, and with the exception of M. Sanderiana, all may be grown in ordinary flower pots. Should space be limited the whole may be grown like M. Sanderiana, in teak baskets, suspended from the roof. In the cultivation of these plants in baskets, it is not advisable to place crocks at the bottom, but a few pieces of fern rhizomes, to prevent the compost being washed away when dipping the plants. M. Sanderiana often produces its flower spikes horizontally from the base of the pseudo-bulbs, and pushes them through the compost in a downward direction.

COMPOST.—Good fibrous peat, Osmunda fibre, and sphagnum moss, in equal proportions, form the most suitable rooting medium. The earthy particles should be removed from the fibres as advised in previous notes. The roots, in most cases, are somewhat large and fleshy, and should not have the compost placed about them too firmly, and the material used in the compost should be as rough, and in as large lumps as is consistent with the size of the pots, or baskets. When grown in pots maxillarias must be well drained, and the remarks made respecting rebasketing are also applicable to repotting.

INSECT PESTS.—Maxillarias, if grown in too high a temperature, or in an atmosphere inclined to be dry, are subject to attacks of red spider, which must be eradicated by sponging, or some other method.

MASDEVALLIA TOVARENSIS, and species of the Chimæroid section, which require a slightly warmer position than the cool house, affords during the winter months, should be removed to the intermediate house and be suspended at the coolest and most airy part. They require plenty of water at all times. These plants also are subject to the attacks of red spider, and yellow thrips, especially during their sojourn in the warmer division, therefore they must be carefully examined from time to time.—J. T. BARKER, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

AZALEAS.—Few plants can surpass these for general usefulness in the conservatory during the winter and spring months. Large numbers of splendid, well-budded plants are imported annually both of indica and mollis varieties, and no plants, to my mind, give such a quantity of bloom in return for the small outlay and labour required. One sees these plants sold by auction in many of the large towns in England, and they can often be thus purchased at a ridiculously low price. I do not, however, recommend buying these plants in this way, as it is a risky proceeding, but rather would advise purchasers to obtain them from some reliable nurseryman. Azaleas are very fine rooting subjects, and when imported can be accommodated in rather small pots. The principal compost for azaleas will be peat and silver sand. Plants should be ordered soon, and directly they are received they should be repotted and the soil rammed firm. They should be stood in cold frames, and sprayed occasionally; they must not be allowed to become dry at the roots, or the leaves will soon drop, and the buds will not develop, but turn soft and brown. After they have become accustomed to this treatment for about three weeks they may be taken into warmer quarters, a few at a time, and gradually forced.

SPIRÆAS.—The many herbaceous spiræas such as S. japonica, S. palmata, S. astilboides, S. Peach Blossom, and S. Queen Alexandra are now available in large quantities, and should be secured and potted up forthwith. These are extremely useful, and when a batch is well grown, many spikes of flowers in varying hues give a delightful effect. Spiræas like a heavy compost, and should be potted firmly. When growing they will need any amount of water, and should on no account be allowed to become dry. When the flower spikes are advancing it may be necessary to water the plants twice daily.

LILY OF THE VALLEY.—Retarded crowns can still be obtained, and where quantities are required batches of crowns should be potted up fortnightly. The quality of the soil used does not matter, as the crowns do not make fresh roots during the process of forcing, but a light porous soil is best. Cocoa-nut fibre refuse is also a good material to place them in. Nine or twelve crowns should be placed in each 5in. pot, and put in a warm house, standing another pot of the same size upside down over the crowns, to keep them dark for a few days. These can be had in bloom in about fourteen days from the time of potting and placing them in heat.—LEWIS SMITH, Norwich.

## HARDY FRUITS.

CHERRIES.—By selecting suitable varieties it is possible to grow cherries on any aspect, the warmer and more protected aspects will naturally be the most suitable for the early varieties. East and west aspects should be chosen for mid-season sorts, and walls facing a northerly direction may be utilised for the late cherries. The following list comprises most of the best, and will ensure a succession of fruits. Early Rivers, Bigarreau Jaboulay, Bigarreau de Schrecken, Frogmore Bigarreau, Knight's Early Black, Governor Wood, Elton Heart, Black Tartarian, Emperor Francis, Waterloo Heart, Noble, Bigarreau Napoleon, Florence, St. Margaret's, May Duke, Guigne d'Annonay, Late Duke, and Guigne de Winckler. Morello, Flemish Red, and Scarlet King succeed well on a north wall. Kentish Red is a prolific cropper of rich flavour, and makes an excellent preserve.

NECTARINES.—A selected list of nectarines for planting will include such varieties as Early Rivers, Lord Napier, Elruge, Dryden, Rivers' Orange, Pineapple, Humboldt, and Spencer. Stanwick Elruge is a fine variety, but requires a warm and well-protected position.

PEACHES.—There are now so many excellent peaches that it is a difficult matter to decide upon which varieties to include or omit in a comprehensive list which will give a succession of fruits throughout the season. The following are all of sterling merit: Duchess of Cornwall, Amsden June, Waterloo, Hale's Early, Rivers' Early York, Early Grosse Mignonne, Peregrine, Crimson Galande, Alexandra Noblesse, Dymond, Stirling Castle, Prince of Wales, Sea Eagle, Late Devonian, Princess of Wales, and Golden Eagle.

PLUMS.—The best dessert kinds are Early Transparent, Transparent (original variety), Late Transparent Gage, Kirke's Blue, Green Gage, Jefferson, Bryanston Gage, Comte d'Althan's, Reine Claude de Bavay, Coe's Golden Drop, Coe's Violet, Golden Transparent, and Late Orange. All the foregoing are worthy the protection of a wall, and few of the gages succeed perfectly without it. Good culinary varieties that will afford a succession from mid-July to November are: Rivers' Early Prolific, Czar, Sultan, Belgian Purple, Victoria, Pond's Seedling, Primate, President, Monarch, and Wyedale. Where possible trees of the later varieties should be planted against a wall, preferably a west aspect, where it is possible to protect the trees at any time against the attack of birds, either during the swelling of the flower buds or when the fruits are ripe. The serious effects of cold winds and frost may also be minimised during the flowering period, and swelling up of the young fruits in the same way. Some varieties of those enumerated as cooking plums are, when fully ripe, good for dessert, notably Rivers' Early Prolific, Czar, Sultan, and President.

DAMSONS. — Bradley's King and Shropshire Prune are the finest in point of size. The Merryweather (a new variety), is a very fine fruit, and will no doubt be largely grown in the near future. Farleigh Prolific is an immense cropper, but the fruits are small.

FIGS.—The finest variety for outdoor culture is Brown Turkey; Brunswick, and White Marseilles may be included if variety is desired. Figs should be afforded a warm position against a wall, or if grown in bush form, they must have a well-protected situation, where they will receive the maximum of sunheat. The wood needs to be thinly trained, and the roots restricted. — W. MESSENGER, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

CUCUMBERS.—To maintain a regular supply at this season of the year, and onwards, great care must be exercised. Plants from seeds sown in August are now coming into bearing, and will need every encouragement to promote stout growths before the winter months arrive. Never over-crop the plants and always keep them perfectly clean. Maintain a steady temperature and an atmosphere in accord with outside conditions. Top-dress very lightly each week with a mixture of sweet loam, flaky leaf-soil, and a little mushroom bed manure, all warmed before use. Cut the fruits as soon as large enough so as not to unduly strain the plants.

RUNNER BEANS.—The late sowings of these and of climbing French beans are still producing serviceable crops. Gather when large enough, and lay those not required on a damp mat. Keep the rows safe from frost by using some protecting material at night.

RHUBARB CROWNS that have been grown for forcing are ripening satisfactorily as a result of the fine and dry September we have had. These will make excellent material for forcing. It will be the better plan, where very early forcing is contemplated, to expose the roots entirely, working all the soil away so as to expose them to the weather for ten days or more, previously to placing them in the forcing quarters. This treatment will give the rhubarb a complete rest, and the response, when placed in heat, will be very marked.

SEAKALE.—This crop has formed very fine, strong crowns this year, and, like rhubarb, is ripening off its foliage very early. If any of the foliage is green let the crop be taken up, lay on the ground for a few hours for the foliage to wilt, when it can then be cut off without any loss from bleeding. Place in mushroom-houses or other structures of similar temperature, and keep quite dark. Give regular supplies of water at the roots. Later lifted plants will be found to shed their leaves easily and completely. In forcing this crop beds of ordinary soil, with a good supply of leaf-mould added, can be formed, or deep boxes or large flower-pots be used.

GENERAL REMARKS.—The lovely summer-like weather of the last five weeks will help to ripen and harden up all vegetable crops, and enable them to withstand the coming winter. Any assistance that can be given in this direction should be afforded. Much may be done by removing all decaying leaves. Brussels sprouts will greatly benefit from this treatment. While fine weather continues dig over vacant plots as roughly as possible; the ground will benefit much if so treated until time for trenching arrives. Frosts must be expected, and prepared for. Continue to earth up celery and cardoons; hoe and fill up cabbage plots; winter parsley, lettuces, spinach, turnips, and onions will be the better for an application of soot or wood ashes.—GEO. ELLWOOD, Swanmore Park Gardens.

## AMONG THE ROSES.

Last year September was one of the best months for roses during the season, and with the present-day varieties it is likely to be so in future. The slightly cooler weather after July and August is admirably suited to the better development of the charming decorative teas and their hybrids. Such varieties as Betty, G. Nabonnand, Peace, Madame Ravary, Richmond, General MacArthur, Lady Ashtown, Theresa, Molly Sharman Crawford, Lady Battersea, Corallina, and Gustave Regis—only to name a dozen that occur to me as I write—are invariably better and more lasting than during the heat of midsummer, when the sun is apt to expand them too quickly. In addition to these lighter colours we now have several capital dark varieties, the flowers of some almost maroon. Victor Hugo, Chateau de Clos Vougeot, Etoile de France, Kaiser Wilhelm, Laurent Carle, and W. E. Lippiat, all give excellent autumn flowers. A few of our best late bloomers among climbers and pillar roses are Ards Rover, Gruss an Teplitz, Aimée Vibert scandens, Madame Alfred Carrière, and William Allen Richardson, which seldom fail to give a fairly good show of blossoms.

### Pruning Ramblers.

There is considerable work to be done among roses this month. Strong shoots of this year's growth upon climbers and ramblers should be made secure against the winds. These being the most valuable part of the plants for next season's display, it is important to avoid any chafing and bruising of the wood and eyes. It ought not to be necessary, but I would again like to warn my readers against the too ruthless removal of these rambling growths, simply because they are flowerless now, and sometimes rather in the way. Far better cut out more of the growths that have already flowered, and so make room to tie these in loosely but securely, allowing plenty of air and light to reach the wood.

The heps upon the rugosas are bright and showy. In connection with these I am much pleased with the small and bright scarlet heps of American Pillar, which are now very prominent upon the deep sea-green foliage so characteristic of this useful rose. I do not remember American Pillar better than it has been this season, in whatever form it was grown. Perhaps it was seen to the greatest advantage as tall, semi-weeping standards. This variety, like Dorothy Perkins and its relatives, has the great advantage of carrying gracefully drooping rods of growth, with deep, glossy green leafage that is always clean and pleasing after the flowering season is past.

### Rooting Cuttings.

But to return a little closer to seasonable work. The present month should find us very busy with cuttings, both of stocks and roses. Most of the climbing polyanthas and wichuraianas root as freely as any of the stocks, and where this is the case I strongly advise their culture in this form rather than having them worked upon foster roots, which are always liable to produce an undesirable sucker, whereas, from cuttings, the whole of the growth is valuable, and the suckers most of all. I have had very indifferent success in rooting some of the later hybrids of the wichuraianas, and have decided not to attempt some of them in that form again.

Dorothy Perkins, striking so freely, and making roots so full of fibre, it occurred to me to use it as stock for other roses; but it will not do. True, they grow freely enough, both as budded plants and grafted under glass, but to keep down suckers was found quite impossible. Even when grafted upon pieces of root alone, suckers formed after the manner of brambles and raspberries, and it needed constant attention to confine the roots to supporting the bud or graft only, and when once the original growth got away the rose was quickly starved.

Briar, Manetti, Polyantha, and De la Grifferaie cuttings for future stocks should have the lower eyes carefully removed before the cuttings are inserted. But roses not intended for stocks should have the whole of their eyes or buds left intact, more particularly those at the bottom, for it is these that will prove the mainstay of the future plant. It is by no means necessary that the wood of these and stocks should be thoroughly ripe before making them up. Indeed, I greatly prefer to catch this wood when a little more than half ripened, because at that time the ground is still warm and the cuttings contain a considerable amount of sap, which is a great help towards quick callus and early rooting, that will prove a great support to the cuttings during the winter months.

The best medium I have found for rooting both stocks and roses is a rather sandy loam, and the freer this is from manure of any kind the better are the results. It is very important that all cuttings should have their base well down upon fairly firm soil. To "hang" them means many failures, and results in the survivors making a larger number of side roots, from where the eyes were removed, instead of at the base, where we can leave them when trimming the stocks previous to shallow planting in beds to be budded upon. Should the ground be dry, I would not delay inserting the cuttings, but pour some water into the opened slit made by the spade previous to setting the cuttings in. I have found this a great help, and would prefer planting in this way upon a dry soil rather than waiting for more natural moisture.

### Preparing for Planting.

As soon as the opportunity comes, I would prepare ground intended for new plantations of roses. This cannot be done too thoroughly, and the bottom soil needs much more attention when preparing than the surface. We cannot reach the bottom soil so well at any future time, whereas the top is always more or less accessible. Therefore be sure and discover the nature of the subsoil now, and treat it accordingly. It should be moved at least two and a half feet deep; three feet would be better. If stiff and clayey, add some manures calculated to lighten this, such as soot and crushed bones. But if naturally of a light, gravelly, and porous nature, supply well decayed manures such as from the cow-shed or pigstye. Even a little clay, or, better still, some stiff loam, will do more good in such a case than giving manure of a light character. Always dig up the bottom as deeply as the tool will allow. Add a dressing of the manure before turning it over, and a second dressing after, and before placing the top spit of soil upon this. If this work is done soon, the soil will have a chance to settle down a little. Do not plant when the soil is wet; if it clogs to the feet or sticks to the tools in any way it is seldom in the best condition for planting, and I would rather wait a considerable time before working upon ground in that state. If it must be done, use planks, and take the little extra trouble to place some prepared compost around the roots before adding the staple soil. Always make the latter firm about the roots, but not rammed down hard. Adding a little at a time, and just placing the foot upon this, is far better than one heavy treading at the last. A. P.

## BARK DISEASES OF FRUIT TREES.

The following is the text of the lecture by Mr. F. J. Chittenden, F.L.S., at the Northern Fruit Congress held at Carlisle, as given in the current issue of the North of England Horticultural Society's Magazine, from which it is reproduced by permission.

One of the results of the extension of fruit growing is the knowledge that to deserve success the cultivator must be ready to take preventive measures against diseases, or to fight them when they appear. Of recent years the State has made some laws regarding plant diseases, but the State is almost powerless unless the individual does his work well, and if every individual does that there is nothing for the State to do.

Everywhere in every county of England, from south to north, one still finds, however, plenty of neglected orchards, and one of the most common evidences of neglect and ignorance is the prevalence of canker. Canker is a bark disease so conspicuous that no one can fail to observe it, but there are two others far less conspicuous that I hope to refer to if time permits.

In order to deal intelligently with any disease it is imperative that an accurate knowledge of the way a plant lives its life should be in the possession of the cultivator, and a few minutes devoted to a consideration of the part the bark plays in the plant's economy. A little experiment which anyone may perform will show us much.

Take a leafy willow shoot, and about three inches from the bottom end cut out a ring of bark about three inches deep. You may strip away the bark from the wood quite easily, for between them lies the cambium, which is the most active of all the living tissues in this part of the stem. It has delicate walls which are easily ruptured, and by its division, and the chemical changes in these walls it adds to the wood on the inside of it the annual rings familiar to everyone, and also adds to the bark on the outside of it in the same way, but to a less extent. The cambium is of the utmost importance, but we must not stop to discuss it now. Let us place our shoot with the bottom nine inches in water, and leave it for three or four weeks. At the end of that time we shall find it has rooted, but rooted in a peculiar way. There will be roots from the bottom three inches on which we left bark, none on the part from which the bark was removed, but there will be roots from the part above the cut. Comparing these roots we find those in the lower part smaller and less well developed than those above, and if we leave them long they will eventually die, while the higher series flourish apace. Willow is useful for this experiment, as its roots can absorb oxygen from the water.

To grow the plant requires, as we do, air, warmth, water, and food, and apparently these roots have air, warmth, moisture, and food, else they could not grow at all. What is there to account for the difference in their growth, then? Only that one or other of these necessities is supplied more liberally in one case than in another, and a little consideration will suggest that the vital thing not well supplied to the lower roots is food.

All gardeners know that all the food a mature plant feeds upon comes from the leaves—is, in fact, made in the leaves, where the food of the whole world is made, and where and by which that energy of which coal is the source was originally stored long before our age. Our experiment shows us that the food is carried down the bark. The removal of the bark did not interfere with the flow of water up the stem, but interfered so seriously with the flow of food down that the roots below the cut were in time starved. A little food had already been stored in the stem, and that they could use, but as soon as it was exhausted they began to wither and die. Those above the cut could draw on the rich supplies sent down from the leaves and continue to exist and flourish on this long after the store in the stem had become exhausted.

May I emphasise the fact that the substances taken in by the plant, by its roots from and with soil-water, and by its leaves from the air, will not feed the plant; they are only the materials which the plant uses for making the stuff it feeds on—sugar, fats, albumen, and the like. A clear understanding of this fact is essential to an appreciation of the value of leaves to a plant and the part the bark plays in acting as a channel for the conveyance of food stuffs to the parts below.

Of course the bark does something else. It is of cork, and like all efficient cork keeps liquids from passing. That is the purpose of the cork. But the cork is on the outside only. Just below is a layer of fibrous cells forming strong, tough bands like bast (indeed the bast of Archangel mats is from this part of the lime tree's bark) which strengthens the stem and enables it to support the enormous weight of the foliage and withstand the buffeting of the winter winds. And there are other tissues, each with some part to play, and among them, lying just outside the delicate cambium, the tubes along which the food passes.

Anything that damages the bark then causes the flow of food down the stem to be checked, and one of the most marked results following an attack of canker flows from this. For a tree to be fruitful an abundance of food is necessary—food, I mean, made by the tree—not food in the sense of much manure, for that stuff from which food is to be made may easily be given in too great quantities, but actual sugar and albumen. If then the downward flow of food is checked more food than usual will accumulate in the branch, and the branch will tend to become more fruitful. How often we see the cankered branches of Lord Suffield bearing heavy crops of fruit, and the reason must be evident. But another result less desirable than heavy fruiting flows from this bark injury. The tissues below it will be deprived of food entirely or to some degree according to the extent and duration of the injury. Thus if the cankered area persists the cambium below will gradually cease to make new wood and bark, and the roots will be starved. Truly, if one member suffers all the members suffer.

It is unnecessary to describe Canker. We are all too familiar with the gaping wounds and cracks in bark to need descriptions, and we may pass now to enquire the cause. Many causes have been suggested, but there is only one common to all. The one actual primary cause of canker is a fungus. There is doubtless some truth in most of the suggested causes, but they are secondary, not primary. Keep the fungus away and the other causes would not produce canker.

This fungus, Necteria ditissima, causes canker on many different kinds of trees, such as ash and beech, as well as apple, and more rarely pear. It grows into and feeds upon the tissues of the bark, ultimately destroying them. It is a parasite, and an unwelcome and troublesome guest that steals from its host the food it has made for itself, lodges itself in its host's channels of communication, and finally destroys the lodging house it has made use of, but not before it has sent out on the wings of the wind, and on the feet of insects numerous little pieces of itself, which we call spores, each capable of starting another parasite of precisely the same dangerous character. Some of the spores are formed in little bright red fruits, easy to see on the canker spots in early spring, or even in the winter, but smaller than a pin's head, and thus often overlooked. Each fruit contains numbers of these tiny spores.

Perhaps the most important point about the habits and life of the fungus from the fruit-grower's point of view, is the fact that when the spores germinate, the thread to which they give rise cannot make its way through healthy, whole bark. Only when the bark has a hole in it can the fungus penetrate into the living cells beneath, begin its march of dire destruction, and start that sequence of events which culminates in death and decay. It is one of the group of organisers called "wound parasites." But it is easy for it to make its way even through a hole as minute as a shot hole, or even smaller, and it behoves the fruit-grower to prevent to the extent of his power the wounding of his trees, or when they are wounded to protect the wounds with something which will encourage healing and prevent the entrance of the fungus.

If the fungus gets in it grows and, as we have said, destroys the tissues on which it lives. There comes a time of rest, however, and during it the tree tries, as every tree tries, to repair the damage done by the fungus by covering it over with a healing layer. Unless the tree is in good health that time is all too short, and before the tissue is cut off and the wound healed where the parasite has taken its abode, the season for tree growth is past, and the season for the fungus development is come. Then goes on a fight between fungus and tree, the one destroying, the other trying to repair, and the marks of the fray may be seen in any old canker wound. Layer on layer of new tissue is put on to be almost as quickly destroyed. It is possible that sometimes the fungus threads may pass along a length of stem and break out in a new part of the bark not previously affected, so that occasionally (when a tree is affected in one part) canker may occur where no wound was present previously.

How are wounds caused? They may be wilful, they may be accidental, they may be due to carelessness, they may be almost natural. Pruning, especially in young trees, is a necessity, and too often it is done with blunt or otherwise unsuitable tools, resulting in wounds difficult to heal. Knives (and nothing else ought to be used in pruning apple or pear trees) cannot be too sharp. Cuts cannot be too clean, but all large cuts should be painted over either with Stockholm tar or lead paint. Smearing over with earth is useless, and worse than useless. All it does is to hide, not to protect a cut. Large wounds are not as a rule necessary unless trees have been neglected in their youth. Among the accidental wounds, and those due to carelessness, we may put those due to scraping with ladders and boots, shot from guns, and so on. I have known an orchard almost ruined through canker gaining an entrance into wounds made when shooting rabbits. Among those due to natural causes, breakages by storms, wounds made by frost and damage by insects and birds, may be mentioned. Of the insects none is worse than the woolly aphis or American blight. The sucking of the insects may possibly induce a sort of gall formation, at any rate they cause wounds. The trees start to heal the wounds by making large masses of tender healing tissue, into which the canker fungus can readily penetrate. No effort should be spared to get rid of this pest, and to avoid making wounds in bark that are difficult to heal quickly, and if such are made cleanly cut them and protect them in the way I have already suggested.

The nature of the soil seems often to have something to do with canker. Indeed, some have put down canker to uncongenial soil surroundings entirely. This is, of course, wrong, but no doubt bad soil conditions are a great contributing factor, just as insects, storms, and shooting rabbits may be contributory factors.

It will, I think, be found that soils where water cannot get away freely are those where apples canker worst. The probable cause of this is not only that trees in such soils suffer in health from the inability of their roots to breathe, but they are much more liable to injury from late frosts, and the same thing applies to trees planted at the bottom of a slope. Frost may frequently damage trees after the leaves begin to appear in such situation, and actually kill buds, leaving places where the fungus may find an entrance, and it may at times cause cracking and splitting of the bark. Such situations should at all costs be avoided when planting is being done, and all land not well drained naturally should be attended to. The cost is rather heavy, but the outlay will be repaid.

It is important to do all one can to avoid canker in the ways suggested, but it is equally important to attend to trees affected so as to enable them to repair their injuries and check the spread of disease. The only method is to cut out all canker wounds cleanly with a sharp knife and paint the wound made to protect it from further infection. If this be done consistently and preventive measures adopted with intelligence and earnestness much may be done to rid our orchards of this pest. Some trees, of course, are beyond repair, and these should be forthwith removed and burned, along with all branches so badly affected as to render it doubtful whether they will recover. Maintenance of good health, careful treatment, and protection of wounds are essentials of success.

Some varieties appear more prone to canker than others; possibly they are more prone to wounding or slower to heal, and it would be well to select others. The best kitchen variety, Wellington, or Dumelow Seedling as it is often called, is one of them; Lady Sudeley in this district is another; Lord Suffield, Lord Grosvenor (in Cumberland), Cellini, Ecklinville, Pott's Seedling, Warner's King, King of the Pippins, and Ribston seem more susceptible than others, although, as I have pointed out, their liability to attack may be due to contributory causes.

## MEDAL ROSES OF 1912.

I read with considerable interest in common with all rosarians interested in new roses, the Rev. J. H. Pemberton's notes on "The Medal Roses of 1912," in your issue of October 5 last. I naturally hesitate very considerably before advancing any opinion of my own that controverts any statement that comes from such an authority, but it is for that reason only that I write you. The opinion of the President of the National Rose Society naturally carries so much weight that that which he may give expression to may seriously effect the reputation of a rose, at any rate, for a season or so; and, although he rightly prefaces his remarks by a statement that they are "merely first impressions," still that statement may be lost sight of, and the effect of his opinion before referred to remain.

The remarks that I desire to draw your attention to occur under the reference to Messrs. Alex. Dickson and Sons' new decorative single Irish Fireflame (called Irish Flame by Mr. Pemberton). This rose is well known to me; its flowers are larger, not smaller, than Irish Elegance. Mr. Pemberton goes on to say that, "from our inspection of the plants at Newtownards, one is inclined to think it took a good many plants to fill such a basket" (refering to the exhibit at Southampton, which, by the way, was not a basket but a series of tripods or bamboo stands), and thereby inferring that this rose is shy blooming; it is not really so, it is quite as free as Irish Elegance.

I think our worthy President, when he looked at the plants, forgot that they had been cut heavily from, first of all for the shows all through the month, and secondly, that over 2,000 buds had been taken from those same plants for budding purposes.

I saw before I left Newtownards, some two or three days after Mr. Pemberton's visit, some plants of this rose. I think they were cut-backs, probably the original plants, that were literally a blaze of colour, as befits a rose with such a name as Fireflame. One other point, Coronation is referred to as "likely to prove the best rose of the year, and yet it did not get the highest award!" Mr. Pemberton unwittingly does the judges of the new seedling roses, and himself included, an injustice here, as Coronation received the highest award at Belfast Show.

Herbert E. Molyneux.

FRUIT GROWING.—Full instructions as to planting, pruning, and management of fruit trees are given in Profitable Fruit Growing —a gold medal essay by John Wright, V.M.H., —price 1s., or by post 1s. 3d., from the Publisher, 148 and 149, Aldersgate Street, London.

CRYSTAL PALACE.

THE GREAT AUTUMN SHOW
of
CHRYSANTHEMUMS
will be held by the
NATIONAL CHRYSANTHEMUM SOCIETY,
at the
CRYSTAL PALACE,
on
OCTOBER 29, 30, 31, 1912.

No extra charge to view this magnificent show.

Schedules and all particulars to be obtained Post Free from the Secretary,
Mr. RICHARD A. WITTY,
72, Savernake Road, Gospel Oak,
London, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—October 8.

Present: Mr. R. Hooper Pearson (in the chair); Messrs. J. O'Brien, J. Fraser, W. Hales, R. Curtis, G. Gordon, J. T. Bennett-Poë, and F. J. Chittenden (hon. sec.).

BULBOPHYLLUM GENTILII. — Mr. O'Brien showed, on behalf of Sir Fred. Moore, a specimen of Bulbophyllum Gentilii, Rolfe (see "Orch. Review," October, 1912, p. 314), curious in having the nectary placed on the upper side of the dorsal sepal. This species has been confounded with B. calamaria (B.M. 4088), and the two are mixed in herbaria.

MENTHA VIRIDIS VAR.—Mr. J. Fraser showed a specimen of the Mentha described by Sir John Smith under the above name occurring wild about Bocking and Maidstone.

NOMENCLATURE OF ORCHID HYBRID.—The committee considered a question of the nomenclature of a hybrid orchid refered to it by the Council. The alleged parentage was C. × Fabia alba (C. labiata × C. Dowiana aurea) × C. Warcewiczii var. "Frau Melanie Beyrodt," and the name suggested C. × Harrisiana. The committee considered this suggested name transgressed the recommendations of the Vienna Botanical Congress regarding plant-names in being too much like existing names in the same genus, thereby tending to confusion (e.g., Cattleya Harrisoniana and C. × Harrisii); the name was therefore not tenable. Further, they thought that although Art. xii. of the rules of horticultural nomenclature ("Journal" R.H.S., xxxvii., p. 151) permitted the use of names of Latin form for such cross-bred plants as this, it would be more convenient if vernacular names were chosen, generally from the classics. They recommended that the exhibitor should be asked to choose such a name.

TOMATOES WITH PALE, ROUND SPOTS.—Some tomatoes with pale spots, circular in outline, about ¼ inch in diameter, and each having a minute black spot in the centre, were sent from Highgate. Microscopic examination revealed the presence of a minute hole where the spot was, but no fungus, and the committee concluded the damage was probably the result of punctures by a hemipterous insect, possibly white fly, or a species of Lygas.

POTATOES WITH SUPER-TUBERATION.—Potatoes showing growth after the first stage of tuber production were sent from Bush Hill Park. These are frequent this season, no doubt as the result of the wet of August.

GLASSINESS IN APPLE.—A specimen sent from Battle showing the peculiar soddening of the tissue called glassiness. This is not at all infrequent this season, several specimens having been received at the society's laboratory, and Mr. Chittenden said he had found some on trees at Wisley (on the sunny side of the tree) as early as July.

## Reading Gardeners' Association.

The second meeting of the session took place in the Abbey Hall on Tuesday. There was another large attendance, the President (Mr. F. B. Parfitt) occupying the chair. The lecturer for the evening was Mr. H. C. Loader, of The Gardens, Erleigh Park, and his subject, "The Value of Observation to the Gardener." In opening his paper Mr. Loader announced that his remarks would be more particularly addressed to the younger members of the audience, and he strongly advised them not to neglect the cultivation of the faculty of observation. The lecturer recalled many instances in his early career in which, by the study and attention to matters which happened to come under his notice, though not necessarily under his care, he had found exceedingly helpful when the time came for him to take the full responsibilities of a head gardener's position. He also urged them not to overlook the value of the opportunity now offered, a privilege not available when he was a youth, of attending the horticultural and other classes promoted by University College, Reading. The knowledge gained by a course of study at such classes would prove of inestimable value later in life when the object of every young gardener's ambition, viz., becoming "head," had been attained.

The lecturer was accorded a very hearty vote of thanks at the conclusion of the debate which followed his remarks. Mr. Loader was congratulated on a very finely-grown collection of vegetables (from the gardens at Erleigh Park) staged by him. Mr. T. Judd exhibited giant potato tubers, and Mr. F. Townsend brought from The Gardens, Hillside, a monster Woodwardia radicans, which was greatly admired.

## The Horticultural Club.

On Tuesday, the 8th inst., this club opened its winter series of dinners and lectures by an invitation to a number of the members of the Midland Reafforesting Association, whose organising secretary, Mr. P. E. Martineau, gave, after the dinner at which Sir Harry J. Veitch presided, a lecture on Afforestation in the Black Country, illustrating his remarks with a considerable number of lantern slides. Among the guests were Sir Richard Paget, Lady Lockyer, Miss Lee Bourn, Mr. R. L. Robinson, Mr. Percy Groom, Mr. M. C. Duchesne, Mr. W. W. Watts, and others connected with the association.

In the Black Country, embracing Walsall, Dudley, and other large coal producing and coal consuming districts, the debris from the pits and furnaces has been allowed to accumulate on the surface until immense areas are simply smothered under extensive hillocks which, unattended to, reduce the country to an all but barren and desert-like waste of many thousands of acres. The object of the association is the afforestation of these areas by the judicious planting of suitable trees, such as the poplar, birch, alder, willow, ash, etc., which experiment has proved to be capable of not only living but thriving in defiance of the vapours emanating both from the works and in many cases even from the still burning pit tips and spoil banks, as they are locally termed. A number of photographs showed clearly that it was possible, by judicious action in this direction, to utterly transform the dreary wastes into picturesque wooded slopes, or even of pretty parks with comparatively little outlay, where, left to themselves, nothing better than coarse grasses would have made their appearance. Uncongenial as the material, of which these heaps consist, would appear to the arboriculturist, it is amply demonstrated that many trees will grow in it, and that the main element of success is adequate rainfall, plus the introduction of the trees either by sowing seeds or planting young saplings, not exceeding two years old, as owing to their small size are enabled to establish themselves without too great a call upon their root resources at the outset.

In the discussion which followed the lecture, in which Sir Richard Paget, Mr. M. C. Duchesne, Mr. R. L. Robinson, Mr. Percy Green, and others participated, the project of the association was recognised as extremely laudable, and worthy of encouragement both on the æsthetic and, as was hoped, on the commercial side, since the reafforestation of the originally forest land not only rendered it healthier and more pleasant for the pitmen and other operatives generally by the improvement of its otherwise dreary and inhospitable aspect, but as the timber produced in the process was locally required in large quantities for many purposes, the commercial value came in as a supporting asset. In addition to this, as the labour required was entirely unskilled, many of the local unemployed could be, and indeed were, provided with work. These two elements of immediately local requirement and available labour were pointed out as factors of success, the absence of which in many other places had led to failure of afforestation schemes. So great indeed were the demonstrated benefits obtained by the association that it was felt the Government should contribute to its support or to the extension of similar schemes in other districts, and that the owners of property should do the like in their own interest owing to the increase of value induced by bettered surroundings.

A hearty vote of thanks to Mr. Martineau (whose address is Bentley Heath, Knowle, Warwickshire) concluded the meeting.

## East Anglian Horticultural Club.

At the October meeting of this club, held at Norwich, a very interesting paper was read by Mr. C. H. Fox, gardener to Lady Mansel, Catton House, Norwich, upon "Deciduous Flowering Trees and Shrubs." He touched upon some twenty-four kinds, and gave practical details of treatment, especially as to position and planting. A capital discussion followed, during which the subject of pruning came largely in for review.

An interesting feature upon the exhibition tables were some plants of figs in eight-inch pots, profusely covered with fruit. These were grown from eyes inserted just eight months ago.

Apples were staged in quantity, and a good display of early chrysanthemums brightened up the room.

## Parkstone (Dorset) Gardeners' Association.

On October 10 a very fine display of apples and pears was made by members of the above association. Mr. T. Alexander had the best two dishes of apples, one of a cooking variety and one of a dessert variety, showing Annie Elizabeth and Cox's Orange Pippin respectively. Second honours went to Mr. A. C. May, who had Peasgood's Nonsuch and Blenheim Orange Pippin. Mr. E. G. Cox was third, and Mr. Gould fourth. In the class for one dish of apples, dessert, Mr. A. C. May was first with Sturmer Pippin; Mr. Alexander second with King of the Pippins; and Mr. W. Camp third with Golden Drop. In the corresponding class for one dish of cooking apples, Mr. Cox won with large fruits of Peasgood's Nonsuch; Mr. May second with Lord Derby; and Mr. Camp third. For one dish of pears Mr. C. Gould was awarded first prize for a fine dish of Pitmaston Duchess; Mr. Rattue was a close second with a dish of unnamed but splendid fruits; and Mr. Cox was third with Pitmaston Duchess.

Mr. T. Alexander was awarded the society's first class certificate for a beautiful collection of twenty-four dishes of apples and pears.

The same evening Mr. G. Garner, of Bournemouth, gave a lecture on "Fruit Culture." He dealt principally with cultural details connected with apples, pears, and grapes, advocating well-trenched ground, made firm afterwards, for apples and pears, with training, pruning, and top-dressing. He recommended the growing of cordons, bushes, and pyramids in preference to tall standards, and with the maintenance of a good balance between root and branch growth.

With regard to grape vines, the lecturer advised growers to have shallow, well-ventilated borders efficiently drained.

Dr. Crallan, the popular President, occupied the chair. A good discussion took place, and cordial votes of thanks were passed to both chairman and lecturer. The attendance of members was very large.

## THERMOMETERS.

The implements and utensils necessary to the equipment of a large garden are many and varied in character, and not the least important of these are thermometers of strict accuracy and scientific construction. A recent visit to Messrs. Negretti and Zambra's establishment at 38, Holborn Viaduct, E.C., gave us an insight into the wonderful variety that exists, and the faultless manufacture that is ensured in the thermometers made by this well-known firm.

Instruments are made for every possible purpose, and many of the thermometers are made specially to meet the needs of the horticulturist, either in the open or in glass-houses. For the modest sum of 3s. 6d. a self-registering thermometer is obtainable, the scale of which is made of permanently-enamelled sheet steel. It has the distinct advantage of being fitted with an adjustable index by means of which the lowest temperature during the night is self-registered, whilst the coloured spirit, of course, indicates the exact temperature at any moment, night or day. Six's self-registering maximum and minimum temperature thermometers are also extremely useful, showing at a glance what has been the minimum and the maximum temperature since the last adjustment, which is effected in an instant by the application of a small magnet to the index. An electrical thermometer, which by means of a very ingenious device is made to ring a bell whenever the temperature falls below a certain point, is of immense value in large establishments, where there are extensive ranges of glass-houses. The thermometer may be hung in the greenhouses and the bell in the bothy or gardener's house, communication being obtained by a wire from the battery. As soon as the temperature in the greenhouse falls to a point that entails risk of injury to the plants the bell rings, and continues to ring until the stoker has given his attention to the matter. Thus the man on duty may take his rest with the assurance of being awakened in the event of his fires requiring attention.

Another instrument that demonstrates the practical value of scientific experiment is the horticultural hygrometer. This may be described as a "frost indicator," showing in advance the approach of frost. A brief explanation of the principle on which the hygrometer works must of necessity give an impression of a somewhat complicated machine, but anyone seeing the instrument and examining it, together with a perusal of a very clear pamphlet issued by the firm, can grasp the matter in a moment, and the possession of one of these little "prophets of frost" will enable a gardener to cover his frames, set fires going, or protect anything necessary against the coming frost.

We can only add that it is to the advantage of our readers to write for the well-illustrated and excellently-compiled catalogue and pamphlets issued by Messrs. Negretti and Zambra, who may be relied upon to supply thermometers that will do their work well and last a lifetime.

## GARDENING ENGAGEMENT.

Mr. Lewis Smith, late of Shottesham Park, Norwich, has been appointed head gardener to A. C. Drummond, Esq., Cadland, Southampton, and enters upon his new duties immediately.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

LANTERN LECTURES.—R. F. G.: I am the honorary secretary of one of the many gardeners' mutual improvement societies in England, and as the attendance at our meetings is not all that could be desired I should like to make them rather more attractive than is at present the case. It is my belief that the best way of doing this would be to have lantern lectures occasionally, and I should like to know whether you consider this would be the right course to take. If you consider that we might introduce lantern lectures with advantage will you advise me whether we should purchase a lantern and work it ourselves or hire it, and where we can obtain suitable sets of slides.—There is no doubt whatever in our mind as to the advantage of illustrating some, if not all, the papers and lectures at the meetings of gardeners' associations with lantern slides. Whether your society should own or hire a lantern depends upon circumstances. It would be cheaper to own the lantern, but cheapness is not everything. The lantern, to show the slides properly, must be a good one, and lanterns of really high-class manufacture are expensive. Moreover, the lantern must be manipulated with some skill to ensure satisfactory results. For the present we should advise you to hire a lantern with an operator from a good firm in the district. The Royal Horticultural Society lend on hire sets of slides with a printed lecture for each set, the latter being written by men of the highest eminence in the respective branches of horticulture. Within the past few weeks the society's list has been augmented by ten new sets, eight of which are devoted to vegetables. The whole of the slides in the society's list are lent at a charge of five shillings per set. Many of the experts who lecture at the meetings of gardeners' associations have slides to illustrate their lectures.

GAS-LIME.—S. W. W., Leicester: I have a garden in which the soil is rich and heavy, and I am told that a dressing of gas-lime will sweeten it and do it good in other ways. Please tell me if it will be right to dig in the gas-lime this autumn, and what will be the effect of the dressing upon next season's crops.—The effect of the gas-lime will be to sweeten the soil, disinfect it, and unlock the plant foods, and so render them available for subsequent crops. Spread the gas-lime thickly on the surface of the ground, and let it remain there for two or three weeks, then trench the ground and mix in the gas-lime as the work proceeds, leaving the surface soil as rough as possible. If rain and snow work the surface down, take advantage of dry weather to lightly and roughly fork it up again, so that aeration may proceed, and a fine tilth be available for seed-sowing or planting next March or April.

AUTUMN-FLOWERING CROCUSES.—M. E. M., Kingston: I should be very glad if you will give a list of the autumn-flowering species of crocus, and their colours. — The principal autumn-flowering crocuses are C. asturicus, rather variable, usually violet or purple, there are several named varieties; C. cancellatus, lilac, with yellow throat, has also a white and yellow variety; C. Clusi, purple, very fine; C. adriaticus, white and purple; C. iridiflorus, outer segments purple, inner ones lilac; C. Karduchorum, rosy lilac, veined with purple; C. longiflorus, lilac and yellow; C. medius, bright purple; C. ochroleucus, creamy-white, tinged with orange; C. pulchellus, lavender-blue, orange tinted; C. Salzmanni, lilac or white, feathered with purple; C. sativus, bright lilac (the saffron crocus), of this there are a number of beautiful varieties, notably Elwesi and Pallasi; C. Scharojani, bright yellow, practically evergreen; C. speciosus, the best-known autumn-flowering species, very free, bright lilac to blue-purple; and C. zonatus, rosy-lilac.

NORTH OF ENGLAND HORTICULTURAL SOCIETY.—H. J. C., Hull: I shall be much obliged if you will publish the name and address of the secretary of the North of England Horticultural Society, and state what the society is for.—The secretary is the Rev. J. Bernard Hall, B.A., and his address is Rawdon, Leeds. The object of the society is "To organise horticulture (scientific, educational, commercial, and general) in the North of England."

BITTER PIT IN APPLES.—H. R. S., Chepstow: I am sending a few specimens of Warner's King apples, which are dotted all over the top with brown marks. These spoil the appearance and value of the fruits and prevent them from keeping. Kindly say what is the cause of the trouble and how it can be prevented.—The brown embedded patches are due to the presence of a fungus named Glœosporium fructigenum, and Warner's King seems especially susceptible to attack. We have frequently received diseased specimens of this apple during the last few years, and an opinion frequently expressed is that the variety seems to have lost its constitutional vigour. Diseased fruits should never be allowed to remain on the ground where they fall, and in the case of trees known to be affected the fruits should be examined regularly after they are of usable size, and when the slightest sign of disease is seen the fruits should be picked, peeled thickly to remove the damaged portion, and be used. The peelings and all apples unfit for use should be burned at once. During the winter spray the trees with a caustic potash solution or one of the preparations advertised, and in July spray the trees with a solution of potassium sulphide.

PETROL AS A CURE FOR AMERICAN BLIGHT.—R. R., Worcester: I have been told that petrol is a cure for American Blight if painted on to the trees after leaf fall. I shall be greatly obliged if you will tell me whether this is correct, or refer me to some work dealing with the matter.—On several occasions notes have been published suggesting that petrol applied with a brush to dormant apple trees would prove a cure for American Blight. Solitary instances of success or failure with any fungicide or insecticide prove nothing; what is needed is a properly conducted experiment. A few years ago Mr. Spencer Pickering conducted experiments at Woburn for the destruction of American Blight or Woolly Aphis, and young trees were immersed bodily in petrol for five minutes. In 10 per cent. of the trees the scion only was killed and in 5 per cent. both stock and scion succumbed, but the trees were not in a robust condition at the time, and a mortality of 7.5 to 15 per cent. was doubtless due to the mere transplanting, and not to the action of the insecticide. In the following June, July, and September, the live trees were examined, and they showed no trace of American Blight. Growth was slightly checked, and was about 94 per cent. of the normal. All this suggests that petrol, properly used, may prove very useful in combating one of the worst pests fruit growers have to deal with. Try it on one or two trees that can well be sacrificed for experimental work, and report in due course.

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill London, N.E.

# "A GRAND FERTILIZER."

"The value of CLAY'S FERTILIZER needs but little emphasis. It is, one may say, an old friend that has been tried and proved over and over again. The latest and greatest testimony to its value comes through the medium of the recent ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION. Large quantities of CLAY'S were supplied for the preparation of the Royal Hospital Gardens at Chelsea, and now that the process of renovation is under way, it is an interesting and significant fact that CLAY'S FERTILIZER is being exclusively used. A point for our readers to bear in mind in connection with CLAY'S is that thousands of amateur growers are daily awakening to the beneficial results following its use; indeed, the demand from all quarters is so greatly on the increase that Messrs. Clay are almost continuously extending their works and plant."—NURSERYMAN AND SEEDSMAN, July 20, 1912.

CLAY'S LONDON FERTILIZER

TRADE MARK.

**Every TIN, BAG & SEAL bears this TRADE MARK—the only guarantee of genuineness**

SOLD EVERYWHERE in **6d.** and **1s.** TINS: and in BRANDED and SEALED BAGS:—7lbs., **2s. 6d.**; 14lbs., **4s. 6d.**; 28lbs., **7s. 6d.**; 56lbs. **12s. 6d.**; 112lbs. **20s.** Or direct from the Works, Carriage Paid in the United Kingdom for Cash with Order (except **6d.** TINS).

**CLAY'S SUCCESSFUL GARDENING.—A thoroughly comprehensive, informing up-to-date publication, 276 pages, illustrated, bound in cloth. To be obtained of Seedsmen, etc., NINEPENCE NET, or Free by Post for this amount direct from the Publishers, as under:—**

## *A Thorough Guide to Planting and Propagation.*

### 476 PAGES AND 255 ILLUSTRATIONS OF PLANTS AND FLOWERS FROM PHOTOGRAPHS.

# EASILY-GROWN HARDY PERENNIALS.

By G. H. VOS, B.A., Editorially supervised by T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

Price **5/-** net; Post Free, packed in box, **5/6.**

*SOME FEATURES OF THE WORK:*

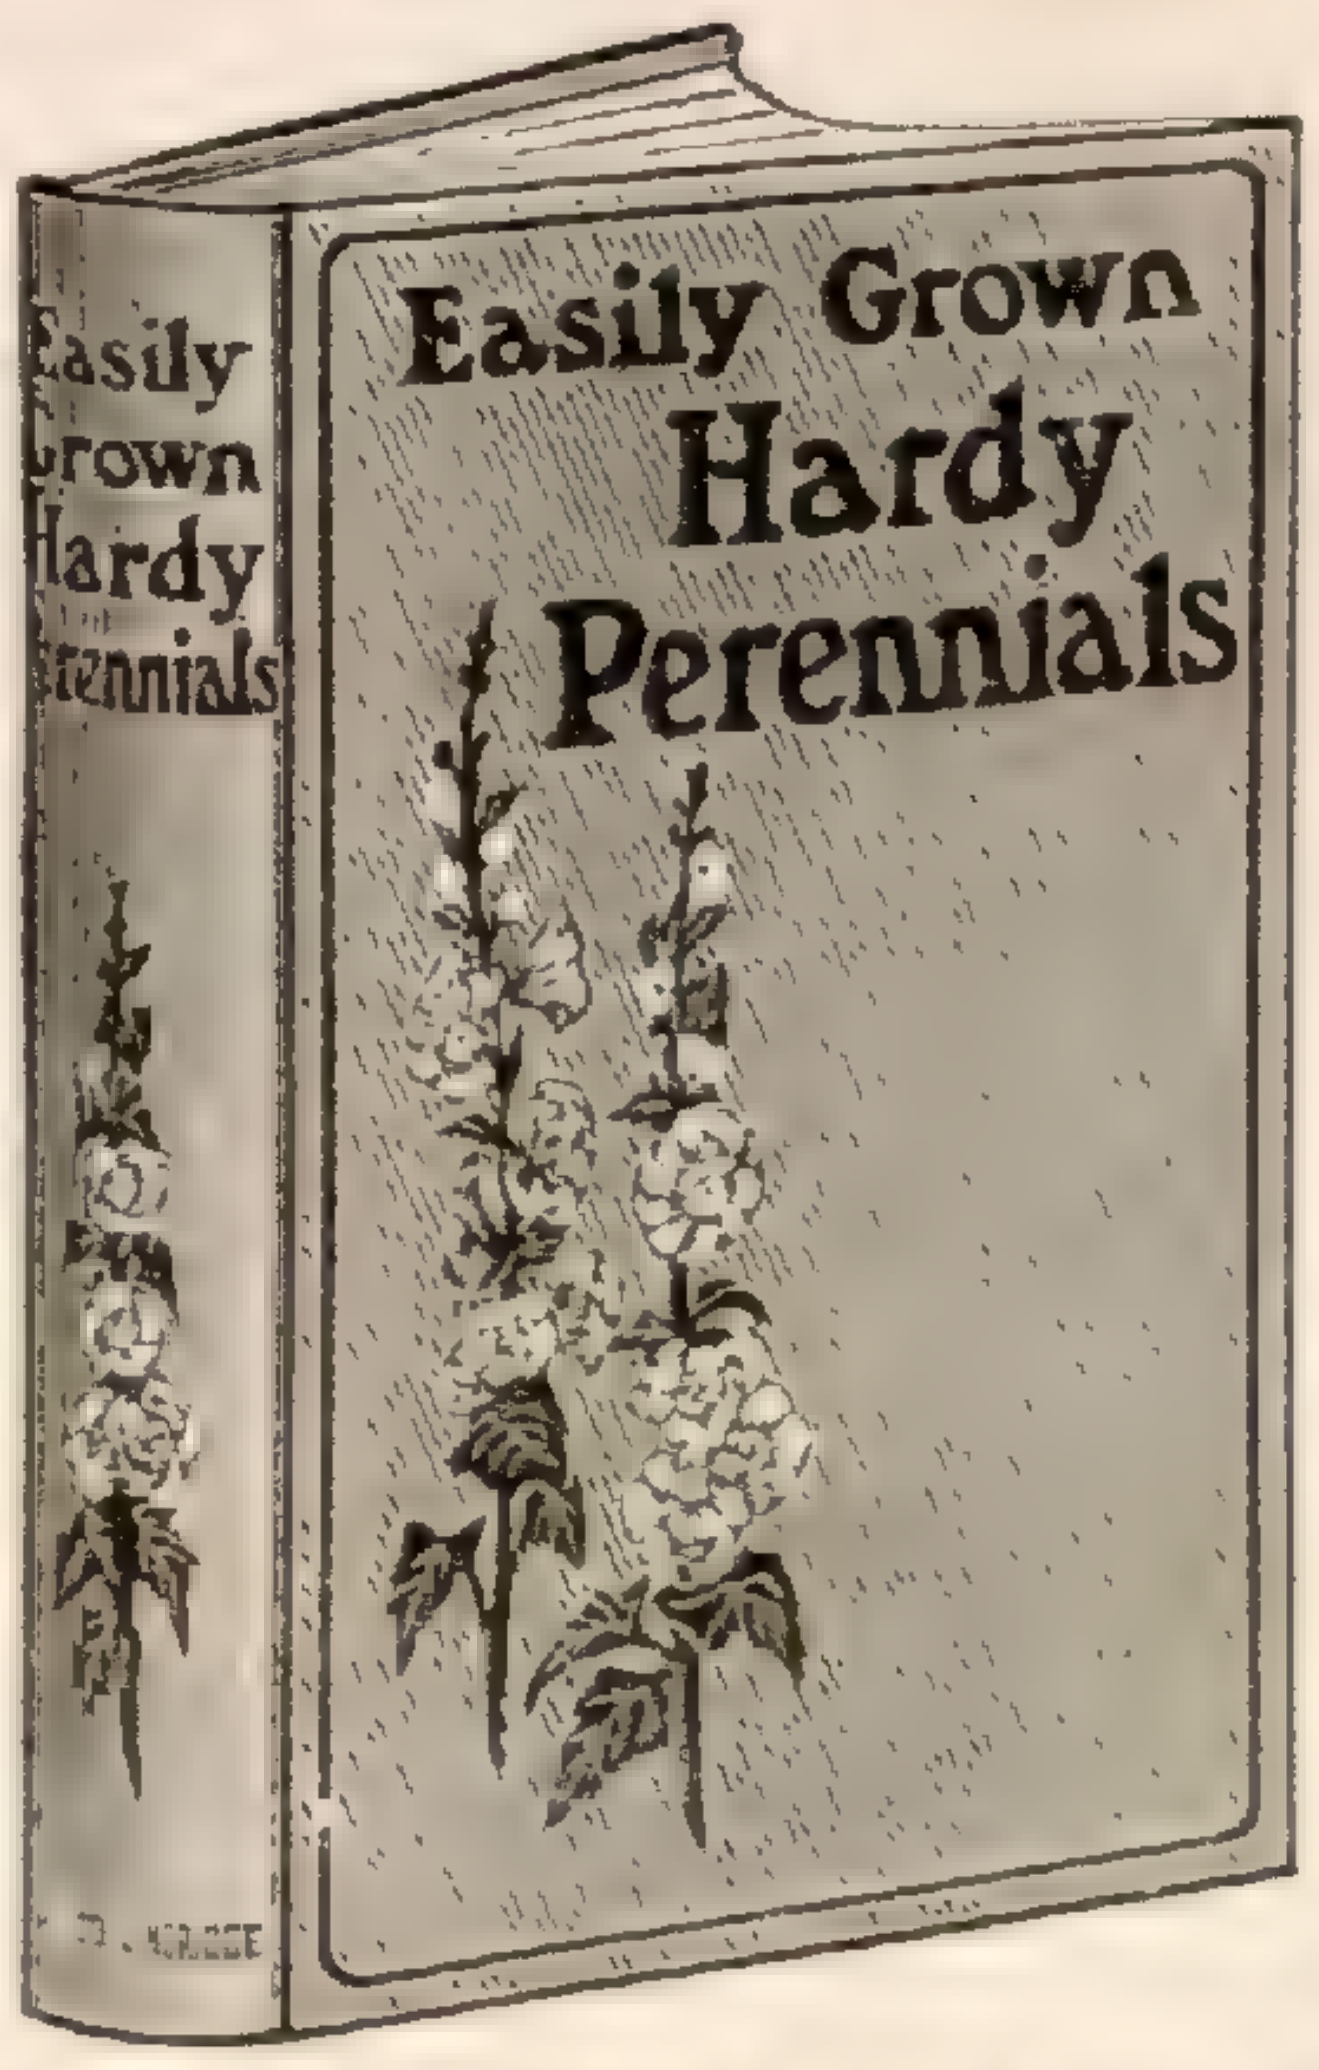
**Soil and Position.**—The particular soil or compost and position for each genus of plants are very fully and carefully described. Shade and sun-loving plants specially mentioned.

**Planting.**—The best time and method of planting are also clearly set forth.

**Pests.**—Special mention is made of any plants likely to be attacked by insect pests, and remedies are given.

**Propagation.**—The best mode of increasing each family of plants described in detail—seeds, cuttings, and division.

**Illustrations.**—Two hundred and fifty-five of the most popular species and varieties portrayed, mostly as growing in the garden.



**Botanical Name.**—Gives the botanical or generic name of each genus of plant described in the book.

**Common or Popular Names.**—Supplies the common or popular English names of all the plants described.

**Natural Order.**—The botanical family to which kind belongs.

**Habit and Uses.**—States whether the plant is fibrous, tuberous, or bulbous rooted, and to what use it can be most effectively put in garden decoration.

**Species and Varieties.**—Describes the most showy varieties worthy of culture, the colour of their flowers, season of blooming, height and native country.

**"The cultural details are very valuable."**—*Gardeners' Chronicle.*

## NAMES OF PLANTS.

Under this heading we can only undertake to name species and well-marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

A. P., Lancaster.—Phytolacca decandra.

E. A. D., Holsworthy.—Polygonum polystachya.

S. S., Winchester.—1, Arundinaria nitida; 2, Molucella lævis.

H. E. C., Matlock.—1, Polygonum lanigerum; 2, P. orientale; 3, Nepeta cataria.

S. R. D., Blackpool.—1, Episcia fulgida; 2, Santolina incana; 3, Artemesia Abrotanum; 4, Hypericum calycinum.

M. E. M., Kingston.—1, Crocus speciosus; 2, Cratægus crus-galli; 3, Monarda punctata; 4, Physostegia virginiana.

W. S., Droitwich.—1, Ruscus aculeatus; 2, Cupressus macrocarpa lutea; 3, Berberis stenophylla; 4, Quercus ilex.

G. B., Old Colwyn.—1, An oxalis, possibly O. rosea; 2, Carex brunnea variegata; 3, Sedum Sieboldi; 4, Cyprus laxus; 5, a species of lotus; 6, Escallonia macrantha.

C., Essex.—1, a form of Berberis vulgaris; 2, Chrysocoma linosyris; 3, an euphorbia, send when in flower; 4, Ophiopogon Jaburan; 5, Begonia Haageana.

## NAMES OF FRUITS.

A. J. G., Burwash.—1, Queen; 2, Hollandbury; 3, not recognised; 4, probably Zephirin Gregoire.

E. R., Windsor.—1, New Hawthornden; 2, Warner's King; 3, Golden Noble; 4, Lemon Pippin; 5, Sturmer Pippin.

D. P., Godalming.—1, Emperor Alexander; 2, Adam's Pearmain; 3, Lord Derby; 4, Worcester Pearmain; 5 not recognised, out of character; 6, Buerré Bosc.

A. J. D., Eltham.—1, Badly damaged, probably Souv. du Congrès; 2, Comte de Lamy; 3, London Pippin; 4, not recognised; 5, Ribston Pippin; 6, Marie Louise d'Uccle.

## THE NORTHERN FRUIT CONGRESS.

It is a pity Mr. Smith was not living in the North when the Hexham Fruit Congress was held. He would then have got hold of the facts. As it is, it is difficult to write on the matters he touches upon without holding forth at length. One or two statements by me must therefore suffice.

1. Mr. Smith has received no commands from me! He has been requested to approach his County Council secretary about a Darlington Fruit Congress, 1914, when we would like to have, not only the support of the local agricultural society and the local horticultural society, which we have already, but also a continuance of that generous support we have already received at the hands of the local educational authorities at Hexham, Newcastle, Carlisle, and now for Kendal, 1913.

2. To be correct, Newcastle Congress and Show, thanks to all concerned, was a financial success, and the same applies to Carlisle Congress and Show. We all owe Mr. Little a debt of gratitude for his services as secretary of the congress, and thanks, too, to the local committee for the splendid way everything was carried out.

3. The N.E.H.S. has no official editor of its monthly magazine and circular. We need some means of intercommunication between members, and some organ in which to publish lectures. That is all we run to at present. If Mr. Smith had continued the reports of his epoch-making researches into the colouring of apples, and enlightened us on his discovery of two species of big bud, no doubt the magazine would have been more interesting, though, perhaps, less instructive!

J. BERNARD HALL.

## MARKETS.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### Flowering Trees and Shrubs.

Trees and shrubs available for the creation of garden scenery are of many kinds, and evince a remarkable divergence in character and adaptability for the various positions the garden affords for the demonstration of the varied charms of arborescent and ligneous vegetation. There are trees and shrubs that are remarkable for their graceful habit or nobility of aspect, that claim attention for the attractive colouring, or elegance of their leafage; and there are others—and they are many—which strongly appeal to garden lovers by reason of the great beauty of their flowers. There is no occasion to institute comparisons between the several classes with a view to determine their relative merits. But it is important the fact should be recognised that all trees and shrubs which possess beauty in a marked degree should, at the planting season, have their claims fully considered, whether their beauty be derived from habit of growth or from fine flowers or bright foliage. There should be a careful selection of kinds from the several classes, and this should be made with due regard to the aid they will render in carrying out a well-devised colour scheme, and their suitability for the positions to be planted. There should be no conflict between trees or shrubs that have beautiful flowers and those remarkable for their attractive leaves. Both should be utilised in such proportions as will enable the planter to produce the desired effect and ensure the diversity of form and colour so essential to the full enjoyment of the garden, whatever may be its dimensions and chief characteristics. At the present time we are more immediately concerned with trees and shrubs that bear flowers of great beauty, and if we urge our readers to plant the finest of these with some degree of liberality, both in furnishing new gardens and making alterations in those which have been long established, we must not be understood as suggesting that those which have handsome leaves or a graceful habit should be less extensively planted. A proper balance should be maintained between the distinctly ornamental kinds, but no longer should the oaks, the elms, the beeches, and other trees that properly belong to the forest and woodland be allowed to occupy the limited space available for trees and shrubs in gardens of comparatively small dimensions. An immense improvement has been effected in this direction during the twenty years that have elapsed since we began our special advocacy of the claims that beautiful flowering trees and shrubs have upon owners of gardens, but much has yet to be accomplished before they will have adequate representation in planting schemes.

MR. WILLIAM YOUNG.

During the past two decades the number of the finest of the flowering trees and shrubs planted annually have increased by at least a thousandfold, if we except the rhododendrons, which had previously obtained fuller recognition than had other classes of shrubs. In some cases a doubt exists as to the advisability of making a distinct departure in the method of planting, and in others trees and shrubs remarkable for the beauty of their flowers are planted so sparingly as to fail to appreciably increase the charms of the garden, and we would direct the attention of those of our readers who hesitate to plant them freely to the fact that while they annually produce a charming display of blossom in their season of flowering, they are at least equal in attractiveness at other seasons to kinds bearing inconspicuous flowers. The greater number of both trees and shrubs bloom during the spring and early summer months, but if we include the heaths, and they should certainly not be omitted, there is hardly a month in the year in which one or more will not yield their floral charms. The number of months over which the procession of flowers in the shrubberies will extend depends, to some extent, on the number of kinds for which space can conveniently be found, but those whose gardens are not large should plant but sparingly, if at all, those which bloom very early in the year, because of the risk of the flowers being injured by damp and fog. If they escape well and good, but if they are injured by the frost a certain amount of disappointment is inevitable. Therefore, the preferable course in all but quite spacious gardens is to plant those kinds that bloom from March onwards. Moreover, shrubs that bloom in April and May can be more fully enjoyed than those so precocious as to yield their flowers in the first two months of the year. It is also desirable, where the area of the garden is not very large, to limit the selection to such kinds as bloom freely and possess much beauty. In the furnishing of large gardens greater latitude may be allowed, for there are many kinds that, while they are not specially showy, are of much interest. The shrubs from which selections should be made include azaleas, berberis, buddleias, ceanothuses, cydonias, cytisus, deutzias, escallonias, forsythias, halesias, heaths, hypericums, honeysuckles, lilacs, olearias, philadelphus, ribes, rhododendrons, viburnums, and weigelas. Then the trees from which selections should be made comprise the double-flowered cherries, catalpas, double-flowered peaches, chestnuts, laburnums, magnolias, plums, styrax, thorns, and Snowy Mespilus. The species and varieties of the foregoing genera do not exhaust the meritorious kinds, as shown in the contributions on flowering trees and shrubs that appear in other parts of this issue, but they should receive first consideration, as they will afford simple material for the production of the most delightful effects. When a selection of these has been made, and the trees or shrubs planted, other kinds can be considered as opportunities offer, and added to the selections previously made, if considered desirable. To ensure a full measure of success the planting must be proceeded with as early as possible so that the roots may have the assistance of the warmth still in the soil. Purchases should be made at once, and, as far as possible, the several kinds should be on their own roots, and especially is it necessary that this should be so in the case of the lilacs, and indeed of all shrubs that sucker freely. The preparation of the soil should be commenced forthwith when new borders are formed. Trench the soil in the usual way, and, if in an exhausted state, previously apply a moderate dressing of manure.

---

**Mr. William Young** is one of the best known and highly respected horticulturists in the South of Scotland. For the long period of twenty-seven years he has had charge of the gardens at Craighlaw, Kirkcowan, Wigtownshire, belonging to Mrs. Fleming Hamilton. A native of Lanarkshire, Mr. Young was at an early age apprenticed with the late Mr. William Noble, then gardener at Bonnington House, Lanark. Mr. Noble, then in the prime of life, was regarded as a man of sterling qualities, and one holding high ideals of the gardening cult, which he endeavoured to instil into the minds of his subordinates, though the precept was misunderstood by some of them. Mr. Young, however, remembers with pleasure the time spent at Bonnington, and believes that his after-success in life is largely due to the excellent training inculcated by Mr. Noble. Afterwards Mr. Young served as journeyman at Headington Hill Hall, Oxford, and at Falkland Palace, Fifeshire, and was for five years foreman to Mr. Ormiston, Alloa Park, Clackmannanshire. From Alloa he went as head gardener to W. F. Stanley, Esq., Cumberlow, South Norwood, Surrey, where he laid out a new kitchen garden and orchard, and otherwise improved the place. From thence he returned to Scotland and entered upon his present situation. As in other callings, but more particularly that of horticulture, a man's success is often assured by close and careful study of his environment. This fact was evidently recognised by Mr. Young, who, on leaving a genial southern climate to begin afresh in a bleak moorland district, did not attempt what was well nigh impossible, but concentrated his efforts on producing in their best form subjects most likely to succeed. These were roses, herbaceous plants, and vegetables, with all of which he has for many years carried off the leading honours at exhibitions, both in the immediate neighbourhood as well as much further afield. A few only of his chief successes can be referred to, viz., at Edinburgh in September last, premier position for eighteen dishes of vegetables (open class), and for thirty-six vases of herbaceous flowers. At Glasgow last year, chief honours for a collection of herbaceous flowers. Three years ago at Edinburgh, the Centenary Cup, presented by nurserymen, was awarded to a collection of hardy flowers from Craighlaw Gardens; while for many years Mr. Young has secured a fair share of the principal honours for roses, exhibiting both pot plants and cut blooms at the leading centres in Scotland. At home, the at one time rather unattractive aspect of the establishment has been entirely changed, as flowers in abundance and great variety now prevail, where previously such were considered unattainable, to the great delight of a generous and sympathetic employer, from whom Mr. Young has always received much encouragement in his endeavours.

**An Interesting Site of an Old Garden.**—Waterloo Station, the terminus of the London and South-Western Railway, which has been greatly extended and improved within recent years, is of some interest as the site of Cuper's Gardens, one of the London spas that were popular early in the eighteenth century. In its day these gardens were prominent among the more popular of these resorts on the south side of the Thames. Boydell Cuper, the first proprietor, was for some time head gardener to the Earl of Arundel, who formed a large and important collection of statues. When the gardens were being laid out by Cuper, the Earl presented him with several statues from his collection, and these occupied a place alongside the walks until 1753, when the gardens were closed, and the land devoted to other purposes.

**A Forest of Araucarias.**—Among the advertisements relating to the sale of landed property that are now appearing is one in which an area of land in Argentina containing 2,000,000 trees of Araucaria imbricata is offered for sale. The value of the timber and resin furnished by the trees is referred to, and it is pointed out that "the fruit . . . is adapted for a variety of purposes, including the making of almond rock."

**Bacteriological Effects of Liming Soils.**—According to the "Research Bulletin" of the Iowa Agricultural Experiment Station, experiments were made at the station with a view to determine the effects of applications of ground limestone on crop yields, the total number of bacteria in the soil, and the number of bacteria of certain groups. The ground limestone was carefully mixed with different lots of soil in pots at the rates of one-half, one, two, and three tons per acre, and the pots were kept at approximately uniform temperature and moisture throughout. After the lapse of a month, the soils were examined, the examination being repeated three times at intervals of two or three weeks; and at each the number of bacteria was estimated. It was found that the applications of limestone resulted in an increase in the number of bacteria in the soil, and the increase was almost proportional to the amount of limestone applied up to three tons per acre. In all cases the largest percentage of gain in bacteria was shown at the first examination. At subsequent dates differences occurring in all the soils, both treated and untreated, obscured to a greater or less extent the differences due to liming. The applications of limestone were also found to increase the ammonifying, nitrifying, and nitrogen-fixing powers of the soil, the increases in each case being found to be almost proportional to the weight of limestone applied.

**Export of Trees, etc., to South Africa.**—From the South African Department of Agriculture comes the following notice: Nurserymen with South African customers are hereby respectfully informed that plants, excluding bulbs and seeds, are admitted into the Union from oversea only under special permit. Permits are not given at all for conifers, or for eucalyptus or acacia trees. They are freely given, without regard to quantity, for house palms, ferns, carnations, geraniums, chrysanthemums, orchids, and many other tender plants; but are given only for ten plants of a variety in the case of ornamental shrubs; while for fruit-bearing plants and roses, and for trees in general, they are given only for varieties that are not procurable in the Union, and that cannot be grown from seed, and for not more than ten of a kind. It is desirable that nurserymen refrain from filling any order in the absence of knowledge that a permit has been issued or is practically certain to be issued with respect to it. Applicants are supplied with permits in duplicate, so that one copy may be sent with the order. Labels and invoices should invariably give the varietal names of trees, shrubs, roses, climbers, etc., as otherwise the inspectors may not be able to connect the plants with the permits. In filling orders for the latest varieties of roses, and orders for other plants for which customers may say they are unable to get permits in advance of ordering owing to their not being able to give the varietal names, it is advisable to send to the customer a list of what varieties will be supplied a week or two ahead of despatching the plants. This action would admit of the customer getting a permit before the plants arrive, and thus perhaps avoid serious delay in the delivery of the consignment.

**Successful Workhouse Gardeners.**—Mr. Walter Wood, a Lewisham farmer and Guardian, some time ago challenged the Master of the workhouse in a competition for vegetable culture. Mr. Wood is a good grower, and evidently thought this challenge would interest and inspire the men who worked in the workhouse garden. These latter are practically all old men of 70 years and upwards, and, under the Master's tuition, they have, for the second year in succession, beaten Mr. Wood handsomely, and, incidentally, increased the food supply of the workhouse.

**Dr. A. Anstruther Lawson,** lecturer on botany at the Glasgow University, has been appointed to the chair of botany at the Sydney University, New South Wales. Dr. Anstruther will be the first occupant of this position at Sydney, and he is well qualified for his duties. He has travelled considerably in Canada, the United States, and the West Indias, and he is familiar with most of the leading botanical institutions in Europe.

**Financial Improvement at Ipswich.**—The Ipswich Horticultural Society has for some time been hampered by debt, but special efforts made this year have reduced the debt to £4 6s. 8d., this being the deficit when accounts were closed. The deficit brought forward from 1911 was £99 12s., and the income that year was £394 13s. 4d., as compared with £531 9s. 10d. this year. We congratulate our Ipswich friends upon their success and the prospect of better times.

**Snowdrop Snuff.**—During a lecture on English wild flowers, delivered at the London Salon of Photography, Mr. H. Essenhigh Corke stated that if the petals of snowdrops were dried and crushed, an excellent substitute for snuff would be produced.

**Œnothera Lamarckiana.**—The well-known work of Professor H. de Vries on the evening primrose, Œnothera Lamarckiana, and the various forms (mutants and hybrids) derived from it has been followed up by various cytologists in the hope of elucidating the origin and nature of these forms with reference to the nuclear phenomena. Among these workers is Miss Anne M. Lutz, who, we learn from "Nature," has published an extensive paper based upon the counting of the chromosomes in the dividing nuclei of various œnotheras, especially in the forms called "triploid mutants"—in which the somatic cells have thrice instead of twice the number of chromosomes normally found in the male and female germ-cells from which the plant arose. The results obtained by Gates, Davis, Geerts, and the writer herself are discussed at length, and considerable ingenuity is shown in the explanation of the various numbers of chromosomes observed in different œnotheras—a list is given of more than forty possible combinations and permutations in the chromosome numbers in the germ-cells, and the writer claims to have demonstrated "the harmonious relationship existing between practically all of the observed phenomena thus far reported for the germ and somatic cells of œnothera."

**The Spring Rose Show** that will be held by the National Rose Society at the Horticultural Hall, Vincent Square, on May 1, 1913, has the promise of proving a great success. The schedule is, we understand, being prepared by the Exhibition Committee, and from what we hear it is likely to be sufficiently comprehensive to ensure a large, varied, and attractive display of the roses that may be had in a high state of development during the spring season.

**Royal Horticultural Society of Ireland.**—An endeavour is being made to increase the attractions of the autumn flower shows in Dublin, and, as far as possible, to make them thoroughly representative of the leading products of the garden in autumn. At the monthly meeting of the society the draft schedule of the autumn show for 1913 was submitted for approval, and this contained several new classes. In several of the leading classes that have had their place in the autumn schedule for some years past the prizes have been augmented.

**A New Park for Newport.**—Lord Tredegar has presented Jew's Wood, a suburban spot of about five acres' extent, to the town of Newport, Monmouth. It is a condition that the present well-timbered aspect of the wood shall be preserved, and that swings shall be erected for the children.

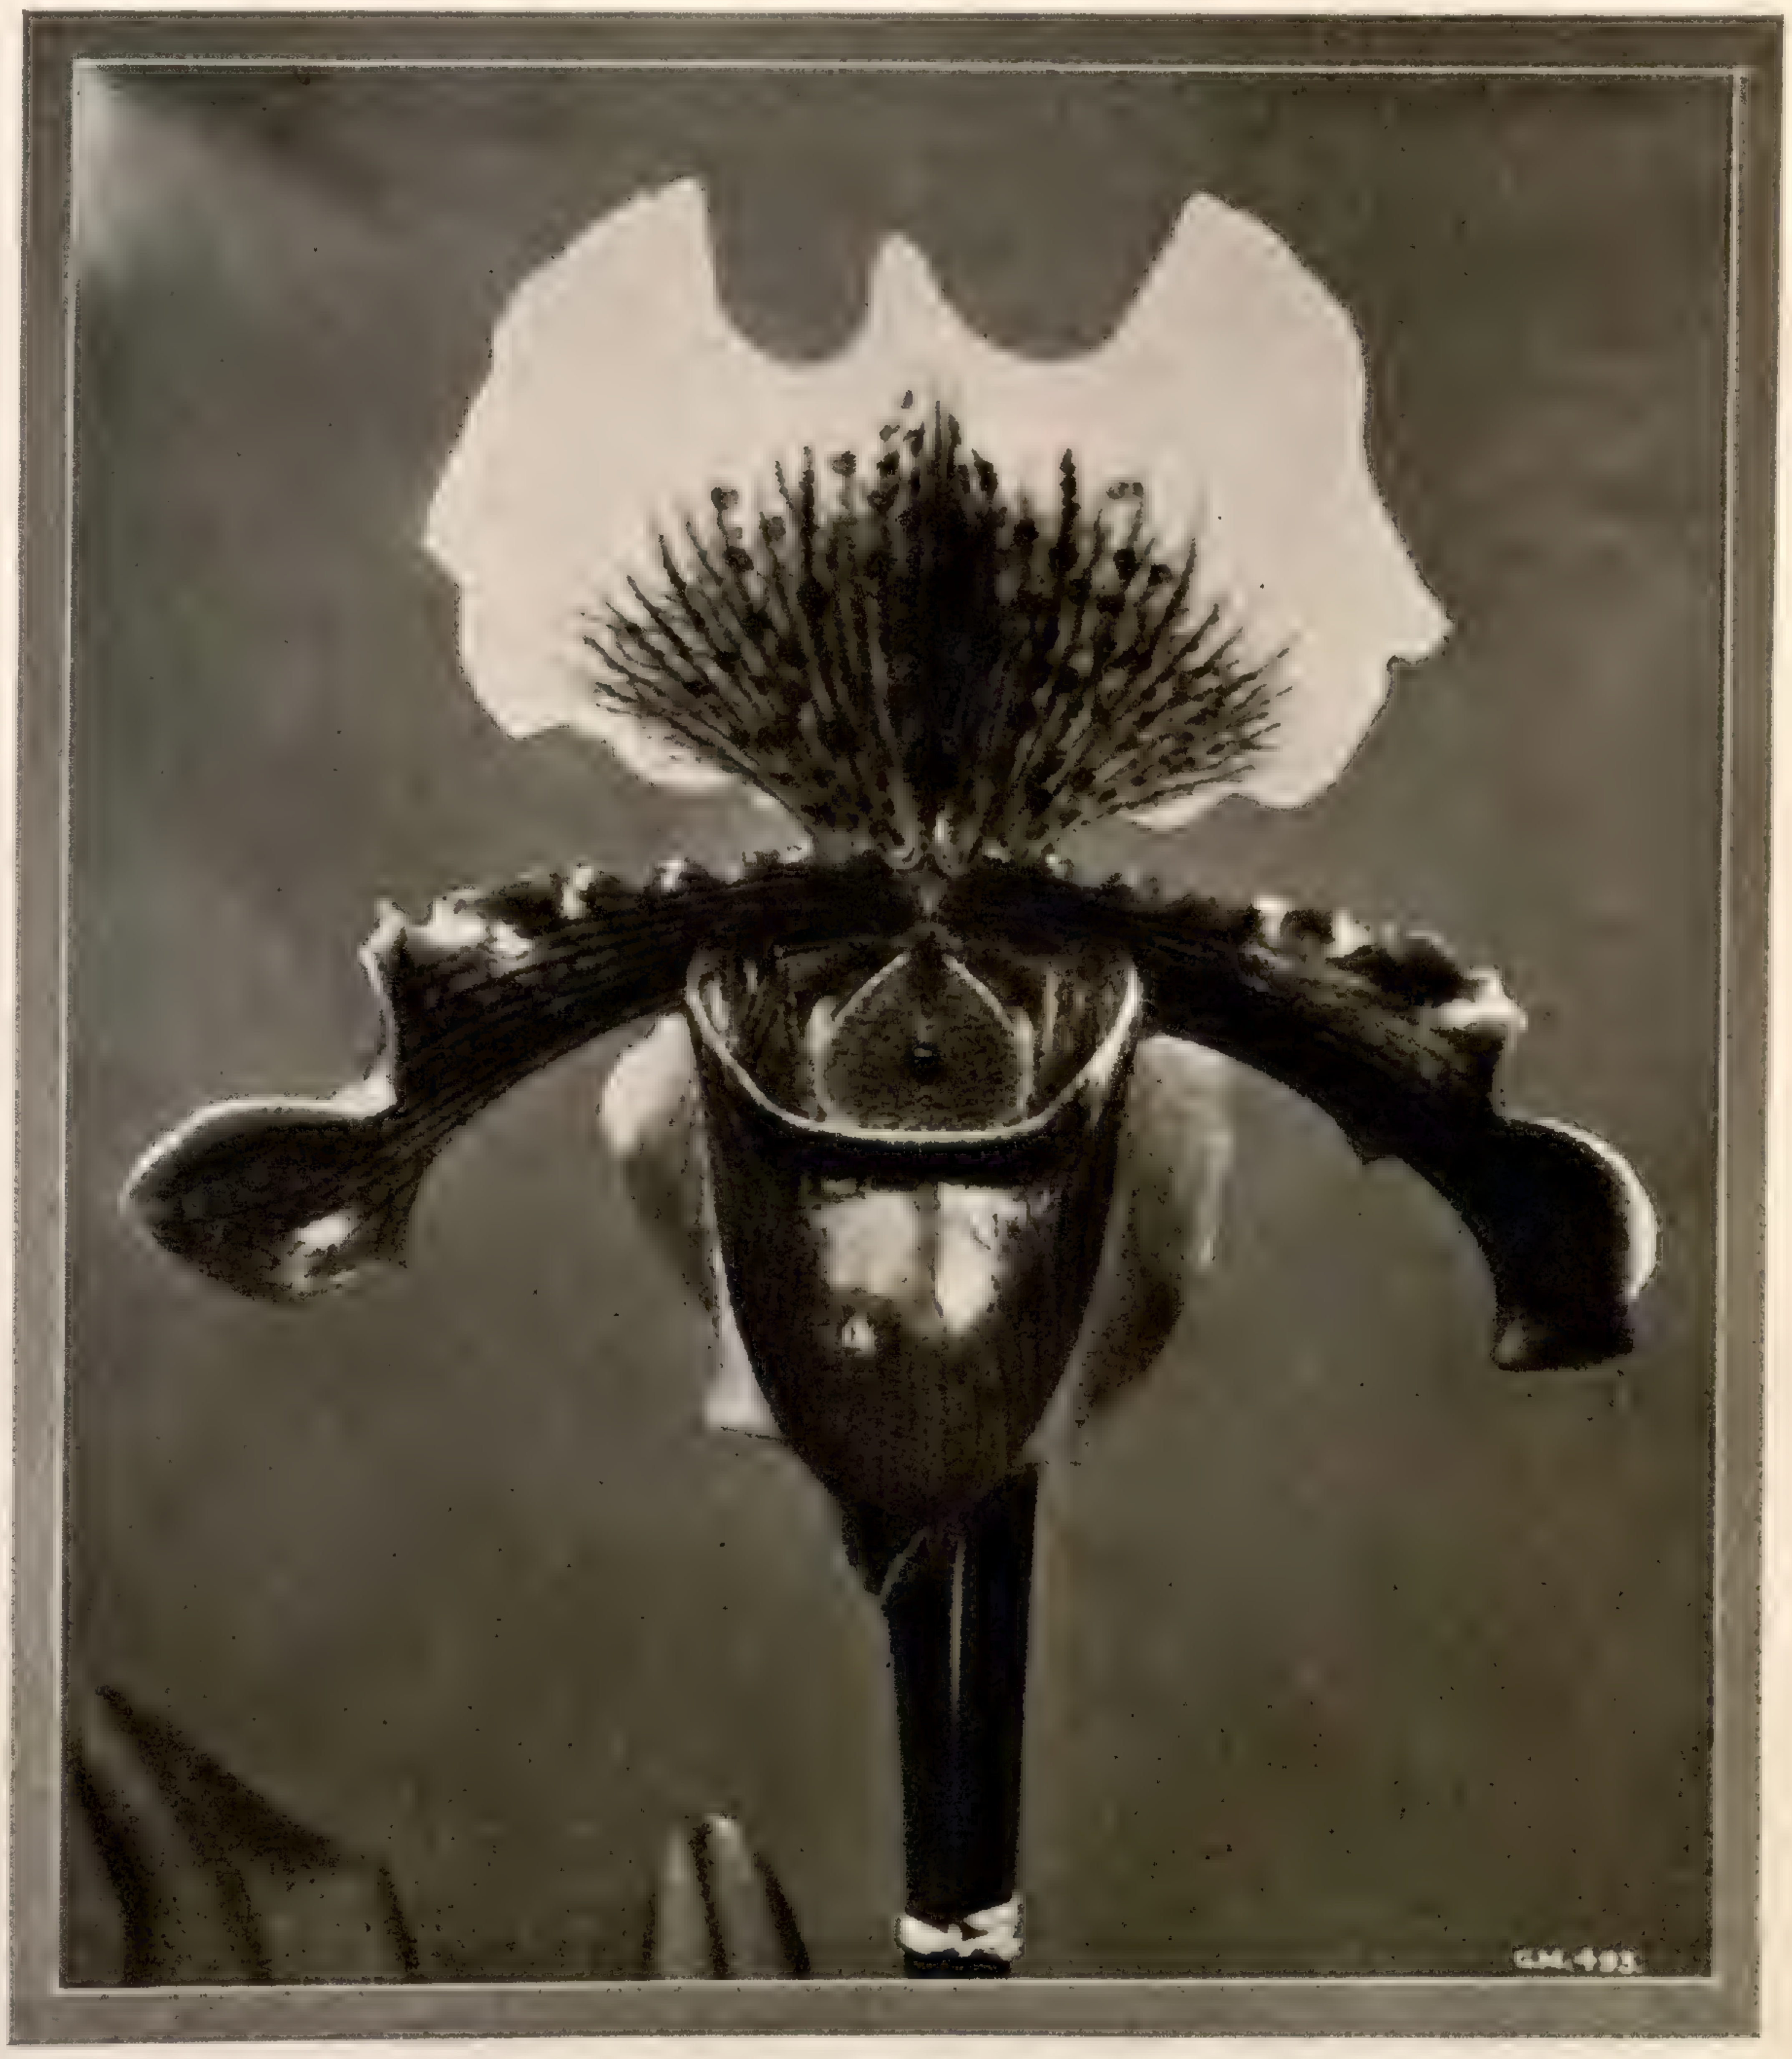
**Chrysanthemums in the London County Council Parks.**—The annual chrysanthemum shows are open to the public at the undermentioned London County Council parks: Battersea Park, Brockwell Park, Finsbury Park, Southwark Park, Victoria Park, and Waterlow Park.

**Cercidiphyllum japonicum.**—This rare deciduous shrub from Japan is quite hardy in our climate, but it is desirable to grow it in a fairly sheltered position, such as a south shrubbery border. It is not very vigorous in growth, and is usually about four or five feet in height. It possesses graceful, drooping, heart-shaped leaves that assume a brilliant red in autumn, in fact, no shrub is more attractive at this season of the year. All who grow choice shrubs should certainly include it in their collection. It prefers a light, open soil that is freely drained, but when the soil is naturally of a heavy and retentive character, a compost of good fibrous loam, leaf-soil, and coarse sand should be prepared for it. If planted firmly in this rooting medium no difficulty should be experienced in making its cultivation a success.

**Prizes for Railway Station Gardens.**—The London and North Western Railway Company offers prizes for the best station gardens on its system, and this year the awards fall as follows: Fulwell and Westbury, £5; Padbury, £3 10s.; Shepshed, £3; Buckingham, £2; Stanmore, £1 5s.; Aylesbury, £1 5s.; Bletchley, £1 5s.; and Croft, £1 5s.

## HARDY AZALEAS.

No shrubby plants cultivated out of doors make a more gorgeous show than azaleas. When a good collection is being formed it is a good plan to thoroughly prepare the ground by trenching, breaking up the soil well, and adding, if such is necessary, some fine peat and road scrapings, or gritty sand and sandstone broken small. Though azaleas will grow quite well in sandy loam, they are all the better if some fine grit and open soil are added to allow surface water to drain away quickly. At the same time it is a good plan to fork in some well-decayed cow manure, as this will give the roots some rich feeding material, and such a compost will suffice for years with an occasional top-dressing.



CYPRIPEDIUM PALLAS ATHENE.

A very fine hybrid of unknown parentage; the colouring is white, green, and dark purple (see page 826). F.C.C., R.H.S., October 22. Mr. W. R. Lee, Plumpton Hall, Heywood, Lancs.

The Ghent and mollis types provide the popular varieties, though there are several species decidedly interesting and beautiful, and, when judiciously arranged, these help to prolong the display. Where it succeeds, good batches of Azalea (or Rhododendron) ledifolia planted among the deciduous kinds will relieve the plantation from bareness throughout the winter.

Azaleas are effective during two seasons of the year. In the autumn the leaf colouring is most beautiful, and from a short distance produce the effect of brilliant bloom. The azaleas may be transplanted with the utmost ease; they shift most readily from August till April. When large plantations are made some evergreens, such as bamboos or skimmias should be included, as these break up the flatness of the azaleas and provide greenery during winter, which is an advantage. Narcissi, etc., should also be grown between them for spring effects. These azaleas can be raised at home quite easily, and good flowering plants secured in three years. One important matter, especially when azaleas are growing on slopes or banks, is that they must be well supplied with water after flowering and until the buds are set.

Some of the best varieties are Gloria Mundi, one of the most vivid and beautiful, and a real good grower, with vermilion and apricot flowers; clumps of this are charming; Grand Monarque, salmon-pink; Soleil d'Orange, Roi des Belges, Peach Rose, Minerva, with large salmon-rose flowers; Fanny, a beautiful soft red; Alba grandiflora, Bouquet de Flore, salmon-pink; Unique, deep yellow, are nearly all sweet scented. Anthony Koster, rich yellow, and is quite one of the finest and most distinct, and probably this and Gloria Mundi are two of the most widely-grown sorts. Dr. Pasteur, orange-red; Emil Liebig, salmon-red; General Vetter, orange; Hugo Koster, salmon-red; J. J. de Vink, soft rose, very beautiful; N. Beets, dark orange; Madame A. Koster, orange-pink; Alphonse Lavalee, flame, a fine flower and a strong grower; Comtesse de Kerchove, orange-red; and Multiflora, red; are among the best of about seventy varieties grown here.

A. amœna is far more hardy than many suppose, and makes a grand show, and, being evergreen, is most valuable. It is a strong grower, and when once well established requires only an occasional top-dressing. We have plants 10ft. across, and these produce thousands of small crimson flowers from April till the end of June, in fact, some are blooming on October 7. There are some fine forms of this species. One of the best is A. Hexe, with larger flowers of a dark crimson shade; splendens, Carminata splendens, Flambeau, and Obtusa alba are all good.

Azalea ledifolia is perfectly hardy, and evergreen, and flowers grow uncommonly well in the front rows of rhododendron beds, or among the deciduous kinds. It gives masses of bloom, and one wonders how the flowers are produced in such quantities, as the beds look as though a white linen sheet had been thrown over them at flowering-time. Azalea rosæflora is a gem for the alpine garden. Azalea occidentalis flowers when nearly all the other types are over; it is white and very fragrant. Azalea Vaseyi is a fine species that flowers very freely, but it is deciduous, and the flowers are produced before the foliage.

In addition to their usefulness in the garden, these azaleas are extremely useful for cutting in the spring and early summer. The flowers are fine for table decoration, being light and graceful, and they can be used in a great variety of ways.

Azaleas are also, for the most part, wonderful subjects for forcing, and last a number of years; if hardened off, planted out on a good piece of ground, and rested during alternate years. They can be purchased cheaply and in quantity.

Hardy azaleas can be raised from seeds, carefully saved, and sown in boxes in February and March, in a temperature of 60 to 65 degrees. Choose finely-sifted, peaty soil, with plenty of sand for a seed-bed, and place a sheet of glass over the seeds. Keep them shaded and in a moist atmosphere. Prick off the seedlings as soon as large enough into other boxes, or into a frame, and provide a gentle bottom heat. Subsequently harden off the plants, and place them in well-prepared beds outside, in a partially-shaded site.

Leonardslee Gardens. W. A. COOK.

## JAPANESE IRIS.

The mere mention of Japanese iris will recall to the garden-lover many pleasing scenes in which these glorious flowers have played a very prominent part. I do not doubt that each reader may have in mind an "idealised picture," in which the Irises of Japan have created a vista of garden beauty unsurpassed by the majority of favourite plants common to English gardens. Look where you will, you will find nothing more superlatively beautiful in July than these irises of the Kæmpferi group, and I may safely say that no other group of flowering plants embraces such a range of indefinable tints, suffusions, and shadings of colour, as are found in these most useful subjects. For use in a garden where water plays its part in the making of a pleasing landscape, the Japanese Irises bring into the picture such a supreme portrayal of beauty in repose, such a wealth of glorious yet restful colourings that one is always impelled to acknowledge that for sheer depth of beauty there is nothing to surpass them.

The sword-like foliage blending in a perfectly natural manner with the reeds, grasses, and usual waterside subjects, and the great flapping blossoms reflecting their wondrous hues in the mirrored water of the pools, combines to make up a plant that is at home in almost any phase of garden design, and which is truly ideal for all phases of natural gardening where water enters into the scheme. There is no need for me to enumerate numbers of successful plantings; it rather concerns me to further popularise the group in the minds of English garden-lovers. We are surely, however, under a great debt of gratitude to the Japanese specialists, who, by generations of steady, peaceful work, have developed the varieties of Iris Kæmpferi to so high a degree of perfection, and if there is any ambition in the heart of the iris-lover, it must assuredly be to view the blossoming vales at iris time in such favoured spots as Hori Kiri, Kamata, and other centres. Although there are a very great number of truly splendid varieties, there is a danger of purchasers duplicating them, simply through the practice of changing the names of these plants from their Japanese renderings to a more sober-sided, commonplace English series of names. It is thus possible for one to buy, say, the same variety under four or five different names. I would advise intending purchasers to select from varieties in blossom, and where this is not possible, then fall back upon the splendid representations of the Japanese artists on rice-paper, which give a really good conception of the varieties as they really are.

Without taking up too much space with detail, I will mention a dozen really fine forms as a little help to selectors. They are as follows: Gekka-no-Nami, heavy white with yellow blotches; Oyodo, an immense violet-blue; Momiji-no-taki, crimson-purple, suffused and feathered with white; Oshokun, intense, rich blue; Iso-no-nami, sky-blue on a lilac-grey ground; Lama-no-mori, large white, gently shaded with softest blue; Kyodaisan, purple, overlaid with rich blue; Bandai-no-nami, a splendid white with large yellow blotches; Kasugano, a pretty reddish-lilac, daintily marked; Shira-taki, a magnificent white, known to Japanese eyes as the White Waterfall; Datedogu, a rich claret-red of great merit; and Choseiden, a first-rate ruby-crimson.

With reference to cultivation, Japanese growers make a point of manuring the irises regularly from November to March, at intervals of about a month. The reason for this is obvious, for, though the crowns are practically at rest during this period, the roots are gathering nutriment to build up the foundation of those glorious blossoms, which are to come with summertide. My own experience is greatly in favour of this plan, and I would urge the free use of cow manure for this purpose, if possible, as for planting. I believe in planting up stocks, especially if division is to take place, as early as possible after flowering. Provided the soil is in good condition, and the work capably done, I have found the irises more ready to respond to demand of culturist at this season than at any other, and one can establish his stock before the winter season sets in. As I have intimated in a previous issue, choice forms can be split up into single crowns, and put into 48-sized pots in a good compost, and be quite ready for planting out in early autumn; or, if desired, kept in pots until spring.

Moisture is a great necessity of the Japanese iris during the growing season, more particularly when the foliage is in full growth, and the flower spikes rising. Hence it is necessary to group them by the waterside, or else grow them in deep, well-worked loamy soil. Good cultivation is essential to success, and, though it is sometimes difficult to bestow full attention upon everything, yet the irises well repay any trouble in this direction. The value of our subjects for summer effect is great, and no scheme of water-scenery should be worked through without their aid.

Although so much has been done by the Japanese, I hold the belief that there is still room for a few more novelties in the irises, and a series of good English-raised forms will be as welcome as those of Japan. In closing, let me urge the use of irises in those schemes of garden adornment where flagged pathways, stone-cased pools, or basins, and other semi-formal arrangements are in vogue. P. S. HAYWARD.

## MORE YELLOW BEDDING ROSES.

In the issue for October 5, page 751, "R." has some interesting notes about yellow roses for outdoor culture. I fully endorse every word he writes, but as there are several other really good yellow bedding varieties I would like to mention them before the planting season has passed away. "R." praises Duchess of Wellington highly; but it deserves even more praise than he accords it. In spite of three sharp frosts on consecutive mornings my plants were still very showy, and would have carried heaps more blooms if this set-back had not interfered with the numerous buds upon the trusses.

Other yellows that make a good show and have been well tried here are Le Progrès, a deep nankeen-yellow that is very free both in bloom and growth. Madame Ravary gives us another that is quite distinct in its golden-yellow and orange-shaded flowers; having beautiful bronzy foliage, and is an exceptionally free grower here, although I note a few well-known growers class it as only moderate in growth. A yellow bedder that has been extra good with me is Mrs. Peter Blair, a deep lemon with a golden-yellow centre; and, like Madame Ravary, very sweetly scented. Then we have two deep lemon-yellows producing large upright trusses of flowers a little more than semi-double, which make a thoroughly good display all through the season. The darkest and sweetest-scented is Madame Pol Varin-Bernier, and the other Madame Pernet Ducher. Both grow to a good uniform height and spread their trusses well.

Lena and Miss Eva are a couple of closer growers with saffron-yellow buds. When planted thickly these are very effective. So, too, are the dwarf-growing China named Chin-chin, and the dwarf polyantha Eugénie Lamesch, both of which retain their colour better than most yellows, which so often fade off to almost white as the flowers expand.

It is somewhat strange that "R." should omit Miss Alice de Rothschild, a really good yellow of Marechal Niel colouring. The flowers are large, carried boldly upright, hold their colour remarkably well, and are very sweet scented. It is a good grower and very free bloomer, and has thrived out of doors during the last two widely different seasons.

Harry Kirk is a beautiful yellow among the tea-scented class. A deep sulphur with rather lighter edges, and good in all respects. James Coey and Senateur Mascuraud are also very deep yellows that open well, although the flowers are of globular form. "R." mentions the old favourite Marie Van Houtte, and few can beat it, but it is prone to hang its blossoms. We have a much larger and more double form of this rose in Mrs. Dudley Cross, a variety given us by Messrs. W. Paul and Son in 1907.

A very showy Indian-yellow and saffron-orange is found in Mrs. Aaron Ward. The flowers are always carried boldly upright and often in large trusses. The habit of this rose makes it a perfect bedder, and it is good both early and late. It is, however, rather uncertain as to colour, a good number coming without much of the Indian-yellow which is so striking in this hardy and useful variety.

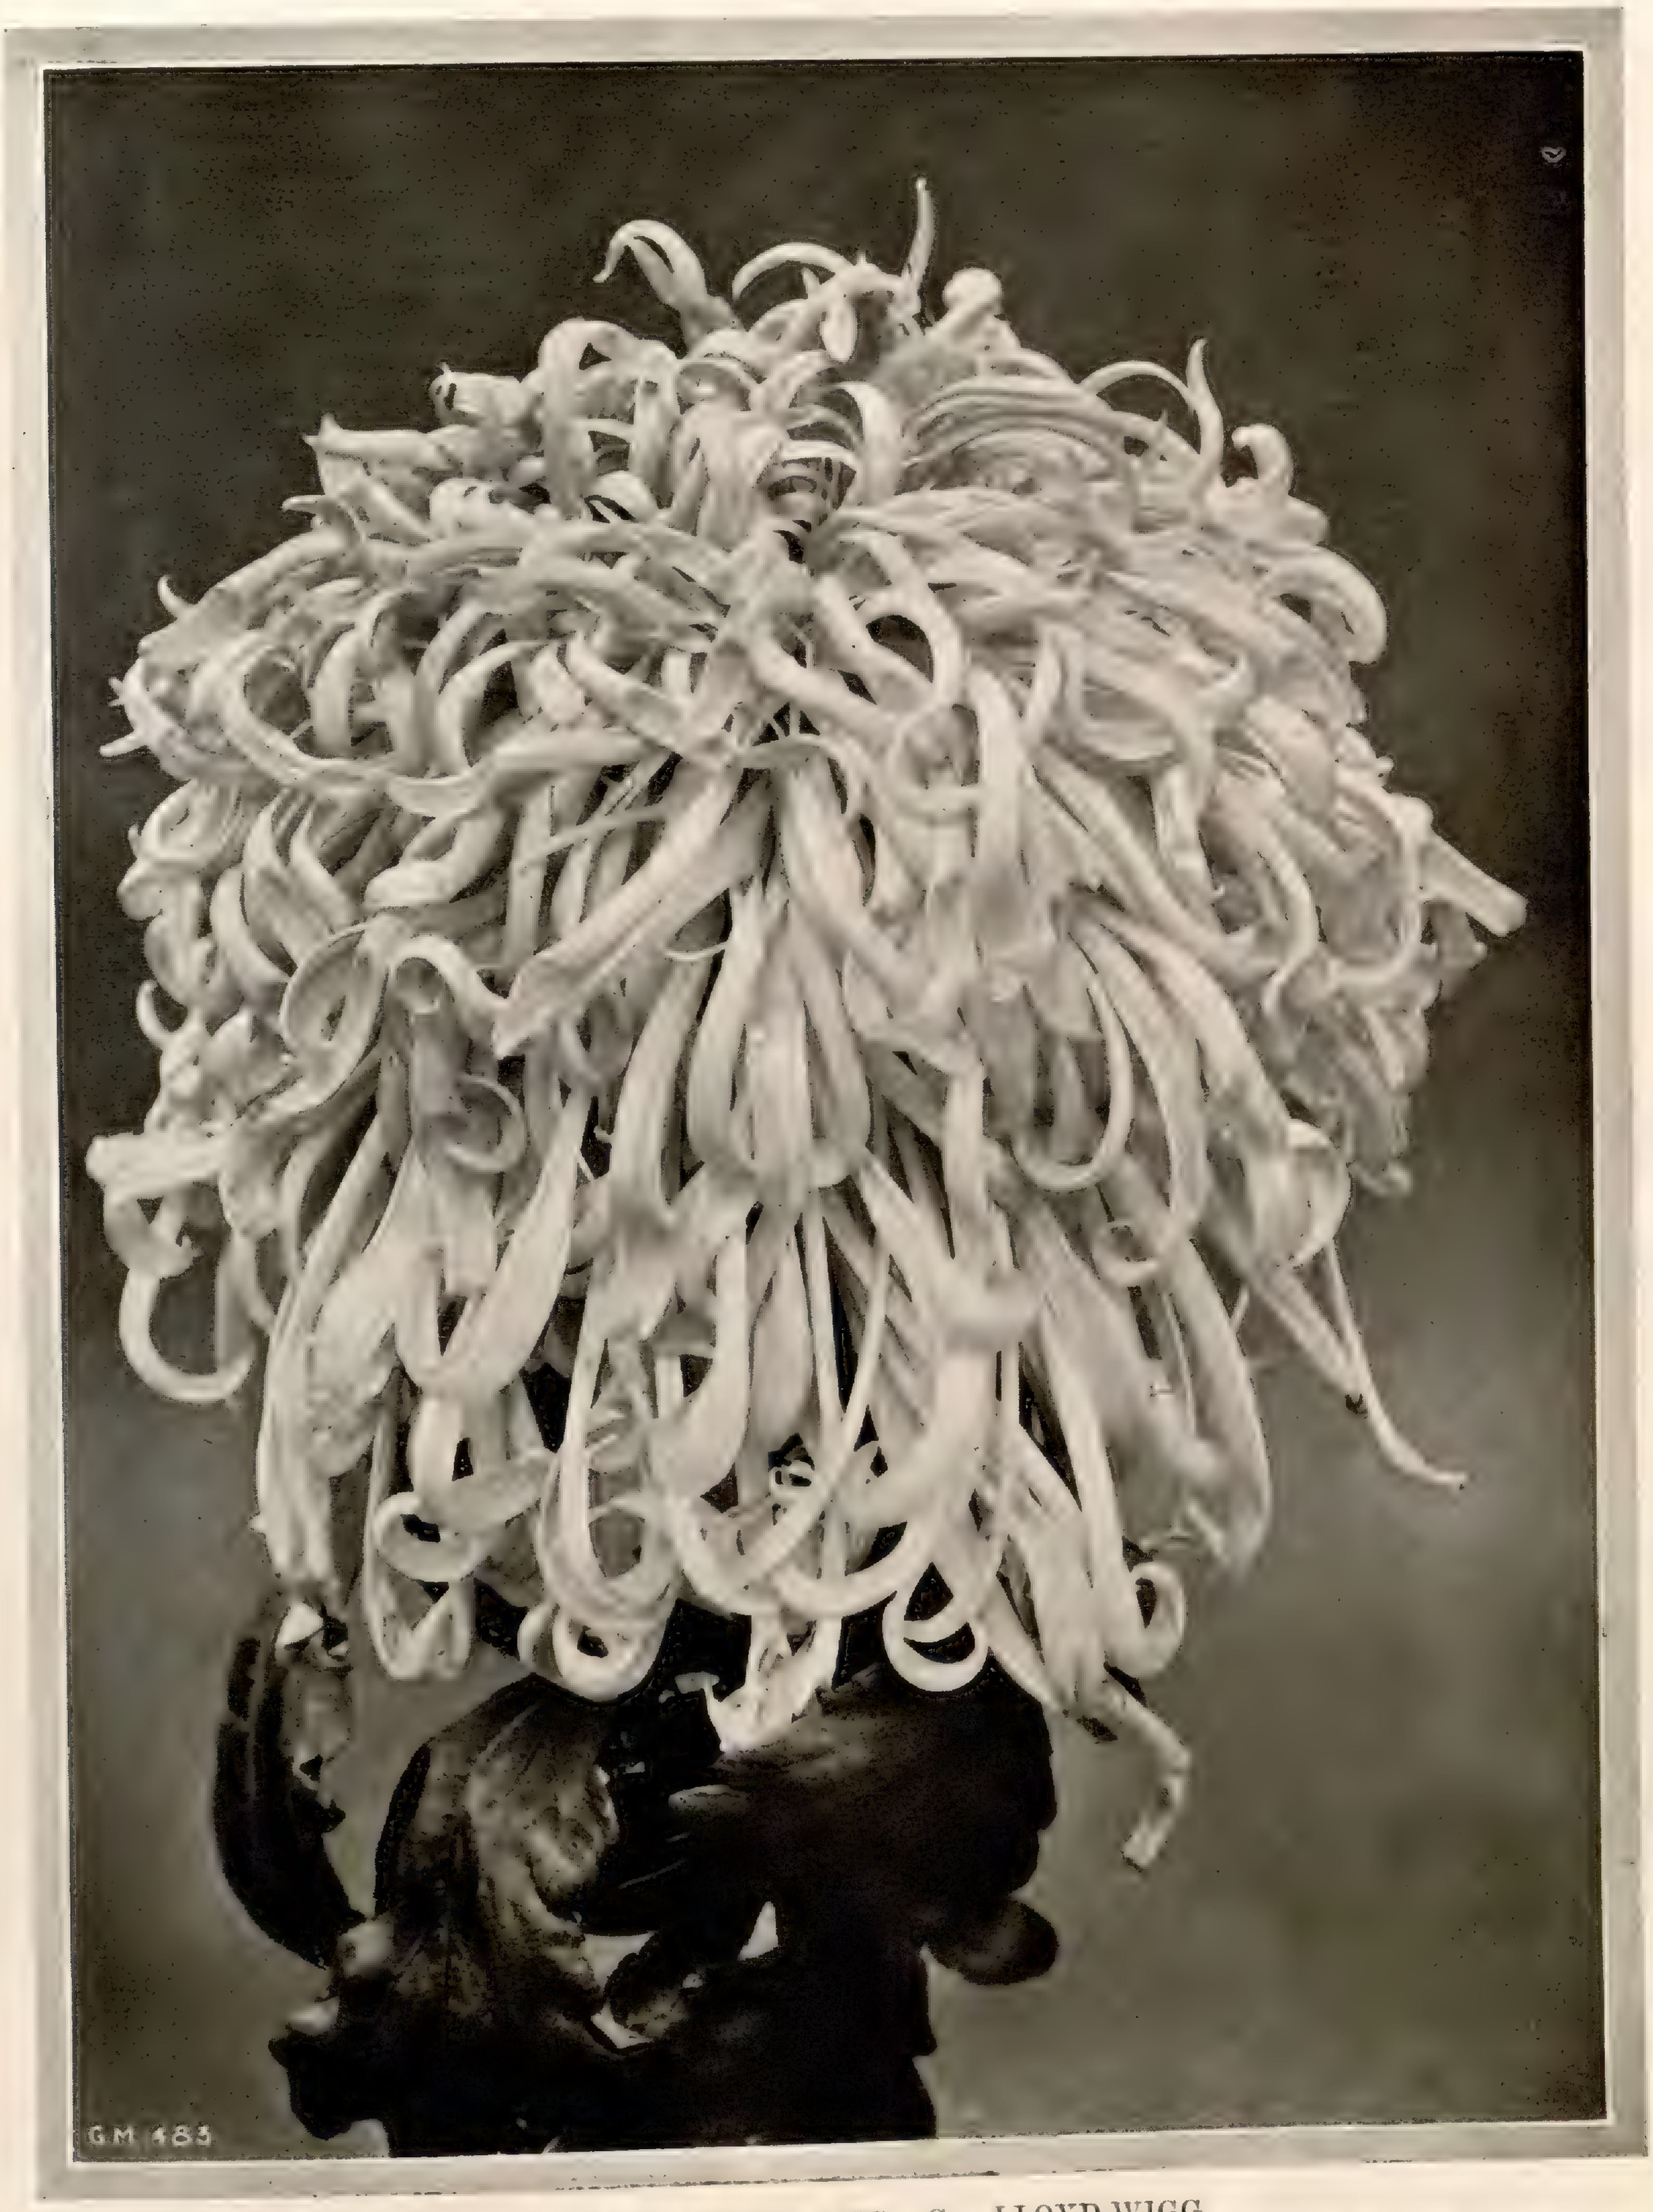
In Melody we have a newer rose from Newtownards, with deep saffron-yellow centre and primrose-yellow edgings. This variety is full of promise, and carries itself well for a bedder. ROSARIAN.

## NEW PLANTS, ETC.

◆

### COTONEASTER ZABELI.

A strong-growing shrub that promises to become a small tree when well established. It is semi-evergreen, and has pointed, ovate leaves between one and two inches long. The dull crimson berries are produced in clusters, but the colouring is not nearly so effective as in the case of C. salicifolia rugosa. A.M., R.H.S., October 8. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.



CHRYSANTHEMUM MRS. G. LLOYD-WIGG.

A distinct Japanese variety described in our issue of October 19; the flowers large, the colour soft yellow. A.M., R.H.S., October 8. Messrs. W. Wells and Co., Merstham.

### COLUMNEA GLABRA.

A handsome Costa Rican species with somewhat pendulous growths that bear erect scarlet flowers three inches long. These flowers are solitary and produced from the upper axils in the leafy ends of the twigs. A freely-flowered, twiggy branch presents a handsome appearance. An intermediate house suits it, and cuttings root readily. "Bot. Mag.," t. 8,453.

### DENDROBIUM IMTHURNI.

A very robust-growing and beautiful species from the New Hebrides. It was discovered by Sir Edward Im Thurn. when Governor of Fiji, in the island of Efate. The growths are from 3 to 4½ft. high, thick and leafy, and bear many-flowered axillary racemes towards the tops of the pseudobulbs. The flowers are of medium size, white, with lilac marks on the side lobes of the lip. The sepals are spirally twisted, and the petals curved upwards at the ends. "Bot. Mag.," t. 8,452.

### BERBERIS VERRUCULOSA.

An attractive Chinese species collected in Western Szechuan by Mr. E. H. Wilson. It forms a dense, low, sturdy bush that should find favour in the rock garden. The twigs are very short, and bear from three to five small, spiny leaves, three sharp spines, each half an inch long, and solitary flowers, each composed of six sepals and six petals, all bright yellow. The flowers are followed by purplish-blue berries. "Bot. Mag.," t. 8,454.

### CHIRONIA LAXA.

The most popular species of chironia in gardens is C. linoides (C. ixifera), but this has a more erect and bushy habit than C. laxa. The latter has slender laxly-branched stems, and linear lanceolate leaves. The bright magenta flowers are borne on stiff peduncles an inch or more long. "Bot. Mag.," t. 8.455.

### PRIMULA WATTI.

A small-growing species found in Eastern Sikkim, where, however, it is somewhat rare. It belongs to the Soldanelloid group, and will probably have to be treated as an annual under cultivation in this country. From the centre of a little cluster of membranous, hairy leaves, the spike rises about 4in. high, bearing at its apex a number of drooping, violet, white-eyed flowers. "Bot. Mag.," t. 8,456.

### CHAMÆDOREA GLAUCIFOLIA.

An elegant species belonging to the Areca group of palms. It hails from South America. Though not common in cultivation it was in some request as a table plant when first introduced to cultivation. A 15ft.-high specimen in the Aroid House at Kew, has a fine crown of graceful leafage, but the slender stem is not strong enough to carry this head of foliage without support. The larger leaves have often as many as forty leaflets on each side. "Bot. Mag.," t. 8,457.

## THE MEADOW RUE-LEAVED COLUMBINE.

Many of the aquilegia species have become neglected owing to the great favour so deservedly shown to the charming long-spurred hybrid columbines, which are so delightful in their time, and we do not so frequently see the other species in our gardens as we did some years ago. One of these little-known species is Aquilegia thalictrifolia, or the meadow rue-leaved columbine, a plant which has, as the name would suggest, a good deal of the appearance of the thalictrums, or meadow rues, in its foliage, just as, on the other hand, one of the thalictrums, T. aquilegifolium, partakes of the leafage of the meadow rue.

In Aquilegia thalictrifolia, the pretty leaves have their three-stalked segments cut into very deep, oblong lobes, hence the resemblance accounting for the specific name.

From this rise stems of about three flowers on each, these being of a kind of lilac-blue, the sepals being about half an inch long and the limb of the petals about the same size, the spurs being rather shorter than these. It does not rank as one of the finest of the alpine aquilegias, but is, withal, a pretty plant, whose attractions are rather heightened by the pubescence with which its stems and leaves are covered.

The cultivation of A. thalictrifolia is easy, and I find that it can be cultivated successfully in the border or the large rockery. It likes partial shade and a soil which is not too dry, but otherwise it is accommodating, and will withstand more drought than it really likes, although it is not so fine under such conditions as those it prefers. A native of the Tyrol, it was introduced in 1879. It is propagated by seeds, which are sometimes offered by specialists in such plants.

S. Arnott.

## FLOWERING SHRUBS FOR THE ROCK GARDEN.

Flowering shrubs take a prominent part in the schemes of rock garden planting, and when provided with sutable positions, they produce a pleasing effect. Due consideration must be paid to the selection of the various kinds, avoiding, to a great extent, those having gross feeding tendencies. These latter, if planted in close proximity to the small-growing alpine plants, will quickly starve them out. Another point to bear in mind is the size the shrubs attain before showing their full beauty.

There are numbers of shrubs of dwarf growth that are useful for limited spaces among the rocks, and quite suitable for associating with the smaller plants, without any fear of encroachment. Positions in the background may be found to accommodate those of taller habits, and many may be used to great advantage as specimen plants within the environments of the rock garden. Additional interest is afforded by a good collection of flowering shrubs, and a more natural effect obtained by their use. Fortunately, there are many excellent shrubs quite suitable for the purpose, and generally the greatest trouble is to decide which not to plant, especially when the dimensions of the rock garden are rather small. When the garden is on a large scale, flowering shrubs may be made a fine feature, planted amongst the rocks, and growing over large boulders. Those enumerated below do not form an exhaustive list, yet they include first-rate subjects in their proper positions.

There are few shrubs that excel the azaleas for producing colour effects during the early part of the summer, and both the Ghent and Mollis types should be planted. A. amœna and A. procumbens are also particularly well suited to the rock garden. The andromedas form a splendid group of plants, A. floribunda, A. paniculata, and A. speciosa being good subjects for peaty beds. Some of the barberries are very effective; B. Darwini, B. stenophylla, and B. Thunbergi are most useful, the latter giving fine foliage effects in the autumn. Choisya ternata should be planted in a sheltered spot, and treated as a specimen plant. It is a beautiful subject, and grows into a good-sized bush. The cistuses or rock roses are indispenable for clothing dry sunny banks, and in favoured districts, where they will stand the winter, should be liberally planted. They thrive exceedingly well near the sea, and produce an abundance of blossom throughout the summer. C. algarvensis has yellow flowers, and is somewhat prostrate in growth; C. albidus, rose; C. crispus, reddish-purple; C. ladaniferus (Gum Cistus), white; C. purpureus, purple with a maroon blotch; and C. villosus, reddish-purple, are all good and delight in warm, sandy soil in sunny positions.

Cotoneaster horizontalis and C. microphylla are good plants for the rougher parts of the rockery, where their growths may ramble over and among large stones. They are by no means showy subjects when in flower, yet they well deserve a place for their berries, foliage, and good habit. Several members of the cytisus family are well suited for the purpose, such as C. Ardoini, C. Kewensis, C. nigricans, C. præcox, C. Schipkænsis, and C. scoparius Andreanus. All the cytisus delight in sunny positions, and great care must be exercised in selecting the correct places when planting. Some, such as C. Andreanus and C. præcox, do not show their full beauty until they attain a good size, therefore it would be a mistake to plant them in the foreground. Others, such as C. kewensis, should be given a place among the smaller plants. Daboicia polifolia is a pretty little heath-like shrub, with rosy-purple, bell-shaped blossoms. It rarely exceeds a height of eighteen inches, and is a most continuous bloomer. There is also a white form.

Daphne alpina, D. Blagayana, and D. cneorum may be numbered among the most select of the rock garden shrubs. A partially shaded situation suits them, and they thrive in a mixture of peat, limestone, and sand. The old D. Mezereum and its white form are well-known, and they are both beautiful subjects for the early part of the year. Dryas octopetala is a dwarf, creeping evergreen, bearing white flowers. Hardy heaths are of great value, and should be liberally planted, the tall kinds in the rougher parts of the garden and the dwarfs in the limited spaces among the small-growing alpine plants. Erica arborea, E. australis, E. carnea, E. codonodes, E. mediterranea, and many others will be found most useful. Genista hispanica, G. sagittalis, and G. tinctoria plena should have a place, the former being the showy Spanish Furze. G. pilosa and G. tinctoria plena have a prostrate habit. The kalmias should be represented by K. angustifolia rubra, K. glauca, and K. latifolia. A cool, peaty soil suits these plants, and they may be associated with the ericas to great advantage. Ledum palustre is another peat-loving subject, delighting in a cool, partially shaded situation.

The New Zealand Pink Broom (Notospartium Carmichæliæ) is a lovely shrub with graceful shoots, which bear small bunches of pea-shaped blossoms. This plant does not appear to be so well known as it deserves, and it is a most beautiful subject when in flower. It is of slow growth, but will reach the height of from four to six feet. Rhododendron ferrugineum and R. hirsutum are capital plants, and besides these two there are R. racemosum, R. odoratum, R. Wilsoni, and R. præcox to choose from. Rosa rugosa and its varieties are excellent subjects for the wilder parts of the rock garden, where they are allowed to grow at will. Romneya Coulteri (Californian Poppy) is a strikingly handsome plant, with large poppy-like flowers, white, with yellow centres.

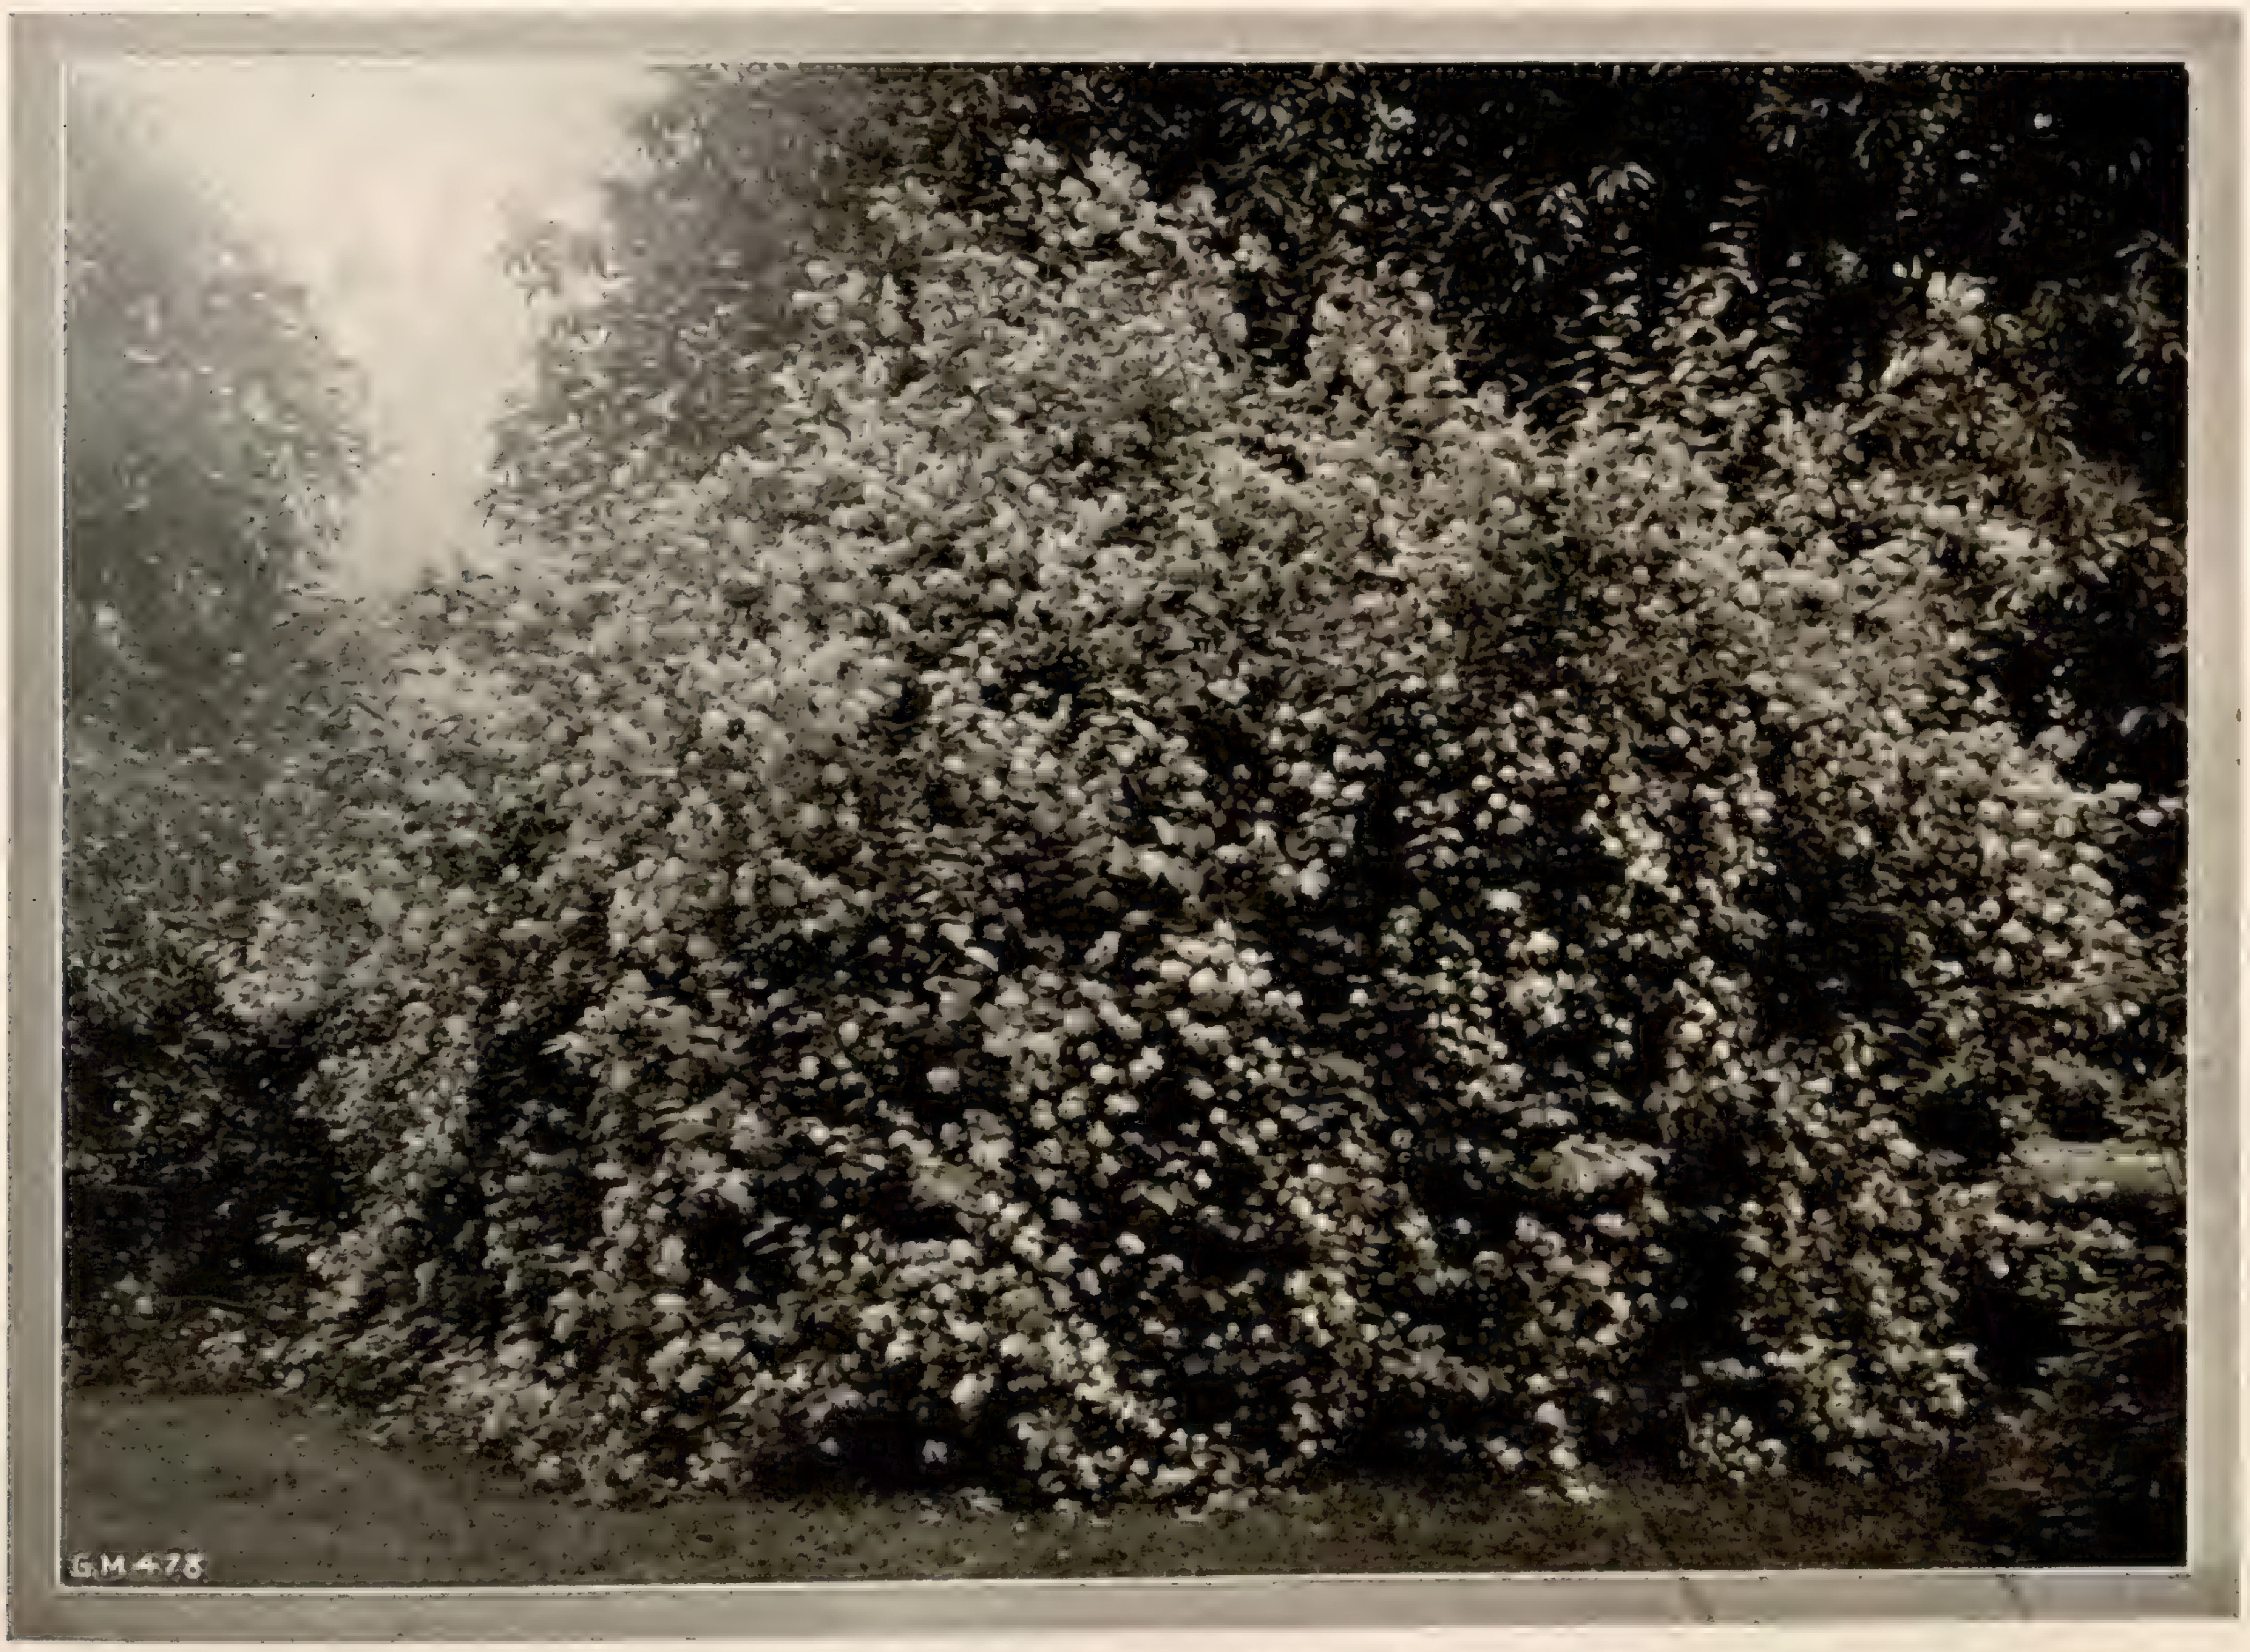
Among the spiræas we have S. arguta multiflora, a very free-flowering kind with white flowers; S. crispifolia, of small stature and with miniature foliage clothing stiff, wiry stems. This is essentially a rock garden plant, with dwarf, compact habits of growth. There are also S. Bumalda Anthony Waterer, S. Thunbergi, and others quite suitable for the rock garden. The double-flowering furze (Ulex europæa flore-pleno) creates a fine effect when grouped in suitable places. To prevent it becoming leggy and unsightly with age, hard pruning is necessary after flowering. This operation should only be performed to prevent untidiness, and must not be done annually, as in the case of many other flowering subjects. The veronicas are a host in themselves for the rock garden, the New Zealand species being especially suitable.

It is rather a difficult matter to know where to leave off when selecting flowering shrubs, but no large rock garden would be complete without a few magnolias. Specimen plants dotted about are very effective in the early part of the year. Mention may be made of M. conspicua, M. Lennei, M. parviflora, M. Soulangeana, and M. stellata. The St. John's Worts, also, are beautiful subjects.

Gnaton Gardens. E. C. Pooley.

# FLOWERING TREES AND SHRUBS FOR SPECIMENS.

Self-evident though it may be, there can hardly be any question as to the desirability of stating, by way of reminder from time to time, that one of the chief essentials to success in furnishing gardens with trees and shrubs is to select the kinds with special reference to their suitability for the positions they are to occupy. Whether they are remarkable for the beauty of their flowers or foliage, or for their elegant or otherwise distinctive habit, this fact should be constantly kept in mind when making selections. The size of the several kinds should, as far as possible, be proportionate to the area they will occupy, for when trees or shrubs that attain to large dimensions are planted in relatively small spaces, a considerable amount of pruning of roots or branches have to be done to keep them within bounds. This involves considerable time and labour, and unless the pruning is performed with considerable skill, the trees or shrubs operated upon will present a much less satisfactory appearance than kinds which can be allowed to grow unchecked, or not pruned beyond what may be necessary to maintain a proper balance between the several parts. On the other hand, where there are spacious borders to be filled and great breadths of lawn to be beautified, a considerable proportion of the kinds selected should attain to a comparatively large size, and possess some degree of boldness when full grown. Those which will be referred to in these notes grow to a rather large size, and make highly effective specimens when allowed sufficient room for their full development, but in no case are the dimensions such as to render them unsuitable for the garden.



PHILADELPHUS INSIGNIS.

A distinct hybrid, robust in growth, free in flowering, and of exceptional merit for specimens of large size. The pure white flowers are borne in comparatively long racemes.

### Æsculus.

The most beautiful of all the chestnuts is Æsculus hippocastanum, or the horse chestnut, but it is too large for gardens other than those of the largest size. The scarlet chesnut (Æ. rubicunda fl. pl) is, on the other hand, of medium size when full grown, and one of the most valuable of trees suitable for lawn specimens, even where the garden is of quite modest dimensions. Somewhat brighter in colour than the type is the variety known as Binoti, and it should have the preference in preparing a selection of the finest kinds. Æ. (Pavia) macrostachya is a handsome tree of small size, and very attractive when bearing a profusion of its pale yellow flowers. It is suitable both for borders and lawns, but it requires a rather warm soil for its full development.

### Berberis.

There are a considerable number of berberis that are most attractive when placed under conditions favourable to their full development, but the finest of all for growing as specimens on the lawn and in bold groups in spacious borders is Berberis stenophylla. Most desirable also is its handsome double variety. Both are extremely elegant in growth, and the rich orange-coloured flowers are borne in great profusion along the slender, gracefully-arching branches. B. Darwini possesses merit for the formation of border groups, but it is not equal to the former for lawn specimens. In growing B. stenophylla on the lawn a good effect is quickly obtained by forming small beds three feet or so in diameter, and arranging three plants in each.

### Buddleias.

Of the buddleias now in cultivation, the most valuable, both for lawn specimens and shrubbery borders are the varieties of B. variabilis, which have been introduced to this country within recent years. As these are dealt with in another part of this issue, I shall not refer to them further than to say that they make excellent lawn specimens, of which a considerable number have come under my notice in English and Scottish gardens. B. globosa, with its orange-coloured, globular flowers, forms a handsome bush with comparatively little attention, and is so distinct in character and colour as to deserve to be more generally planted than has yet been the case.

### Cerasus.

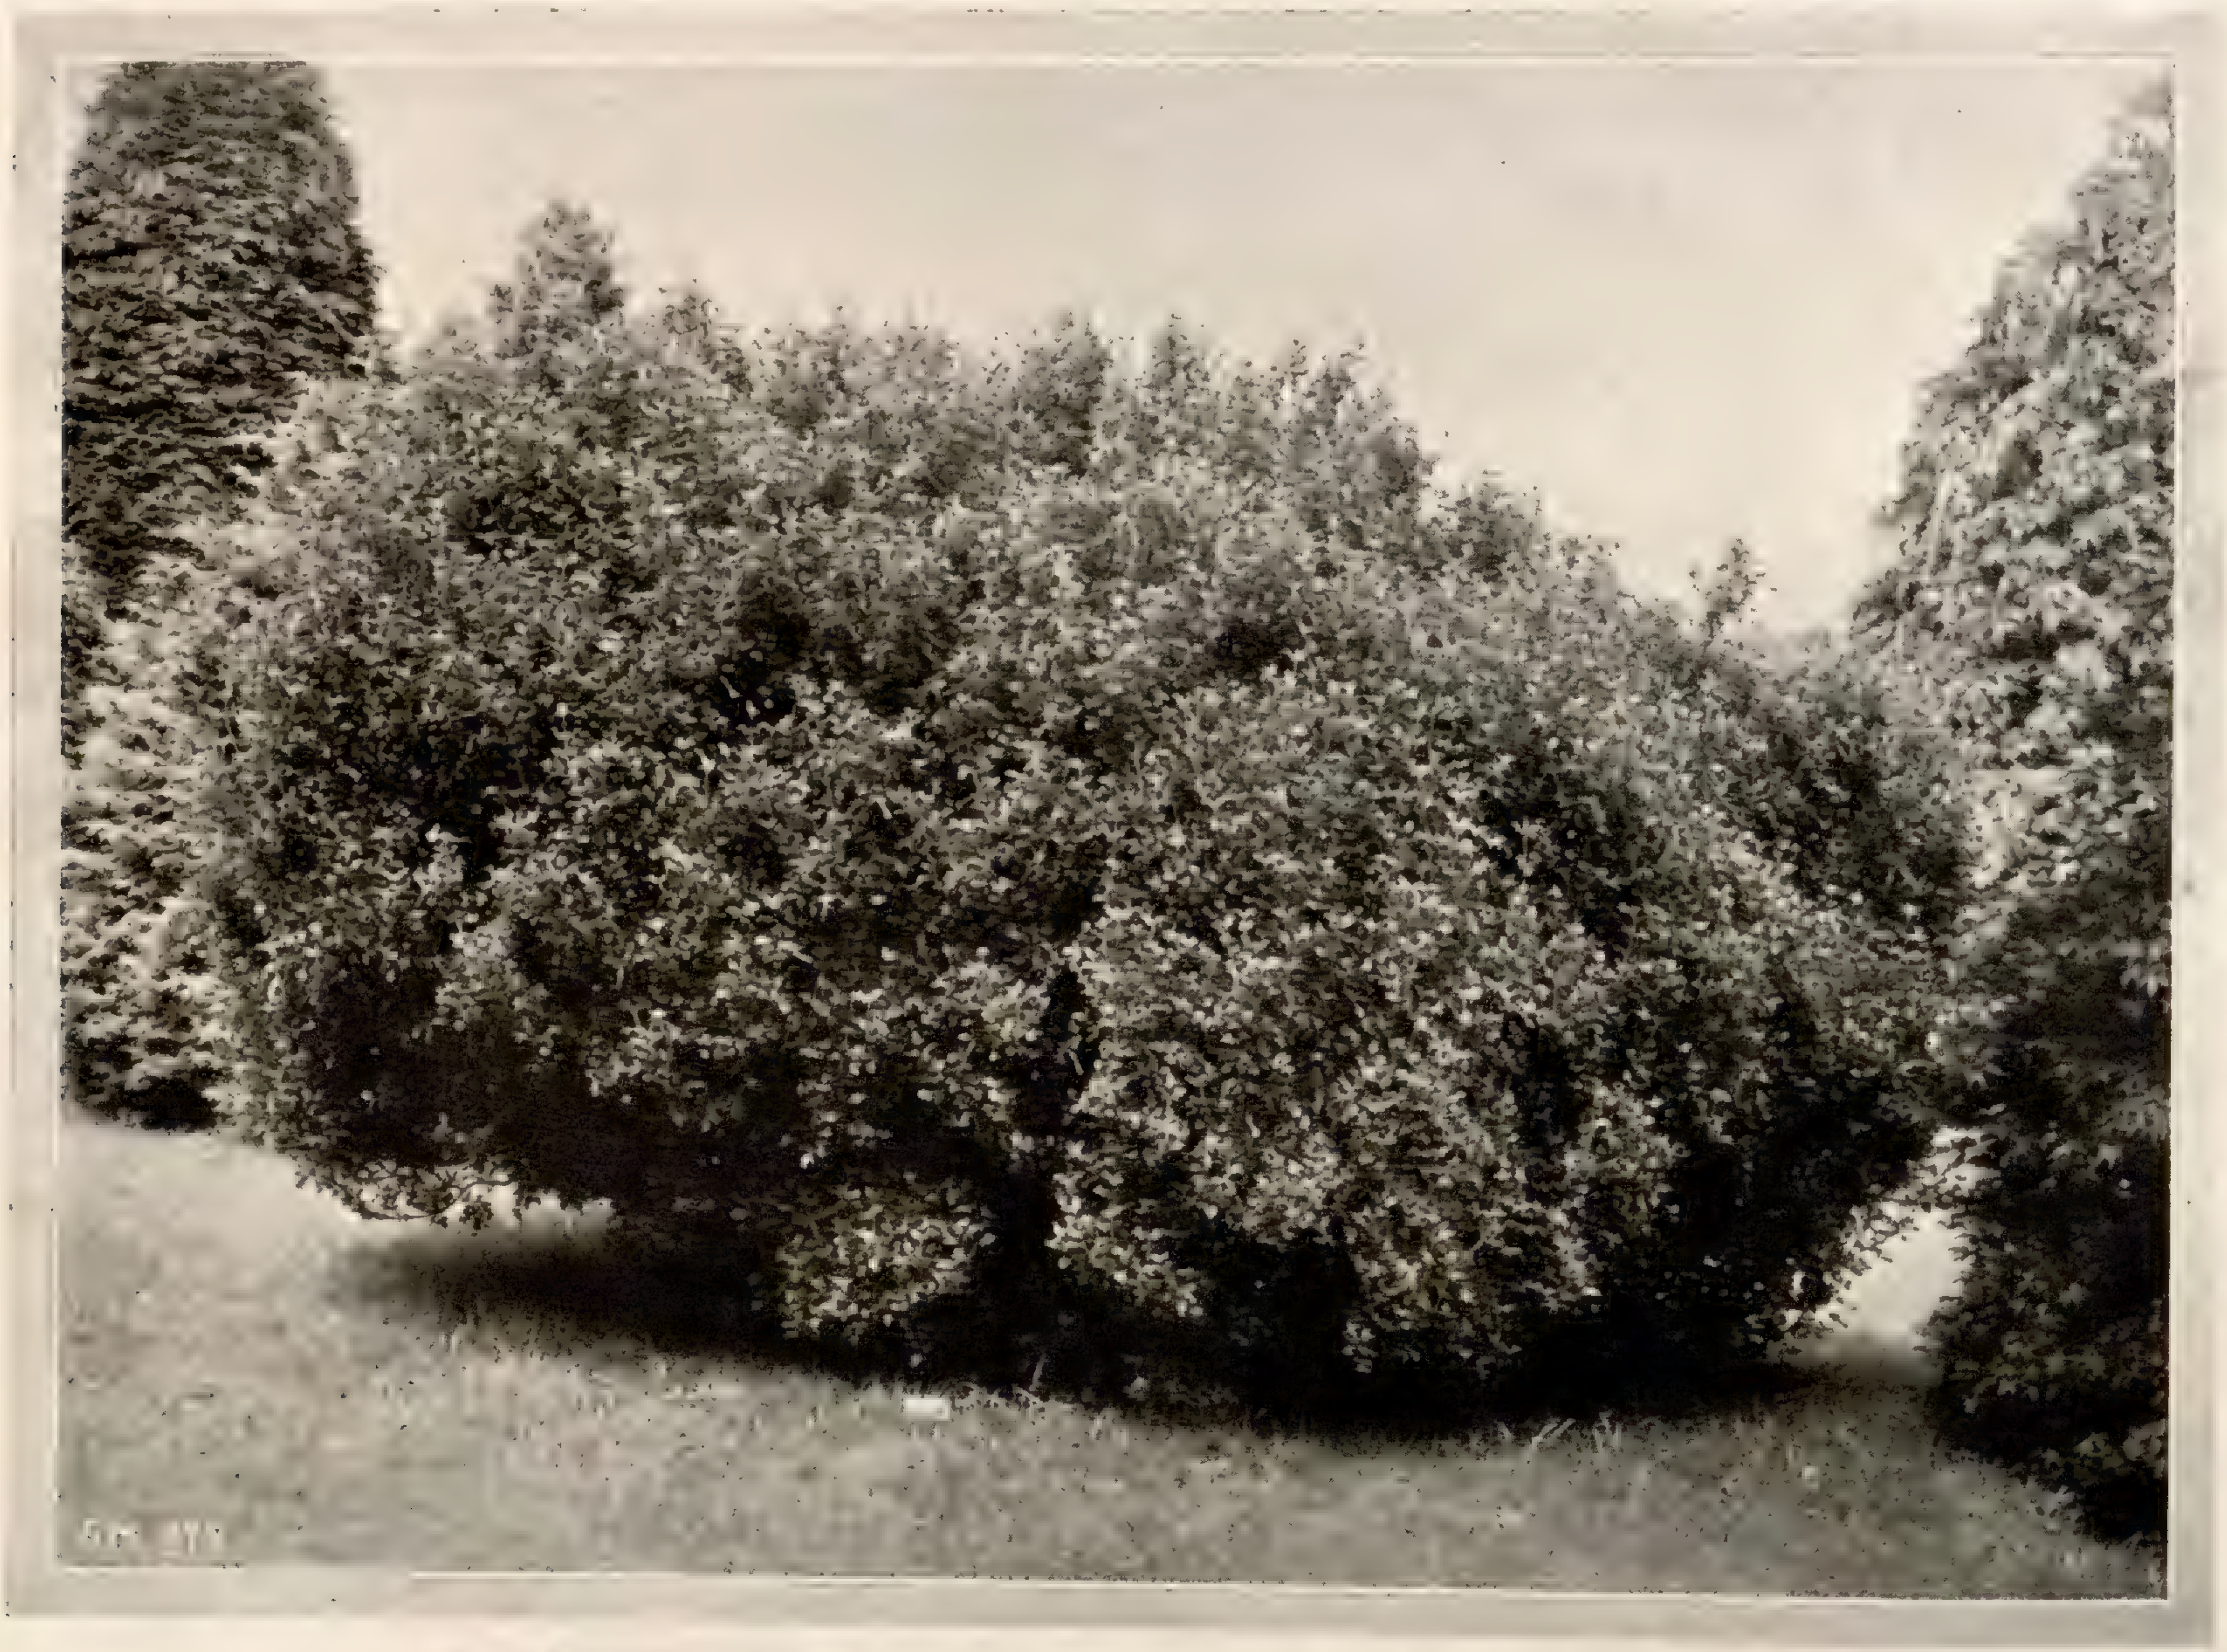
The ornamental cherries include some of the finest of the trees suitable for the garden, and should be included in the smallest selection. Those that can be the most strongly recommended are Cerasus avium fl. pl., a comparatively large tree, bearing in great profusion large pure white double flowers. C. pseudo-cerasus, a handsome tree, with compact, spreading head, and bearing in great profusion large double flowers of a pale rose colour. Its variety, J. H. Veitch, is still more beautiful; the flowers are not less profuse, but are larger and are of a brilliant rose-pink hue. As they bloom at different periods, both should be planted. C. p.-c. serrulata is very free in blooming, and has large double-white flowers. It is distinct in growth, the main branches spreading out more or less horizontally, and producing a distinct effect.

### Cratægus.

The hawthorns include a goodly number of trees of great beauty when in bloom, and some are highly attractive at other periods of their growth. The double-flowered varieties of the common hawthorn make handsome trees of medium size, and are remarkably beautiful when in bloom. Paul's Double Scarlet is the best of them, but the Double Pink and Double White are both desirable. The Weeping Thorn, which has single white flowers, is a graceful tree that should not be overlooked. C. Carrierei and C. tanacetifolia are two beautiful white-flowered thorns that are of much value, as they bloom several weeks after the varieties of C. oxycantha. All the thorns here mentioned are especially suitable for lawn specimens.

### Desfontainea.

The distinct and beautiful Desfontainea spinosa is unfortunately not sufficiently hardy to admit of it being successfully grown other than in kind climates. In the southern western counties it grows vigorously and blooms freely, but nowhere have I seen it in such a high state of development as in the famous gardens of Castlewellan, the Irish seat of the Earl of Annesley. These gardens are on a southern slope of one of the smaller of the Mourne Mountains, co. Down, Ireland, and about four miles from the sea. In these gardens the desfontainea grows with the vigour of the holly, and the specimen herewith illustrated was about fifteen feet in diameter and eight or nine feet high. There are several large specimens of this beautiful Chilean shrub at Castlewellan, and all were flowering with great freedom when I saw them at the end of July last. The flowers are about three inches in length, and of a rich scarlet hue, with golden-yellow lobes. Where the conditions are favourable it forms a very handsome lawn specimen, and should be planted wherever there is a probability of it succeeding, a warm position being selected for the purpose of the experiment. The specimen illustrated was bearing thousands of flowers, but owing to their tonal value, photographically, being much the same as that of the leaves, they are not readily seen.



A MAGNIFICENT SPECIMEN OF DESFONTAINEA SPINOSA.

In the gardens of Castlewellan, the seat of the Earl of Annesley. In growth and foliage this Chilean shrub resembles the holly, and bears a profusion of scarlet and yellow flowers.

### Eucryphia.

The beautiful E. pinnatifolia is another introduction from Chile, and is of much value from the fact that it can be successfully cultivated under conditions less favourable than those necessary in growing Desfontainea spinosa. In favoured districts it makes a good lawn specimen, the large pure white single flowers being especially attractive; but in many gardens it will be preferable to plant it in a warm, sheltered border. In most gardens to which it is introduced for the first time it will be well to grow it in a sheltered border for a year or two, and then transfer it to an open position should it be considered advisable.

### Laburnums.

The laburnums are equally useful as single specimens on the lawn and for planting in prominent positions in shrubbery borders. Both the Common (L. vulgare) and the Scotch (L. alpinum) laburnums should be grown, the finest of the varieties being, as a matter of course, selected. The best of the forms of the first-named are Alschingeri and Vossi, and of the latter Parksi and Watereri. The Scotch laburnum and its varieties are the best suited for lawn specimens, because of their shapely heads, and they are somewhat later in flowering than L. vulgare and its varieties.

### Magnolias.

The best known of these trees have no superiors, and should be grown in both large and small gardens. They are admirably adapted for cultivation as lawn specimens and also for association with other subjects in the shrubbery border. M. conspicua and M. Soulangeana and their varieties make handsome trees, some twenty or more feet in height, and are characterised by freedom of flowering. The first-named, as so well known, has white flowers, while those of the other are pale rose, and where space permits both should be planted; but where there is room for only one, M. Soulangeana, should be selected because of it being later in coming into bloom, and the flowers not so liable to be injured by frost. Nigra, a deep-coloured form of the last-named, is well deserving a place in the garden, although not, perhaps, quite so attractive as the type. M. Lennei has the advantage of being still later in coming into bloom, and has very large flowers of a rich red-purple on the outer side. In the western counties well-developed trees are to be met with, but elsewhere it usually grows in the form of a big bush. The stations for magnolias should be carefully prepared by adding a liberal proportion of light, rich compost to the staple soil.

### Philadelphus.

The mock oranges of robust growth include several that, by reason of their graceful habit and abundant flower production, are admirably adapted for lawn specimens and of much value for occupying prominent positions in the shrubbery. Even the old and well-known P. coronarius and several of its varieties, are not without value as specimens, but they are so far inferior to several others that there is no occasion at the present time to consider their merits. P. Gordonianus forms a very attractive specimen when allowed sufficient room for the full development of its growths, which, in the flowering season, are simply wreaths of the large snowy-white blossoms. P. grandiflorus floribundus is equally vigorous and free in blooming, and has the advantage of being more graceful in habit, and is therefore preferable. Somewhat similar in character to P. grandiflorus floribundus and of much merit is P. Lewisi californica, both for planting on the lawn and in the shrubbery.

It is well to consider the merits of the three last-named kinds, because some of them can be readily obtained in the usual way, but the best of all the mock oranges attaining a large size is the comparatively unknown P. insignis. This hybrid, the specimen of which at Kew is herewith illustrated, has a robust and elegant habit, and produces its flowers very freely and in large racemes, as so well shown in the illustration. The flowers are of the purest white, and not fragrant. As this fine mock orange is so little known that it has not yet made its way into trade catalogues, it will be of interest to mention that it was first described by M. A. E. Carriere as a new plant in the "Revue Horticole" in 1870 (page 40). It was apparently sent to him by M. Billiard, who appears to have been the raiser, for it is of hybrid origin. The synonymous name of P. Billiardi, which the plant bears, also suggests that it was raised by M. Billiard. In the description no mention is made of the parents. The Kew specimen has attained dimensions that suggest its having occupied its present position upwards of twenty years.

### Prunus.

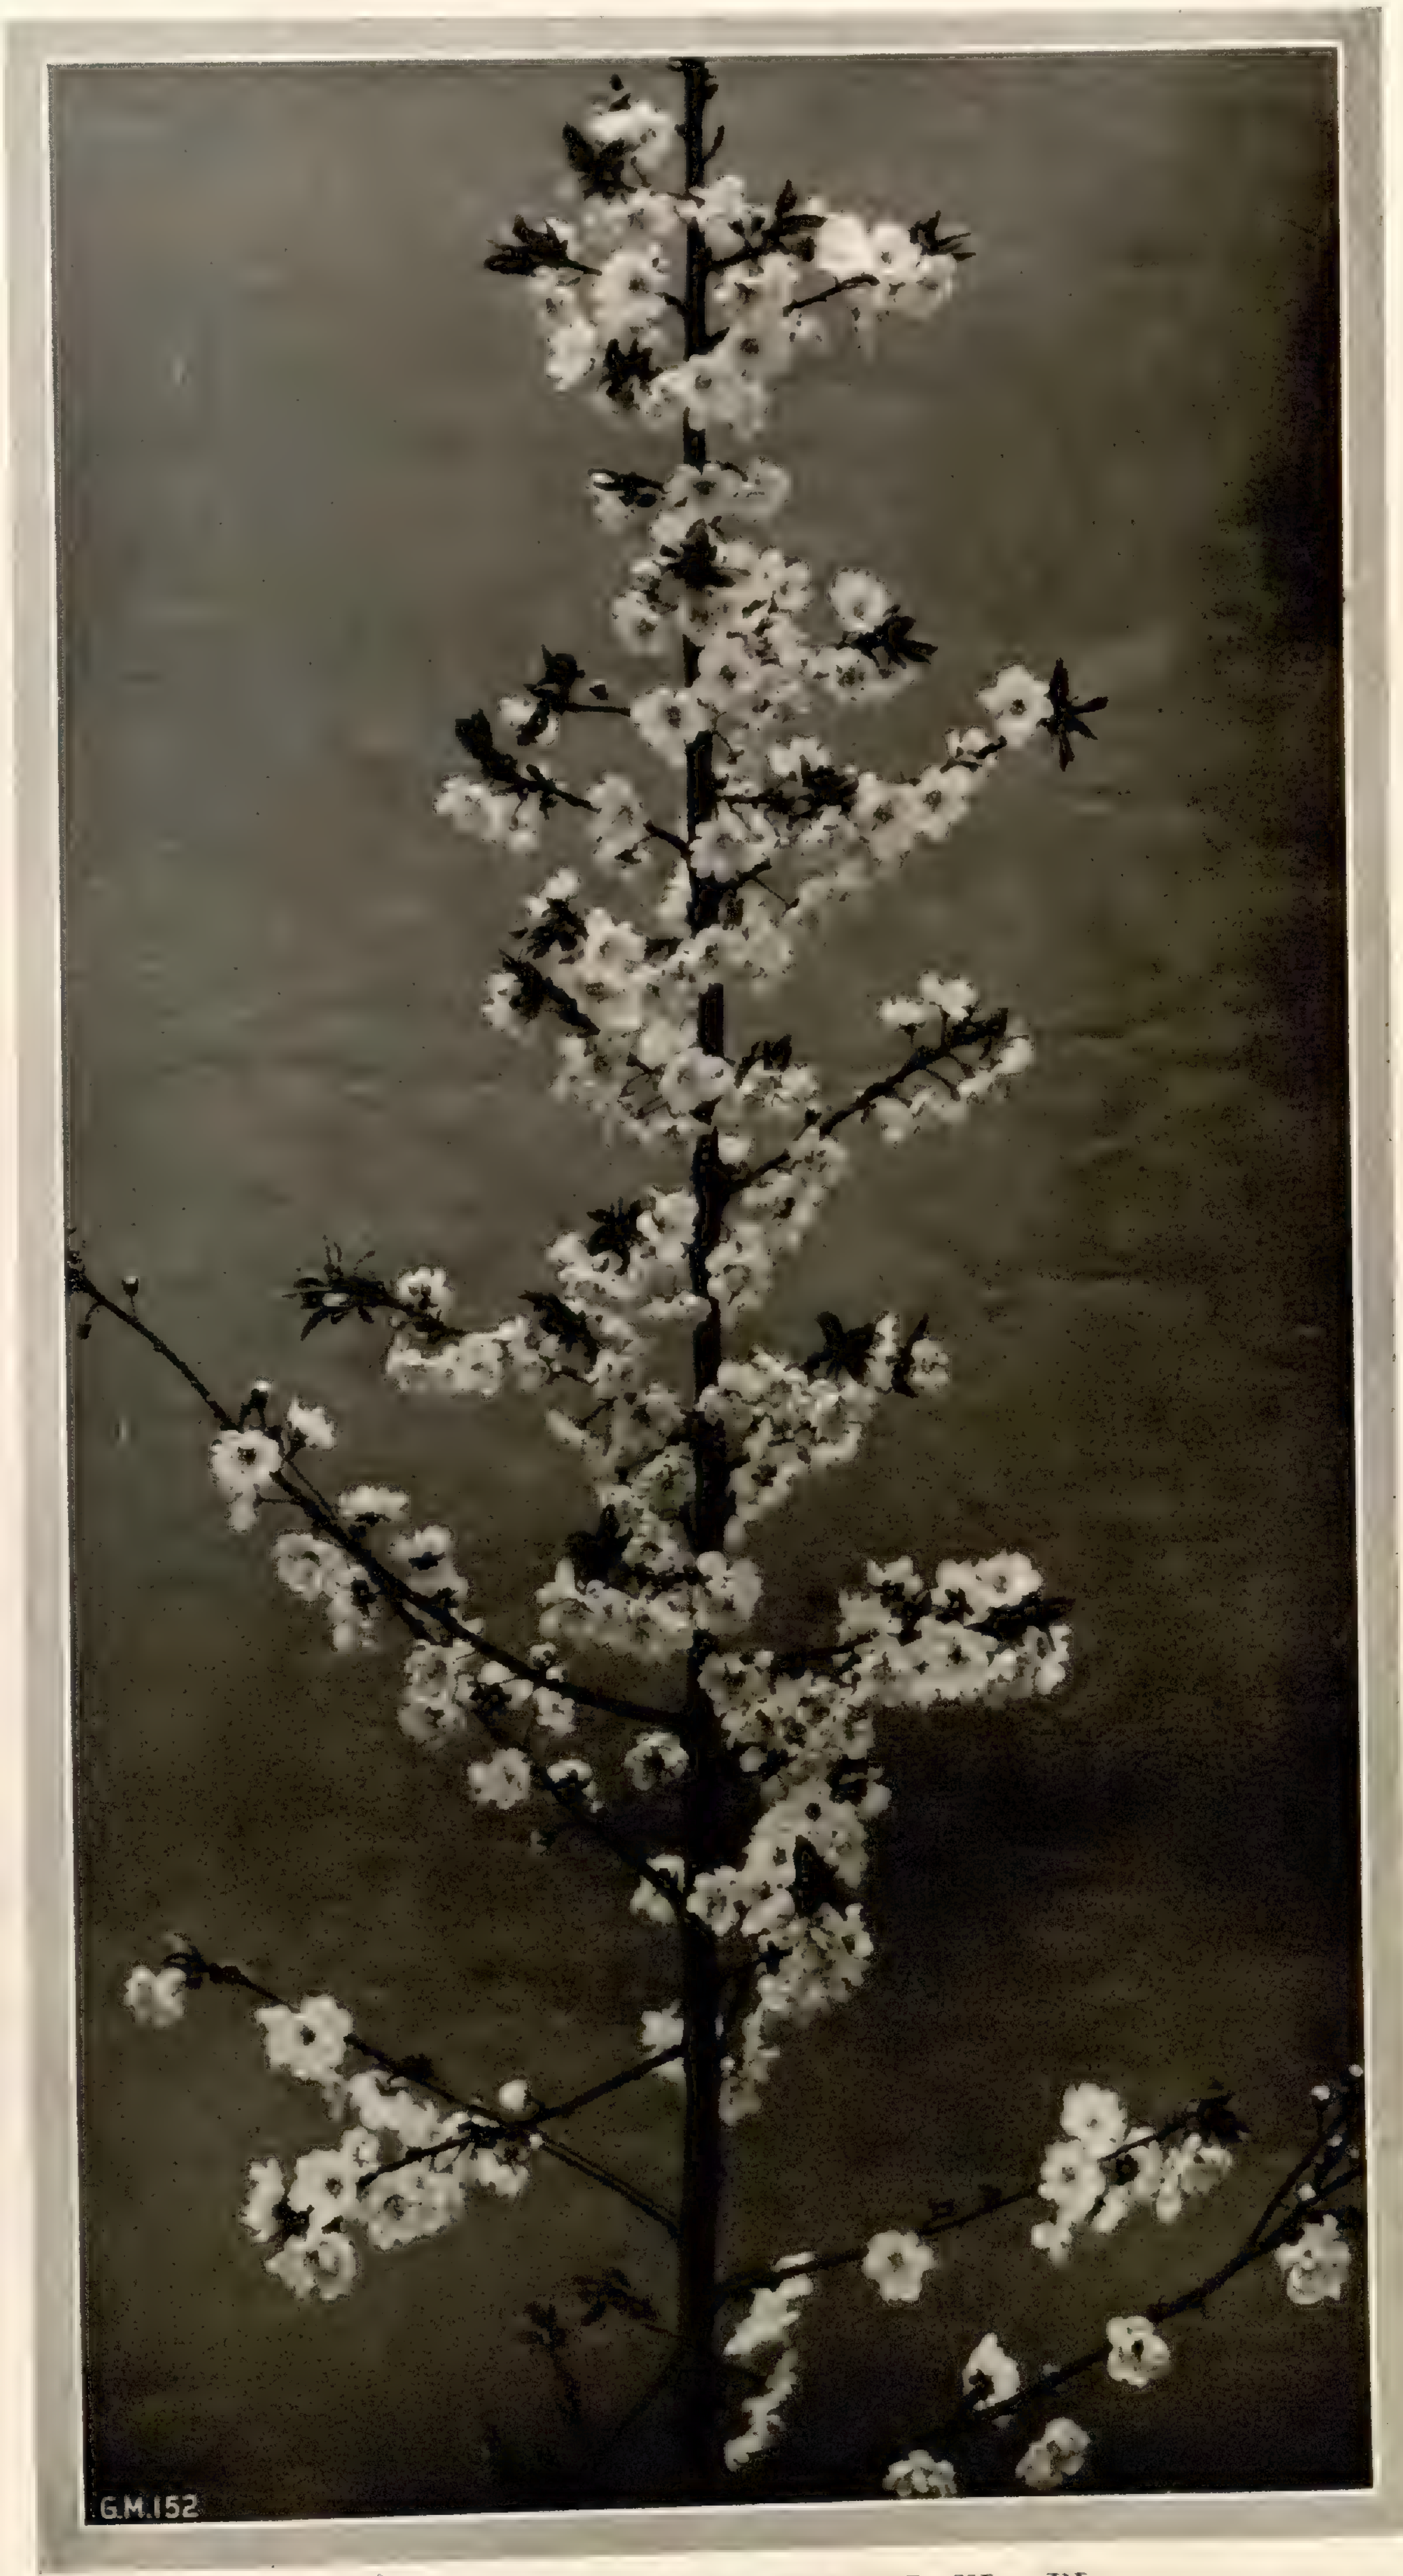
The well-known Prunus Pissardi forms a handsome tree of moderate size, and the pale flowers produce a pleasing effect in contrast with the dark bronzy-red leaves, which usually make their appearance during the season of flowering. Still finer in every way is its variety Moseri fl. pl., which has large double rose-coloured flowers that retain their beauty for a longer time than do those of the type. The foliage is equal in depth of colouring to that of P. Pissardi, and the tree has therefore a double claim upon planters engaged in the creation or improvement of garden scenery.

### Spiræa.

The remarkably distinct and handsome S. Lindleyana, with elegant leafage and feathery inflorescence is one of the best of the shrubby plants for lawn specimens, and it has the advantage of being equally suitable for both large and small gardens. Two or three plants will, if arranged in a small bed, which has been liberally enriched with manure, soon form handsome specimens.

### Syringas.

The lilacs include some of the best of the flowering shrubs for the purpose now under consideration, and should be rather freely used in proportion to the area of the garden. Alba grandiflora, white; Dr. Lindley, deep rose; Congo, rose-red; and Princess Marie, pink-lilac, are excellent single varieties; and Alphonse Lavallée, violet-blue; Lemoinei, rose-lilac; Madame Abel Chatenay, white; Madame Lemoine, pure white; Michael Buchner, lilac; and President Grevy, rose-lilac, are double varieties possessing much merit. In the cultivation of lilacs as specimens it is essential to keep them to one main stem by the suppression of suckers, and they should all be on their own roots. Rubra de Marley is very effective when grown in standard form with six or seven-feet stems.



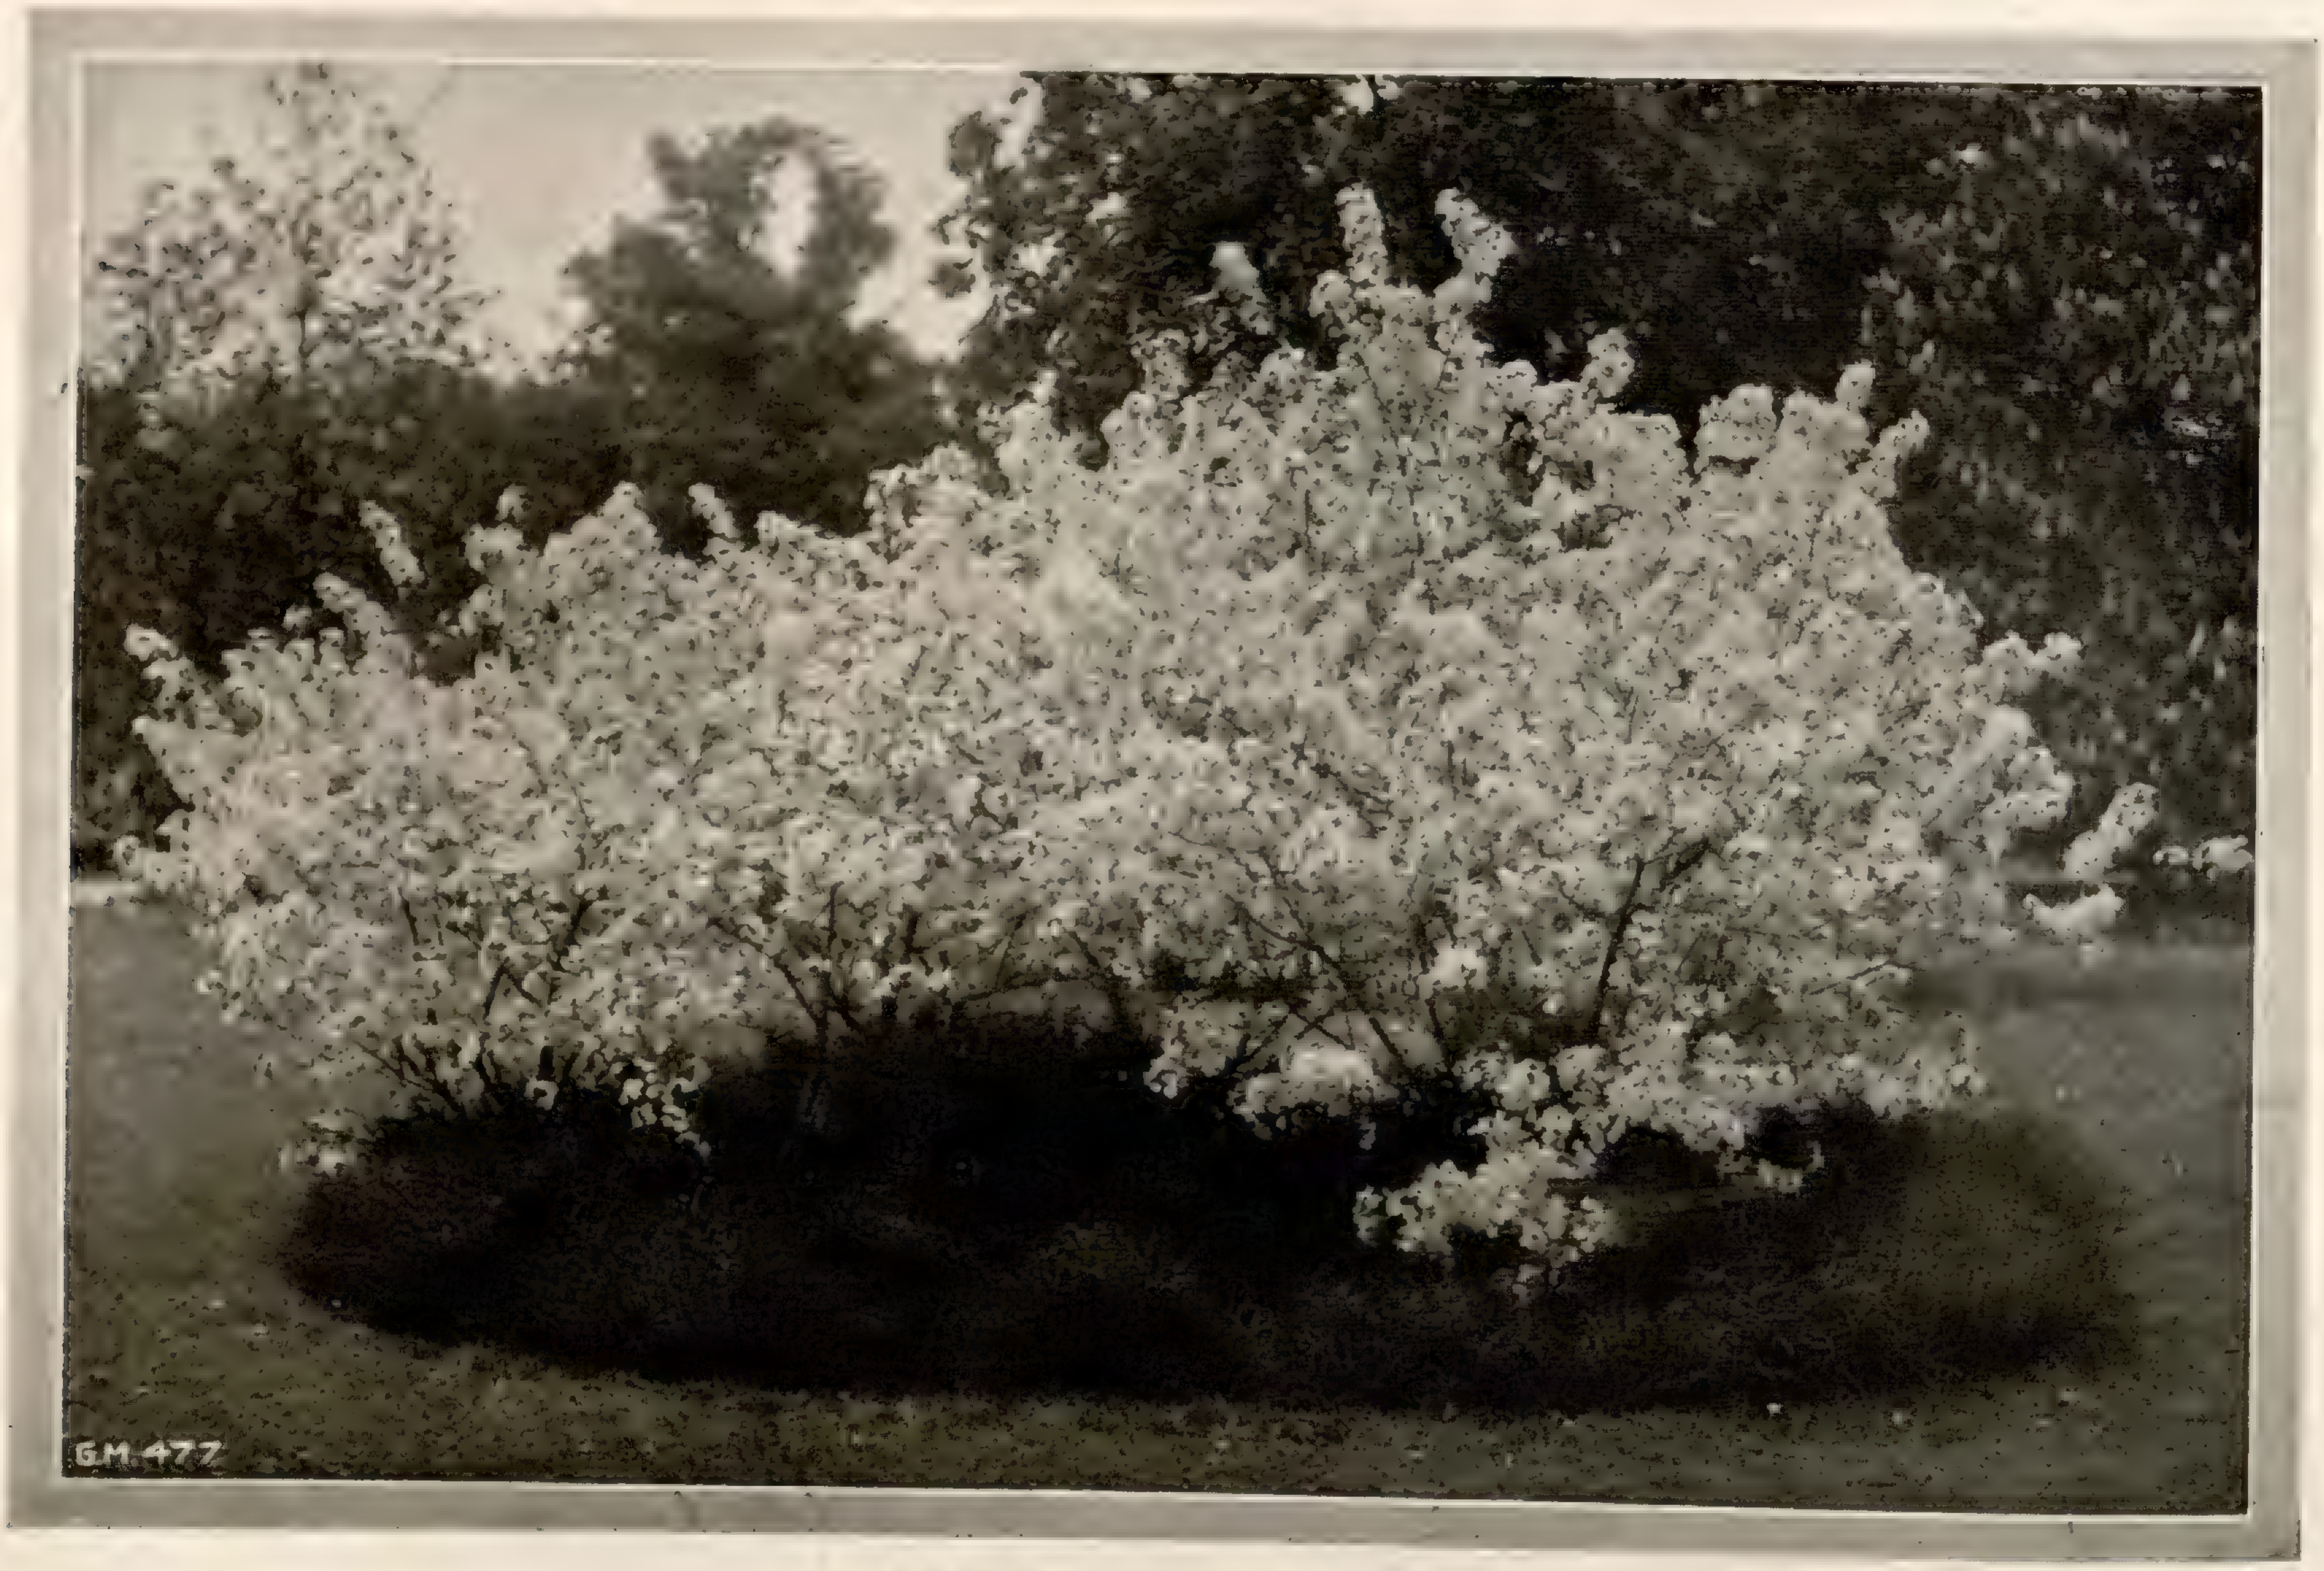
PRUNUS PISSARDI MOSERI FL. PL.
A fine variety, with large semi-double rose-pink flowers and bronze-red foliage.
A.M., R.H.S., March 19. Messrs. J. Veitch and Sons, Chelsea.

### Viburnum.

The Guelder Rose or Snowball Tree (Viburnum opulus sterile) is especially attractive when grown as lawn specimens, and these are readily obtained by arranging three plants in a small bed. It is, of course, one of the most beautiful of the kinds with white flowers for bold groups in the shrubbery, but in too many instances the plants are so crowded as to render it impossible for them to show their true character. It is not desirable this shrub should occupy over much space, but the plants grown should have enough room to display their distinctive charms. G.

# THE ORNAMENTAL CRAB APPLES.

Amongst the species of trees which constitute the genus pyrus are many which exhibit ornamental features of the highest quality, and of this number several of the best are included in the malus or apple section of the family. They possess a fairly lengthy flowering period, for the earlier ones may be found in bloom by mid-April, and the late ones are scarcely over by the end of May. Added to this, a number of kinds produce highly-coloured fruit, which, in itself, is a reason for their culture. As a rule, the various sorts of pyrus are amongst the easiest trees to cultivate, but it must be remembered that they are subject to attacks from American Blight in the same degree as the garden kinds of apple, therefore it is inadvisable to plant them in crowded places where they cannot obtain plenty of air, or in districts where American Blight is very bad, for it is only species belonging to the malus section of the genus which fall a prey to the pest, other kinds escaping, even when growing amongst badly infested apple trees. Amongst the numerous kinds included in the section, the following are specially worthy of note:



PYRUS SCHEIDECKERI. [Photo: C. P. Raffill.

An effective lawn group of this beautiful crab in the Royal Gardens, Kew. The flowers are relatively of large size, and of a pleasing pink hue.

### P. baccata.

This, the well-known Siberian Crab, grows into a large, round-headed tree, 20 to 35ft. high, with a branch diameter of 30ft. or more. The almost white flowers are slightly flushed with rose, and it is rarely that they are not produced in such profusion as to almost hide the branches. There are several varieties, but they do not differ much in regard to flowers; the principal differences being noticeable in colour, shape, and size of fruits. P. baccata is a native of the Himalayas, China, and Japan.

### P. coronaria.

The American Crab Apple is met with in a wild state in the Eastern United States. The type is rarely seen in this country, but a variety with double flowers has attained a certain amount of notoriety during the last few years. P. coronaria forms a small round-headed tree with large, white, rose-flushed flowers, that are followed by round fruits, which, when ripe, are of a bright glossy green. The variety flore pleno is remarkable for its large flowers, which are not approached in size by those of any other pyrus, for they frequently exceed two inches in diameter, and are white with a rather deep rose flush. They appear towards the end of May.

### P. floribunda.

This finds favour with everyone by reason of its free-flowering character. It more often assumes the dimensions of a large bush, rather than a tree, and specimens 15ft. high, and 20 to 30ft. in diameter, with branches sweeping the ground, may often be seen. The rose-shaded flowers open about the end of April, and they are in such profusion as to hide the branches. A variety, atrosanguinea, with darker-coloured flowers than the type, may be obtained. By forming a group of the two kinds a very pretty effect is provided. The species is a native of Japan.

### P. Halliana.

A certain amount of mystery centres about this tree, for no one appears to know what its origin is. It, however, seems to be a hybrid, and probably P. floribunda is one of its parents. It is, however, of more upright and less bushy habit than that species. Whatever its origin, it is very showy, for the semi-double flowers are large and heavily shaded with a rich rosy-red hue.

### P. malus.

Many fine specimens of this, the common European crab apple, will be called to mind, occupying places in hedgerows and plantations in various parts of the country. Its rose-flushed flowers are very like those of our garden apples, and they are frequently succeeded by highly-coloured fruits. Of the several named varieties, astracanica, the parent of the Red Astracan apple; flore-albo pleno, pendula, and rosea, are very distinct.

### P. Niedzwetzkyanus.

This is one of the most distinct of all pyruses, and one which has been highly recommended of late for general planting. Whether it is really a good species, or whether it is but a well-marked form of P. malus is not very certain. Obtained originally from the Caucasus, it has many points of resemblance with the common crab apple, but its flowers are a peculiar shade of red, and a similar colour permeates all parts of the tree; leaves, wood, roots, and shoots. This peculiar character separates it from all other kinds, and makes it a popular tree for ornamental planting.

### P. prunifolia.

In many respects this Siberian species has much in common with P. baccata, the principal difference being noticeable in the fruits, for, whereas in P. baccata the calyx lobes are deciduous and fall very early, in P. prunifolia they are persistent, and last until the fruits fall. The fruits of the latter kind mature at an earlier date than those of the former. Some forms are highly coloured and very showy.

### P. Ringo.

This Japanese species bears white, rose-flushed flowers an inch across with great freedom. Its most showy time is, however, autumn, for at that period the branches are heavily laden with golden fruits.

### P. Scheideckeri.

This has only become really well known during the last ten or twelve years. Of hybrid origin, its parents are said to be P. prunifolia and P. floribunda. The flowers are semi-double, and larger than those of either parent, and they are borne with such freedom that growth suffers, and the bushes are apt to assume a stunted character, whilst it is often difficult to get good growth buds for purposes of propagation. It is popular alike for border culture and for forcing.

### P. spectabilis.

A native of China and Japan, this is rarely represented in this country, except by one or other of its double-flowered forms. The type assumes the proportions of a well-grown apple tree, and bears large flowers 1½ to 2in. across. The variety flore pleno is extremely ornamental, both when in flower in April or May, and again in autumn, when the leaves assume very pretty tints previous to falling. This form has large pink and white flowers; flore albo has white flowers, and Kaido rich rose-coloured blooms.

### P. Toringo.

Another Japanese tree of showy appearance when in flower; it is, however, of less general worth than the double-flowered form of P. spectabilis.

In addition to the kinds mentioned above. the numerous large-fruited crabs of the John Downie type are all very pretty when in flower. W. Dallimore.

Kew.

---

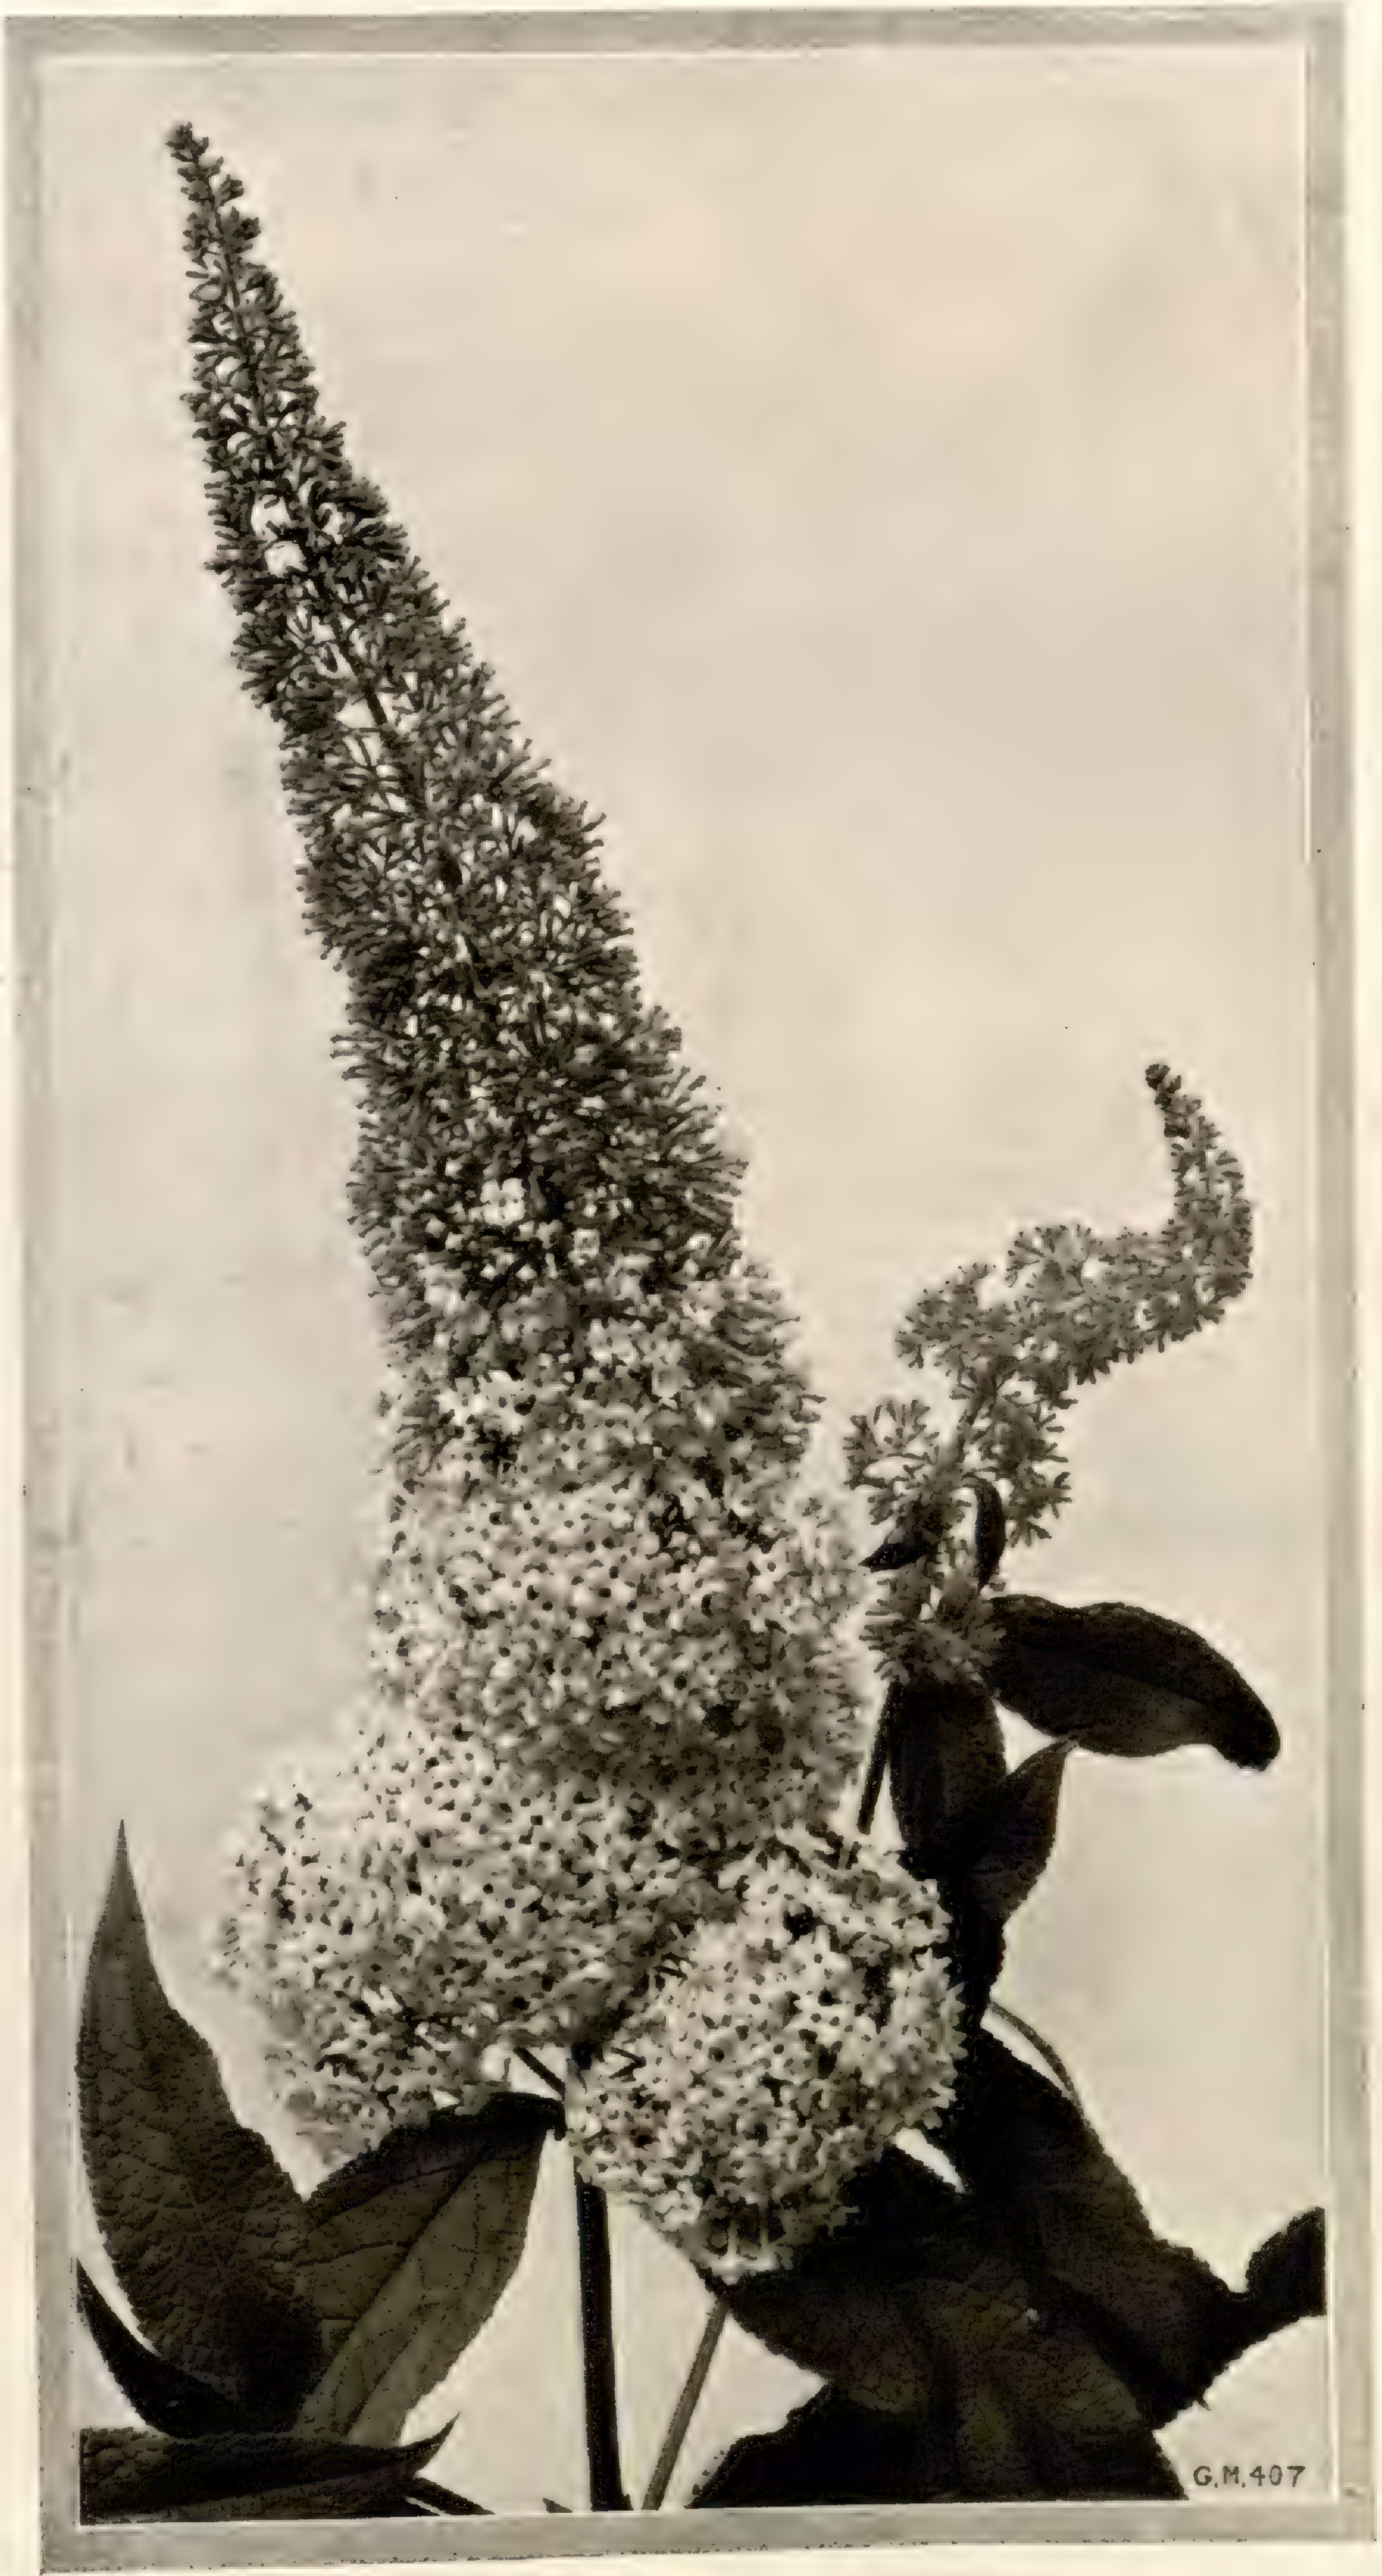
## BUDDLEIA VARIABILIS AND ITS VARIETIES.

Probably no packet of seed amongst the numerous ones received from the Arnold Arboretum in 1908 more fully justified great expectations than did the one of Buddleia variabilis. Mr. Wilson, the well-known collector, speaks of the particular bush from which he gathered the seed as being a good form, with flowers of a dark purple hue, and this no doubt accounts in a great measure for the many beautiful and distinct varieties that have been raised from it.

The seed in question was sown with many others in shallow boxes and placed in a warm house early in the New Year, and there remained for a month or two, any that showed signs of germinating being removed immediately to a cooler structure. When well hardened off, the seed boxes were transferred to cold frames, and the pricking off of the seedlings into other boxes with a rather greater depth of soil received attention in due course. For a time they were kept close, and carefully watered until established, when air was freely given, the plants making luxuriant growth.

The largest plants were in the same season pricked out in a border, chiefly with a view to test their hardiness. The following spring they were replanted, and made excellent growth, and flowered abundantly, and the different varieties were noted and marked accordingly. Since then we have planted them freely amongst our flowering and other shrubs, and few subjects during the season of flowering have been more greatly admired.

The varieties of Buddleia variabilis ought to be planted in every garden where a home for shrubs is found, as they are not exacting in their requirements, are quite hardy in constitution, and though the foliage may be cut with early autumn frosts before fully matured, they will break again with wonderful freedom in the spring. The spikes of flowers can only be described as magnificent, and frequently one sees a growth six to eight feet long bearing a huge terminal spike with numerous lateral growths that will bloom later. For quite two months they continue in bloom, and the spikes last a long time when cut and placed in water for room decoration. To obtain the largest blooms the plants should be pruned back fairly hard in the spring as growth is commencing, and for the information of those who may intend planting them this autumn, it may be stated that the addition to the soil of manure, road sand, and leaf-mould will be found of benefit. Where the plants are grown in masses of rhododendrons and allowed to produce their flowers above the foliage of the latter as I have seen them, the spikes naturally lose in point of size, but a large bush is most effective.



BUDDLEIA VARIABILIS SUPERBA.

A distinct and handsome variety; the flower spikes very large, and the colour rich blue.

Propagation is effected by means of cuttings, which are best taken during the month of August, and inserted in pots of sandy soil, using clean, well-drained pots and a compost of finely-sifted loam, leaf-mould, and coarse sand. Make fairly firm, and choose young growths that will be found breaking from the axils. Keep very close, and shade from bright sun, and give a thorough soaking of water with a rose-can after insertion. These will soon callus over, but do not often root readily, therefore potting off singly should not be too hurriedly carried out. Another method of increasing them is by division of the roots, for, as can often be seen when transplanting, the small portions left in the ground readily form young plants.

The variation in colour comprise shades of rose from pale to dark, lavender, pale blue, purple, etc., each and all the shades being very beautiful. A distinct variation is also shown in the shape of the spikes, some being particularly long and narrow, while others form quite a pyramid of bloom.

Among the best of our varieties are B. variabilis rosea, quite one of the best and most distinct; B. v. lilacina, an attractive flower of a pleasing and uncommon lavender hue; B. v. gigantea, an imposing variety, with immense growths and spikes of flower; B. v. superba, a fine variety, the flowers rich blue and borne in handsome spikes; B. v. Delight, B. v. Distinction, and B. v. perfecta. As so well known, B. v. magnifica and B. v. Veitchiana are highly attractive.

Edwin Beckett.

Aldenham House Gardens.

## VARIETIES OF HARDY CLEMATIS.

A large number of the clematises now in cultivation are capable of investing gardens with a degree of beauty that is not readily excelled by any other group of climbing shrubs; indeed, their only formidable rival is the rose, and happily each genus is particularly rich in those colours that are but sparingly represented in the other. It is not unusual to find capacity of these two classes for decorative effect reaching its highest expression when employed in combination. On pergolas and arches and for clothing unsightly trees or clambering over rustic work, the unrestrained growth of clematis has freest expression, and even if the space is limited, they may still be employed, either grown on a single pole, or in the form of free pyramids, formed by three poles erected in the form of a tripod. The hybrid forms are mostly moderate growers, and, if allowed to ramble over another shrub, such as an old bush of laurestinus, they disclose their beauty in a pleasing manner, and rarely injure their living support.

Clematises succeed in a cool, rich soil, which should be prepared by being broken up to a depth of at least two feet, some time in advance of planting. They are partial to limestone, and should therefore have a quantity of old mortar or chalk added to the soil where such is naturally absent.

The trade usually supplies garden varieties of clematis grafted upon a wild species, and in planting it is advisable to keep the union well under the surface of the ground with the view of inducing the scion to form roots on its own account. It is common knowledge that the clematis frequently fails when grafted from some unexplained reason, often dying down to the ground, but there is always the possibility of it breaking again from a dormant bud, and when on its own roots the resulting growth will be of the variety desired.

Clematises bloom at different periods of the year, some flowering upon wood of the previous year. These form the earliest section, and include the well-known montana and its variety rubens, the latter differing from the type in having purple leaf-stalks and dark foliage and rose-coloured flowers. The forms of C. patens bloom in succession, the flowers being much larger and the colours varied. A selection includes: Lord Derby, pale mauve, with purple anthers; Margaret Dunbar, pale blue; Nelly Koster, white; Sir Garnet Wolseley, blue with distinct bar of plum colour; The Queen, lavender; Fair Rosamund, blush-white.

Forms of C. florida bloom about midsummer, producing flowers of the largest size; representative varieties are: Countess of Lovelace, double rosettes of bluish lilac; Duchess of Edinburgh, pure, double white; J. G. Veitch, lavender-blue; Elaine, double azure blue.

The varieties of lanuginosa bloom on the current wood, and flower throughout summer and autumn in many soft, delicate shades and large flowers. Typical varieties of great excellence include: Elsa Spath, deep violet-purple; Fairy Queen, flesh-white, with a bar of pink; King Edward VII., lilac-mauve, deeper centre; Henryi, creamy-white; Lady Caroline Neville, heliotrope, with mauve bars on petals; Marcel Moser, mauve-violet, with a distinct bar of red; Mr. Gladstone, azure blue; Queen Alexandra, pale lavender, lilac-purple base.

The varieties of C. Jackmani bloom in autumn from wood of the same year; the flowers are large and the colours exceedingly rich. These include Gypsy Queen, velvet purple; Jackmani, in distinct colours, white, red, and violet-purple, the form superba being the richest of the last-named shades; Mdme. Edouard André, velvety red; Perle d'Azure, sky blue; Snow-white Jackmani, large white; Velutina purpurea, dark purple-violet; Ville de Lyon, reddish-crimson.

Hybrids of coccinea bloom in autumn, having small, bell-shaped flowers of great beauty; Admiration, deep salmon, edged violet, and shaded with violet heliotrope; Countess of Onslow, bright violet-purple, with a broad band of scarlet down the centre of each petal; Duchess of Albany, bright pink shading to soft lilac-pink; Duchess of York, blush-pink, tinted deeper along the centre of each petal; Grace Darling, rosy-carmine, star-shaped flowers.

Thomas Smith.

**Rhododendron intricatum.**—This, one of Wilson's many introductions from China, is a pretty little alpine species, and remarkable from the fact that it will often give a second crop of flowers during the autumn months. It is as yet decidedly uncommon, and was first shown at the meeting of the Royal Horticultural Society on April 2, 1907, when a first-class certificate was awarded it under the name of Rhododendron nigro-punctatum. The general appearance of the plant, either in or out of flower, suggests a daphne, rather than a rhododendron, as it forms a neat, compact little bush clothed with small elliptic leaves, while the flowers, borne in little terminal clusters, are lilac in colour, and less than half an inch in diameter. W. T.

**Costus igneus.**—The flowers of this member of the Ginger Wort family are, as a rule, borne during the last three months of the year, and during the dull weather we so often experience at that time the intense deep orange tint of the blossoms causes them to stand out in a marked manner from their associates. Like many of its allies, it forms a thickened root-stock, from whence are pushed up leafy stems, that reach a height of eighteen inches, or a little more. The flowers, which are borne in a cone-like head, are from two to three inches in diameter, and thin in texture. Individually they do not last long, but a succession is kept up from one head for a considerable time. It is a native of Bahia, and potted in light compost, with a liberal amount of water when growing, it will thrive under stove treatment.—W.

## FLOWERING SHRUBS AND TREES FOR SMALL GARDENS.

From among the many ornamental trees and shrubs available for garden decoration it is sometimes difficult for the owner of a small garden to make a selection, especially when he is unacquainted with the virtues of each particular plant, and has to rely on the advice of someone else. Moreover, it is an extremely difficult problem for one who has more than a passing knowledge of trees and shrubs to select a certain number, and say definitely that those are the very best of the many hundreds which are available. No selection of the best shrubs would be complete for certain parts of the country without one or more members of Ericaceæ were included; but for other parts of the country, where lime is prevalent in the soil to any great extent, it would be quite useless to suggest these plants. Then there are excellent plants like the various kinds of brooms, which grow easily and flower well, which have to be excluded on account of their comparatively short life; for the best results are only obtained from young or moderately young plants. Therefore in the following selection care has been taken to choose twelve kinds which are generally useful, give comparatively little trouble, and last for a considerable number of years in good condition, although in some cases they may fall short of certain omitted plants in the matter of beauty, but which are more fastidious in their requirements.

### Spiræa arguta.

This is one of the first to suggest itself. Of hybrid origin, it is one of the best of a very large family of shrubs. Although it may sometimes be found between 4 and 5ft. in height, it does not grow rapidly after it has attained a height of 3ft., and may be kept dwarf by pruning after the flowers are over. Growing into a shapely bush, the main branches are well furnished with thin, wiry branchlets, and small, dainty leaves. In April white flowers are borne in great profusion from axillary buds, and the plant never misses flowering freely. Propagation by cuttings is difficult, but layered branches put down in spring root during summer.

### Forsythia suspensa.

Objection might be taken to this Chinese shrub on account of its vigorous habit, but it is so amenable to different methods of culture, stands pruning well, and thrives under all sorts of conditions, that it is everybody's plant. Planted to grow over another shrub or over a trellis, its long pendant branches clothed from end to end with bell-shaped yellow flowers, it is most effective. Against a wall it has also a beautiful appearance; while when grown as a specimen bush, and cut hard back each year, it sends up strong, vigorous, upright shoots, which blossom profusely. Pruning should take place about the end of April, when the flowers fade.

### Weigela Eva Rathke.

This is one of the best of the many kinds of diervilla, or weigela. Of hybrid origin, it forms a bush 3 to 4ft. high, and blossoms freely from May to July. The tubular flowers are of a rich red colour, and are most freely produced on young wood; therefore it is a good plan to thin some of the older wood out now and then. A good time to do this is during summer. To induce the plant to give the best possible results, rich loamy soil must be given, with an occasional surface dressing of well-rotted manure. Cuttings of soft shoots root quickly in a heated frame during early summer.

### Berberis Darwini.

When a small garden is under consideration, this Chilian species is the better kind to plant, but when room is no object preference may be given to B. stenophylla. B. Darwini is well known by reason of its glossy, evergreen leaves, and freely-produced inflorescences of orange-coloured flowers, which are followed by black or purple fruits covered with a glaucous bloom. It may be kept fairly dwarf by pruning as soon as the flowers are over. Cuttings root well in a cold frame, and plants may be easily raised from seeds.

### Philadelphus Lemoinei erectus.

This is, perhaps, the best of the dwarf-growing mock oranges. If left to its own devices, it grows into a dense bush 5ft. high, but that is not the best method of culture. It is always advisable to keep the plant supplied with young wood. Therefore, directly the flowers fade, cut all flowering wood away, and leave only such strong young shoots as are growing from the base. During summer they attain a length of 2½ or 3ft., and produce fragrant white flowers from end to end the following June. Rich loamy soil is essential to the best results, and propagation is easily performed by cuttings.

### Syringa persica.

This, the Persian lilac, might well be planted more extensively in gardens where tall-growing kinds would be out of place than it is at present; for it is very graceful in outline, blooms freely, with flowers of the most approved shade and delicious fragrance. Although it eventually grows 5 to 6ft. high, with a like diameter, it takes a long while to attain a height of 3ft. Once planted in good loamy soil, it gives little trouble, and rarely needs more than an occasional thinning. The flowers are to be found during May and June. Layered branches form a good means of increase.

### Viburnum tomentosum, var. plicatum.

The Japanese counterpart of our common guelder rose, or snowball tree, is, however, much dwarfer than our native plant, for when mature it rarely grows more than 5½ft. high, and is frequently seen about 3 or 3½ft. Forming a shapely bush, it bears its large heads of white sterile flowers very freely in June. Good loamy soil is essential to success. Cuttings may be rooted during summer.

### Olearia Haasti.

One of the most useful of all evergreens, for it thrives alike in inland gardens and when exposed to sea air. Its small dark green leaves are attractive throughout the year, while in August it has the further attraction of showy white flowers. Cuttings root readily in a cold frame, and it stands severe pruning when necessary. A New Zealand shrub, it is met with between 2½ and 4ft. in height.

### Ribes sanguineum, var. splendens.

Although the flowering currant of gardens is one of the oldest and best-known flowering shrubs, it is still one of the best and most ornamental. This variety differs from the type by reason of its rich red flowers. There are few gardens where it will not thrive.

### Prunus serrulata, var. James H. Veitch.

A Japanese cherry of high ornamental qualities. Forming a small tree, it is peculiar because its long branches are beset with short spurs, from which the rosy flowers, which individually are a couple of inches across, appear in profusion in May. The young leaves are also showy, for they have a rich bronze tinge.

### The Snowdrop Tree.

The Snowdrop or Silver-bell Tree (Halesia tetraptera) is a showy and rather uncommon tree from the southern United States. Growing in this country from 15 to 25ft. high, it forms a wide-spreading head, with a short trunk. The white bell-shaped flowers are at their best in June, and they hang in profusion from the younger branches. Although it assumes the proportions of a small tree, it may also be grown as a spreading bush 6 to 8ft. high and as far through. Under either condition it finds many admirers. Unfortunately, although its curiously-angled fruits are interesting, they are not showy, neither do the leaves assume such brilliant tints as those of numerous other trees in autumn.

SILVER BELL OR SNOWDROP TREE (HALESIA TETRAPTERA).

A charming shrub or small tree with pure white flowers that resemble those of the snowdrop.

### Paul's Double Scarlet Thorn.

This thorn completes the list. It is a very useful flowering tree, and one which is always popular. The double red flowers last in good condition for a considerable time, and the tree needs little attention beyond an occasional thinning of the branches. Those who are not fond of double flowers might substitute Cratægus mollis for it. This has white flowers, succeeded by large red fruits. W. Park.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

SEASONABLE NOTES.—Cœlogyne cristata and its varieties have now completed their growth for the season, and the liberal supply of water afforded them must be greatly reduced. From now onwards until after the flowering stage, the compost should be kept just moist enough to keep the pseudo-bulbs plump and healthy. At this season the species resents being kept dry, and many cases where this species fails to bloom satisfactorily is attributable to this cause. During the dull days of winter, the plants should be afforded all the light possible, with a supply of fresh air daily. They delight in a cool intermediate temperature, and a succession of their lovely flowers may be obtained by growing some at the warm end, and others at the cool end of the house. To prolong the season it may be advisable to remove a few plants at intervals into a slightly warmer house, but the plants must not be unduly forced. Those specimens which were repotted last spring should not be allowed to flower, as it usually takes two seasons to re-establish, and get them thoroughly strong again. Badly-rooted plants, no matter to what species they belong, should not be allowed to produce flowers. The sole object of the cultivator should be to grow his plants stronger year by year until they have become so thoroughly established that they can annually develop flowers without distress.

DENDROBIUMS will by now have mostly made up their growths, and should be removed to the resting-house. Plants of the evergreen section, which include D. thyrsiflorum, D. densiflorum, D. Farmeri, D. Bronckartianum, and others, may also be removed from their growing quarters to a cooler and better ventilated place, but they must not be kept quite so dry at the roots as the D. nobile section. Dendrobiums, while at rest, require sufficient water to keep the pseudo-bulbs and the leaves fresh and plump, and must not be allowed to shrivel at any time. The deciduous D. aureum will soon be pushing out flower buds from the nodes of the pseudo-bulbs made last year, but the plants should be allowed to remain in the resting-house until the buds are half developed, when more heat may be given. This old dendrobium should be grown by all lovers of these interesting and beautiful plants on account of its delightful perfume. Dendrobiums should be rested in a house that does not go below 55 degrees, and the atmosphere must be kept moderately dry.

SHADING.—All permanent shading may now be removed from the houses, as we have reached the season when every bit of light obtainable is beneficial to the plants. Thanks to the beautiful weather we have experienced during the last few weeks, our plants are finishing their growths much better than at one time seemed possible.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

APHELANDRAS.—These handsome stove plants are surpassed by few that produce their flowers in autumn or early winter. One of the best is A. aurantiaca Roezli; this bears terminal spikes of brilliant scarlet flowers thrown well above the silvery-green leafage. Although, during active growth in summer, these plants delight in abundance of moisture both at the roots and in the atmosphere, they should be accorded dry conditions from the time the flower spikes appear until they have finished flowering. Continue to give frequent applications of weak liquid manure until the flower spikes are nearly developed when only clear water should be given. When the plants pass out of flower gradually reduce the supply of water, and finally only give sufficient to prevent shrivelling of the wood during the resting period. Unless large specimens are required, some of the older plants may be thrown away, only retaining the younger ones for next year, and for the production of cuttings. Cuttings of half-ripened shoots, if taken with a heel of the old wood, root readily in spring.

IXORAS.—Although not nearly so extensively cultivated as they once were, the ixoras are well worth growing, especially where there are large stove houses. Given proper treatment they seldom fail to make a fine display during summer. The fading flowers should now be removed. Prune away all sappy and spindly growths in order to ensure proper maturation of the remainder, for on this depends, in no small degree, free flowering in ensuing years. After thoroughly cleaning the plants place them in a warm and fairly dry position near the roof glass, and gradually reduce the supply of water, but at no time should they suffer from being too dry.

DRACÆNAS.—This is a good time to "ring" the tops of any plants that have lost their lower leaves. If this is carefully done now the tops make nice plants for use next spring, long before cuttings can be taken off and rooted. Small 60-sized pots answer well if sawn in half longitudinally. With a sharp knife cut through the bark immediately below a joint, in the half-ripened portion of the stem; then make another cut half an inch below and remove the intervening ring of bark. Place the halves of the pot in position, one on either side, and tie firmly. Three parts fill the pot with a mixture of chopped sphagnum moss, peat, charcoal, and sharp sand. Keep this moist by frequent syringings, and maintain a high temperature and humid atmosphere. When well rooted sever from the parent plant below the pot, and place in a larger pot.

ALOCASIAS.—Plants of the evergreen species will now need less water, both at the roots and overhead, but provided the roots are in a sweet, open medium, a moderate amount of water will be required throughout the winter. Nothing is so prejudicial to these plants as stagnation about the roots, especially during winter. The deciduous kinds may be dried off and wintered in precisely the same way as recommended for caladiums.—H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

PINE APPLES.—Fruiting plants will be benefited by occasional weak applications of liquid manure until the fruits have fully developed, when it should be withheld; clear water must also be given very sparingly when the fruits are ripe. Keep the plants in a temperature of 70 degrees at night, and, with sun heat, from 80 to 85 degrees by day, admitting a little air through the top ventilators at all times. Where the bottom heat of late fruiting plants is likely to decline below 75 to 80 degrees, the beds should be renewed without delay, but one must be careful not to use material that will become overheated, or otherwise much damage will be caused to the roots. Endeavour to raise the plants near the glass, so that they will be exposed to all the sun and light possible; maintain a house temperature of from 70 to 75 degrees, and pay particular attention to the application of water, so that the proper degree of moisture must be maintained in the soil, or otherwise the roots will decay. When the fruits are swelling, the atmosphere of the house should be kept fairly moist by sprinkling the paths and walls with clean tepid water several times a day. Successional plants should be kept steadily at 60 degrees at night and about 70 degrees by day. This temperature will considerably check any excitement of growth, and the plants will succeed far better later on if this is observed.

FIGS.—The late crops will have been gathered, and the trees should be subjected to a lower temperature, to induce a complete rest. If the roots of permanently planted trees require attention, now is the best time to undertake the work. Proceed in the same manner as that recommended for the renovation of vines. Plants in pots should be shifted into a larger size if required, and the others top-dressed with good fibrous loam, and well-pulverised cow manure, afterwards placing the plants in a cold house or an open shed; give water sparingly to the roots, but do not on any account allow the soil to become too dry at any time.

STRAWBERRIES IN POTS.—These must be protected from frost and heavy rains. Old sash lights are very useful at the present time to give the necessary protection for a few weeks hence; later on, as frost becomes more severe, it will be necessary to provide more adequate protection by placing the stock in cold frames or pits. At the present time allow all the air and light possible by removing the lights on fine days and nights. Continue to give weak applications of liquid manure to all plants that are well rooted. In the early part of next month select and make ready a batch of the earliest plants, which can be placed in a cold house preparatory to forcing; examine the drainage before taking them inside, and select only those plants that have the strongest crowns.—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

THE HERBACEOUS BORDER.—The present is a good time to undertake the renovation of hardy flower borders, as when the work can be completed in the autumn the plants soon become established. Hardy perennials are frequently allowed to remain in the same position undisturbed for a number of years, with the result that the clumps become unduly large, and frequently weakened in growth. To grow the plants well, it is essential to divide and replant them every third or fourth year. When new borders are to be made or old ones replanted, the most thorough preparation of the ground is necessary. Dig up the plants and lay them in on a convenient piece of ground, and take care that the labels are securely attached to each. Apply a thorough dressing of well-rotted farmyard manure, cultivate the soil to a depth of at least 2ft., and incorporate the manure well with the soil as the work proceeds. Allow the ground to settle for a week or two, and then carry out the work of planting during mild weather when the soil is in a fairly dry and friable condition. Some of the larger clumps will need division, and this should be done by placing two forks through them, back to back, and levering them apart; this is much better than chopping a clump in half with a spade. It is desirable to retain the outside portions of the clumps.

REPLANTING requires great care, or the appearance of the border may easily be spoiled. It is necessary to arrange it so that there will be a continual display of bloom the whole season, consequently late-flowering subjects must be planted near early-flowering ones. Arrange the plants so that the colours will harmonise; soft harmonies or direct contrasts are best. It is not desirable to make the groups too large, three plants to each being quite enough, for if large masses of plants like delphiniums and pæonies are included in the border, the result is that there are large blanks during the late summer and autumn. It is not necessary to plant all the tall subjects at the back; some may be allowed to extend to the centre of the border; if the right subjects are judiciously planted in this way, with dwarfer plants between, the result is the formation of irregular bays or inlets at intervals, and the whole arrangement is rendered more attractive. Plant firmly, and label each group carefully as the work proceeds. Level the ground over neatly after planting, and apply a light top-dressing of old mushroom-bed manure or other suitable material.

THE ROCK GARDEN.—Most alpines have made vigorous growth during the past season, and some of the more robust plants, like arabis and aubrietia, have probably overgrown their allotted space; if this is so, shorten back their growths now. Keep the rockery free from weeds, or these will soon overcome some of the more delicate specimens.—J. GARDNER, Batsford Park Gardens.

BIRMINGHAM GREAT
CHRYSANTHEMUM SHOW.

BINGLEY HALL.

TUESDAY, WEDNESDAY, and THURSDAY,
5th, 6th, and 7th November.
ALFRED NOAKES, Secretary.

THE BOURNEMOUTH HORTICULTURAL SOCIETY.

The Twenty-sixth EXHIBITION of AUTUMN FLOWERS will be held at the WINTER GARDENS PAVILION, on TUESDAY and WEDNESDAY, November 5th and 6th, 1912. Will be opened on TUESDAY, at 12 noon, by SIR ALBERT KAYE ROLLIT, LL.D., D.C.L., Litt.D., F.R.H.S., President of the National Chrysanthemum Society.
Sir DANIEL MORRIS, K.C.M.G., F.R.H.S.,
Chairman of Council.
C. H. ROLLS, Esq., J.P., F.R.H.S.,
Vice-Chairman of Council.
W. SHAVE, Secretary, The Cottage, Northleigh, Wimborne.

CRYSTAL PALACE.

THE GREAT AUTUMN SHOW
of
CHRYSANTHEMUMS
will be held by the
NATIONAL CHRYSANTHEMUM SOCIETY,
at the
CRYSTAL PALACE,
on
OCTOBER 29, 30, 31, 1912.

No extra charge to view this magnificent show.

Schedules and all particulars to be obtained Post Free from the Secretary,
Mr. RICHARD A. WITTY,
72, Savernake Road, Gospel Oak,
London, N.W.

HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY'S SHOW,
In the CITY HALL, HULL,
20th and 21st November.
Entries close 13th November, 1912.

Schedules on application to—
JAMES DIXON, Hon. Secretary,
County Buildings, Hull.

SCOTTISH HORTICULTURAL ASSOCIATION.

CHRYSANTHEMUM EXHIBITION.

The Association will hold its next
GREAT CHRYSANTHEMUM EXHIBITION
in the
WAVERLEY MARKET, EDINBURGH,
on
November 14th, 15th, and 16th.
Copies of the Prize List, which contains all particulars as to prizes, conditions of competition, etc., may be obtained on application to the Secretary,
A. D. RICHARDSON,
19, Waverley Market,
Edinburgh.
Entries close on November 6th.
Application for space for non-competitive exhibits should be made without delay.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

The exhibition held at Westminster on Tuesday, October 22, was a fine one, and the hall was well filled with exhibits. Large numbers of novelties were brought forward, thirty-three being adjudicated upon by the Orchid Committee. Hardy shrubs, stove plants, hardy flowers, orchids, chrysanthemums, and fruits provided the chief subjects on view. During the afternoon there was a large crowd of visitors.

### FLORAL COMMITTEE.

A wonderful display of hardy evergreen shrubs was made by Mr. L. R. Russell, Richmond. The whole length of the hall right opposite the entrance, and a width of about ten feet was filled and the table space next to it was also filled with the overflow plants, so that there was a Russell avenue. In recent years the introduction of so many fine deciduous flowering trees and shrubs has made it just possible that the merits of many well-known ornamental evergreens may be overlooked. Such an exhibit as this acts as a good reminder of those merits and the interest taken in it proved its educational value. Bamboos, throwing their graceful spires of elegant leafage 15ft. high, formed a light background for a number of specimen hollies, green and variegated, gold and silver, many of them freely berried, and about 10ft. high. Between the hollies were large standards of variously-coloured tree ivies, while dotted along the foreground of the group were pillar specimens of Hedera dentata variegata with its bold creamy-variegated leaves. Berried aucubas, grouplets of finely-fruited pernettyas, cotoneasters, symphoricarpus, and skimmias gave colour and interest to the whole. Golden forms of Cupressus obtusa, yews, Cedrus atlantica, Cupressus macrocarpa, and Retinospora tetragona were very effective, and the white flowers of laurustinus were also cheery.

Across the top end of the hall there was another large and very fine exhibit from Messrs. James Veitch and Sons, Chelsea. This consisted almost entirely of stove plants and orchids. A fine background was made up of Cocos plumosus, and in front of this were staged grand specimen plants of the huge-leaved Cocoloba pubescens, the equally bold Dieffenbachia imperialis, the long-leaved Cyclanthus bipartitus, masses of Dracæna Godseffiana, and D. Sanderiana, Anthurium Veitchi, and the grey-green Alocasia argyrea. Tall and finely-grown specimens of Croton Thomsoni, C. B. Comte, C. candatus tortilis with spirally twisted gold and brown leaves, and C. Resplendent rose above the smaller plants. Marantas were capitally shown, and the little groups of exquisitely beautiful silver and purple bertolonias were very charming. Groups of Lilium speciosum were also very effective, and the elevated specimens of Nepenthes Chelsoni excellens, N. Tiveyi, N. Amesiana, N. Sir W. Thiselton Dyer—very fine—and N. mixta created a great deal of interest. In the centre, backed by a beautiful Phœnix Roebelini, were a few orchids, notably Vanda cœrulea, the bright Epidendrum vitellinum majus, Disa grandiflora, some cypripediums, and lælio-cattleyas. Winter-flowering begonias were well shown by the Messrs. J. Veitch and Sons in another group, and with these were associated the bright Leonotus Leonurus, and a selection of chrysanthemums, the latter being chiefly represented by very dwarf, beautifully grown, and freely-flowered decorative plants in small pots.

Chrysanthemums were boldly exhibited by Messrs. W. Wells and Co., Merstham; their exhibit was a fine one, and included immense blooms of such Japanese varieties as Mrs. Henshaw, Mrs. G. Lloyd-Wigg, Frank Payne, Mrs. L. Thorn, and the beautiful White Queen. Miss M. Pope, Celia, Caterham Bronze, and the big Miss Margaret Walker were very fine singles shown by the Messrs. Wells. The Messrs. Price and Fyfe, Grove Park Nursery, Lee, S.E., exhibited chrysanthemums in great variety, and associated their flowers with sprays of ornamental foliage.

Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow, exhibited some first-class market chrysanthemums, setting up fine bunches of Celia, R. C. Pulling, Charles Kingsley, Edith Pagram, Mensa, W. Garner, Florrie King, and Cedie Mason, all grand single sorts. They also staged the pale yellow incurved variety J. W. Streeter, and gained an A.M. for it. Mr. Norman Davis, Framfield, Sussex, gained an A.M. for single chrysanthemum Mrs. Loo Thomson, primrose-yellow; and for the golden single variety Charles Kingsley. Mr. C. Beckett, Chilton Gardens, Hungerford, gained an A.M. for the primrose-yellow Hon. Mrs. John Ward; a fine Japanese chrysanthemum.

Scolopendrium vulgare crispum nobile, Bolton's Broad form (F.C.C.), is a fine plant, and a splendid specimen of it was shown by W. B. Cranfield, Esq., East Lodge, Enfield Chase. Clianthus Dampieri, The Glory Pea, was prominent in the exhibit from Messrs. Stuart Low and Co.; this firm contributed excellent carnations, Gloriosa being very finely shown, and a collection of crotons. Mr. P. Purnell, Woodlands, Streatham, grouped crotons, celosias, palms, ferns, and Primula obconica—it is always pleasing to find amateurs bold enough to bring exhibits to the hall.

Begonia Bavaria, with drooping panicles of pink flowers, a good winter bloomer, was shown freely by Messrs. S. Bide and Son, Farnham; the same firm exhibited Begonia Saxony, with drooping clusters of very rich, rosy-pink flowers. From Messrs. H. Cannell and Sons, Swanley, came succulents in great variety, the graceful Lotus peliorhynchus, and a few spikes of gorgeous cannas. The popular Begonia Gloire de Lorraine was shown by Mr. G. Gumbrell, gardener to Mrs. Percy Westmacott, Rose Mount, Ascot, who displayed about thirty freely-flowered specimens. Among the carnations from Messrs. Allwood Bathurst, Haywards Heath, we made special note of Baroness de Brienen, the rich heliotrope variety Fairmount, and the yellow La Rayonnante.

Nephrolepis Millsi, another elegant fern with finely divided fronds, gained an A.M. for Mr. W. A. Manda, St. Albans; Mr. Manda again showed the fine Polypodium Mandaianum and Nephrolepis Whitmanni. Chrysanthemums in small pots, cyclamens, and Primula obconica made up a bright exhibit for Messrs. H. B. May and Sons, Edmonton.

Michaelmas daisies from Mr. H. J. Jones, Ryecroft, Lewisham, proved interesting at this late date, Moonstone and Climax standing out well. Mr. Jones also showed two good new Japanese chrysanthemums named Bob Pulling (A.M.), golden yellow; and Master Rex, rich amber. Mr. L. T. Greening, Richmond, and Miss Dixon, Edenbridge, each showed hardy flowers, and the latter added a few melons.

The very fine Michaelmas daisy named Climax, with large bluish flowers, was very largely shown by Messrs. Whitelegge and Page, Chislehurst. Mr. A. H. Chapman, gardener to L. F. Harrison, Esq., Orchards, East Grinstead, sent up a new single chrysanthemum named Miss M. Borrer (A.M.), a fine bright rose-pink variety. Mr. Thos. Page, Hampton, brought up a good new white chrysanthemum of market type, named Mrs. John Maher (A.M.).

Carnations from Messrs. Young and Co., Hatherley, Cheltenham, included fine blooms of Geisha, Mikado, May Day, Mrs. Greswold Williams, and Christmas Cheer. Mr. G. Prince, Longworth, put up a quite pretty lot of roses, his Hugh Dickson, Richmond, Rayon d'Or, and Lady Hillingdon being quite fresh and fragrant from out of doors.

Perpetual carnations were extensively shown by Messrs. W. Cutbush and Son, Highgate, associated with dwarf roses and edged with the graceful, drooping pink-flowered Heeria rosea, a somewhat neglected plant. A variegated form of Bougainvillea glabra was conspicuous in this exhibit. Saxifrages, sempervivums, shortias, soldanellas, sedums, veronicas, and other dwarf alpine plants were displayed by Messrs. T. S. Ware, Feltham.

### ORCHID COMMITTEE.

A few very fine orchids set up by Mr. Shill, gardener to Baron Bruno-Schroder, The Dell, Egham, included Brasso-cattleya Queen Alexandra, The Dell var. (F.C.C.), an exquisitely lovely large-lipped, fringed, white flower; Cattleya labiata Opal (F.C.C.), with a pink tint on the white lip; Lælio-cattleya George Woodhams, with huge purple flowers, and the green and white Cypripedium Alma Gevaert. Lælio-cattleya Golden Oriole, Holford's var., a very bright flower, gained an A.M. for Mr. Alexander, grower to Sir George Holford, Westonbirt, Tetbury.

Cypripedium Pallas Athene (F.C.C.), a big flower, parentage unknown, with purple spottings on the white, green-based lip, attracted a great deal of attention; this was from W. R. Lee, Esq., Plumpton Hall, Heywood. Cymbidium Doris (F.C.C.), cream, pink, and buff, with brown markings, was a fine hybrid between C. insigne and C. Traceyanum, shown by Messrs. J. and A. McBean, Cooksbridge, Comte Joseph de Hemptinne, St. Desins, Ghent, sent over several beautiful orchids, all unnamed, save the rich orange-yellow Lælio-cattleya Hemptinne (A.M.). Two good white forms of Cattleya labiata were shown by Mr. E. V. Low, Haywards Heath; C. l. Lady Duff was very chaste.

Messrs. Charlesworth and Co., Haywards Heath, submitted Cattleya Portia with a head of eight light purple flowers; Odontoglossum grande with a spike of eight flowers; Oncidium splendidum aureum, etc. Varieties of Cattleya labiata, a good C. Hardyana and C. Sylvia came from Messrs. Hassall and Co., Southgate; and Mr. E. H. Davidson, Twyford, showed Sophro-lælio-cattleya Zondhage (A.M.), with rosy flowers, and other good things. The quaint Cirrhopetalum refractum and the white form of Oncidium ornithorhynchum came from Messrs. Mansell and Hatcher, Rawdon.

Messrs. Sander and Son, St. Albans, showed some very fine forms of Cattleya Fabia, the beautiful Lælio-cattleya Nysa superba, C. Portia magnifica, Cypripedium Goldfinch, etc. Messrs. J. Cypher and Sons, Cheltenham, presented cypripediums largely, notably C. Fairrieanum, C. Sir Redvers Buller, C. insigne Harefield Hall, and C. i. Sanderæ; Dendrobium formosum giganteum was also well shown. Messrs. Stuart Low and Co.'s exhibit of orchids was gay with Oncidium varcosum, Cattleya labiata, Vanda cærulea, Dendrobium formosum giganteum, etc. Sophro-cat.-lælia Menippe var. H. S. Goodson (A.M.), with small ruby-crimson flower, was a feature of the group of orchids from Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney; Phaio-cymbidium Chardwarense was also conspicuous in this group, and so was Cattleya Maggie Raphael Goodson's var. (A.M.).

### FRUIT AND VEGETABLE COMMITTEE.

A very fine collection of apples and pears grown under orchard house conditions was submitted by Messrs. G. Bunyard and Co., Maidstone. The fruits were all of fine size, clean, and handsome, and staged in baskets. Beurre Clairgeau, Emile d'Heyst, Doyenne du Comice, Beurre de Jonghe, Charles Ernest, Beurre Diel, and Marie Benoist pears were very finely shown, and the examples of King of Tompkins County, Golden Noble, Twenty-ounce, Norfolk Beauty, Emperor Alexander, Cox's Orange Pippin, and Cox's Pomona apples were excellent.

From the Purfleet School Garden, Essex, came some capital apples, pears, plums, and nuts, all grown by lads from 11 to 14 years of age. Royal Muscadine and Esperione grapes grown against a wooden fence were quite good, and attracted no small amount of attention. Mr. E. G. Walker, gardener to C. Baring Young, Esq., Oak Hill Park, West Barnet, sent a few dishes of apples and pears, and among the latter Beurre Diel was good.

About three dozen really handsome plants of Dobbie's Exhibition Parsley, from Messrs. Dobbie and Co., Edinburgh, made up a very attractive exhibit, and the plants were quite as elegant as many ferns.

### CERTIFICATES AND AWARDS.

First Class Certificate.—To Scolopendrium vulgare crispum nobile, Bolton's Broad form, from Mr. W. B. Cranfield, Enfield Chase; to Cattleya labiata Opal and to Brasso-cattleya Queen Alexandra, Dell var., from Baron Bruno Schröder (gardener, Mr. D. Shill), Egham; and to Cymbidium Doris, from Messrs. J. and A. McBean, Cooksbridge.

Award of Merit.—To Cypripedium Pallas Athene, from W. R. Lee, Esq., Plumpton Hall, Heywood; to Cattleya Princess Mary, from Pantia Ralli, Esq., Ashstead Park, Leatherhead; to Lælio-cattleya Golden Oriole, Holford's var., from Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury; to Sophro-lælio-cattleya Heatonense Zandhage, from Mr. Davidson, Twyford; to Sophro-cat.-lælia Menippe var. H. S. Goodson, and Cattleya Maggie Raphael Goodson's var., from H. S. Goodson, Esq., Fairlawn, Putney; to Lælio-cattleya Hemptinne, from Comte Joseph de Hemptinne, St. Denis, Ghent; to decorative chrysanthemum, Mrs. John Maher, from Mr. Thos. Page, Hampton; to single chrysanthemums Mrs. Loo Thomson and Charles Kingsley, from Mr. Norman Davis, Framfield, Sussex; to Japanese chrysanthemum Hon. Mrs. John Ward, from Mr. C. Beckett, Chilton Gardens, Hungerford; to single chrysanthemum Miss Borrer, from Mr. L. Harrison, East Grinstead; to Japanese chrysanthemum Bob Pulling, from Mr. H. J. Jones, Lewisham; to incurved chrysanthemum J. W. Streeter, from Messrs. Cragg, Harrison, and Cragg, Hounslow; and to Nephrolepis Millsi, from Mr. W. A. Manda, St. Albans.

### MEDALS.

Gold.—To Mr. L. R. Russell, Richmond, for evergreen and berried shrubs; to Messrs. J. Veitch and Sons, Chelsea, for stove plants.

Silver-gilt Banksian.—To Messrs. G. Bunyard and Co., Maidstone, for orchard house fruits; to Messrs. Stuart Low and Co., for carnations, crotons, etc.

Silver Flora.—To Messrs. H. B. May and Sons, Edmonton, for ferns and chrysanthemums; to Messrs. W. Wells and Co., Merstham, for chrysanthemums; to Messrs. J. Cypher and Sons, Cheltenham, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. Shill, gardener to Baron Bruno Schröder, Egham, for orchids.

Silver Knightian.—To the superintendent of the Purfleet School Garden, Essex, for fruits.

Silver Banksian.—To Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, for orchids; to Messrs. Hassall and Co., Southgate, for orchids; to Messrs. H. Cannell and Sons, Swanley, for succulents; to Messrs. Cragg, Harrison, and Cragg, Hounslow, for chrysanthemums; to Messrs. W. Cutbush and Son, Highgate, for carnations and roses; to Messrs. Young and Co., Hatherley, for carnations; to Messrs. Dobbie and Co., Edinburgh, for parsley.

Bronze Flora.—To the Misses Price and Fyfe, for chrysanthemums and carnations; to Messrs. T. S. Ware, Feltham, for hardy plants.

Bronze Banksian.—To Mr. P. Purnell, Streatham, for celosias and crotons; to Mrs. Percy Westmacott, Ascot, for begonias.

---

## National Sweet Pea Society.

There was a fairly good attendance at the annual meeting of this society, held at the Hotel Windsor, Westminster, at half-past two p.m. on Thursday, October 17. Mr. Robert Sydenham presided.

After minutes, letters, and other preliminary matters had been disposed of, the Report of the Committee and the Financial Statement for 1912 were read. We append an abridged account.

### REPORT OF COMMITTEE FOR 1912.

Following the usual and excellent custom the Report was circulated among the members present, and its division into special subjects rendered reference easy. Of the Trials, Awards to Novelties, and the London Exhibition we need say little, as we have dealt with these matters in due season. Reference was made to the wonderfully international character of the annual dinner, owing to the presence of so many members from over the seas, and, as might have been expected, the success of the members of the Society at the Great International Exhibition in May, 1912, called for special comment.

One hundred and eighty-six new members were added to the list, and at the time of closing the accounts about the same number of old members had omitted to pay their subscription for 1912. Doubtless many of these omissions will be rectified before the new list of members is issued. There are over 1,200 members, and these include some resident in Japan, Peru, Russia, Switzerland, France, Germany, Australia, New Zealand, Canada, South Africa, and the United States.

Arrangements have been already made for holding the Society's trials at the Burbage Experimental Station, Hinckley, in 1913, under the conduct of Major C. C. Hurst, F.L.S. The committee understands that it will not be possible to hold trials at Sutton Green again, therefore a larger test will be made at Hinckley. The "Annual" and Schedule for 1913 will be issued to members during the first week in December, 1912. Mr. Lester Morse will contribute his "Impressions of the London Show"; Dr. Boxall has promised "Notes on Sweet Peas in New Zealand," and in addition to the Reports, Audit, Prize List of 1912, and List of Members, the "Annual" will include the Conference Proceedings and many items of special interest.

The London Exhibition of 1913 will be held on Thursday, July 17, and will continue for the one day only. Arrangements are in progress for holding a provincial show in the North of England about the second week in August. The Carlisle Horticultural Society has promised a hearty welcome to the National Sweet Pea Society, and as Carlisle is very central, both for the North of England and the Scottish and Irish members, and moreover is in a district where there is plenty of enthusiasm for sweet peas, a splendid exhibition and a large accession of members may be anticipated.

### FINANCE.

The Society is to be congratulated upon its sound financial position. Early in the year £50 was placed on deposit, this amount bringing the Society's reserve fund up to £200. The profit on the year's working was less than in 1910 and 1911, but this may be largely accounted for by the shortening of the financial year by two months. Accounts were closed on September 30, instead of November 31. The Society has no outstanding liabilities except in respect of members who have already paid their subscriptions for 1913. Holding two sets of trials has necessarily increased the expenditure in this direction, and the alteration of the tiered staging for the exhibition is an extra item of expense. On the other hand the item for "Prizes Presented" shows a decrease of £31 4s., as compared with 1911, the sums being £59 9s. and £90 13s. respectively. But this decrease is more apparent than real, because many friends purchased and presented plate to the value of £28 7s., for competition in the district classes.

The turnover for the year was £892 1s. 4d., and the chief items of income were: Subscriptions, £335 19s. 9d.; fees from affiliated societies, £59 6s. 6d.; prizes presented, £59 9s.; trials charges, £57 5s. 9d.; gate money, £36 8s. 6d.; advertisements, £48 14s. 6d.; and vase hire, £16 9s. 4d. The chief items of expenditure were: Purchase of medals, etc., £55 19s. 6d.; trials expenses, £68 3s. 3d.; printing and stationery, £224 6s. 5d.; honorarium to secretary, £73 10s.; London Show, prizes and expenses, £113 4s. 8d.; postages and carriage, £46 1s. 6d.; annual meeting and conference expenses, £9 1s. 9d. Besides putting away £50, the Society carries forwards a balance of £53 11s. 5d., and the Secretary stated that £32 15s. 8d., due on 1912 account, had been received since September 30.

The President moved the adoption of the report and financial statement, and these were adopted. A vote of thanks to officers and committee, moved by Mr. John Collingridge, and seconded by Mr. C. Foreman, was heartily passed, and on the motion of Mr. W. Cuthbertson and Mr. Stevenson it was unanimously agreed that the Right Hon. Sir George O. Trevelyan, Bart., be elected

President, subject to his accepting the position. It appeared that Sir George had begged to be excused on the score of advancing years. Mr. Edward Sherwood was re-elected Treasurer; Mr. C. H. Curtis as Hon. Secretary, and voted a substantial honorarium; Mr. Herbert Smith, as Chairman of Committee; and Mr. Richard Gluyas as Auditor of the Society's Accounts.

### ELECTIONS AND DISCUSSION.

The election of the General Committee resulted in the addition of Messrs. J. Harrison Dick, W. H. Wilkins, T. H. Dipnall, and Bertrand W. Deal, to the existing list, to make good the losses by death and non-attendance. The ballot for the Floral Committee resulted in the election of Messrs. H. E. Bide, Robert Bolton, F. H. Chapman, A. Hallam, A. Ireland, Thomas Jones, G. W. Leak, Thomas Stevenson, and H. D. Tigwell.

Captain Ashworth, of Upton-on-Severn, took advantage of "Any other business" to move "That this meeting shall consider the situation created by the proposal of Mr. W. P. Wright to establish trials, and by the intention of Miss Hemus to endeavour to start a new society." Mr. W. Lumley seconded the motion. Captain Ashworth said that trials conducted by any one person could have no weight among people in general, and Miss Hemus' name had been used without authority in connection with the Reading proposal. He felt that the Society's Floral Committee was not constituted so as to give general satisfaction, and he considered that the traders should themselves have sufficient dignity to put this matter in order. Further, he thought members resident a long distance from London should have an opportunity of voting on any proposals made by the Committee or private members. Several members spoke to the motion, and though a good feeling prevailed there were moments when pleasantries seemed likely to degenerate into personalities. Mr. W. J. Unwin and Mr. G. W. Leak led matters into the proper channel, and the latter pointed out that when the General Committee was unanimous in wishing to exclude from the Floral Committee anyone having an interest in any variety on trial, and brought forward a rule to that effect, the annual meeting defeated the proposal by about 37 votes to 35. He also said it was too late to bring in such a rule now as due notice had to be given, but possibly a similar rule might in the near future be acceptable.

Captain Ashworth said that if there was a possibility of having the matter reconsidered, say, at the next annual meeting, or a little before, Miss Hemus would not go on with her scheme for a new society, but would, with him, do everything possible to further the interests of the N.S.P.S. He begged leave to withdraw his motion, and substitute the following, "It is recommended that the General Committee circulate to all members, for special vote by post, all proposals for the modification of the rules of the Society that may be brought forward before the next annual meeting." When doing this he said that on all occasions he had been treated in the most courteous manner possible at the meeting of the society. The motion was carried, and the meeting closed with a vote of thanks to the President.

### DINNER.

About the usual number stayed for dinner, and this pleasant little function was also presided over by Mr. Robert Sydenham. The only toasts were "The King" and "Our Society," and to the latter Mr. F. W. Harvey responded.

### CONFERENCE.

The North Room was fairly well filled by a few minutes after seven p.m., when the Conference proceedings commenced under the chairmanship of Mr. Herbert Smith, who introduced Major C. C. Hurst, F.L.S. Major Hurst read his paper slowly and most distinctly; his subject was "Rogues in Sweet Peas," and it is not too much to say that no finer pronouncement has ever been heard in connection with sweet pea breeding and the fixity of stocks. The paper was highly technical, and an unquestionable proof of the immense value of Mendelian methods in breeding and fixing sweet peas. Every raiser and seed grower should join the Society, if only for the purpose of securing the full text of this paper in the Society's "Annual," and for the opportunity they would then have of inspecting the Society's trials and Major Hurst's experiments at Burbage.

A brisk and profitable discussion followed. Mr. Sydenham asked whether pure lines from the seeds in one pod, or only from the seeds from one plant, should be grown. Major Hurst said that if plants from one seed pod could be kept distinct it would be better than from the one plant, but he thought it was hardly possible viewed economically. Mr. Ireland and Mr. Cuthbertson both referred to the variety Thomas Stevenson that lost the silver medal at the Society's trials this year because it had one rogue; only one plant of the same rogue had appeared in nearly half a mile of the variety at Mark's Tey. Major Hurst said that in this case evidently a grain of foreign pollen had reached the stigma of one flower the previous year.

Mr. Leak said it was not possible for many of them to give the time that Major Hurst did to experiment, nor was everybody capable of so closely and cleverly observing sweet peas. The lecture was a splendid one, and could only be appreciated fully when studied carefully in the "Annual" during the winter. Mr. Vernon Hill referred to cases of the reversion of Spencer forms to practically the original wild type in Spain and Sicily, one such case occurring in his mother's garden from seeds saved from the best varieties. Major Hurst considered that pollination by the wild form had occurred. Mr. Bide and Mr. Harvey added their experience of several matters, and Mr. E. W. King said that in California the growers had not fully appreciated the importance of rogueing the crops so as to get them quite true to type. Mr. Cuthbertson said that he took heart because Major Hurst had shown the possibility of breeding sweet peas so true that not more than five rogues per 1,000 need appear in the seeds distributed. The elimination of type rogues and of varieties with clamped keels seemed to be leading points to observe, but in his own opinion there was little fear of trouble arising from cross fertilisation by wind or insect agency. Messrs. Stevenson, Weston, and H. A. Perkin contributed to the discussion, and Major Hurst replied to numerous points raised.

Mr. Robert Bolton proposed, and Mr. W. Alsen seconded a vote of thanks to Major Hurst, and this was very heartily accorded. Thanks to Mr. Sydenham for providing cigars and cigarettes for the audience, and to Mr. Herbert Smith, for presiding, closed what will probably come to be regarded as the most valuable conference yet held.

## Broughty Ferry Horticultural Association.

The ordinary monthly meeting was held under the presidency of Mr. James Bethel on the evening of the 15th inst., when an admirable lecture was given by Mr. Robert Bell, Kinnaird Castle Gardens, who had for his subject, "Making and Planting of Herbaceous Borders."

After giving a definition of what was meant by the term "herbaceous," and pointing out errors which the inexperienced were ready to fall into, he proceeded to give a practical demonstration of the process of border making, drainage, trenching, and manuring, and backgrounds were dealt with. He gave a lucid description of the massing system as adopted in the gardens at Kinnaird Castle, where some of the borders were 15ft. wide by about 400ft. long. The blending of shades was sometimes a difficult matter, but he said that time and patience would overcome it. A short list of the newest and best plants grown in the borders at Kinnaird was given and profitable discussions followed, after which the lecturer was cordially thanked.

The monthly prize was won by Mr. David Keillor, who had a fine vase of pompon dahlias. Other exhibits were Michaelmas daisies from the president, and a branch of pear Beurré d'Amanlis, with fruits and flowers on the same spur.

## Dundee Horticultural Society.

The annual general business meeting was held in the Y.M.C.A. Hall on October 11. The President, W. S. Melville, Esq., J.P., presided over a sparsely attended meeting. The treasurer's financial statement showed a loss on the year's workings of £28 16s. 3d. The total income for the year was £1,076 1s. 5d., against an expenditure of £1,104 17s. 8d. In moving the adoption of the accounts, the Chairman attributed the loss to the rain on the Saturday afternoon, when there was a poor attendance, and also to the extra expense of the show, which was on a more extensive scale than usual.

Retiring office-bearers were re-elected with two exceptions, Messrs. Alex. Macrea and Robert Stewart filling up these vacancies. It was decided to hold the next show on August 28, 29, and 30, 1913, and to offer prizes to the extent of £250.

A new session was opened at the Technical College on the 18th inst., with a lecture on "Fungoid Diseases affecting Garden Crops," delivered by Mr. George P. Berry, Edinburgh and East of Scotland College of Agriculture. In dealing with his subject Mr. Berry briefly outlined the life history of mildew, rust, and rot, and gave recipes for prevention or cure of each. After this he dealt exhaustively with black scab or wart disease of potatoes, and the American gooseberry mildew, two comparatively new diseases to this locality, and scheduled as notifiable under the Pests Act of 1877 and 1907. The lecture was enhanced by the exhibition of specimens of the various diseases on the plants attacked.

## Croydon Gardeners' Society.

The meeting of this society, held on Tuesday, 15th inst., at the Sunflower Temperance Hotel, George Street, Croydon, was well attended, and the enthusiasm of the members was more than ever perceptible. Commencing with the competition of bottled fruit, in which four exhibitors took part, the result of very keen competition was eagerly awaited. Messrs. H. Alderman and W. H. Plowman were the judges, and awarded first honours to Mr. F. J. Hainge, of Kenley; the hon. secretary (Mr. Harry Boshier) was placed next, and Mr. W. Veness third. Mr. Oxtoby was awarded an extra prize. The judges were unanimous in their opinion that the four exhibits were of a very high standard.

Upon tables reaching round the room were other exhibits brought by members. Mr. F. W. Moore stage a dish of Brussels sprouts and a dish of Glou Morceau pears. Mr. E. Mann sent four dishes of apples. Mr. W. Coles put up a collection of hardy and half-hardy flowers and cauliflowers. Mr. W. Graves' exhibit was also cauliflowers. Mr. T. W. Hayden staged a vase of Climax Michaelmas daisies. A collection of outdoor chrysanthemums was staged by Mr. A. Edwards, and Mr. W. Tyrrell had similar flowers with the addition of Michaelmas daisies; and from the gardens of Coombe House Mr. M. E. Mills brought a collection of Michaelmas daisies. One of the donors of the prizes for the bottled fruit competition, Mr. T. R. Willis, staged a small collection of sterilised fruits. The hearty thanks of the meeting was given to all exhibitors.

To conclude the evening's proceedings Mr. H. Alderman, of Morden Hall Gardens, Mitcham, read a most interesting paper on "Gardening and Gardeners—Past and Present." Mr. Alderman has several times been heard by this Society, and his unassuming manner and generous spirit have made him many friends.

## Beckenham Horticultural Society.

The first lecture of the winter session of the above society was given by Mr. E. H. Jenkins, on "Cross Breeding and Hybridising." A subject always of absorbing interest was made more so by the clear enunciation of the many points so necessary to successful hybridising. The importance of selecting, by the aid of the microscope, only the finest pollen which is so potent in action, and the wonderful process which takes place when active pollen falls on a receptive stigma were emphasised. Hermetically sealed pollen will keep from three to six weeks, said Mr. Jenkins, a point of interest where operations are among both early and late-flowering plants. The lecturer spoke of cross-breeding not being all profit, and said that carnation growers were perfectly satisfied if they could obtain ten or twelve good varieties from a thousand seedlings.

## OBITUARY.

### MRS. D'OMBRAIN.

We regret to record the death of Mrs. D'Ombrain, the widow of the Rev. H. H. D'Ombrain, which occurred a short time since, on her 87th birthday. From its earliest days Mrs. D'Ombrain evinced the warmest interest in the National Rose Society, and this interest was maintained until her death.

### MR. JAMES KERR.

We have to record the death of Mr. James Kerr, who for several years carried on business as nurseryman, florist, and seedsman in association with his brother, Mr. George W. Kerr, in Dumfries, under the name of Kerr Brothers. The firm did a considerable business, but on its discontinuance Mr. James Kerr emigrated to New Zealand and settled at Gisborne, where he established the floral farm at Kaiti. This he had to leave on account of his wife's health. He was at that time in a serious condition of health, and the death of Mrs. Kerr so prostrated him that he could not recover, and he died in the hospital at Napier. Mr. Kerr was a good judge of florists' flowers, and was keenly interested in horticulture generally. His early death, leaving three young children, is regretted by many friends in this country.

**Origanum Dictamnus.**—The first time I met with this pretty little plant grown in a pot, was many years ago, in the window of a Surrey cottage. The good wife spoke of it as pink hops, which was certainly not an inappropriate title. Since then I have used it, and other allied kinds, for greenhouse decoration during the summer months, and find that they are much appreciated, possessing as they do a quiet beauty of their own. The drooping heads of pink flowers are disposed much as in those of the hop. It is a native of Crete, was introduced in 1551, and is none too hardy in our winters, so that it is best protected by a frame.—K.

**Hardy Flowering Shrubs.** — There are many hardy shrubs which are grown in large quantities in pots by many of our leading nurserymen, and can be utilised during the winter and spring months. Kalmia latifolia is a beautiful subject, and is very easy to manage, needing practically the same compost as the azaleas; it is necessary to select those which are well set with flower spikes, otherwise they will fail to bloom this year. Andromeda floribunda, Spiræa arguta, lilacs, Staphelia colchica, Prunus sinensis, Prunus triloba fl. pl., Choiseya ternata, Viburnum opulus, double white and rose cherries, laurestinus, rhododendrons, and Wistaria sinensis, are all most valuable subjects, and can be brought into bloom whenever required by placing them in heat. Many of those mentioned can be procured as standards, and this very greatly enhances their value for all purposes.—L. SMITH.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

HARDY PINGUICULAS.—G. O., Bristol: I am interesting myself in insectivorous plants, and should be glad if you will kindly tell me which species of pinguicula are likely to prove hardy in a sheltered, boggy position in a Bristol garden.—There are seven species that may be grown satisfactorily out of doors, especially in sheltered positions where the boggy nature of the soil is suitable. It is a good plan to make little colonies of each species, as in that way the plants are most interesting and attractive. Pinguicula alpina has white, yellow-throated flowers, and does well facing north; P. grandiflora is generally regarded as the finest of hardy species, and its violet-blue flowers, an inch long, are very attractive; P. hirtiflora hails from the uplands of Greece and Italy, and it has violet, yellow-eyed flowers; P. lusitanica is a native summer-flowering species, but is widely distributed through South-Western Europe, the lilac flowers have a yellow throat; P. lutea has yellow flowers that are not so flat as those of other kinds; P. vallisneriæfolia comes from Spain, and has lilac or soft-purple flowers, with paler centre; P. vulgaris, the common Bog Violet, closes the list, and its violet-coloured flowers are very charming from May to October.

SPRING-FLOWERING LAURUSTINUS.—A. H., Alresford: Can you tell me if there is an early spring-flowering species or variety of the useful laurustinus? — The laurustinus is a species of Viburnum—V. Tinus. It has numerous varieties, and most of these commence to flower in the late autumn, continuing to bloom through the winter and often on until Easter, according to weather and situation. Viburnum Tinus hirtum is one of the very best forms for autumn and winter flowering, and V. T. lucidum is the best for spring flowering, as it is later than the rest of the varieties.

NUPHARS.—J. M. D., Newbury: Being under the impression that Nuphar luteum was the only member of its genus, I recently challenged a statement to the contrary. Would you be good enough to say whether there are other species, and if there are, will you kindly name them, and say whether they are as meritorious as N. luteum for water gardening?—There are two native species of Nuphar, i.e., N. luteum and N. pumilum. They are, however, so much alike that quite often the one is mistaken for the other. N. pumilum has shorter anthers, and rather smaller, more rounded petals than N. luteum; the stigma is also different, rarely having more than ten rays to the ten to thirty rays of N. luteum. Both these species flower from June to August, and are desirable water plants. Nuphar advena is a useful North American species with erect, cordate leaves, and large yellow flowers that rise well above the water surface. The anthers are red, and the sepals purple-green.

PLANT FOODS.—M. C. G., Wharfedale: If you would be good enough to state what are the chief sources of plant food, under their respective headings, I shall be greatly obliged, because, as a beginner, I feel some difficulty in properly grouping the various manures.—The food of plants consists of oxygen, carbon, hydrogen, nitrogen, sulphur, phosphorus, potash, iron, lime, soda, magnesia, and chlorine. With the exception of nitrogen, potash, and phosphorous, most of these foods are obtainable by the plant from air, soil, and water. Sometimes a soil lacks a sufficiency of some material, such as lime, for certain crops, and so the natural supply must be supplemented. The chief sources of nitrogen are nitrate of soda, sulphate of ammonia, guano, soot, dried blood, and gas liquor. The leading sources of potash are kainit, sulphate of potash, muriate of potash, seaweed, and the ashes from all kinds of vegetable matter. Lime is useful in liberating potash locked up in the soil, and so rendering it available for plant food. Phosphatic manures are superphosphate of lime, bones, and bone meal, bone superphosphate, and basic slag.

FUNGUS ON GOOSEBERRY STEMS.—T. R. A., Lincoln: I am sending a piece of old gooseberry stem with a peculiar fungus-like growth upon it, made up apparently of several individuals growing one above the other. Kindly tell me what the growth is, and how to deal with it.—The curious woody fungus on the piece of old gooseberry stem indicates decreptitude. Evidently the bush is old and enfeebled, and it should be dug up and burned. The fungus is Fomes ribis, a perennial species that appears to confine its attention entirely to old and useless currant and gooseberry bushes. Get rid of your ancient bushes, and secure new and sturdy young stock.

JUNIPERS AS DANGEROUS PLANTS NEAR ORCHARDS.—E. N. V., Romford: Can you tell me whether there is any truth in the statement that junipers are dangerous plants to grow near orchards, or indeed near fruit trees of any kind? A gardening friend made the statement, but was not at all clear

LANDSCAPE GARDENING.
COLOUR SCHEMES.

Plans prepared and work efficiently carried out by thoroughly experienced men.

We shall be pleased to assist you if in doubt on any subject concerning your Garden.

We issue the following Catalogues, and will gladly send you copies free—

1. HARDY PLANTS, describing one of the most representative and extensive collections of Herbaceous and Rock and Alpine Plants in existence.
2. BULBS, FRUIT TREES, ROSES, CLIMBING PLANTS, etc., an up-to-date descriptive list comprising all the best varieties.
3. AQUATICS, BOG AND WATER PLANTS, a list of those varieties and kinds really worth growing.

10, THE ARCADE, Liverpool Street,
LONDON, E.C.
Nurseries—TWYFORD, BERKS. Visitors invited.

as to why junipers should be dangerous. Perhaps you can help us, as we are both very interested in hardy fruit culture.—That there is some truth in the statement will be evident when we say that certain kinds of fungi injurious to hawthorns, pears, medlars, and Mountain Ash, use the junipers as host plants. Just as the Black Wheat Rust uses the Barberry for a host, so several Cluster-cups (species of Gymosporangium) use the junipers as a host. The possibility of danger is very great, and where it is apprehended then the junipers near by should be destroyed. Without berberis there would be no wheat rust; if junipers were cleared away a number of fungus pests injurious to pears, etc., would cease to exist, because one part of the life cycle of these fungi can only be lived on a juniper.

## NAMES OF PLANTS.

O. B. W., Warrington.—1, Doodia aspera; 2, Strobilanthes Dyerianus.

M. J., Carlisle.—1, Retinospora tetragona aurea; 2, Symphoricarpus racemosus.

S. J., Wrexham.—1, Escallonia macrantha; 2, Cotoneaster horizontalis; 3, Gaultheria procumbens.

B. S. S., Epsom.—1, Costus igneus; 2, Adiantum cuneatum gracillimum; 3, Lomaria gibba; 4, Maranta Veitchi; 5, Ficus Parcelli.

M. E. M., Derby.—1, Epidendrum vitellinum majus; 2, Cypripedium Tityus; 3, Brassavola Digbyana; 4, Calanthe Veitchi; 5, Cattleya Harrisonæ; 6, a poor form of Cattleya labiata.

## NAMES OF FRUITS.

L. J., Lincoln.—Cornish Gilliflower.

R. T. E., Bangor.—1, Lord Derby; 2, not recognised.

O. M. M., Shields.—1, Mère de Ménage; 2, Norfolk Beefing; 3, Ribston Pippin.

B. P., Hook.—1, Emperor Alexander; 2, Fearn's Pippin; 3, Wealthy; 4, Margil.

F. S. B., Plymouth.—1, Beurré Clairgeau; 2, Cellini; 3, Egremont Russet; 4, Benoni; 5, Dutch Mignonne; 6, Gravenstein.

F. F., Barnstaple.—1, Beurré Diel; 2, Beurré Bosc; 3, Uvedale's St. Germain; 4, Lord Derby; 5, King of the Pippins; 6, Sturmer Pippin.

| Blacklands | per ton | 70 0 | | 85 0 |

## SPRAYING FOR BIG BUD OF BLACK CURRANTS.

A small experiment was carried out by one of the officers of the Board of Agriculture at Harvington, Worcestershire, to test the efficacy of various sprays for combating big bud of black currants. The bushes occupied three-quarters of an acre of ground, but only a small proportion of them were treated. There were two varieties, Prince of Wales and Carter's Champion, all of them affected, the former having an estimated percentage of 60 big buds and the latter of 50.

The bushes were sprayed across the rows so as to eliminate differences solely due to the variety, and the sprays used were:

(1) Lime and sulphur in the dry form at the rate of one part of lime to four of sulphur. Air-slaked lime was used, as ground quicklime in small quantities could not be obtained.

(2) Quassia and soft soap at the rate of 2lb. of quassia chips, 1lb. of soft soap, and ten gallons of water. The quassia chips were boiled for two hours, and then the soft soap was added.

(3) Soft soap alone at the rate of 1lb. of soft soap to ten gallons of water.

The first three transverse rows were treated with lime and sulphur, the next four were left as control, the next two were sprayed with soft soap, the next four were left as control, and the next 2½ were sprayed with quassia and soft soap. The remaining and larger part of the plantation was left as control.

The two series of intervening control rows were left more to separate any overlapping effects than to act as strict controls.

On the first spraying, April 20, the sprays were applied as above. On the second spraying, May 4, the lime and sulphur was used in the proportion of 1 to 8. On the third spraying, May 25, pure sulphur was used instead of lime and sulphur.

---

We are retaining this column week by week to take our readers on "flying visits" to our new Exhibition Warehouses and Testing Grounds at Raynes Park, Wimbledon, which are always open to the public.—James Carter and Co., The King's Seedsmen.

### I.—IF IT WERE A THOUSAND MILES AWAY.

If Raynes Park were a thousand miles' pilgrimage, all London would eagerly flock there to see what is undoubtedly a sight without parallel in the industrial kingdom But being, as it is, within twenty-five minutes' motor run of Piccadilly Circus, and four minutes' walk of Raynes Park Station, on the L. and S.W. Ry., it shares the fate of Westminster Abbey and the Tower, which tens of thousands of London people live their lives without seeing.

So the Visitors' Book in the spacious marble Entrance Hall tells us. Here are pages of visitors from places so far apart as Burma and Belgium, Kansas City and Johannesburg, Sweden and Sydney, Germany and the Azores, Budapest and Canada, sparsely leavened with visitors from Mayfair.

It was a new idea deliberately to break away from the stereotyped form of ugly, depressing, multi-storied warehouse, and to build a great bungalow workplace on novel and hygienic lines, where the workpeople could go about their duties in cheerfulness and comfort.

And as the endless stream of trains speed by on the adjacent railroad, the eyes of the passengers are focussed by day upon this strikingly original industrial palace, with its broad carriage drive and beautiful gardens; and by night upon the two-thousand-light electric sign announcing the Exhibition Warehouses and Testing Grounds of Carters Tested Seeds.

Next week: "Five minutes with the Bulbs."

James Carter & Co.

On May 4 immense swarms of mites could be seen outside each big bud. They were also to be found in considerable numbers on the leaves and flowers. Many living mites were found on the bushes sprayed with quassia and soft soap, though the bushes were sprayed as thoroughly as possible. On May 25 slight scorching was seen on the young leaves of the bushes treated with lime and sulphur. A microscopical examination of big buds from treated bushes and those from control bushes showed but little difference. In each case swarms of mites could be seen at the opening of the buds. Though many of the big buds had dried up there were still plenty from which an active migration was going on.

On June 16 the scorching of the leaves on the "sulphured" bushes was more marked. All the big buds were dried up, but mites were found in the young buds just forming.

On November 4 the plantation was examined as the owner was grubbing the bushes. Sample twigs were taken from the various rows and submitted to microscopical examination. This was necessary, as in November all the buds that contain mites have not yet become "big."

The samples were taken quite indiscriminately, and represented a fair average of the buds. The big buds in each sample were counted with the following results.

| | Big Bud. | Normal Bud. | Percentage of Big Bud. |
|---|---|---|---|
| Control ................. | 68 | 102 | 66.7 |
| Lime and sulphur... | 76 | 167 | 45.5 |
| Quassia and soft soap | 69 | 135 | 51.1 |

The sample from those bushes treated with soft soap only were not counted, as they were obviously no better than the control. Thus the lime and sulphur treatment reduced the amount of disease to two-thirds of the untreated, and the quassia and soft soap to four-fifths.—"Journal of the Board of Agriculture."

## FORTHCOMING ENGAGEMENTS.

TUESDAY, October 29.—National Chrysanthemum Society's Exhibition at the Crystal Palace; three days.

Kent Commercial Fruit Show, at Maidstone; two days.

WEDNESDAY, October 30.—Kent County Chrysanthemum Show; two days.

Croydon Chrysanthemum Show; two days.

THURSDAY, October 31.—Torquay Chrysanthemum Show.

FRIDAY, November 1.—Hinckley Chrysanthemum Show.

SATURDAY, November 2.—French Horticultural Society of London.

TUESDAY, November 5.—Southampton Chrysanthemum Show; two days.

Chelmsford Chrysanthemum Show; two days.

Brighton Chrysanthemum Show; two days.

Bournemouth Chrysanthemum Show; two days.

Scottish Horticultural Association.

Royal Horticultural Society's Orchid Show; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Double Flowers," by Miss E. R. Saunders; Scientific Committee at 4 o'clock.

## Situations Wanted.

B. H. BROOKS, Court Gardens, Brantham, Manningtree, Essex, highly recommends H. SMEE as SECOND JOURNEYMAN, in good establishment; quick and obliging; five years' experience; excellent references; age 23.

CAPTAIN GORDON highly recommends his GARDENER as Head Working, where two or more are kept; life experience; excellent references; age 31; no encumbrance. GARDENER, Southend, Wickwar, Gloucestershire.

E. DEAN, Esq., highly recommends GARDENER (Head or Single-handed); 5½ years with him; 29 years' experience Inside and Out; age 43 Apply WELSTEAD, Woodvale, Woodvale Avenue, South Norwood.

FOREMAN (Inside) or GARDENER (Second).—Mr. J. V. MACDONALD, Whetstone Gardens, Edgbaston, Birmingham, wishes to recommend THOMAS EVANS as above; age 27; good experience in Fruit and Plant Houses.

GARDENER seeks SITUATION, experienced inside and out; practical in fruit and rose-growing; highest references.—GARDENER, 8, Stanley Villas, Stanley Road, Carshalton-on-the-Hill, Surrey.

GARDENER (Head Working) requires SITUATION where three or more are kept; highest references; age 33; single. B. H. BROOKS, Court Gardens, Brantham, Manningtree, Essex.

GARDENER (Head) seeks SITUATION, where one or two are kept, 14 years' experience in all branches, Inside and Out, in large establishments; excellent ref.; highly recommended. H. PAYNE, 59 Thorpe End, Melton Mowbray.

GARDENER (Head Working) seeks Situation; life experience in good all-round gardening; age 40; married, two children; good references. HOARE, Wycombe Court Gardens, High Wycombe.

GARDENER (Head Working).—MR. COLLETT, Kirtlington Park Gardens, highly recommends his FOREMAN, H. STEDMAN, as above; 19 years' practical experience in all branches; age 35; married, two children; life abstainer; excellent references; disengaged when suited. H. STEDMAN, Bicester Lodge, Kirtlington Park, Oxon.

GARDENER (Head Working, where several are kept); thoroughly experienced in all branches; age 30; married when suited; excellent character. R. SCRIVEN, Combe Hill, Barton St. David, Taunton.

**Read what our Advertisers write re "Gardeners' Magazine."**

October 14th.

"I beg to inform you that I have obtained a Situation as Second Gardener, so you may take my name off the Register. Thanking you very sincerely,

"Yours truly,
"W. S. C."

**The "GARDENERS' MAGAZINE" is the gardener's friend. Read it and recommend it to your friends.**

GARDENER, Single-handed; 14 years' experience in general gardening; age 28; single. W. VAISEY, Barnsley Park Gardens, Cirencester.

IMPROVER in Gentleman's Garden or good Nursery; age 18; abstainer; strong, willing; 3½ years in present situation, Market Nursery. TED PIXLEY, care of J. W. Lawson, The Vinery, Harby, near Lincoln.

JOURNEYMAN (Inside) seeks SITUATION; eight years' experience; good references. J. BADNELL, 62, Greys Hill, Henley-on-Thames.

MR. MARINIER can very highly recommend M. BARTSCH to any Lady or Gentleman requiring a capable and trustworthy GARDENER; age 25; single; leaving La Touraine, Carlton Road, Weymouth.

STRONG LAD, age 17½, seeks SITUATION as IMPROVER; two years' experience in present place; anxious to learn; Bothy preferred. F. MOSS, Sunnyside, Moorfield Road, Orpington, Kent.

YOUNG MAN seeks SITUATION in or near Surrey, on Pleasure Grounds, under one or two; 18 years old; four years' experience; used to mowing machines; good references. A. SAYERS, Brosely Cottage, Bookham, Surrey.

YOUNG MAN seeks a SITUATION as IMPROVER (Inside or Inside and Out); Bothy preferred; good references; abstainer. ALBERT HOUSE, 29, Rowley Road, Reading, Berks.

YOUNG MAN seeks SITUATION (Inside and Out; age 21; strong and willing; six years' experience; three years' nursery, last place; good references; abstainer. W. COWARD, Old Broughton Road, Melksham, Wilts.

YOUNG MAN (25) seeks SITUATION as GROWER; Tomatoes, Cucumbers, Bulbs, Mushrooms, Cut Flowers, etc.; could take charge of small nursery; abstainer; good references; wages, 23s.; Midlands preferred. F. STUBBS, 16, Stanley Gardens, Cricklewood, London.

YOUNG MAN, 26 (Single) seeks SITUATION as COWMAN, and help in Garden; highly recommended by R. E. Campbell, Esq., Glenwood. C. T., Ivy Cottage, Callow Hill, Virginia Water, Surrey.

YOUNG MAN seeks SITUATION in private place to look after horse or pony cart, or help clean motor; live in cottage on the place; widowed mother will help in house if required; excellent characters; handy man; state wages; seven years' experience gardening. T. S. FEIST, 43, Brook Street, Polegate, Surrey.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Fog.

A fog, in principle, is nothing more or less than a cloud which, instead of floating in the air above our heads, is resting upon the soil, and, very frequently, is so shallow in depth that on an otherwise clear night the moon and stars may be visible through it. It also frequently displays its cloud nature by its local and patchy occurrence, so that in towns one street may be densely obscured, while another closely adjacent may be quite clear. The presence of fog is usually determined by a perfect absence of wind and a definite change of temperature, which may act either way, such as a drop in aerial temperature, when the soil has been warmed, or a rise, when the soil has become cold, the difference in either case resulting in a chill of the surface layer of aerial moisture, which is thus condensed into watery particles, and so becomes visible. It is for this reason that fogs so often set in after sunset and disappear when the sun has risen long enough to exercise its warming power on the atmosphere A fog, in short, is an indication of a local super-suppuration, and a very few degrees' difference in the thermometer determines its existence or non-existence in the cold seasons of the year. In the country, where the air is pure, a fog or dense mist is a purely innocuous phenomenon, as we may judge by the healthy appearance of alpine plants, whose habitats are in or near the region of the clouds. In the vicinity of cities and towns however, where the air is laden with impurities, not only do these exercise a marked effect upon the fog itself, by forming nuclei, round which the aqueous particles condense, but the presence of these impurities renders the fog thicker, and dark in colour, instead of the pure normal white of clean aqueous vapour. It is thus that the "London particular" is formed, and in this vitiated state the fog is extremely detrimental both to man and the plant world by its poisonous effect upon the human lungs of the one, and the foliage of the other. To vegetation it is particularly harmful, since, while under dry conditions the deleterious matter present in the air does not adhere to the foliage, the fog, by condensing upon the leaves, deposits thereon not only the solid impurities it contains, which block up the stomata, but it carries some of these impurities, such as sulphurous acid, into their pores in a state of solution to act as one of the deadliest poisons to plant life. It is a curious fact that this year, in the earlier part of October, although the fogs which prevailed round London were apparently of the clean description, being quite white in colour, they proved, nevertheless, to be exceptionally virulent, since, quite independently of a few degrees of frost which accompanied them, the evergreen foliage of all herbaceous plants and ferns was found to be browned, and even killed, to a far greater extent than usual after the fog had disappeared. The particular fog which apparently was the cause of so much damage, was, we are informed, despite its apparent purity, of so foul a nature that white linen toilet cloths in the vicinity of open windows were so much blackened by the indraught of fog, that in a few hours all articles standing upon them, when lifted, showed where they had been by white silhouettes on a dark grey ground, owing to the deposited filth. The question has been mooted whether such a deposit, and its obvious poisonous effects, may not be partly due to suspended dust from tar-covered roads being precipitated by the action of the fog. A point in favour of such an idea is that it was practically the earliest of the fogs which was the worst. Both the deposit and its effects on vegetation we have ourselves personally witnessed. Happily, in these later days such great improvements have been made in lighting and diminution of smoke by the adoption of better methods of combustion, that the old-fashioned pea-soup fog is much more rarely seen, or when seen the "soup" is greatly diluted. The more common type nowadays is what is termed a sky fog, represented by a thick pall of mingled mist and smoke, which lies, seemingly, but little above the housetops, and shrouds us all in sunless gloom. Bad as this is however, it is devoid of either the toxic effects we have spoken of or the obstructive character of the ground fog, supposed to be typical of November, but, as we have seen, by no means exclusively so.

MR. JOHN McKINNON.

**Mr. John McKinnon,** whose portrait we have the pleasure of giving in this issue, has occupied his present position of head gardener to the Earl of Aberdeen, at Haddo House, seven years, and during this period he has so highly distinguished himself as to have taken a foremost place among the many good gardeners who are pursuing their avocation in the district of which the city of Aberdeen is the centre. In proof of this it is sufficient to recall the fact that on the reconstitution of the North of Scotland Horticultural Association, about two years since, Mr. McKinnon was elected as president. That he justified the honour that was done him was made abundantly evident by the fact that the membership closely approached three hundred during the first year, and that at the first annual meeting he was unanimously re-elected. Mr. McKinnon was appointed by the Earl of Aberdeen to the charge of Haddo House gardens in succession to the late Mr. Forrest, who retired at the time after thirty-seven years' service. The gardens of Haddo House are extensive, and the cultivation of the various kinds of plants, fruits, flowers, and vegetables that are in request in an establishment of the first class are grown largely and well. Where everything, both in the open and under glass, bears the impress of ripe judgment and cultural skill of a high order, it is difficult to particularise; but it may be said that Malmaison and tree carnations form one of the outstanding features. The collection is large, and the results obtained eminently satisfactory, the special attention given to these flowers being due to the high appreciation in which they are held by the Countess of Aberdeen. In addition to his duties as head gardener at Haddo House, Mr. McKinnon has the supervision of the garden at House of Cromar, a mansion recently built by the Earl of Aberdeen on his estate on Deeside, about twenty-five miles distant from Balmoral. Previous to entering on the charge of the Haddo House gardens Mr. McKinnon was head gardener at Eastwood Hill, near Glasgow, seven years, and before that foreman at Kilnside, in Renfrewshire, for two years, where he had charge of a fine collection of orchids.

**Cape Pelargoniums** appear to be regarded with but little favour by horticulturists in the Isle of Wight. The other evening Mr. C. Martin gave a lecture on the International Horticultural Exhibition held at Chelsea in May last, and, at the close, expressed his regret that the Isle of Wight Cup should have been awarded to the specimen pelargoniums from the gardens of Gunnersbury House. Mr. Linington, the chairman of the local committee for the Isle of Wight, also expressed his disappointment that the cup should have been awarded for scented geraniums rather than for something more worthy. We agree the cup might have been awarded to something different, but it could not have well been awarded to anything more worthy of distinction than the splendidly developed specimens that were shown by Mr. Leopold de Rothschild. So far as we are aware, the owner of the Gunnersbury House Gardens and his talented gardener have not expressed themselves as being otherwise than perfectly satisfied with the award, but some of the horticulturists who are in a position to fully appreciate the unique character of the collection, regarded it as deserving of a somewhat higher award. There is really nothing in this difference of opinion, for such differences have obtained from the earliest days of horticultural exhibitions, and are likely to continue as long as there are competitive gatherings.

**Orchid Show and Conference.**—The development which orchids have undergone in recent years has been so rapid and considerable that it has now become possible to hold an exhibition specially for those blooming in the autumn. Recognising this fact, the Council of the Royal Horticultural Society included in their programme for the current year an orchid show, which, as previously announced in these pages, will be held on Tuesday and Wednesday next, the 5th and 6th inst. Ten years ago such an exhibition was unthought of, and had it been suggested there would have been some difficulty in organising it on such lines as would have ensured any considerable degree of success, the present ability to hold one being mainly the result of the splendid work that has been accomplished by the hybridists, whose numbers have been greatly increased within recent years. Having regard to this fact, it is a matter of some importance that a conference on orchids will be held at the Royal Horticultural Hall on the second day of the show. There will be two sessions, one from 11 a.m. to 1 p.m., and the other from 2 to 4 p.m. At the morning session Professor Keeble will read a paper on "The Physiology of Fertilisation," and this will be followed by a paper by Major C. C. Hurst on "The Application of Genetics to Orchid Breeding." At the afternoon session papers on "Some Epiphytical Orchids" and "Albinism in Orchids" will be read by Mr. H. G. Alexander and Mr. R. G. Thwaites respectively. Mr. J. Gurney Fowler, chairman of the Orchid Committee, will be the president of the conference.

**National Sweet Pea Trials for 1913.**—The committee of the National Sweet Pea Society will hold trials of sweet peas at the Burbage Experiment Station, Leicestershire, conducted by Major C. C. Hurst, F.L.S., in 1913. No certificates or awards will be granted to novelties unless they are sent for trial. For the novelty trials a charge of 2s. 6d. per variety will be made, and novelties will be accepted only from the raiser or introducer. Thirty seeds of each novelty must reach the hon. secretary, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex, before January 4, 1913. The seeds must be placed in plain packets, but each packet much bear a number or letter for purposes of identification. With the seeds there must be a letter bearing the sender's name at the top, the number or letter of each variety sent, and, opposite such letter or number, the name of the variety (if any), the colour section to which it belongs, and (if orange or salmon) whether it should be shaded. Sweet peas will also be tested for purity at a charge of 10s. per stock or variety. Not fewer than two dozen seeds should be sent. In every case the amount due for trial charges must accompany the seeds. Every sender will receive the report of the Floral Committee in the autumn of 1913.

**Presentation of Fruit to the Lord Mayor.**—In accordance with the annual custom, a presentation of fruit was made to the Lord Mayor of London by the Fruiterers' Company on Monday evening last. The presentation was made by the Master of the company, who, with the Wardens and Court, was subsequently entertained at dinner. The fruit was acknowledged to be the finest lot the company has yet presented to the Lord Mayor. It was contained in three large ornamental baskets, the centre one having four handles in the Grecian style, and when filled was about four feet high. As a central feature was a grand pineapple, flanked by Cannon Hall, Muscat of Alexandria, and Gros Colmar grapes, of superb quality and finish, the pyramid being composed of golden melons and highly-coloured apples and immense pears, the latter being arranged with due regard to a tasteful contrast of colour. The handles of the basket were charmingly decorated with Madame Abel Chatenay and Niphetos roses, which were arranged alternately, and enlivened with richly-coloured croton leaves and autumnal foliage. The oblong baskets at the end of the table were so arranged as to present the appearance of trophies of apples and pears, which were surmounted by pineapples of large size and fine finish. Conspicuous among the splendidly-developed pears were Doyenne du Comice, Beurré Diel, and Pitmaston Duchess, and the most noteworthy apples for brilliancy of colouring were King of the Pippins, Gascoyne's Scarlet, Cox's Pomona, Emperor Alexander, Cox's Orange Pippin, Twenty-Ounce, and Rival, and for their golden hues Lord Derby, Norfolk Beauty, Peasgood's Nonsuch, and Stirling Castle were the most remarkable. The tasteful arrangement of autumn-tinted foliage on the table, interspersed with specimen apples and pears, made a fine setting for the baskets of fruit and contributed much to the general effect. The work was ably done by Messrs. Brooks, of Regent Street, the Court fruiterers, under the direction of Mr. George Bunyard, V.M.H.

**National Rose Society's Exhibitions,** 1913.—The dates of the exhibitions that have been arranged by the National Rose Society for next year are as follows: Spring Show, at the Royal Horticultural Hall, May 1; Metropolitan Show, in the gardens of the Royal Botanic Society, Regent's Park, July 5; Provincial Show, at Gloucester, July 15; and Autumn Show, at the Royal Horticultural Hall, in September. The provincial exhibition will be held in conjunction with the show of the Gloucester Rose and Sweet Pea Society, which completes its twenty-fifth year in 1913. With Mr. Conway Jones as one of the more prominent members of the local society, and the promises of the hearty support of the Mayor and Corporation of Gloucester, the exhibition should be of quite exceptional interest.

**Daffodil versus Leek.**—On the insurance stamp Wales is represented by a daffodil, which is associated with the rose, thistle, and shamrock, and Welshmen have recently contended that the Welsh leek was really a daffodil. In connection with this controversy it is of interest to remember that the name is pure Anglo-Saxon, and, as Canon Ellacombe points out, it originally meant any vegetable; then it was restricted to any bulbous vegetable before it was finally restricted to the leek of gardens. According to Professor Wright, the "importance" of the leek was considered so much above that of any other vegetable that leac-tun, the leek garden, became the common name of the kitchen garden, and leac-ward, the leek-keeper, was used to designate the gardener. It is an interesting little controversy, and as we sympathise with the Welshmen, who are desirous of adopting the daffodil as the floral emblem of Wales, we regret our inability to find in any of the old books relating to plants, that have been published since 1535, any suggestion that the plant favoured by Wales was other than our leek.

**Morphology of the Leaf.**—Mr. O. F. Cook has, we learn from "Nature," published an interesting note in the "Journal" of the Washington Academy of Sciences on the morphology of the leaf in various members of the Prunus section of Rosaceæ, sometimes regarded as a separate family (Amygdalaceæ). The leaves of plum, peach, apricot, etc., have a joint at the base, just above the insertion of the stipules, as in many leguminous plants; the part below this joint does not fall off with the leaf-stalk, but remains alive and forms a supplementary bud-scale. This is regarded as a vegetative character which supports the view that the Amygdalaceæ are deserving of family rank, and also as strengthening the connection between the rosaceous and leguminous series. The fact that small leafy outgrowths sometimes replace the nectaries on the upper part of the leaf-stalk in various Amygdalaceæ suggests the view that the immediate ancestors of this family had compound leaves, these nectaries corresponding to the marginal glands of the leaf-blade and representing rudiments of divisions of compound leaves.

**Torquay Gardeners.**—The opening meeting of the winter session of the Torquay Gardeners' Association was of special interest. Mr. W. A. Masterman, one of the vice-presidents, gave an interesting address on the Royal International Horticultural Exhibition held at Chelsea in May last. In the course of the proceedings following the address, Mr. Masterman, on behalf of the members, presented Mr. A. Pidgeon with a silver watch as a mark of the appreciation of the services he has rendered the society as hon. librarian during the past eleven years. Mr. Pidgeon, who has retired from the office of librarian, is succeeded by his son, Mr. W. J. Pidgeon. The hon. secretary, Mr. G. Lee, has relinquished his office in consequence of his appointment as curator of the museum of the Torquay Natural History Society, and is succeeded by Mr. Holder.

MR. NORMAN DAVIS'S FINE GROUP OF CHRYSANTHEMUMS,
Which secured a large gold medal, and Messrs. Clay and Son's gold medal, at the National Chrysanthemum Society's Exhibition at the Crystal Palace on October 29. (See page 846.)

**Peach Growing in British Columbia.**—A fruit grower in Penticton—famous for its peaches—has recently picked and shipped ten tons of peaches from his ten-acre orchard, and estimates that there were ten tons still to gather from the same orchard. The fruit from the first picking was rather small owing to the inability of the grower to obtain labourers to thin the peaches. A grower with a similar holding in the same district has gathered a large quantity of peaches averaging half-pound each. A small quantity of Penticton peaches recently arrived in England, and was sent for the purpose of showing what fine fruit can be grown in this region. Examples of these peaches, from a district which has only been opened up about five years, were on view in the windows of the Canadian Government Emigration Offices, at Charing Cross, and at the offices of the Canadian Pacific Railway, the Grand Trunk Railway, and the Canadian Northern Railway.

**Colonial Fruits.**—At a recent sitting of the Dominions Royal Commission in London evidence was given on the necessity that exists in this country for more abundant supplies from the Colonies of plants suitable for the distillation of essential oils, and of the various kinds of fruits used in confectionery. With reference to the latter, Mr. Stanley Machin stated that he saw no reason why a larger proportion of the raw materials used in the United Kingdom in the confectionery and preserved fruit trades should not be produced within the Empire. For example, oranges, citrons, and lemons were imported in large quantities from Spain, Greece, Italy, etc., but were at present imported in comparatively small quantities from Malta, Australia, and the West India Islands. A most important factor in the jam and preserve-making industry was the supply of fruit pulp, especially apricot pulp, which at present was imported from the Colonies in only very small quantities. Australia had at times sent supplies to this market, the quality of which was good, but the export trade did not appear to have been extended to any extent. The British demand, which was very large, had, therefore, to be provided from Spain, Italy, France, and California. The supply of almonds from British possessions was valued at only £3,852, but immense quantities which were used in the trade, to the value of £949,627, and, presumably, could be grown in British possessions, were imported from France, Portugal, Italy, Spain, and Morocco.

## KENT COMMERCIAL FRUIT SHOW.

No one who visited the extensive and extremely interesting exhibition held in the Corn Exchange, Maidstone, on October 29 and 30 could fail to be impressed by the evidence here afforded of the growing importance of fruit farming in this country. It was not only the quantity and the quality of the fruit shown—excellent though this was—but also the intense interest evinced by the company of growers and experts who gathered, not only from Kent, but from far distant counties, that made one realise that at last our agriculturists and market gardeners, and even the country cottagers, are waking up to the fact that fruit culture, carried on upon systematic and businesslike lines, with the aid of science, is a pursuit with hitherto undreamt-of possibilities.

This was but the second annual show held in Kent under the auspices of the Kent Commercial Fruit Show Association, and with the support of the South Eastern Agricultural College. Last year the show was at Ashford, and everybody was pleased with the results of the first effort. There were on that occasion 550 boxes of apples staged in the competitive classes, but the judges on Tuesday last had over 1,200 boxes placed before them, thus showing that the society has quickly aroused the interest which everyone concerned so ardently desired. It must also be stated that most noticeable improvement was evidenced all round in the grading and packing of the fruit in comparison with last year, and this, of course, is really the great point, being that which has hitherto marked the dividing line between British and Colonial growers.

In the principal classes the fruits were shown packed in Federation standard boxes, the dimensions being 20in. long by 11in. wide and 10in. deep, while half-boxes used in some classes were 5in. deep and of the same length and breadth as the others. Obviously a great number of exhibits staged in this manner provided a display of great uniformity, and some might say monotony. Certainly, from a spectaclar point of view, there was a vast difference between this show and the R.H.S. fruit show, but from an economic point of view and for real value to the community at large this, it must be admitted, was the more important. The judging of the exhibits was of necessity carried out on entirely different lines from those adopted at the ordinary horticultural shows, and it may be stated that, in certain classes where excellence of packing was specially asked for, some of the best quality apples were left out of the prize list simply because the packing was not what may be called first-rate.

Apart from the judging itself, the most interesting item in the first day's programme was the auction sale of the exhibits. Some capital prices were made, especially of the winning lots, but the record—and a capital one it was—was reached by the first-prize lot of Bramley's Seedling. The six boxes, containing 63 apples in each, fetched 40s. per box, and there was a good deal of excitement among the bidders, several London buyers being keen on obtaining this exceptionally fine lot of Bramley's.

It is significant of the high esteem in which that fine apple Bramley's Seedling is held, that the first class in the schedule was for six boxes of this variety, and it may be added that there was an excellent entry of about three dozen lots, among which the judges had a hard task to find the winners. He must be hard to please who would be dissatisfied with Mr. G. E. Champion's first-prize set, which came from Linton, Maidstone. They were as even in size and shape as could well be, and were of as good a colour as ever we have seen this variety. Messrs. W. Skinner and Sons, Boughton Monchelsea, Maidstone, took second place, but their packing was not so neatly done as in the winning set. Close, indeed, to second was Mr. R. Ferguson, Maidstone, who was given third place, his fruits being sound and weighty examples. Mr. W. W. Hubble, Hunton, Maidstone, came fourth.

Newton Wonder, another deservedly popular apple, brought entries from widely separated localities, and here again the first prize went to six boxes that fully merited their honours. Messrs. Gaskain and Whiting, Dargate, Faversham, were the successful exhibitors, and their moderately-sized but very even fruits were packed diagonally in their boxes in a manner that ensured safe transit. Mr. C. Murdoch, Linton, Maidstone, came second, his fruits being beautifully ripe and of very attractive colour; Mr. F. Smith, Loddington, had wonderful size to his credit in his third-prize lot; the fourth going to much smaller fruits staged by Major W. A. Nicholson, West Malling. There were not a few who lingered over Mr. Smith's exhibit, remarking that third place was low in the scale for what were undoubtedly a wonderful lot of apples.

Lane's Prince Albert made a good class, and it was most interesting to note the wide difference in size, colour, and finish of the fruits sent from different districts. It would have been pardonable if some visitor had ventured the opinion that there was a mixture of varieties in the class. No one had cause to complain of the colour of the first-prize exhibit staged by the executors of the late R. Neve, Esq., Tenterden, but it must be admitted there were more even lots than this in the class. Mr. E. H. Chambers' second-prize set were bright, clean examples of reasonable size, but they did not seem to fit so comfortably into the boxes as could be wished. Mr. F. Neame, Faversham, who took third, had plain green fruits, as well as highly coloured: Major Nicholson's fourth-prize fruits had not a tinge of red about them.

One of the grandest of all the classes was that for six boxes of Blenheim Pippin. Nothing finer or more appetising could be desired than the great array of this superb and still highly-prized apple, and, needless to say, there was a constant group of admirers before this class. Messrs. Gaskain and Whiting led off with the most even, beautifully packed fruit, which were just as large as we like them, and of magnificent colour. Second place was taken by Mr. W. W. Hubble, whose fruits were good, but not so nicely packed as those of Mr. A. Hiskin, who secured third prize. There was not a bad box of fruit in the whole of this class, and for good packing it afforded an example to the whole show.

Lord Derby, a big, useful kitchen apple, found plenty of competitors, but this, in our opinion, is scarcely an apple for box-packing in an ordinary way. However, from an exhibition standpoint, this was a good class, and we can only commend Messrs. Gaskain and Whiting on their merited success in winning first prize with a splendid lot of fruit, whilst Mr. W. W. Hubble and Mr. F. Smith, who took second and third, had also good fruits.

Very pretty were the Worcester Pearmains, and one can readily understand that this handsome apple should fetch higher prices when neatly boxed than when presented in hampers or baskets. Mr. S. Smith had a grand lot, nice size, rich colour, and pleasing aroma; second prize winner was Mr. F. Smith, third place being given Mr. A. Miskin, Chart Sutton, Maidstone. A class was provided for three boxes of any one dessert apple other than Blenheim Orange or Worcester Pearmain. Messrs. Gaskain and Whiting scored with Allington Pippin, so highly developed as to be almost unrecognisable. Mr. R. Stephenson's Cox's Orange Pippins secured second place, and of these we may certainly say their colour could not be surpassed. Mr. S. Smith came in third with Loddington Pearmain. In the class for the best packed box Mr. A. Miskin proved successful, following three-two style of packing, with eye upwards. Mr. F. Smith was awarded the second prize, third place being taken by Major Nicholson.

There were many small classes for single boxes of both dessert and cooking apples, and there were also classes confined to small growers in Kent. We refrain from giving detailed lists of names of the winning exhibitors in these smaller classes, but suffice it to say right through the schedule we were pleased to see keen competition and excellent quality. One class, however, was the centre of considerable interest, it being for a half-box of a new dessert apple. Rival was the winning variety, staged by Mr. F. Duncanson. The prize in this class was a champion cup.

Pears were very few in comparison with the vast quantity of apples, but, nevertheless, some excellent fruits were staged. The winner for three half-boxes was Messrs. Gaskain and Whiting, the variety being Elektea, a long, shapely, green-skinned fruit that looks like an excellent keeper. Beurre Bachelier, shown by the same firm, was credited with another first prize. Mr. A. Hiskin took second with beautifully-coloured Doyenne du Comice. We are tempted to raise one protest, to the effect that the organisers of the show should insist upon every variety of fruit shown bearing a legibly-written label with its name. Another improvement in an excellently-managed show would be to have the address of each exhibitor on the class cards.

There were three challenge or champion cups presented, one being the Coupe Cup, which was awarded to Mr. Champion for his half-dozen boxes of Bramley's Seedling; the Garcia Cup, taken by Messrs. Gaskain and Whiting, with Lord Derby; and the George Mence Smith Cup, for the best single box of apples, was awarded to the same firm.

## MESSRS. G. BUNYARD AND CO.'S DISPLAY.

Messrs. G. Bunyard and Co., Lim., who, of course, were very much at home during the fruit show, filled a separate building on the opposite side of the thoroughfare to the exhibition itself, with a most beautiful collection of choice fruits. The display comprised upwards of 200 varieties of apples and pears, and, although in so vast a collection it is impossible to enumerate all that were worthy of mention, we must make a note of a few of the best. Of dessert apples, nothing could be finer than Allington Pippin, Rival, Cox's Orange, Coronation, and May Queen. A dessert apple that is just now at its best, and that very good, is Mother, a handsome fruit of great merit. Of culinary apples there were Bramley's Seedling, Newton Wonder, Lane's Prince Albert, and Warner's King, as well as Bismarcks, Lord Derby, and Golden Noble, the latter a beautiful clear yellow. Norfolk Beauty cannot be overlooked as an apple that is making great headway in the public favour. A few of the best pears were Doyenne du Comice, Marie Benoist, Charles Ernest, Santa Claus, Emile d'Heyst, President Dromard, and Josephine de Malines. Some good stewing pears were Uvedale's St. Germains (turning the scale at 2lb. each), Catillac, and Doyenne d'Alencon.

## NON-COMPETITIVE.

A highly-instructive exhibit came from the South-Eastern College, Wye, Kent. Boxes of apples, packed in various styles, such as diagonal, offset, straight, and fancy, each style having points of special adaptability to certain sizes and shapes of fruit. The boxes of specially-picked apples, separately wrapped in tissue paper, were highly commendable, and it was interesting to learn that a brisk demand has sprung up for British apples for export, packed in this particular manner. A very nice collection of both dessert and kitchen apples came from Messrs. Seabrook and Sons, Chelmsford, all the Kentish growers readily admitting that the exhibit bore indisputable testimony to the suitability of Essex soil and climate for pomology.

## APPLIANCES AND SUNDRIES.

These were largely exhibited, and although a good many of the preparations, machines, and tools on view were of the usual useful but well-known character, there were a few novelties that possessed merits and advantages that all growers for profit should be ready to recognise. Messrs. McDougall Bros., Manchester, had fruit tree washes that have, as a result of many experiments and careful analyses, been brought to a wonderful standard of efficiency. Messrs. Corfe and Son, Maidstone, showed their lime-sulphur solution, and branches of fruit trees infested with pests were shown in contrast to the clean wood resulting from proper spraying. Dedlee Spray for Aphis, Corfe's Arsenate of Lead, and Pure Nicotine were on this stand.

Messrs. Voss and Co., Lim., Millwall, E., brought their many useful chemical preparations, other large exhibitors in this line being Mr. M. Herrod, Wisbech; and Messrs. Lewis Berger and Sons, Lim., Homerton, London.

Among appliances the familiar Abol syringes of Messrs. E. A. White, Lim., Paddock Wood, were shown in a variety of patterns with nozzles and connections for all purposes Quite a collection of fruit adorned this stand demonstrating the value of Abol Fruit Tree wash as an aid to the production of good, clean fruit.

Among a host of Knapsack and larger spraying machines exhibited by the Four Oaks Spraying Machine Company, Sutton Coldfield, were a new Knapsack, fitted with an improved non-waste air chamber, and a capital pneumatic cylinder machine with pump attached.

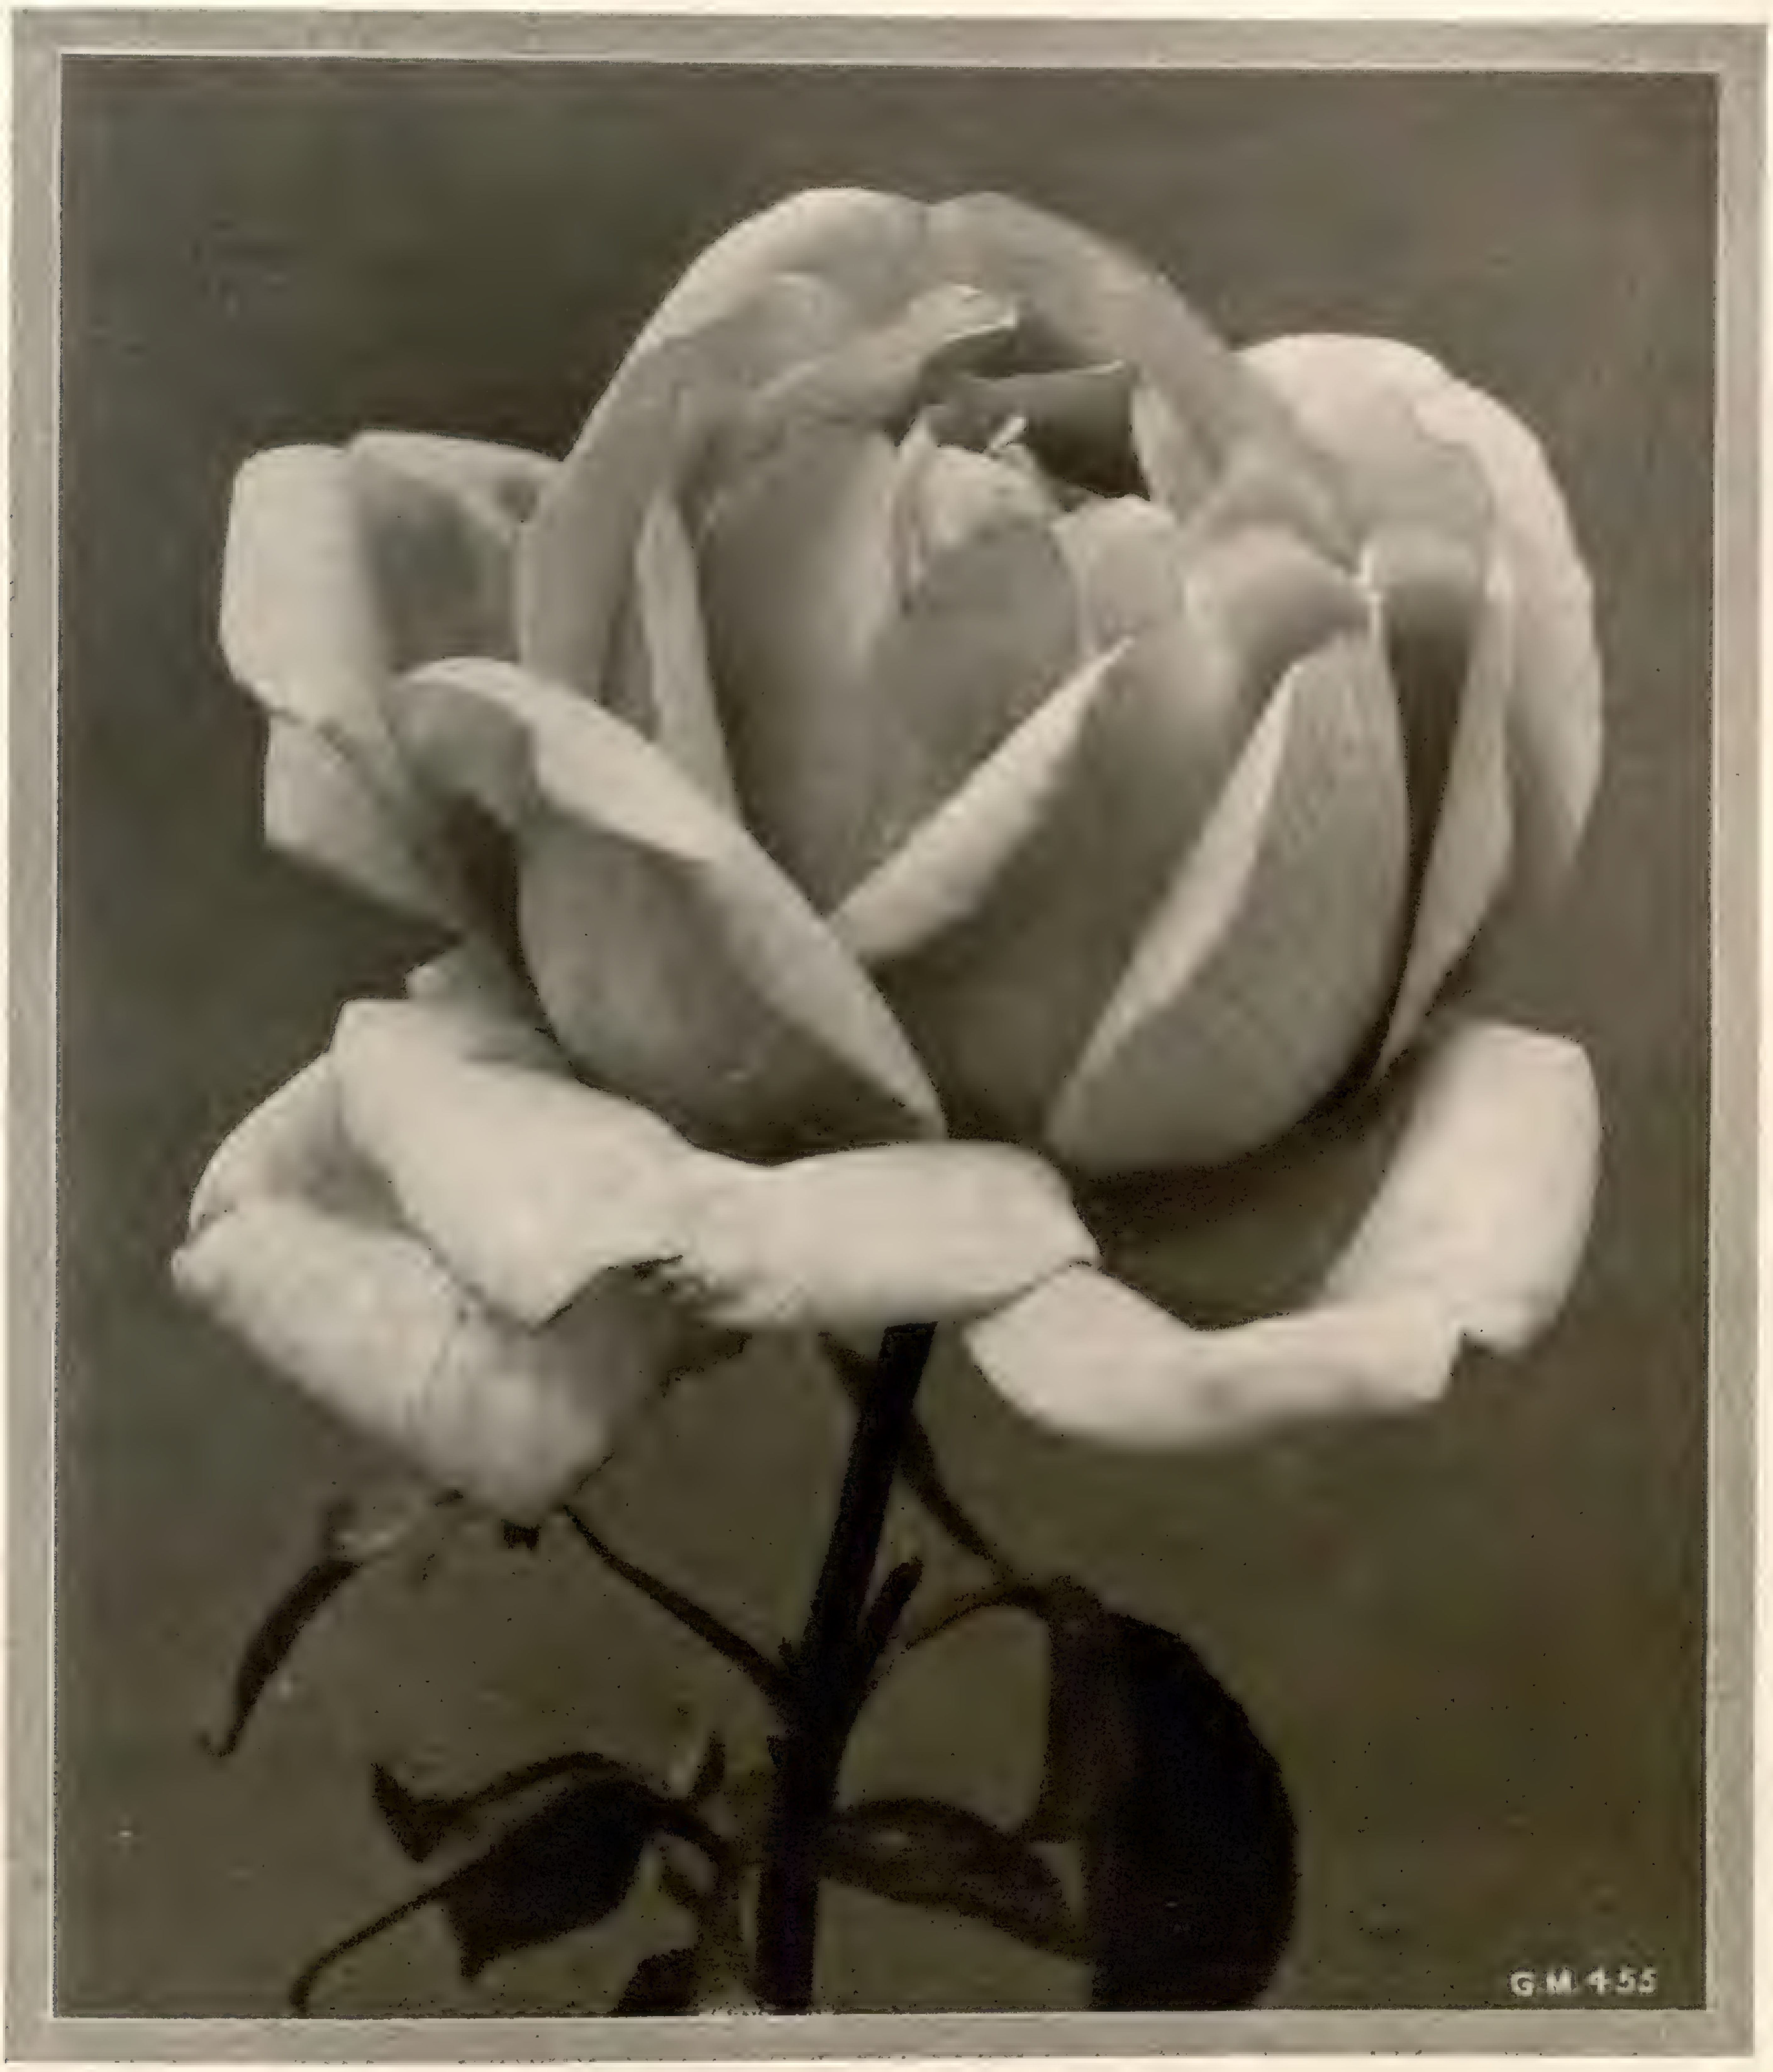
Messrs. Weeks and Son, Lim., Maidstone, were exhibitors of big machines suitable for orchard work, hop plantations, and potato fields; and Messrs. Drake and Fletcher had a whole range of various makers' machines in all shapes and sizes.

Messrs. Weeks and Son, Lim., had one of the most important appliances on view in the shape of a hand grading and packing table, which in a quite simple manner sorted apples into six different grades, and presented them conveniently for packing into boxes or hampers. Made of flannel-lined wood, the whole operation of grading can be done with the machine without the slightest damage to the fruit. The grading in the hands of an accustomed lad or girl can be done at the rate of a bushel in three minutes.

## MESSRS. ALEX. DICKSON AND SONS' ROSES.

As in the case of some other important towns that might be mentioned, the Newtown of the Ards has enjoyed considerable fame during a material part of its long and eventful history. At one time, and that somewhat remote, the town was noteworthy as the centre of numerous religious establishments, of which several were of much importance, as indicated by the ruins that remain to remind us of their greatness. Later Newtownards, to give the town its more modern designation, became famous as a centre of the linen industry, its manufactures of this fabric continuing to be regarded with much favour, and, as the result thereof, maintain their high place in the markets. Now it has attained to so high a position as a great centre of rose growing and rose raising that it has become a household word wherever roses are grown and appreciated, or, in other words, throughout the civilised world. In thus briefly referring to a point that is not without interest, it must not be assumed that an attempt will be made to give a sketch of the history of the town. It would be a pleasant task, but at the present time the writer is more concerned with the many beautiful roses that we owe to the activities of the Messrs. Alex. Dickson and Sons, and contribute so liberally to the charms and interest of many thousands of gardens.

If a question were asked as to the length of the time over which the firm has given special attention to the cross-fertilisation and the raising of seedling roses, a fairly correct answer would be about a quarter of a century. It may be a few more years than twenty-five since they entered on the work which has brought them so much renown, for there are roses of their raising in the catalogue of the National Rose Society that were introduced to cultivation twenty-one years ago. The Royal Nurseries have a history extending over a century or so, and were founded by Mr. Alexander Dickson, the father of Mr. George Dickson, the venerable and highly respected head of the firm, and under his skilful management the business assumed large proportions long before he relinquished his business life. Mr. A. Dickson devoted a considerable share of his attention to the hybridisation and cross-fertilisation of plants, and chief among his successes were numerous Cape heaths that were remarkable for their great beauty. Mr. George Dickson, following on much the same lines as his father, achieved such a measure of success as to necessitate a considerable extension of the boundaries of the nurseries from time to time. Notwithstanding the increased demands that were made upon his time and attention



H.T. ROSE MRS. MACKELLAR.

The flowers soft yellow. Raised by Messrs. Alex. Dickson and Sons, and received an Award of Merit from the R.H.S., on September 24, 1912.

by the extension of the operations of the firm, Mr. G. Dickson did not at any period of his active business life lose sight of his responsibilities as a citizen, and, as a consequence, he took a very prominent part in local affairs. As evidence of the high estimation in which the public services that he so willingly rendered were held by his neighbours, it may be mentioned that he was chairman of the Newtownards Horticultural Society for fifty years, and on the occasion of the jubilee of his chairmanship in 1905, he was entertained at a public dinner and presented with his portrait in oils. He was also for a long period a member of the Board of Guardians for the town, and five years its chairman, and on his retirement in 1906, in consequence of his advancing years, he was presented with his portrait in oils at a public luncheon given in his honour. The following year the Council of the Royal Horticultural Society conferred upon him the well-merited distinction of the Victoria Medal of Honour, a distinction that gave pleasure not only to his immediate friends, but to all who were acquainted with the recipient and his work. Although no longer able, owing to his great age, to take an active part in the management of the business, which has now devolved on his talented sons, he continues to take a keen interest in what is being done.

As so well-known to all who are in any way acquainted with what has been accomplished at Newtownards in the development of the rose, Mr. Alex. Dickson has from the first devoted special attention to this branch of the firm's activities, and the success has been achieved by him in conjunction with Mr. G. Dickson, jun., is little short of marvellous. During the period over which the raising of seedling roses has extended, between 120 and 130 varieties have been introduced to cultivation, and if every one of this number has not been able to hold its own in its particular class and shade of colour, a surprisingly large proportion of them have maintained a very prominent position among the leading varieties, new and old. The most conclusive proof of the staying powers of the Newtownards roses is perhaps to be found in the catalogue of the National Rose Society for the current year. This catalogue contains 600 varieties selected by rosarians who are well acquainted with the distinctive characteristics and merits of the roses, well nigh innumerable, now in cultivation, and of these fifty were raised by Messrs. A. Dickson and Sons. This fact is of special interest as showing that, while a full share of attention has been devoted to the production of varieties remarkable for the fine form and attractive colouring of the flowers, the importance of a good constitution and free and continuous flowering has been constantly kept in mind.

In giving attention to the roses that have been introduced within the past three years, it was interesting to see how great is the demand for novelties, this demand being undoubtedly stimulated by the knowledge that the seedling roses raised by the firm are subjected to a long and thorough test, especially with regard to constitution and freedom and continuity of flowering before they are selected for distribution. As mentioned by that distinguished rosarian, Mr. H. E. Molyneux, in our issue of Octobed 19, 20,000 stocks have been worked with that remarkably distinct and highly effective single rose Fireflame, which obtained the award of a gold medal at the Southampton exhibition of the National Rose Society in June last. So large a number of stocks worked with one variety is enough to fill one with astonishment, and would probably have done so had not the glorious display of colour produced by the breadths of maidens of the variety diverted attention from them. The flowers are larger in size and similar in shape to those of Irish Elegance, but the colour is an effective shade of old gold. It cannot well fail to rank high as a garden rose, and for decorative purposes in a cut state, the flowers will, unless my judgment is at fault, far surpass in popularity those of Irish Elegance, high as that unquestionably is.

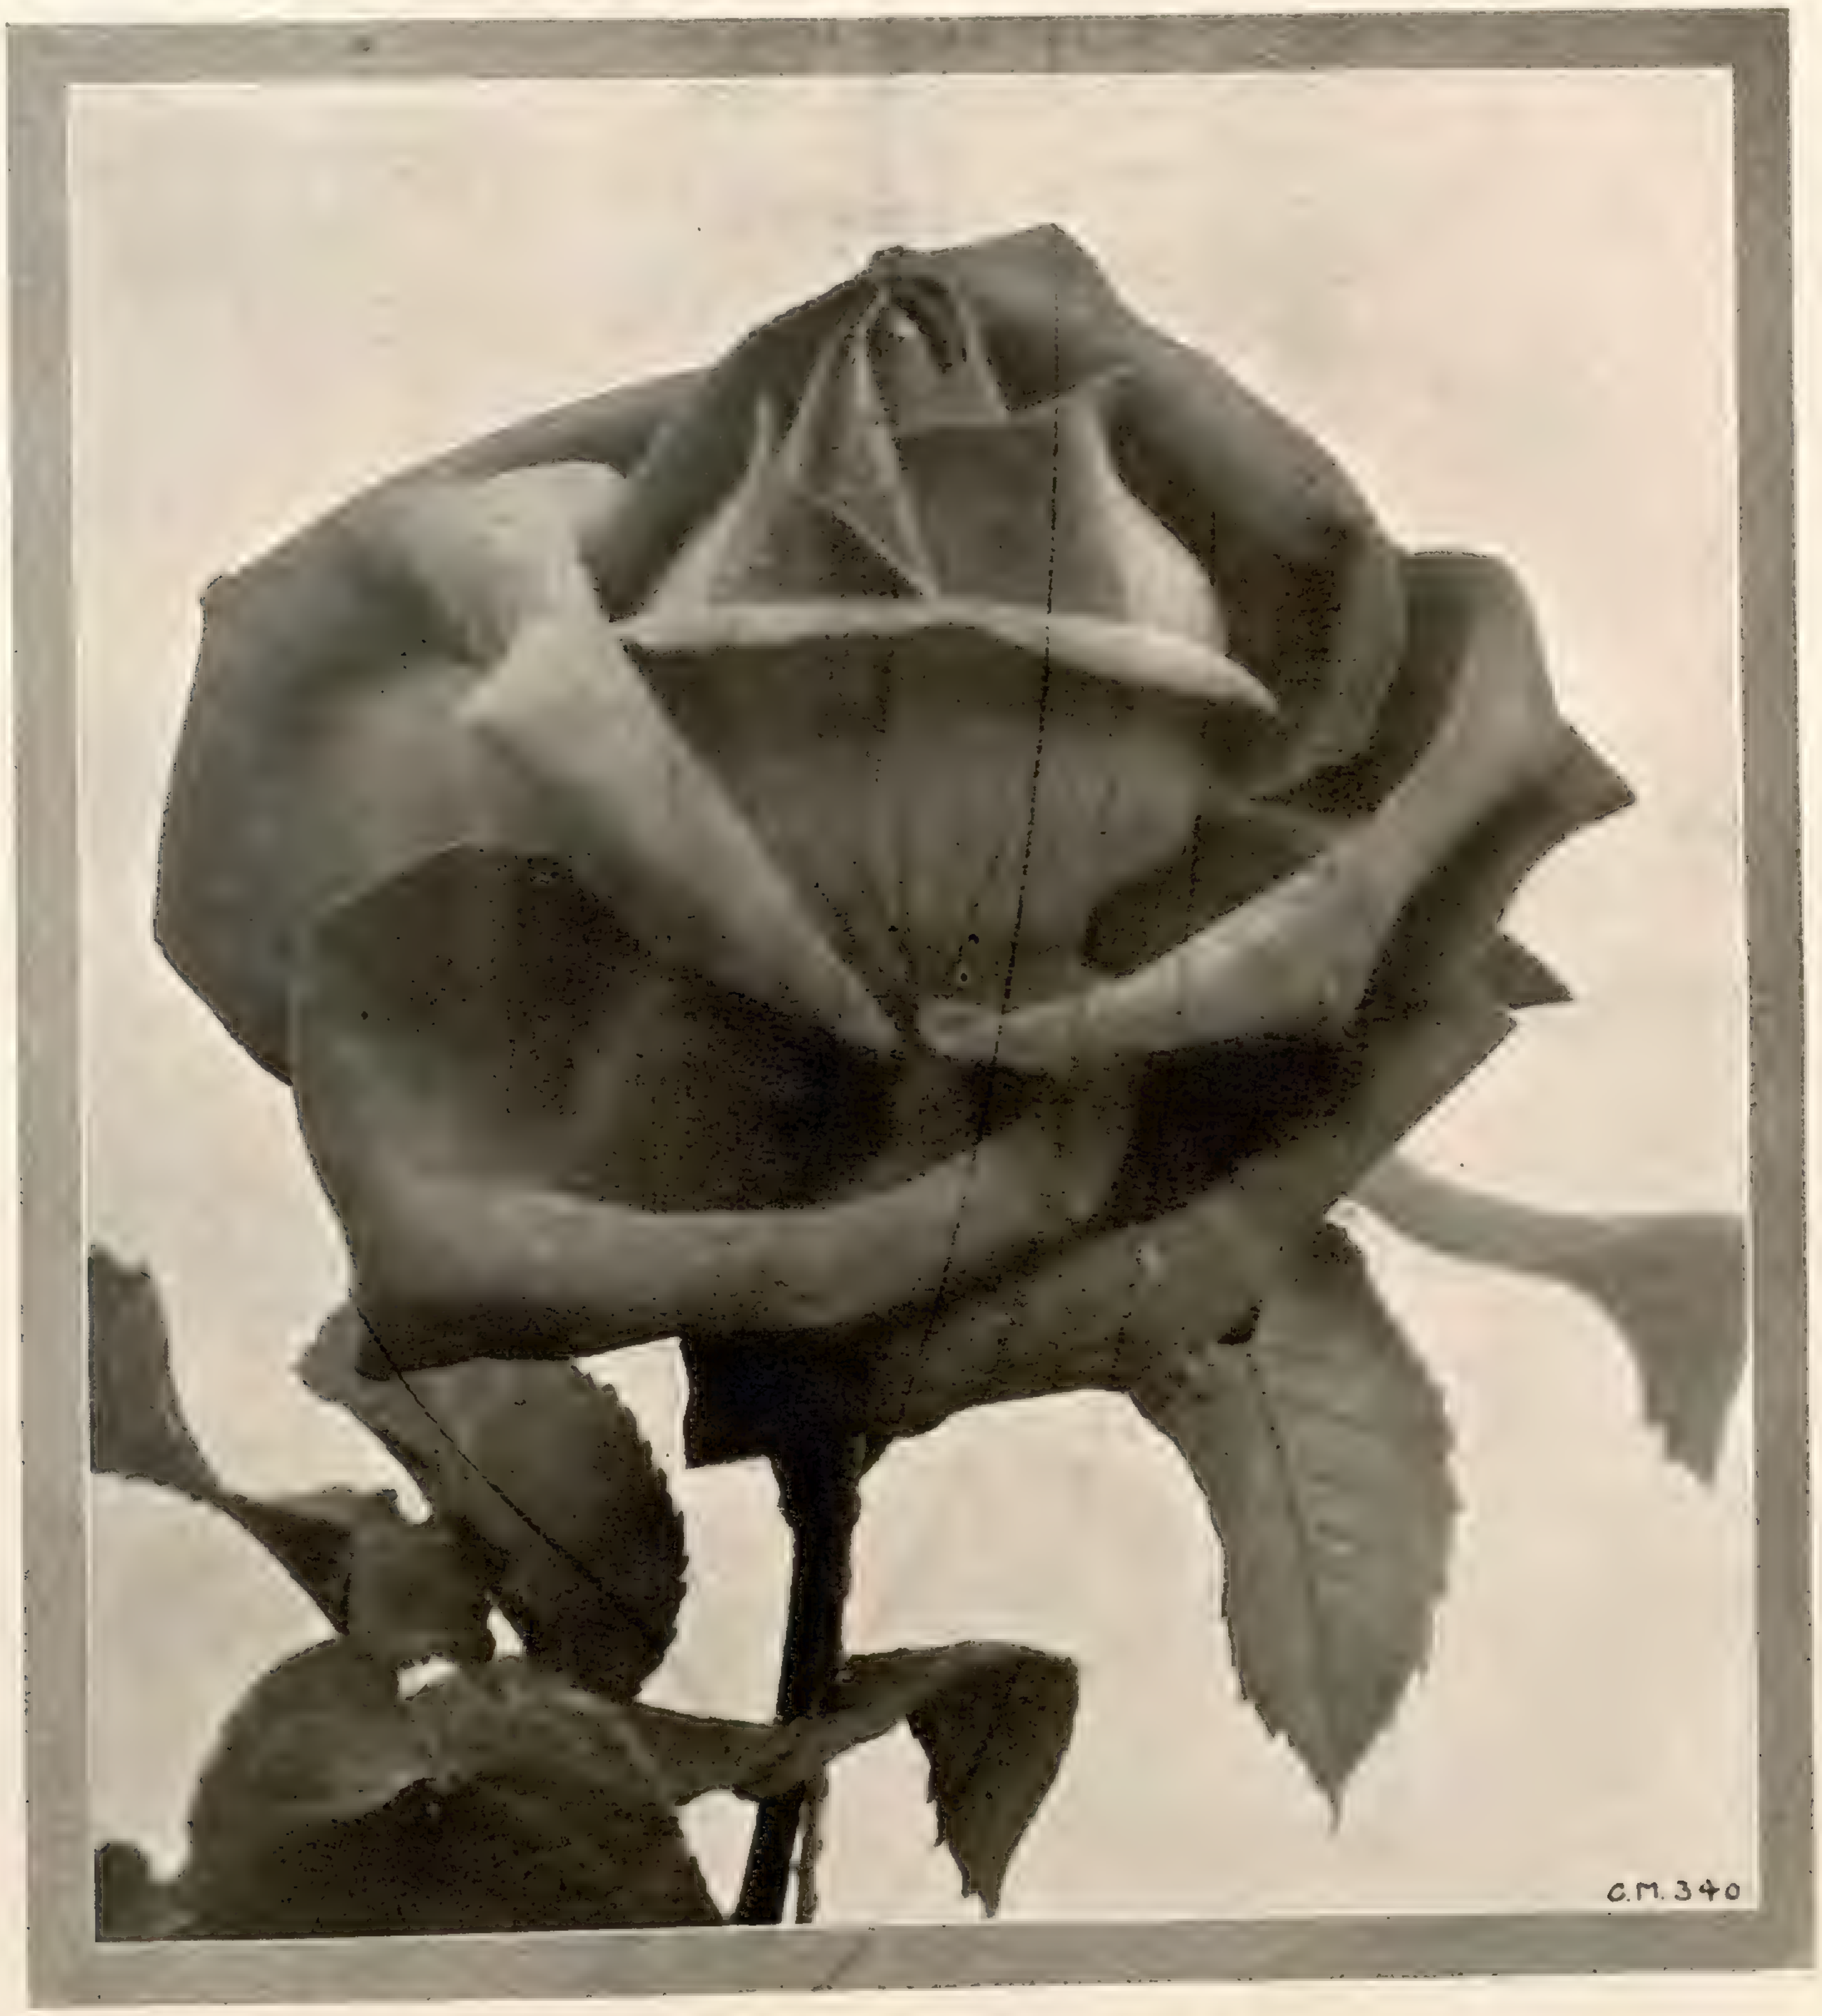
Especially interesting to me in walking through the quarters in the nurseries that are devoted to the most recent of the new varieties, were the great breadths of George Dickson (H.T.), H. Vessey Machin (H.T.), and Edward Bohane (H.T.), a trio of crimson roses of such high merit as to render it difficult to speak of them in measured terms. George Dickson is in every way worthy of the distinguished name it bears, and will unquestionably attain to a high degree of popularity among exhibitors. The flowers are large and splendidly built, and the colour is a rich velvety crimson. In 1911 this variety received the award of a gold medal at the National Rose Society's exhibition at Ulverston, the silver medal for the best rose in the show at Bath on July 12, the silver medal for the best H.T. at Helensburgh on July 14, the first prize for the best H.T. at Gourock on July 22, and the silver medal for a new rose at the Yorkshire Agricultural Society's Show, July 22. This year it was awarded the silver medal for the best H.T. shown in trade collections at the exhibitions held by the National Rose Society in London and Belfast on July 9 and 19 respectively, and on September 24 an Award of Merit was made in its favour by the Royal Horticultural Society's Floral Committee. Greater distinction a new rose could not well obtain. As in the case of the variety immediately preceding it, H. Vessey Machin bears the name of a distinguished rosarian who is held in the highest estimation, and is in every way worthy of it. The flowers are of large size with stout and reflexed petals, and the colour is rich crimson. It received the award of a gold medal at the National Rose Society's exhibition at Belfast on July 19. Edward Bohane (H.T.) is a grand crimson flower, large in size, of superb form, and delightfully fragrant. This has yet to win its gold medal, but when the time comes it is not likely to prove a difficult task. It was exhibited for the first time at the exhibition held by the Royal Horticultural Society on September 24, when it unanimously received an Award of Merit.

Very distinct in character and colour to the three fine roses referred to in the preceding paragraph is Mrs. Mackellar (H.T.), which the firm submitted to the Floral Committee of the Royal Horticultural Society on September 24, when it received an Award of Merit. When at Newtownards this variety greatly impressed me, for it has a vigorous habit, and is free in flowering, and of much promise as a garden rose, while the blooms are of so high a quality as to be able to render good service in a competitive gathering. The flowers are of large size, fine form, and delightfully fragrant, and the colour is a soft yet bright shade of yellow. Especially attractive, also, were the breadths of the exquisitely beautiful decorative rose, Queen Mary, which received the award of a silver-gilt medal from the National Rose Society on July 9. It has a free branching habit, the flowers are borne in great profusion, and the blooms as they commence to open are bright red, and when fully expanded the petals are rich yellow with a broad margin of brilliant rose.

The novelties of 1911 form a large and important group, and in making a critical inspection of them in going through the breadths in the nurseries, note was made of the following as being of quite exceptional merit: Alexander Hill Gray (T.), an important addition to its class, the blooms of large size, superb form, and of so rich a shade of yellow as to suggest the colouring of Marechal Niel; Carine (H.T.), a beautiful decorative rose that is highly effective in the garden, the flowers being of fine form, and borne on stout stems, while the colouring is a delightful combination of blush, carmine, fawn and salmon; Duchess of Westminster (H.T.) is a distinct variety, bearing large, finely-formed flowers, the colour rose-madder; an excellent exhibition rose, and described as especially suitable for pot culture. Ferniehurst (H.T.) is an attractive variety, of value both for exhibition and the garden, the flowers of good size and fine form, and the colour fawn suffused with rose-pink, deepening to copper colour in the centre. Lady Barham (H.T.), a grand exhibition rose, the blooms large, and the colour a beautiful shade of coral pink. Lady Greenall (H.T.), a superb addition to the rich orange-yellow roses now becoming so popular, and will be found of special value to exhibitors. Lady Margaret Boscawen (H.T.) is a valuable garden rose with fawn-pink flowers, which are produced in the most profuse manner; and Melody (H.T.), a beautiful garden rose, remarkably free in blooming and very effective, the colour being saffron-yellow passing to primrose at the edges of the petals.

One of the oldest of the Newtownards roses that have a place in the National Rose Society's catalogue is Margaret Dickson (H.T.), which was introduced in 1891, and is one of the best of the strong-growing blush-coloured roses for the garden, making a fine standard. The others include: Avoca (H.T.), a distinct and effective variety, suitable both for the garden and exhibition stage, the flowers rich scarlet-crimson, and remarkable for their fragrance; Charles J. Grahame (H.T.), a richly-coloured rose, useful both for exhibition and the garden, the flowers large, fragrant, and of a bright crimson hue; Countess of Annesley (H.T.), a vigorous garden rose, with fragrant flowers of a pleasing rose-salmon hue; Countess of Derby (H.T.), also a fine garden variety, the flowers soft rose coloured and very freely produced; Dean Hole (H.T.), a valuable variety, suitable for the garden and exhibition stage, the blooms large, fragrant, and of fine form, and the colour soft rose; Dorothy Page Roberts (H.T.), a beautiful pink bedding rose; Dr. J. Campbell Hall (H.T.), rose, shaded white; and Dr. O'Donel Browne (H.T.), carmine, are two excellent garden varieties, the second of the two being also of much value for exhibition; Duchess of Wellington is a distinct garden rose, strong in growth, and bearing saffron-yellow flowers that have the additional merit of being fragrant.

Prominent among the varieties that are equally valuable for exhibition and the garden is Florence Pemberton (H.T.), a charming rose with cream-white flowers suffused at the margins with pale rose, and one of the best of its colour for standards; G. C. Waud (H.T.), one of the varieties distributed by the firm four years since, is of special excellence, the colour an effective shade of red-rose, and the blooms are of fine form, possessing the delicate perfume of the tea-scented varieties; while an excellent exhibition rose of its colour, it possesses much value for garden decoration; Harry Kirk (T.), is a vigorous growing variety with sulphur-yellow flowers, that has proved of much value as a bedding rose, and should be largely planted; Hugh Watson (H.P.) has proved a useful addition to the crimson hybrid perpetuals, it being valuable for the garden and exhibition stage, and the shapely blooms are delightfully fragrant. The single varieties of the Irish Elegance type are so well known and highly appreciated that they need hardly be mentioned. They all make effective displays of colour in the garden, and the variety mentioned is unquestionably the most popular of all the single roses for the decoration of the dinner table. The brilliant crimson Liberty (H.T.) is one of the best bedding roses of its colour, and excellent for pot culture, and is useful for the supply of roses for decorative purposes in a cut state. M. H. Walsh (H.P.) is a good crimson rose for exhibition and garden decoration, its blooms being not only suitable for taking part in a close competition, but are very fragrant. Mrs. Sharman Crawford (H.T.) is an excellent variety which has long been in cultivation, and is still considered one of the best light pink varieties for bedding and standards, and useful for exhibition.



H.T. ROSE GEORGE DICKSON.

Flowers rich crimson. Raised by Messrs. Alex. Dickson and Sons, and received the N.R.S. Gold Medal in 1911 and the R.H.S. Award of Merit, September 24, 1912.

Of surprising interest were the many beautiful roses, of which there were considerable breadths, under number, and many are the notes that were made with reference to them. But until such times as they have received their names no useful purpose would be served in referring to them other than to say that they include many varieties which indicate the remarkable progress that is being made in the development of new shades of colour. Time might doubtless have been pleasantly spent in a walk through the departments other than that which is devoted to roses, but this latter, which includes many large fields as well as the huge quarters in the nurseries, contained so much of interest that the end of a fairly long day was reached before it was exhausted. G.

## FAGUS BETULOIDES.

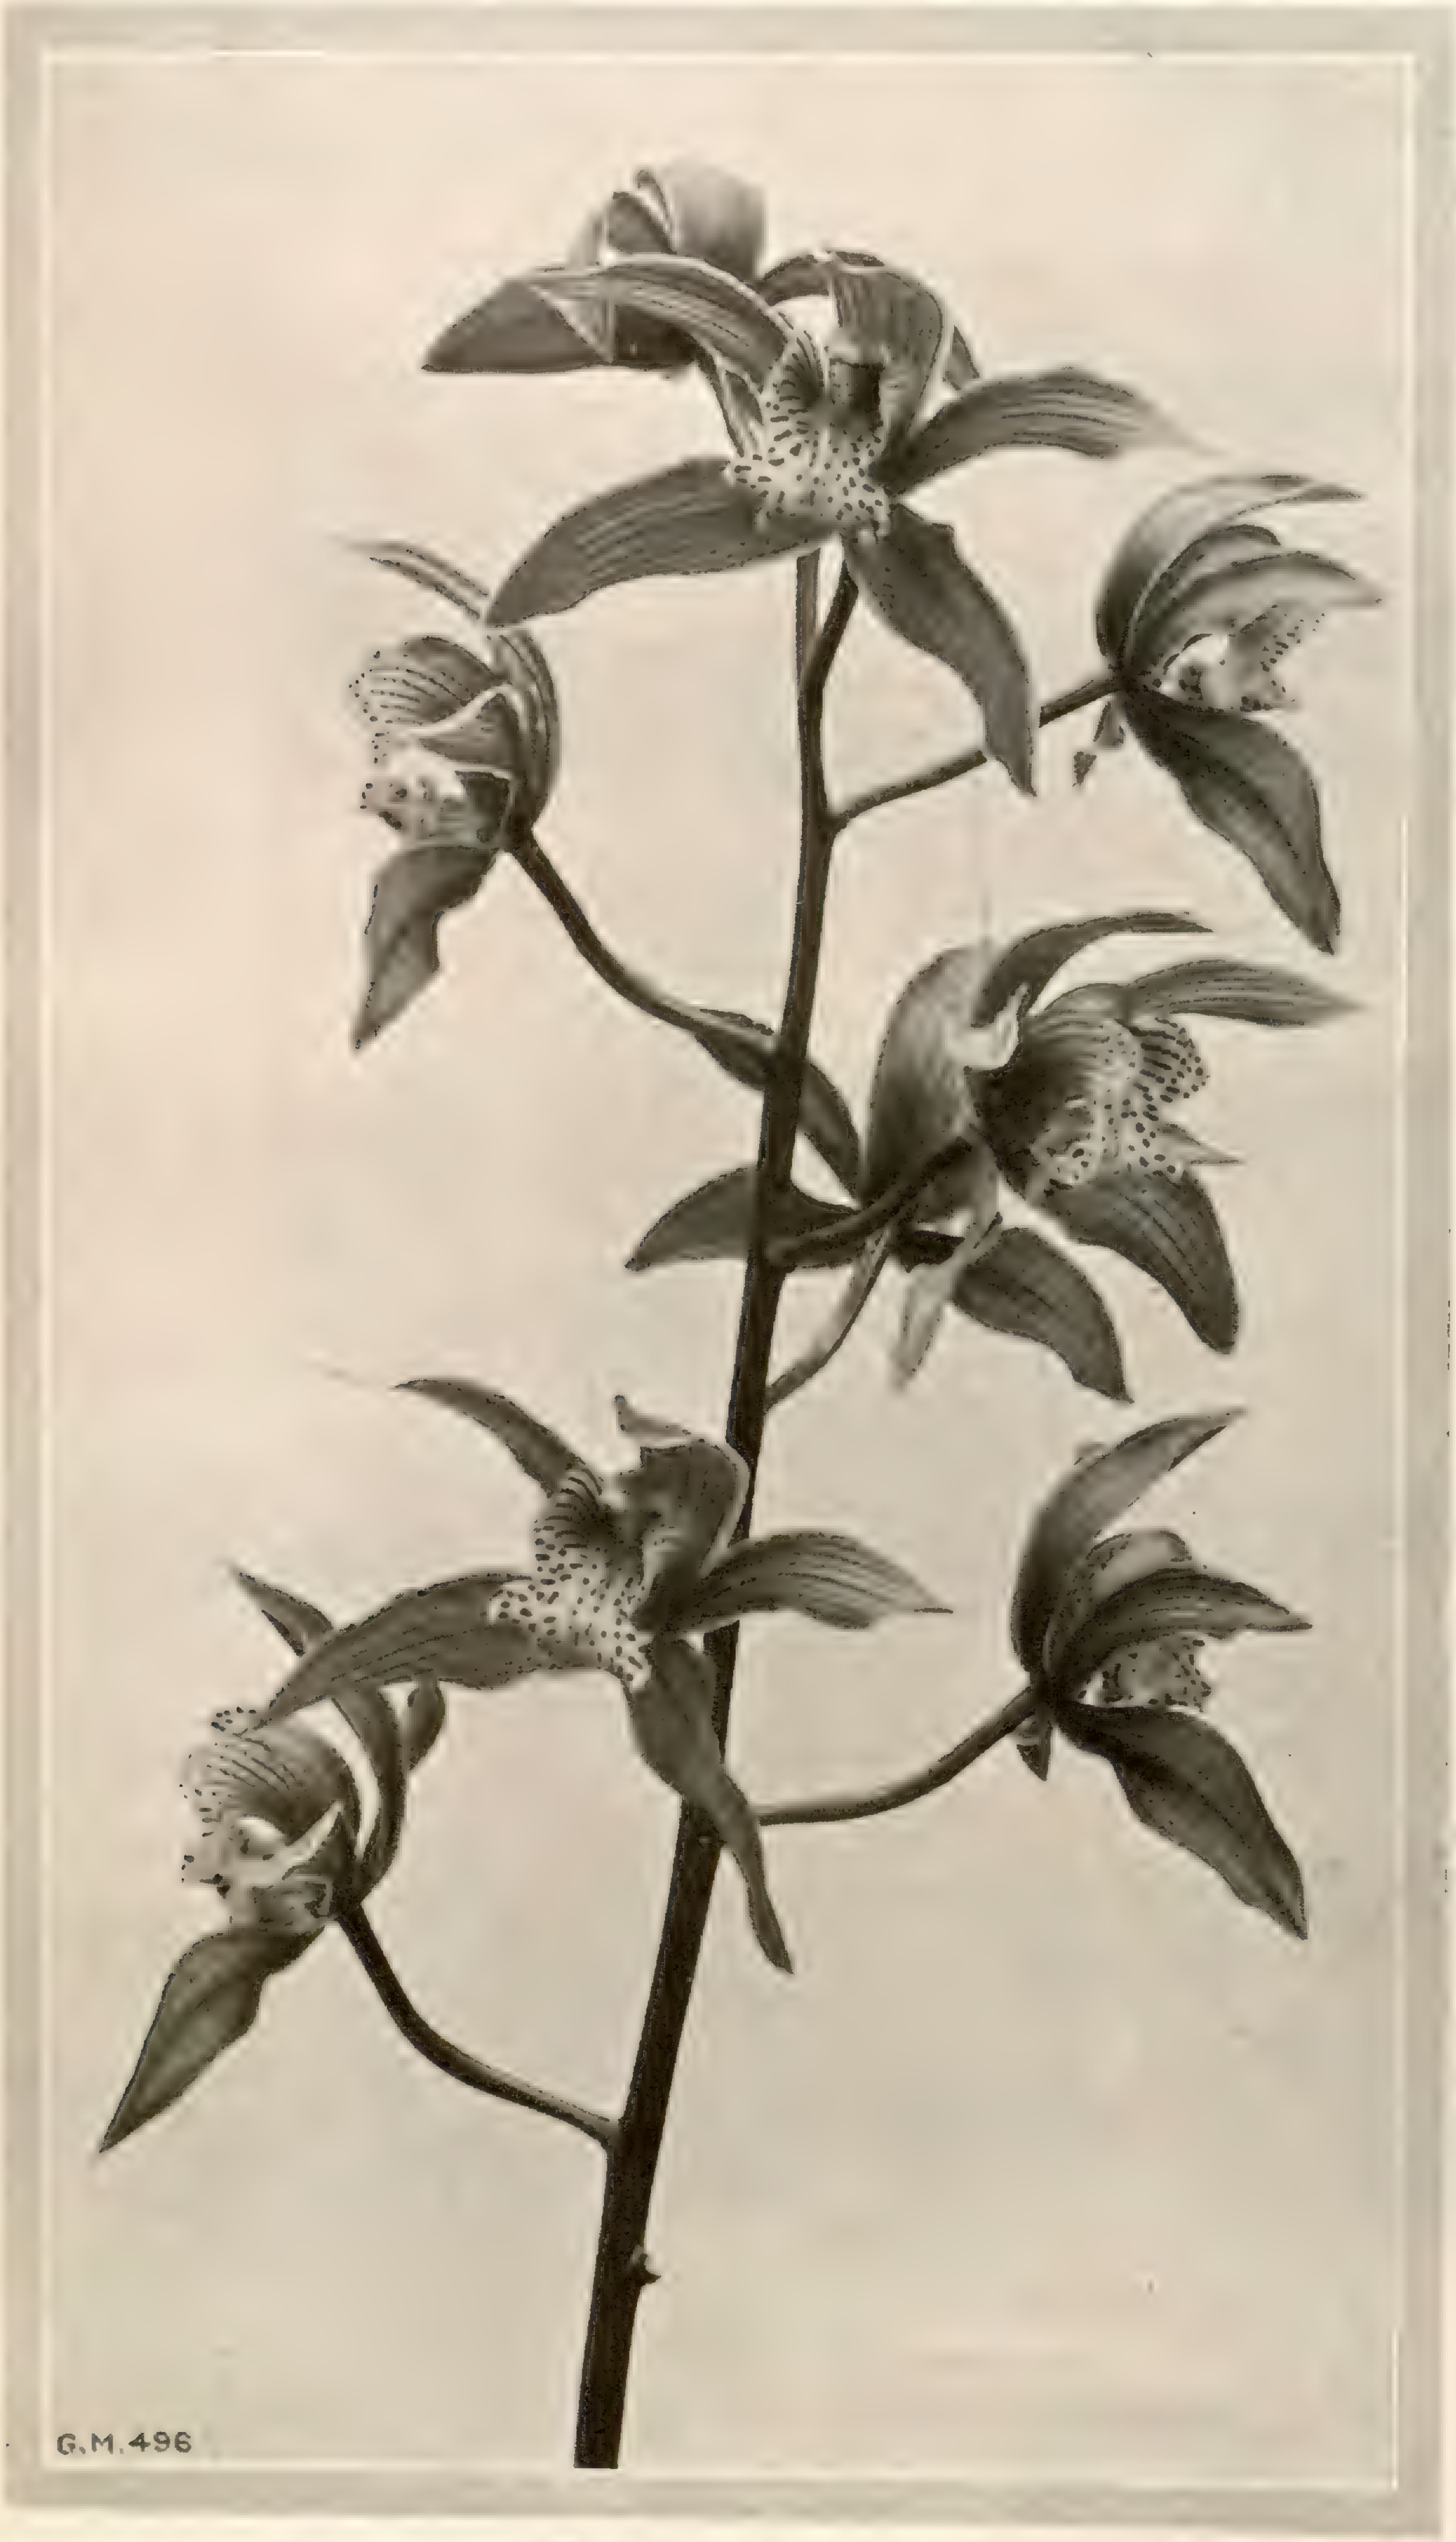
Although this evergreen beech is too tender for general cultivation in the British Isles, there are places in the south and south-west counties where it thrives fairly satisfactorily, and, could it be obtained more easily, it would doubtless become a popular tree. Unfortunately, no one appears to be able to raise a good stock of plants, and there are numerous difficulties in the way of introducing seeds from its native habitat. It is found wild in the extreme south of South America in a latitude very similar to that of the South of England. Its headquarters appear to be in Tierra del Fuego, and its presence there was described more than half a century ago in Captain King's "Voyage of the Adventure and Beagle," for on page 576 the following passage occurs: "At Port Famine and in the neighbourhood the evergreen beech grows in the greatest abundance, and reaches a very large size. Trees of this species three feet in diameter are abundant; of four feet there are many, and there is one tree (perhaps the very same noticed by Commodore Byron), which measures seven feet in diameter for seventeen feet above the roots, and then divides into three large branches, each of which is three feet through." It is further stated that this tree forms the prevailing feature in the scenery of Tierra del Fuego.

In the British Isles it is seen as a bush or small tree usually below eighteen feet in height. The small oval leaves are thick in texture, and dark green in colour, and the fruits, which, though very small, resemble those of the common beech in shape, are sometimes produced, but, judging from the scarcity of the species, they are usually unfertile. It is possible to raise plants by layering branches, but it is a slow process, and although cuttings have been known to root, the general results of propagation by this method of procedure have not been satisfactory. W. D.

## NEW PLANTS, ETC.

### CYMBIDIUM DORIS.

This is a quite new hybrid, and has been raised by crossing the tall, spiked, pink C insigne with the large-flowered, arching C. Tracyanum. It has a fairly tall spike that carries a number of flowers of large size. The sepals and petals are creamy, but with thin lines of red-brown and a pink suffusion. The lip is very reminiscent of C. Tracyanum, is waved, reflexed at the apex, pale cream-yellow, with red-brown markings chiefly towards the margins. Our illustration represents the flower spike about one-half the natural size. F.C.C., R.H.S., October 22. Messrs. J. and A. McBean, Cooksbridge.



G.M.496

CYMBIDIUM DORIS.

A fine new hybrid from C. insigne and C. Tracyanum; flowers about twice as large as illustrated, creamy-buff, and pink, with red-brown markings. F.C.C., R.H.S., October 22. Messrs. J. and A. McBean, Cooksbridge.

### CYPRIPEDIUM PALLAS ATHENE.

A handsome hybrid of unknown parentage (see p. 813), but obviously a descendant from C. insigne Harefield Hall. The broad dorsal sepal is white, with a green base and purple markings, while the petals and lip are green and brown. F.C.C., R.H.S., October 22. Mr. W. R. Lee, Plumpton Hall, Heywood, Lancs.

### CATTLEYA LABIATA OPAL.

A large-flowered white form that has a faint tinge of pink on the yellow-throated labellum. The plant exhibited carried four shapely and substantial flowers. F.C.C., R.H.S., October 22. Baron Bruno Schroder.

### CATTLEYA MAGGIE RAPHAEL, GOODSON'S VAR.

A fine form of a popular hybrid, and one that has a very handsome crimson lip, lined with yellow. A.M., R.H.S., October 22. H. S. Goodson, Esq.

### CATTLEYA PRINCESS MARY.

A beautiful hybrid from C. Warneri alba and C. Dowiana. It has white sepals and petals, and a gold, white, and purple lip. Pantia Ralli, Esq., Ashstead Park, Leatherhead.

### LÆLIO-CATTLEYA GOLDEN ORIOLE, HOLFORD'S VARIETY.

This very bright autumn-flowering hybrid is derived from L.-c. Charlesworthi and Cattleya aurea. The sepals and petals are a trifle narrow, and bright orange-yellow, while the large lip is light crimson, freely veined and shaded with gold. A.M., R.H.S., October 22. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### LÆLIO-CATTLEYA HEMPTINNEI.

This is a handsome hybrid between Cattleya Dowiana aurea and L.-c. Rouselensis. The flowers are of medium size, substantial, and bright. The sepals and petals are deep yellow and the lip is of similar colour with dark red markings. A.M., R.H.S., October 22. Comte Joseph de Hemptinne, St. Denis, Ghent.

### SOPHRO-LÆLIO-CATTLEYA ZANDHAGE.

A shapely flower with soft rose-coloured sepals and petals, and a broad red-crimson lip The parentage was given as Cattleya Enid and Sophro-lælia Heatonensis. A.M., R.H.S., October 22. Mr. E. H. Davidson, Orchid Dene, Twyford.

### SOPHRO-LÆLIO-CATTLEYA MENIPPE, VAR. H. S. GOODSON.

A rather small flower, shapely, and of a deep reddish-rose colour with darker, crimson-tinted lip. A.M., R.H.S., October 22. H. S. Goodson, Esq. (gardener, Mr. Day), Fairlawn, Putney.

### BRASSO-CATTLEYA DIGBYANO-MOSSIÆ THE DELL VARIETY.

This is a lovely orchid with very large, white flowers, the lip being particularly well developed and remarkably fringed. Towards the base of the lip there is a small, pale-yellow area. F.C.C., R.H.S., October 22. Baron Bruno Schroder (gardener, Mr. J. E. Shill), The Dell, Egham.

### SCOLOPENDRIUM VULGARE CRISPUM NOBILE BOLTON'S BROAD FORM.

A splendid hardy fern with a name most unfortunately long. The fronds are particularly broad, and some of them 2½ft. long; all are finely frilled and of a rich green hue. A first-rate specimen, fully a yard across, was exhibited. F.C.C., R.H.S., October 22. Mr. W. B. Cranfield, East Lodge, Enfield Chase.

### NEPHROLEPIS MILLSI.

A neat plumose form, and of more erect and open habit than most of the recent introductions. The fronds are finely divided and elegant, but not of "mossy" character. A.M., R.H.S., October 22. Mr. W. A. Manda, St. Albans.

### CHRYSANTHEMUMS.

Toddles.—A very brilliant crimson single variety with pointed florets, and a narrow yellow zone around the yellow disk. Award for colour. Mr. H. W. Thorp, Worthing.

Bob Pulling.—A splendid, large yellow Japanese variety, previously described. A.M., R.H.S., October 22. Mr. H. J. Jones, Lewisham.

Hon. Mrs. John Ward.—A large Japanese variety with long, drooping florets, fairly broad, and of a lovely deep primrose. A sport from White Queen. F.C.C., N.C.S., October 21; A.M., R.H.S., October 22. Mr. C. Beckett, gardener to the Hon. J. Ward, Chilton, Hungerford.

Master Rex.—A very distinct and handsome Japanese variety, with loosely curling and twisting florets that make up a capital bloom. The colour is bright amber. F.C.C., N.C.S., October 21. Mr. G. Mileham, Leatherhead.

Mrs. Joan Miller.—A wide Japanese variety with broad florets that narrow and curl a little at the tips. The colour is bright rose-pink with silvery reverse. F.C.C., N.C.S., October 21. Mr. G. Mileham, Leatherhead.

Vera Potterton.—A very solid, reflexing Japanese variety of medium size. The inner florets are short, blunt, and broad. A fine pink shade. Commendation, N.C.S., October 21. Mr. Thos. Page, Hampton.

Mrs. John Maher. A medium sized Japanese variety, the graceful, refined flowers being carried on long, stiff stems. Pure white. F.C.C., N.C.S., October 21; A.M., R.H.S., October 22. Mr. Thomas Page, Hampton.

Sussex Yellow.—A very distinct rich yellow single variety with several rows of broad florets that recurve at the tips. A handsome variety. F.C.C., N.C.S., October 21. Mr. Norman Davis, Framfield, Sussex.

Ideality.—A lovely white single variety with broad florets, that recurve a very little at the tips. This variety is the result of crossing Mary Anderson with Mensa. F.C.C., N.C.S., October 21. Mr. Norman Davis, Framfield.

Mrs. Loo Thomson.—This is a large single variety of great promise, as it is a beautiful primrose sport from the well-known Mensa. F.C.C., N.C.S., October 21. A.M., R.H.S., October 22. Mr. Norman Davis.

Charles Kingsley.—Another grand single variety with substantial florets of a lovely shade of deep yellow. There is also the faintest possible tinting of bronze on some of the florets. F.C.C., N.C.S., October 21; A.M., R.H.S., October 22. Mr. Norman Davis, Framfield.

Phyllis Cragg.—A useful light pink reflexed Japanese variety, evidently a good substantial market variety, colour, stem, and form being alike good. Commendation, N.C.S., October 21. Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow.

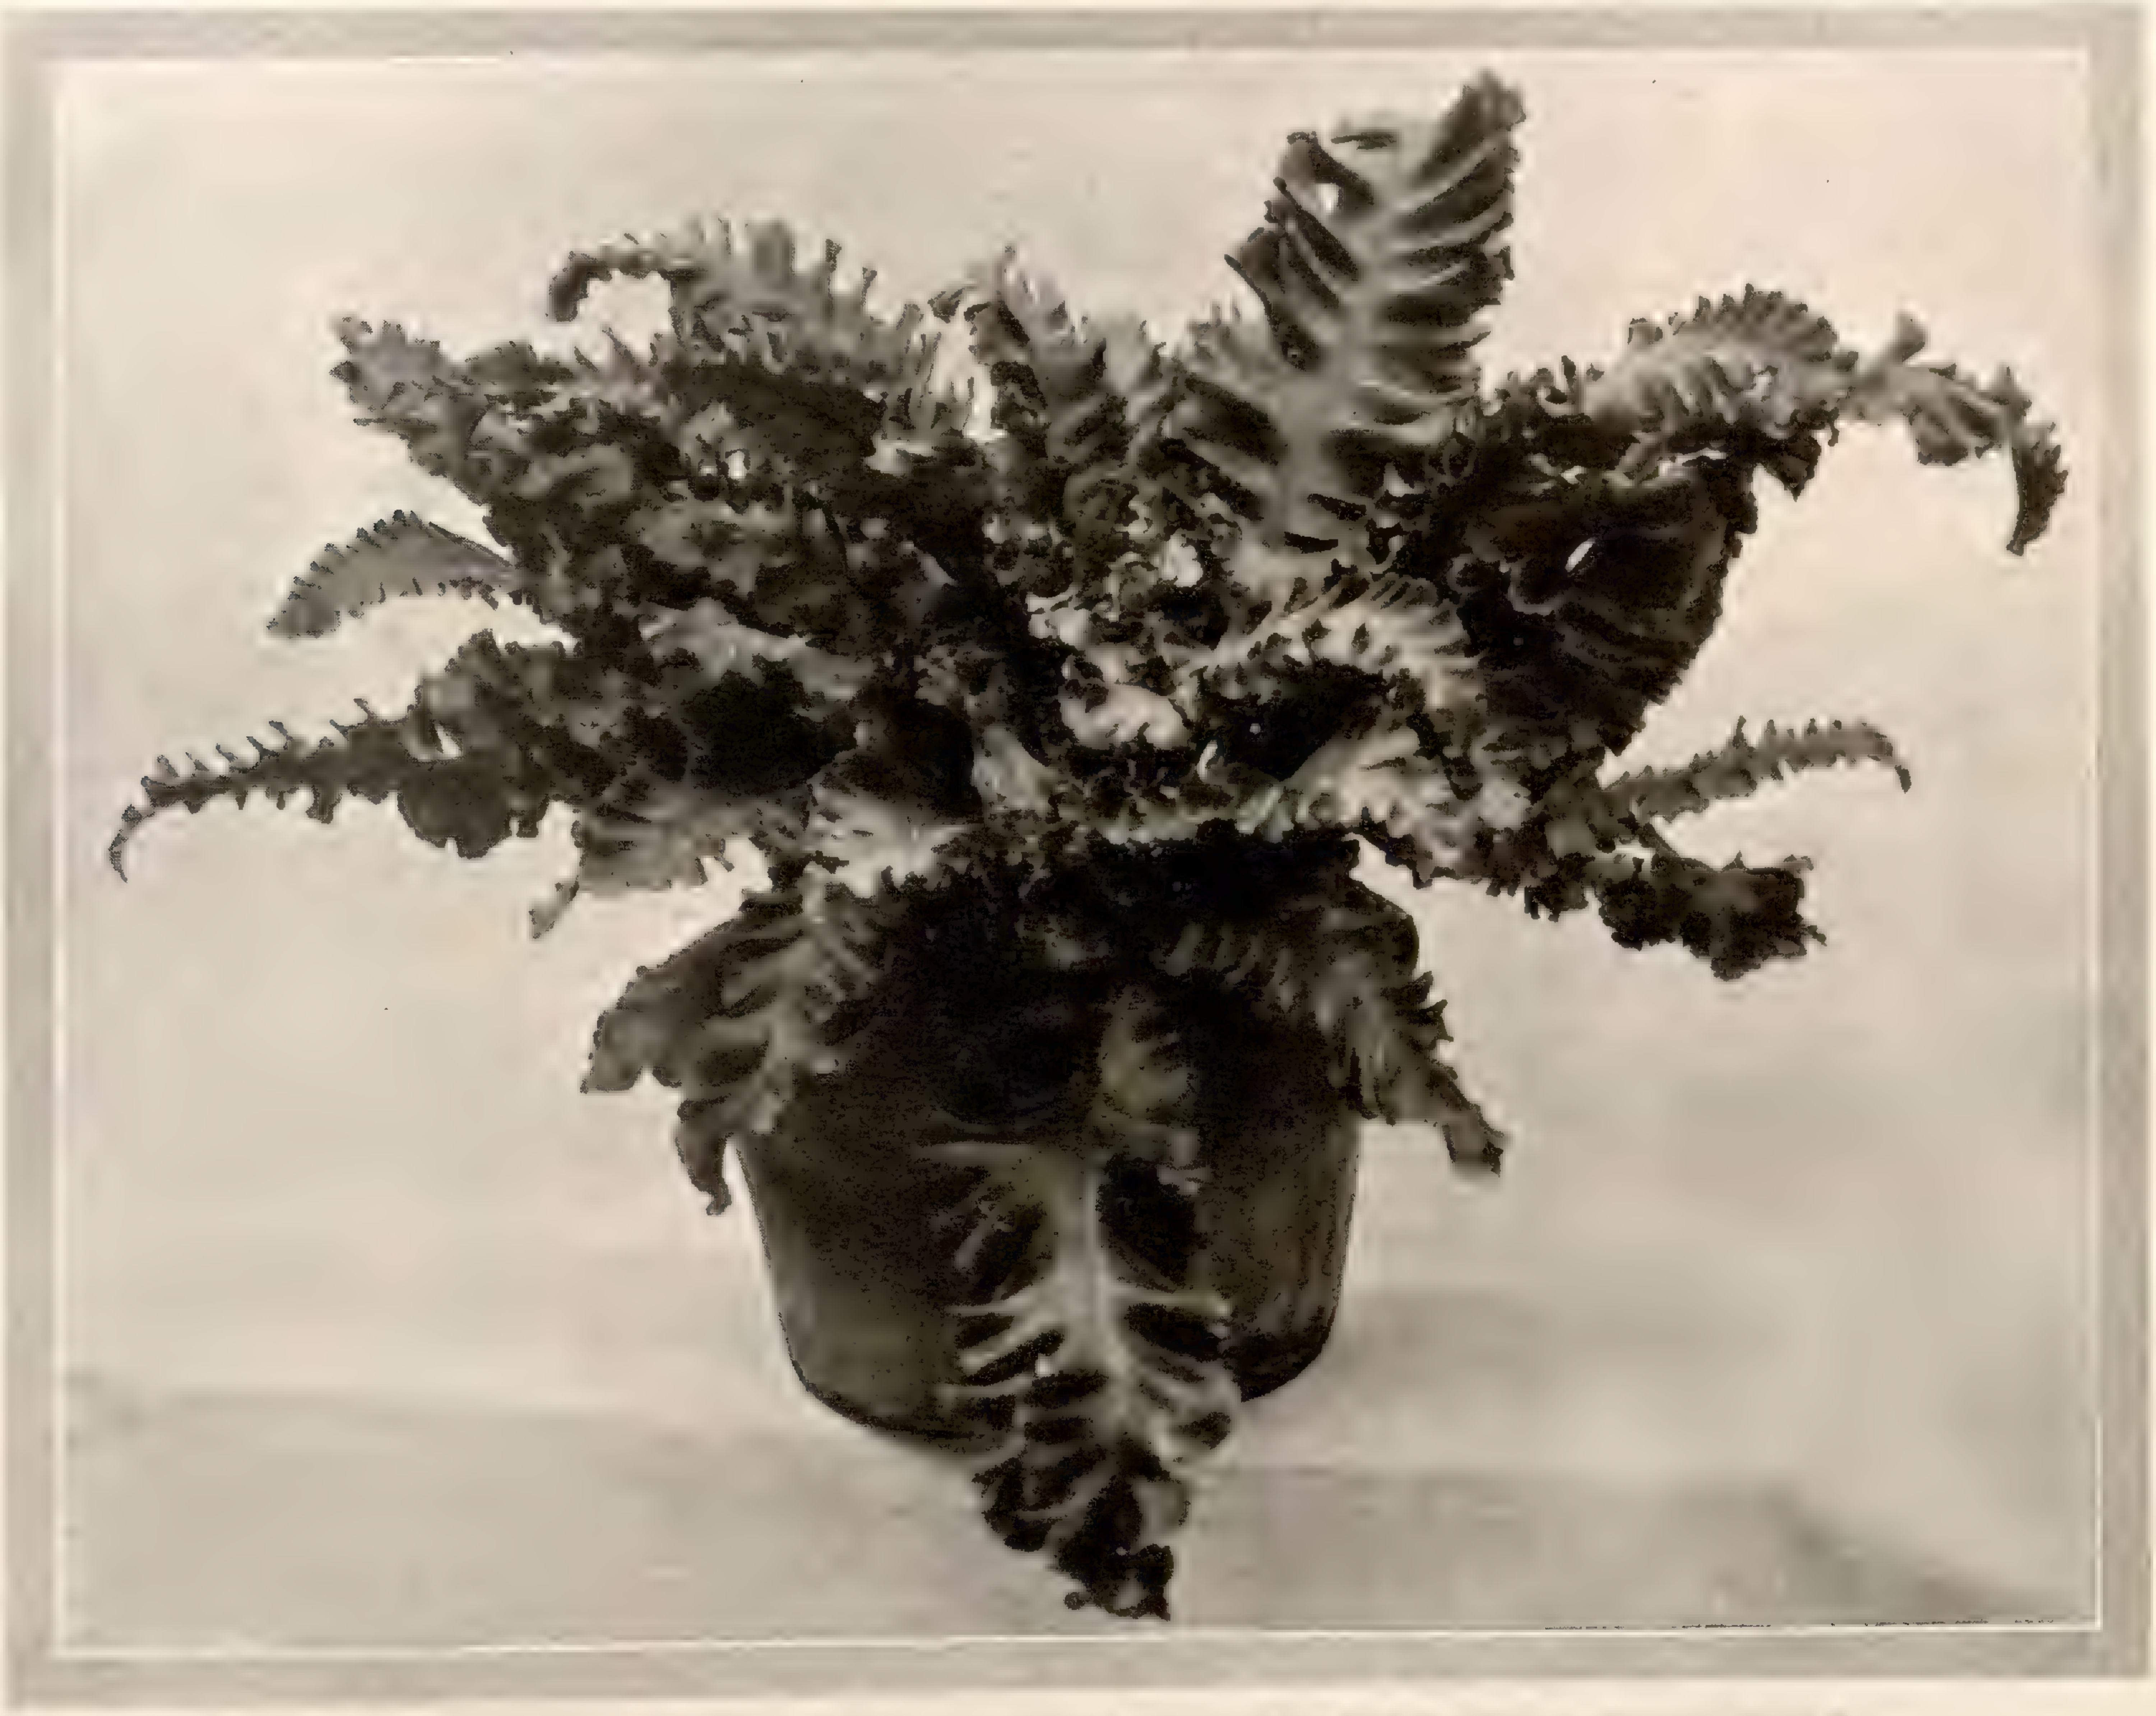
J. W. Streeter.—A primrose-yellow incurved variety, the flower shapely and solid. A sport from the white H. W. Thorp. F.C.C., October 21; A.M., R.H.S., October 22. Messrs. Cragg, Harrison, and Cragg, Hounslow.

Miss M. Borrer.—A large, free-flowering single variety, producing fine sprays of shapely rose-pink flowers. A.M., R.H.S., October 22. L. F. Harrison, Esq. (gardener, Mr. A. H. Chapman), Orchards, East Grinstead.

White Beauty.—A lovely medium-sized, single variety of the purest whiteness. A charming chrysanthemum grown in spray form. Commended, N.C.S., October 21. Mr. Philip Ladds, Swanley Junction.

Primrose Queen.—A good Japanese variety of elegant shape and refined appearance. The colour is light yellow, shading to pale primrose towards the tips of the outer petals. F.C.C., N.C.S., October 21. Mr. Martin Silsbury, Shanklin, Isle of Wight.

**Tomatoes.**—Those raised early in October will require putting into thumb pots. Use a sandy compost, and when potted place on shelves in a house with a temperature of 55 to 60 deg. Be very careful not to overwater the young plants.—G. E.



SCOLOPENDRIUM VULGARE CRISPUM NOBILE, BOLTON'S BROAD FORM.
A noble hardy fern with beautifully-frilled fronds. F.C.C., R.H.S. October 22. Mr. W. B. Cranfield, East Lodge, Enfield.

## EUCRYPHIA CORDIFOLIA.

The three species of eucryphia which are in cultivation are all natives of the Southern Hemisphere, two being found in Chili and other parts of South America, and the other in Tasmania. The two American species are more ornamental than the other, and of the two E. pinnatifolia is the best known, for, although not a common plant, good specimens are met with in gardens here and there throughout the southern counties, where its large white flowers, which bear some resemblance to the blossoms of a single camellia, are at their best in July.

The second species, E. cordifolia, is less well known, although an occasional specimen is seen. Its native habitat is said to be the humid forests of Chili, Chiloe and Valdivia, where it forms a large bush or small tree. It may be distinguished from E. pinnatifolia by its simple instead of pinnate leaves. These are broadly oblong, 2in. to 3in. long, and about 1¾in. in width, and, like those of the other species, evergreen in mild winters but deciduous when severe frost occurs. The white flowers, which are about 2in. across, appear singly from the leaf axils, the colour of the petals being relieved by the central mass of golden stamens.

It is said to have flowered for the first time out of doors in the Coombe Wood nursery of Messrs. J. Veitch and Sons, in 1897. As is the case with the better known species it dislikes root disturbance, and appears to give most satisfactory results when planted in rather light, well-drained loam into which a little peat has been dug. W. D.

## RAISING PERPETUAL-FLOWERING CARNATIONS FROM SEED.

The carnation is an old, old flower, and much time and money have been spent on tracing its history. The perpetual-flowering carnation is, as we all know, a florist's production of recent years, and those of us who were associated with the raising of new varieties when Miss Lizzie MacGowan was considered the limit of productiveness, realise the progress and great possibilities which lie before us. This work, however, can never progress unless seedlings are raised.

The percentage to-day is about one good novelty in five thousand seedlings, so that the chances of great success are small. It does not follow that if you raise five thousand seedlings you will procure a good novelty. On the other hand, you might raise only half a dozen and obtain a second Enchantress. The glorious uncertainty of it all adds interest to anyone possessed of a speculative mind. Only recently we paid perhaps the highest price ever given for the stock of a perpetual carnation in this country, and yet the variety was procured quite by chance; and last year I gave a city clerk a price well into two figures for a perpetual carnation seedling he obtained from an eighteenpenny packet of seed.

This may read like a chapter from the "Arabian Nights," but such are the possibilities if the best seeds are sown. You have to open quite a number of oysters before finding a pearl. Human nature itself is very much mixed, as one finds by taking stock of a crowd, and it is not to be marvelled at if seedlings of the perpetual carnation are mixed in quality.

The charm of perpetual carnation seedlings is that they will flower within nine months from the date of sowing the seeds, and the percentage of singles and "splitters" from good seeds is comparatively small. It is unnecessary to deal with the simple methods of raising seedlings and their culture afterwards, because those who grow carnation plants can raise seedlings. The best season to sow is a debatable point, but there is less importance in the best season to sow the seeds, than there is in when it was fertilised and ripened. As a rule, it is best to sow the seeds now or during the winter, so that the seedlings flower for the first time during spring and summer, when the useless ones can be discarded, and the others grown to produce flowers during the following dull season. If seeds are sown in spring large plants will be utilising valuable room in winter, and some of them will be useless. Hence winter sowing is the best.

It is always a surprise to me to see Marguerite carnations grown in pots for autumn flowering, when beautiful seedling perpetual varieties could be grown for the same expense in labour, and in the case of the latter there is always the chance of obtaining something of phenomenal merit. I believe there are instances of men having dug a well in their back garden and struck gold. But that does not occur as a general rule.

The perpetual carnation is a florist's flower, but no flower can live upon the past, and the present is soon gone. That is why new seedlings must be raised, so that the good work may go on, and our collections enriched from time to time with varieties that in some attributes are superior to the older forms.

Montagu C. Allwood.

Hayward's Heath.

## GARISH DAHLIAS.

I am afraid the remarkable effusion, or shall I call it a tirade, against the pæony-flowered dahlias from your correspondent, "C. T. D.," on page 783, has come rather late in the day to affect their popularity as garden flowers, a popularity they are fully entitled to, and this I venture to assure "C. T. D." they are likely to maintain. But evidently your correspondent judges the flowers as he sees them at the autumn flower shows, and he bewails the fact that they are irregular in outline and petal. Why, this is the very reason they caught the public eye, and came into favour at once as beautiful garden flowers. They were never intended to be exhibition flowers in any sense of the word, and are taken to flower shows by trade firms so that the public may have an opportunity of seeing them, and if your correspondent's knowledge of this section has only been obtained by these means, I feel sure he will excuse my saying his knowledge of this flower is very imperfect.

As to garishness, save the mark! Why should a bright colour be beautiful in one flower and garish in another? Why should scarlet in the double dahlia be a gem, and in the pæony-flowered "simply awful"? To me it is inexplicable. I have never yet heard anyone who even suggested that the pæony-flowered forms were an improvement on any existing class of dahlia, and I think "C. T. D." must have drawn on his imagination in making the suggestion. There is no doubt that this section owes much of its popularity to the superintendents of our public parks and gardens, as in these latter they have been, and are still, extensively used, and I do not think even "C. T. D." can regard these gentlemen as lacking in horticultural taste, but I do think they are often leaders of such taste, as seen in this particular flower.

I do not believe any single person is under the impression that the pæony-flowered dahlia is perfect, but to reduce it to the so-called refinement of the other dahlias would effectually kill its mission in this world, viz., to provide a bright display of flowers in our borders and beds during the autumn months. I admit it wants improving, not so much in the flower itself as in the stems. Many of the first introductions should now be consigned to the rubbish heap to make way for the improvements that have already been made in this direction during the past few years, as these have good sturdy habits and strong stems. As to colours, that is only a matter of individual taste, for we have in the section quite as many soft shades and tones as loud or bright ones.

I also notice "C. T. D." would like to put the old florist's rule-of-thumb round the collarette section, but I am afraid it is too late in the day to attempt such a thing, for there are already two distinct forms of the flower recognised—the French type, with rounded petals and a close-fitting collar, and the German type with pointed star-like petals and a loose, open collar. I am afraid your correspondent's knowledge of this section is of a somewhat cursory character, for he says their collars are invariably irregular, like a bad set of teeth; this is erroneous, for some sorts produce perfect collars. I have seen scores of them during the past season. To my mind it would be a mistake to attempt to adopt a close-fitting collar to the star-like type, for it would be entirely out of character, and take away that lightness and delicacy which at present is their chief charm.

I trust nothing in the shape of a standard of perfection will be drawn up by any society. Such a standard has not been adopted for the cactus varieties, and they seem to have come along pretty well during the past thirty years without one.

Doubtless "C. T. D.," in his closing remarks and advice to dahlia raisers and growers, thinks he is likely to guide the dahlia world, but in spite of his adopting the editorial "we," he is not likely to persuade people to follow him in his particular direction.

J. B. Riding.

---

The note on "Garish Dahlias" from the pen of C. T. D." must, I feel sure, call forth criticism from many lovers of the pæony-flowered dahlias. This section has assuredly come to stay, for every year is placing them on a firmer footing, and I contend that they are most beautiful for garden decoration.

I raise no objection to "C. T. D.'s" eulogistic remarks about the more symmetrical show, fancy, pompon, and single dahlias; indeed, I go further, and say I heartily agree with him that they are perfectly lovely. I, however, take a broader view, and see beauty in the "ragged-looking pæony." May I suggest that he takes a somewhat autocratic view, and forgets that we are now living in the twentieth century, and faced with the problem of suiting a far wider range of tastes than was the case in the Victorian era.

In these gardens we grow all sections of dahlias. This year about 2,000 plants were used to furnish the dahlia garden, and nearly half of these belonged to the pæony-flowered section. The giant decorative, collarette, single, and pompon sorts we grow freely, and the show, fancy, cactus, dwarf cactus, stars, etc., in moderate numbers. The garden devoted to them was a magnificent sight from early in July to early in October, and was seen by many hundreds of people of all classes. It was interesting to observe the opinions expressed on the various sections, but I unhesitatingly say that the pæony-flowered and the collarette sorts strongly appealed to all.

Surely it is not too much to expect that, some few out of these hundreds of visitors possessed taste. Among the number was a member of one of the oldest dahlia-growing firms in this country. When the pæony-flowered section was introduced he had a strong objection to them but now he is a most enthusiastic lover of the section. I am sorry that "C. T. D.'s" protest did not appear a few weeks ago, before the frosts put all types on the same footing, as I should have been pleased to have extended to him an invitation to come and see our dahlias. Once having seen them, I should have been surprised if he had gone away unconverted as to their beauty and usefulness for garden adornment, or at least if he had gone away without a very considerable broadening of his view.

Arthur Cobb.

Duffryn Gardens, near Cardiff.

## STORING DAHLIA ROOTS.

Many roots of valuable dahlias are often lost through bad storing. Frost is not the cause of the loss in every case, although it does destroy great numbers. When only stored under loose straw on a floor, where cold draughts—often frosty ones—penetrate, the roots are soon ruined. Too often no fine, close-fitting material is used in addition to the straw or other litter, and then frosts reach the roots. Again, dahlia tubers are often stored in damp cellars or similar places, and the crowns become badly infested with fungus, and decay in the spring-time.

The best way to store the tubers is to select a comparatively dry shed free from cold draughts, to well embed the roots in clean sand, the latter just covering the crowns, and to put on a thin covering of straw, and more straw or mats in case of very severe frosts. Very rarely indeed will fungus attack the tubers when stored in such conditions, and in spring they will be plump and sound, and soon produce a number of young suckers suitable for propagation.

Geo. Garner.

## PERPETUAL CARNATION ROSETTE.

The activity of the American raisers of carnations would appear to be in no way abated, for they continue to place at the command of cultivators varieties that are at once distinct from or superior to the many and varied forms that are now generally grown. One of the most noteworthy of the new perpetual carnations with self-coloured flowers that have had their origin in the United States is the exquisitely beautiful variety Rosette which during the present autumn has been splendidly shown both by Messrs. Allwood Brothers, of Hayward's Heath, Sussex, and Messrs. Stuart Low and Co., Bush Hill Park, Enfield. Rosette is one of the most refined of the perpetual varieties, and has the merit of possessing a good constitution, and being very free in flowering. The flowers are rather above medium size, of exquisite form, and the colour is a delightful shade of rose-cerise. Not only is the form of the flowers all that could well be desired, but they have an exceptionally good calyx that is wholly free from the defect of splitting, a point of no small importance in carnations largely used for decorative purposes in a cut state. The flowers that we have the pleasure of illustrating were selected from a large number that were exhibited at a recent meeting of the Royal Horticultural Society by the Messrs. Allwood Brothers, and, it may be added, these were remarkable for their uniformity both as regards elegance of form and attractiveness of colour.

## NOTES ON PERPETUAL CARNATIONS.

A few notes concerning perpetual carnations, just before the commencement of the winter season, may perhaps be of interest to many. A glance around reveals a great improvement in the size of plants and blossoms, as compared with 1911. This I regard as being partly due to the fairly cool weather experienced last summer, and partly owing to the rigid selection of the best and strongest plants to provide the cuttings for the present stock.

The free use of salt spray has prevented any attack of red spider, and rust is practically an absentee this season, much to our pleasure. This insidious foe is somewhat troublesome with growers who have badly-ventilated houses, or who have a miscellaneous collection of plants to grow in the same houses, but to those who can grow their carnations away from the ordinary run of greenhouse plants this fungoid disease should occasion but little trouble. The great point is to secure an even temperature, plenty of air circulating amongst the plants, and to use a suitable spray at short intervals.

The new patent wire plant supports, which can be easily affixed to slender bamboo sticks, are ideal for pot plants. They are decidedly neat in appearance, and hold the growths in an erect position without bunching them as one had to when using raffia or other tying material. Moreover, one can freely cut the blossoms without any trouble or derangement of the growths left.

For blossoms which split the calyx I can heartily commend the use of the new wire calyx rings. They entirely supersede the old rubber rings, and are much easier to fix, hold the calyx firmly without pinching, and, being very thin and green in colour, are almost invisible.

Reverting to other matters, I would urge the free use of lime rubble and crushed oyster-shell for incorporation with soil for potting purposes, both being splendid agents for imparting health and vigour to carnations. They can also be used with other ingredients for the purpose of top-dressings.

A short time back I made a brief appeal for the increase of fragrance in carnations. Many otherwise grand flowers lack this necessary attribute, and it is time that raisers devoted more attention to securing a rich clove-like fragrance in addition to finely-formed, well-coloured blossoms. To ensure this, one would have to exercise care in the choice of seed and pollen parents, and make an even "more rigid" selection of the young flowering seedlings, but it would be worth while. A little group of seedlings, flowered for the first time during this past summer (1912), have been remarkable for their fragrance, but the main batch were almost devoid of perfume. A few special forms will be carried forward with the idea of bringing us a race of perpetual varieties whose strongest point shall be fragrance.

PERPETUAL CARNATION ROSETTE.
A beautiful variety with rich rose-cerise flowers.

Of our standard varieties I have this season again noted that for quickness to blossom and for continuity in flower production Elegance was first among the pinks, and that this year May Day was the first to crop freely. This is ideal for earliness. Elegance now promises well, and will not fail us for many months to come.

Marjorie is by far the earliest and freest white I have handled. It is not so large as the newer American whites, but it is the first of all with us, and successional flowers follow very quickly. Hitherto I have not had a poor bloom of this variety, and the stems are stiff, clean, and straight, and the calyx, petals, and form distinctly good. At times it is of the purest white, at others a soft rosy flush suffuses the interior of the blossoms, but it is always lasting and delightful.

Mrs. Crook, the crimson fancy, is very continuous, and a small batch is hardly ever out of flower. I like Regina more than ever; it is very fine, free and large, but Rex seems to be following Mrs. Burnett, which I like for its colour and perfume. Mikado is better than ever, standing on guard against its rivals, Geisha and Fairmount. La Mode cannot stand against these, in my opinion, and I fancy Geisha in particular is going to be very popular.

P. S. Hayward.

## NERINES.

Since the days when the old Nerine sarniensis (Guernsey Lily) was introduced many fine species and varieties of this showy genus have found their way into our gardens, but we do not find them grown to any considerable extent. Nerines, though not hardy, except in the most favoured spots in this country, are nevertheless well worthy of cultivation in all places where room can be afforded them. Most of them will succeed well in a cold frame, provided the frost is kept from them during the winter, and when all danger of frost is past they should be stood in a sunny position in the open until the foliage dies down. It is thought by some that repotting prevents the bulbs from flowering freely, but that is not my experience, and, having grown some hundreds, which bloomed most profusely, a few remarks upon management may be of general interest.

The nerine is a native of South Africa, and, with us, flowers in the autumn before the foliage has developed. When grown in pots, about five bulbs should be placed in 32's or 24's, according to the size of the bulbs and the variety grown, as some kinds make much larger bulbs than others, and their foliage, too, is much stronger, and therefore needs more room to develop. The bulbs should be potted up in August, and stood in a cold frame, so that the lights could be put over them to protect them from rain, as it is necessary to keep the soil dry until the flower-buds appear, when water should be given in moderate quantities. Air should be admitted freely both day and night so as to induce the flower stems to grow as stout as possible, and on no account should the plants be introduced into artificial heat, as this causes the flower-spikes to draw up spindly, and renders them incapable of supporting the flowers in an upright position. Large, well-ripened bulbs should produce two trusses of bloom each; it is seldom they produce more. As the flower-stems appear before the leaves, it will be necessary when using these plants for decorative purposes to employ other foliage to cover the pots.

When the plants have gone out of flower they should be stood in a cold frame, and here the foliage will continue to grow provided frost is excluded, so that by spring it will have become thoroughly developed. When all danger of severe frost is past, the pots should be stood in a sunny position in the open where the bulbs will become ripened and the foliage die off, so that a rest may be given them before repotting in August.

The most popular kinds grown in pots are N. Fothergilli. This has a fair-sized bulb, and as the foliage is rather broad it requires more pot room than some of the smaller-growing kinds. The flower stems are stout, carrying from six to eight or more bright crimson flowers. There is a variety known as N. Fothergilli major, which is similar in every respect except that it grows larger. N. sarniensis is a smaller-growing kind, producing bright red flowers on slender stems in September and October. This is most useful for cutting, as the individual flowers remain in perfection for a considerable time, and, having such a light, elegant appearance, are exquisite for arranging in vases. This species will grow in the open in sheltered situations near the sea in the southern counties, but I have always found it do much better when given the protection of a cold frame, as the foliage is apt to be injured by frost, and when this happens the bulbs receive a check, and so do not bloom so freely afterwards.

N. coruscans is another good kind, producing fine scarlet flowers; it is worthy of cultivation, and should be given a place where there is only room for two or three kinds. N. Bowdeni is of recent introduction, and rather a strong grower, making bulbs and foliage similar to that of N. Fothergilli major, but the flowers are of a beautiful pink colour. There are many other kinds worthy of inclusion, and as all seed freely, there is no difficulty in raising hybrids. Seed germinates freely, and soon produces good bulbs, so that there is no difficulty in working up a stock of these plants.

H. C. Prinsep.

## PERENNIALS FOR SPRING FLOWERING.

One of the most striking instances of neglect of plants is the manner in which most of the spring-blooming perennials are either not employed at all, or else so inefficiently that their whole merits are wasted. Bedding out with herbaceous plants for summer is becoming popular, whether they are left to spread in the ground or are lifted later for border enrichment, but the beauties that blossom from March to the end of May are seldom placed anywhere but as isolated specimens on rockeries.

A notable example of fine gardening was given in the front garden of a villa in a southern county last year; the precise site was a four-feet wide border against a white stone house, facing south-west. The back row consisted of Daphne Mezereum shrubs, alternately trained to the wall and set forward as bushes, the next row was of Megasea speciosa Leichtlini, the third of Pulmonaria mollis, and the fourth was an edging belt composed of the single crimson primrose Miss Massey, double lilac and double white primroses. The megasea is an exceedingly showy form, fifteen inches high, producing handsome foliage and clear rose blooms; the pulmonaria, with its mingling of blue and rose, harmonised with the peach of the double primroses in a fashion that an artist would anticipate.

Window-boxes above were remarkable for the use of another neglected spring perennial, in front of and between miniature golden shrubs; this was Megasea Stracheyi, which gives an immense amount of April florescence, of pale pink, at a height of six inches. In ornamental stone urns near were double rose and gold tulips edged by purple pansies, and pink, as distinct from white, arabis. This was a worthy attempt to bring neglected plants into prominence.

Orobus vernus is an instance of a pleasing perennial, one foot high. Although the blue-lilac blossoms cannot be called striking, they give a particularly agreeable contrast to the gold, orange, and brown of double wallflowers, those giants that our grandfathers cultivated to perfection, but which are now seldom seen attaining the height and wealth of spikes of which the plant is capable. There is a double white variety of this orobus that is passing out of notice; still it is not more valuable than the double white arabis that has succeeded it. Other blue and white flowering early perennials are the six-inch Omphalodes verna and O. v. alba.

A shrub often classed among herbaceous plants and belonging to the order rosaceæ is Nuttallia cerasiformis. This should become a denizen of every garden. Growing ultimately to a height of four feet, it gives early white blossom, and is suited, like the daphne, to wall-training if this method is preferred. By-the-bye, two familiar shrubs make a satisfactory effect nailed against a warm wall, giving their already early fresh green leafage some weeks sooner than in the open. These are the red or yellow American currants and the Snowberry Tree (Symphoricarpus). In front of these might be grouped Japanese primroses, in any locality where ordinary primroses thrive, with auriculas perhaps, or the twelve-inch yellow Potentilla pyrenaica, or the two-feet Potentilla rupestris, white. Primula japonica should not be grown near a red-brick wall, as its crimson shade clashes.

Uncommon spring effects can be gained, too, by filling borders with a crimson-and-gold variety of German iris, and purple Helleborus orientalis, with giant polyanthuses for an edging. Small standards of the Japanese quince will give an exquisite show at intervals along a terrace border; beneath them crimson pansies would make plenty of colour, with double blue and white hepaticas for an earlier display. The double rose hepatica will make a harmony as a carpet to a small shrubbery of golden privet, the whole being improved by the proximity of copper beeches, forming new leaves later as companion to the yellow shrub, deep-lined German iris being set in clumps here and there, with a ring of Darwin tulips around each.

Purple, as distinct from violet, German iris, constitute one of the herbaceous border's richest hues in early May; the double red daisy, Bellis perennis, adds to the glowing appearance if lavishly planted for a foreground, tall purple columbines will add to the iris hue, or succeed it; purple pansies will not be out of place, and the edging may be of rose, crimson, mauve, not lavender, and purple aubrietia, that useful miniature perennial that begins early and is loth to discontinue blooming. It is by concentrating colour that notable masses are gained at a season when brilliance and richness of hue are otherwise missed.

Giant gold pansies are so valuable that it is surprising how seldom they are separated from those of other tints. If they are cultivated in rich deep soil, with different doronicums, and edged by several sorts of yellow madwort, or alyssum, the result will be an early bed, or stretch of border, of brightness scarcely ever witnessed until summer.

Dicentra eximia is a dwarf plant of no especial value as a specimen, but capable of assisting excellently in bed-filling. As a close carpet its ruddy bloom and lovely foliage will tone delightfully with crimson polyanthuses and wallflowers. Lastly, the Lady's Smock (Cardamine pratense fl. pl.) should not be despised. Its pale purple colour is a fit companion for yellow and violet German irises and columbines, edged by hybrid primroses. M. H.

**Barkerias.**—The different species of these Mexican orchids are now classed with epidendrums. B. elegans, B. spectabilis, B. Lindleyana, and B. Skinneri are difficult plants to cultivate and keep in a presentable condition for long together. They are best grown in shallow pans, suspended close up to the roof glass, where they obtain the maximum amount of light, giving them plenty of water during the growing season, and resting them afterwards as advised for the other Mexican species. They do best in a compost similar to that used for cattleyas and lælias, but care must be taken not to overburden the roots with compost by placing them in large receptacles. The house in which these and other Mexican species are grown must be well ventilated on all favourable occasions, especially at night, as they enjoy a buoyant and airy atmosphere at all times, therefore very little damping down will be necessary unless there is much sun heat, or an extra amount of fire heat has to be used, owing to extreme weather.—J. T. Barker.

## CROCUS SPECIES.

It is scarcely possible to conceive of failure with the various species and varieties of crocus, as they are generally regarded as among the easiest of all bulbs to grow, but, unlike most other bulbous plants, they resent deep planting, and where this is practised, much of their strength is dissipated, and the flowers are not equal to those produced by similar bulbs, placed at a depth of only two inches in the soil. Planting of croci should begin early, commencing with the autumn-flowering species, as these flower toward the end of September and during October. C. speciosus is one of the hardiest and largest, strong bulbs producing six to a dozen flowers of bright pure blue, pencilled with a deeper shade. C. Aitchisoni is a selected form, even more vigorous than the type, with darker flowers. C. zonatus is much smaller, but exceedingly free, the flowers being of a pretty rose-lilac shade. C. pulchellus produces lavender-blue flowers, intermediate in size between C. zonatus and C. speciosus; the anthers in this species are much paler in colour than the normal orange of most kinds. C. longiflorus has rose-lilac flowers. C. hyemalis Foxi produces white flowers, veined purple, and C. sativus gives purple-lilac flowers with dark-coloured veins and brilliant orange stigma, the latter producing the saffron of commerce. The last-named species gives only indifferent results on some soils, and even with favourable conditions it must always be well-established to flower freely.

Following the autumn kinds are those that flower some time during winter, and include C. biflorus, with white flowers, pencilled violet; C. chrysanthus, with various shades of yellow; C. Susianus, golden-yellow; C. Imperati, variable, but mostly shades of violet; C. Sieberi, pale blue, with dark yellow base; and C. vitellinus, with bright yellow flowers.

Of the spring-flowering species, C. aureus produces golden-yellow flowers, the varieties concolor and pallidas giving sulphur and primrose self-coloured flowers respectively. C. Tommasinianus is a dainty species, with silvery-grey and pale lavender-coloured flowers. C. vernus gives white flowers pencilled purple, and of this there are several distinct forms. C. versicolor, the Scotch crocus, produces white flowers pencilled with reddish-purple.

All the species and varieties of crocus are admirable for planting in short grass, under trees, at edges of walks, in woodlands, or around lawns. The winter and spring-flowering kinds, named above, are generally characterised by smaller flowers than the popular large-flowering Dutch forms, and for this reason they provide a distinct contrast and welcome change, producing most pleasing effects, either in garden or woodland, when planted with a liberal hand.

Thomas Smith.

Coombe Court Gardens.

**Border Chrysanthemums.**—These are making a charming display, and will continue to do so for some little time if the weather remains open. Keep them carefully tied to their supports, and stir the soil with the hoe. It is often convenient to lift a number to flower under glass when the early-flowering section is not largely grown in pots. Provided that the roots are well soaked when they are lifted they are none the worse for the disturbance. After the outdoor plants have finished flowering they should be lifted and placed in boxes, so that they can be stored in cold frames for the winter. See that a label is carefully attached to each variety.—J. Gardner.

## EDUCATION AND TRAINING OF YOUNG GARDENERS.

(Continued from page 793.)

◆

### The Importance of Little Things.

Young gardeners do not, methinks, attach sufficient importance to this. Everything they do should be done well. Once this fact is impressed upon them in their daily routine and practice the better will it be for them. A carelessly-written letter—I have had many such from young gardeners myself, and I have made mental note of it—points to other things besides their writing. A carelessly-written label, a plant tied in a slovenly manner, plants in pots stood down in a careless way and not level, all indicate the kind of workman he is. Carelessness in the arrangement of flowering plants for colour effect, the inability to see and remove faded foliage and flowers, both reflect upon the workman himself. In many cases it takes quite as much time in the long run to do work in a slipshod manner as it does to do it in a proper way. Method should, as far as it is practicable, enter into all phases of gardening. Two instances occur just now to me to illustrate this—the careful packing of fruits in a rational manner as contrasted with the same done in a careless way—the packing of flowers so that they will withstand the possible rough treatment of transit is most important. It pays to pack well.

### The Use of Spare Hours.

This is a valuable asset to every young gardener, if he will but take advantage of it. First, I would advise him to keep a diary of the work he does from day to day, add to these notes as occasion may occur later on. This will be much better than mental notes. Every young man should know wherein he is weak. If it be in writing, or any of the elementary essentials, he should in the long winter evenings do his utmost to improve his education. In the longer days he should have time to take every advantage in acquiring the names, the characteristics, and other features of fruits, flowers, and even vegetables. I have noted that young men are not so well up in the names of trees, shrubs, and hardy border flowers as they should be. No gardener would, I am sure, object to the young men moving about the gardens in order to accomplish this; it can be done without anyone obtruding himself where he should not, at certain times, be found. All that is needed in this is discretion.

Visiting other gardens is a most important factor in the education of young gardeners, as it is also to the older men. Young men, at such times, should cultivate the art of mental observation, and should be able to write up notes afterwards that will prove useful later on in life. To see the same garden at different periods of the year is also most instructive, especially so if alterations and extensions are being made.

### The Present-day Literature. Its Great Advantages.

In speaking of literature I do so in its broadest sense. I mean not only the weekly gardening periodicals, and some monthly ones, too, but also the various (and the many) works that have issued from the press during the past few years. When I was a young man there were but few such then in circulation; this remark refers to both the periodicals and the individual works on gardening. I say without any hesitation that gardeners of all ages and conditions, their employers and amateurs also, were never so well informed upon matters horticultural as at the present day. It is no excuse to a man if he now fails to obtain information in a general way. The illustrations, too, that are so well rendered now, add much to the knowledge that is supplied in the observations made thereon in the letterpress. All phases of gardening are dealt with in the most up-to-date manner. Therefore the young gardener of the present day has inestimable advantages over his somewhat remote predecessors. The rising generation of gardeners cannot too highly value this great boon. But is it taken advantage of as it should be? I must candidly say I think it is not. I have alluded to illustrations—this needs amplifying. These illustrations are not merely examples of products taken at exhibitions, and the like, but also of how to do certain work in the most workmanlike manner.

### Its Temptations and Snares.

Whilst the increase I have alluded to has been for the good of the gardening fraternity, there has also been an increase in cheap, trashy literature, some of which should be burned as soon as it is printed. Some of these inferior products of the printing press have an undoubted fascination for young (and other) men. This is not only in the daily issues with sensational headings, but also in the cheap, trashy serials and novelettes that are spread broadcast over the land. Our young gardeners will do well to avoid all such, and keep their minds upon subjects that will assist them to advance in the pursuits of their profession, and also in literature that is entertaining, yet instructive.

### The Boon of Technical and Continuation Schools.

The value of these to the rising generation cannot well be over-estimated. In the South of England their importance is now being recognised, and we are following in the wake of the Northern and Midland districts in this. Young gardeners should, wherever they can, take advantage of the classes that are arranged for the mutual benefit of young people. It will pay to make a sacrifice in time and in money, too, to accomplish this. Here again one cannot say what subject to take and what not to take, but it should be something that will benefit the rising aspirant in his profession. I am fully convinced that the better a young gardener is equipped in all things that pertain to his profession, the better will it be for him in after-life. He should be conversational to such a degree as to be able to hold his own and to be able to give the why and wherefore both of success and of failure—the latter often occurs.

### The Future of the Younger Gardeners.

My reference to this is that, if I had my time over again, Mr. Editor, I should follow the same profession, but I might take advantages of my past experiences, and so endeavour to benefit by them. Is there a future for young gardeners, some may ask? My reply to this is yes, there is, beyond any question, but the rising generation must equip themselves with every possible adjunct to their profession. This is, in my opinion, the correct way to raise the social status of gardeners. It must be done individually. Mutual help is beneficial beyond any question. This should be cheerfully rendered by every gardener to his fellow gardeners. There should also always be mutual trust and confidence between employer and employed. When this obtains it is better for all parties concerned.

Jas. Hudson, V.M.H.

**Calanthes** of the C. vestita and C. Veitchi groups are now showing their flower-spikes. Expose the plants fully to the light, and admit air freely whenever the outside conditions permit. Water must not be withheld until the foliage has decayed, for if the plants are allowed to suffer the roots perish, the pseudo-bulbs fail to ripen satisfactorily, and next year the growths are smaller than they ought to be. If a little liquid manure water has been given them occasionally, the spikes should be strong, and able to produce richly-coloured, well-formed flowers. From this time onwards water should be carefully applied until the flowers are fully developed, gradually decreasing the amount until the foliage falls away; very little is required during the flowering period.—J. T. Barker.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

MEXICAN LÆLIAS. — The principal species of these most useful plants are L. albida, L. autumnalis, L. Marriottiana, L. Gouldiana, and L. anceps. Those most usually met with, and generally grown are L. autumnalis and L. anceps, and when well grown few plants produce more lovely flowers than these at Christmas time. Where a representative collection of the forms of L. anceps is grown, there is great variety, from the pure white L. anceps alba to the deeply-coloured L. a. Chamberlainiana, besides the many varieties with flowers of intermediate shades of colour. L. autumnalis and its chaste variety L. a. alba make a strong contrast when seen in bloom side by side, and this great diversity in colour of the same species makes orchid growing interesting and fascinating. L. Gouldiana, with its deeply-coloured yet bright flowers, which blooms at a later season than those previously mentioned, and where these Mexican lælias are grown, it should not be left out, for, thanks to our collectors, it may now be obtained at reasonable prices. At the present time many of these plants are developing their flower spikes, and care should be taken that none of the spikes are allowed to get so near the roof glass as to suffer injury from cold or condensed moisture. In low-roofed house, where there is insufficient head-room for the long spikes they should be carefully tied down to neat stakes, training them in the direction where they will obtain all the sun and light possible. These lælias delight in sunshine and light at all times, and even during hot weather it is only necessary to shade them during the hottest and brightest part of the day to prevent scorching. The plants should be carefully examined at night, and after each watering, as woodlice and other pests feed upon the young roots at this season, and do considerable harm. During the flowering season the plants need only sufficient water to keep the compost moist, and afterwards still less will suffice until growth recommences. The usual Mexican or cattleya house temperature will answer requirements.

ODONTOGLOSSUMS, such as O. citrosmum, which requires more heat than those that are grown in the cool-house, generally thrive when grown under similar conditions to the barkerias. They succeed grown in baskets or shallow pans suspended from the roof, and now that they are completing their growths they may be placed in the warmest and lightest part of the house, giving them water whenever they require it until growth is complete, when only sufficient to prevent shrivelling must be given them. Such plants as O. grande and O. Schlieperianum, that have recently bloomed, should be placed on a dry shelf, or in a similar position in the cool intermediate house, where they will rest. O. Insleayi and its varieties, that are now producing their flower-spikes, must be copiously supplied with water until the flowers fade, when they may be treated in like manner. Slugs being very partial to the succulent flower spikes of these species, the plants are best placed upon pest-proof stands to keep them out of harm's way.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

THE PRINCIPAL WORK in the houses at this time will be the care of and attention to the different subjects that have lately been housed. It is not necessary to employ much heat, especially if the weather remains open and bright during the day, but as the evenings approach the fires must be made up so that there may be a brisk circulation in the pipes at night. There must be artificial heat during wet days, or dampness will soon work havoc, but the plants must also have fresh air whenever the weather conditions will permit.

CHRYSANTHEMUMS.—The Japanese and incurved varieties are opening their blooms rapidly. Examine each plant, and remove all side shoots. Earwigs will often be discovered hiding in the hollow canes which are used for supports. Caterpillars are most destructive to the blooms, and, being the exact colour of the leaves, are often most difficult to detect; these will be found hiding during the day on the reverse side of the petals of the blooms or underneath the leaves, and they must be picked off and destroyed. Any stakes projecting above the bud should be cut down just underneath it. In rearranging the groups the plants should not be stood too closely together or loss of leaves will result; tall plants should be stood in the back with some brought forward at intervals to form mounds, the dwarf ones being used to fill the spaces between. Artistic arrangement is most essential in the conservatory. When the blooms are half developed liquid manure is no longer required. Should green-fly make its appearance the houses must be fumigated two or three times in succession.

PRIMULAS AND CINERARIAS. — Primulas are growing quickly, and will require a lot of feeding if well rooted, and the flower spikes may now be left to develop. Cinerarias also will be growing freely, and, if large specimens are required, the plants growing in 5in. pots may now be potted on into 10in.

ACHIMENES AND GESNERIAS will now have finished flowering, and be gradually dying down; they should be carefully stored away in a dry place, leaving them in their pots until the spring. It is quite possible now, by taking off the young growths of cannas, and potting them regularly (as I have previously described in this Calendar) to obtain splendid spikes of these glorious flowers all the year round. Should it, however, be necessary to increase the stock of any particular variety, the old stools may be kept over during the winter. The pots should be stood underneath the stage, and the plants kept dry, and allowed to rest by withholding water.

LACHENALIAS AND FREESIAS. — Batches should be potted up at intervals, and stood in cold frames, six bulbs of lachenalias placed in each 5in. pot will be sufficient, while nine bulbs of freesias can be accommodated in the same sized pot. These plants like rich fibrous loam, with a little leaf-soil and coarse sand; they should be potted firmly, one inch underneath the surface of the soil, and covered with a layer of cocoanut-fibre or moss until well rooted.

SPANISH IRIS.—These are delightful subjects for pots, and should be treated in the same way as lachenalias. They must not be subjected to forcing or the flowers will all come blind.—Lewis Smith, Cadland, Southampton.

## HARDY FRUITS.

PRUNING.—An early start is advisable when much pruning has to be done, so that the work may be well advanced before bad weather sets in. Take advantage of the mild periods to carry out such operations, which may be more expeditiously performed during genial climatic conditions. The Morello cherry trees should be first pruned; trees that have received proper treatment will need but a general thinning of the barren shoots, and the removal of spurs and snags resulting from the shortening back of superfluous shoots last winter. For my own part I prefer to cut away such shoots altogether, but some growers convert them into spurs by leaving them about an inch in length, these generally bear fruit, hence the reason for leaving them, but they should be cut clean out the following autumn. It is, I believe, generally understood that the Morello trained on walls produces its fruit on the previous year's growth similar to the peach and nectarine and is trained in much the same way with the exception of the spacing of the growths, the foliage of the Morello taking up much less room than the peach, consequently the shoots may be laid in closer together, but, as a rule, the shoots should not be less than four inches apart. The Morello may be severely thinned, and therefore, where crowded together, many branches and shoots may be removed to correct this evil, with no injury to the trees. The oldest and least productive branches should be cut out, and strong young shoots laid in to take their places. It may be necessary to shorten back some of the main branches for the purpose of making space to lay in young and vigorous shoots. When pruning young trees of any kind, keep the centre open, first building up the wings; it is then an easy matter to fill up the middle without seriously affecting the side branches. If the trees are railed, let the rails be drawn out with the exception of a few to hold the main branches in position, the trees may then be sprayed with a winter wash.

STRAWBERRIES.—Advantage should be taken of a fine day to run the hoe through the land to keep down weeds and aerate the soil; constant stirring of the surface soil is most beneficial to young plants. By this time the old decaying leaves of established plants should have been removed and burnt. A dressing of bone-flour and sulphate of potash lightly forked in will prove beneficial to the plants on most soils of a light or medium character; for heavy soils potash may be present, and freshly-slaked lime would be of more value; 2½oz. of bone-flour and 1½oz. of sulphate of potash to the square yard may be used as a dressing.

THE FRUIT ROOM.—All specked and decayed fruits should be promptly removed, otherwise they quickly spoil their immediate neighbours; care must be exercised in handling the sound specimens. With the lengthy spell of mild weather experienced of late, it has been somewhat difficult to keep down the temperature of the fruit room. It is a good plan to close the room during the day, and open wide all means for admitting air throughout the night, closing them the first thing in the morning.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

ASPARAGUS.—The growth of this choice vegetable should now be quite ripe enough for cutting down; a good sharp hook in capable hands will soon cut the growths close to the ground's surface. Follow this with a clearance of weeds and rubbish. Then lightly prick over the beds with a fork to aerate the soil. It will be a great advantage to strew over the beds burnt garden refuse and soot. After a week or ten days of such airing apply a winter dressing of decayed farm-yard manure for the autumnal rains to carry to the roots. On light and naturally-drained soils this is exceedingly advantageous, but wherever the soil is very wet, and therefore retentive, it is the better plan to have an alley between each bed, to provide for winter drainage.

BROCCOLI.—A few varieties will be forming heads, and should therefore be examined two or three times a week. Protect them from frosts and wet by tying the leaves together over the heads. Quite early in November the winter and spring broccoli should be heeled over; this procedure, as a rule, saves 90 per cent. of the plants during the most severe winters. The "heeling" is accomplished by taking out a "spit" of soil immediately north of the plant, then gradually tip the plant over to the north, the spit from in front of the following plant being placed evenly on and around the one already laid over, close up to the leaves.

LEEKS. — Carry out the final blanching when the foliage is dry, and before severe weather sets in. When completed apply a top-dressing of long stable litter, to prevent heavy rains from washing the earth into the stems, and to ward off severe frosts. Celery should receive its final earthing. Previous to this apply a good dressing of freshly slaked lime around the stems.

TARRAGON, MINT, and CHIVES should be placed in the forcing pit as the demands require. Dress the mint and tarragon beds liberally with old decaying hotbed manure and wood ashes, previously cutting down the old stems.—G. Ellwood, Swanmore Gardens.

# EXHIBITIONS AND MEETINGS.

◆

## National Chrysanthemum Society.

Favoured with fine weather and a capital competition the National Chrysanthemum Society's exhibition, held at the Crystal Palace on October 29, 30, and 31, was one of the best held during recent years. The bright opening day brought out the rich colours of the flowers, and everybody and everything seemed to be in good humour. Mr Thomas Stevenson's successes provided one of the great features of the show, while the trade displays made respectively by Mr. Norman Davis, Messrs. Wells and Co., and Mr. H. J. Jones were among the finest exhibits the chrysanthemum world has ever seen. Floral art was well represented, and the smaller growers turned out well in the various classes provided for them.

The Society's Floral Committee had a busy time, no fewer than seventy-four varieties being submitted to their judgment. Several visitors from over seas were present at the judges' luncheon, these including a gentleman from Mombassa, Mr. Cox from South Africa, and Mr. W. Duckham, a well-known American grower.

### PRINCIPAL VASE CLASS.

In the great vase class a competitor has to stage a dozen varieties, three blooms of each, in large vases. Five competitors came forward on this occasion, and the premier award of £9 fell to Mr. Thomas Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, who staged large, fresh, and bright blooms of Lady Talbot, Master James, Hon. Mrs. Lopes, Miss Alice Finch, Frances Joliffe, Mrs. R. A. Witty, Madame J. Rivol, Queenie Chandler, Mrs. R. Luxford, Wm. Turner, Fred Chandler, and F. S. Vallis (superb). Mr. F. Beeson, gardener to J. Newton Mappin, Esq., Headley Park, Epsom, come second, and some of his best varieties were Mrs. A. T. Miller, Henry Poulton, Reg. Vallis, Edith Smith, and Lady Talbot. The third award fell to Mr. W. Rigby, gardener to the Rev. A. C. Cooper Marsden, Borstaldene, Bickley.

Only one exhibitor came forward in the class for a dozen vases of incurved blooms, distinct, and this was Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashstead Park, Epsom, who was awarded the first prize for fine flowers of G. G. Evans, Bocace, Mrs. G. Judson, Clara Wells, W. J. Higgs, Buttercup, Frank Trestrian, Mrs. G. Denyer, C. H. Curtis, Calypso, Romana, and Wiseman.

### JAPANESE BLOOMS.

The President's silver bowl for the best two dozen Japanese varieties was competed for by thirteen exhibitors. It fell to the all-conquering Mr. Stevenson, who in his set had very fine specimens of Hon. Mrs. Lopes, Miss Roope, Fred Chandler, Wm. Turner, F. S. Vallis, and Mrs. Gilbert Drabble. The second prize went to Mr. W. Sargent, gardener to G. L. Wigg, Esq., Rockshan, Merstham; third to Mr. G. Hunt; and fourth to Mr. H. Lloyd, gardener to Captain Wiener, Ewell Castle, Ewell.

In an open class for a dozen Japanese blooms, arranged for effect with foliage and plants, Mr. N. Davis provided the prizes. There were nine competitors, and Mr. T. Stevenson led the way once more with some grand blooms of Frances Joliffe, Queen Mary, F. S. Vallis, etc., associated with ferns and crotons; Mr. A. Smith, the Convent Gardens, Roehampton, came second, and Mr. G. Mileham, gardener to A. T. Miller, Esq., Emlyn House, Leatherhead, third.

Mr. T. Beeson had the best vase of two blooms of a white Japanese variety, and won with Mrs. A. T. Miller; eight competitors. For three flowers of a yellow variety Mr. W. Evans, Marlow, scored with wonderfully large and graceful specimens of Lady Talbot; eleven competitors. In the any other colour class Mr. D. Fairweather, gardener to R. H. B. Marsham, Esq., Bifrons Park, Canterbury, scored with Francis Rowe in good form; Mr. E. Guile second with Reginald Vallis; twelve entries.

### HOLMES' MEMORIAL CUP CLASS.

Seven competitors came forward in the competition for the Holmes Memorial Cup in a class for forty-eight Japanese blooms, distinct. The premier position was awarded to Mr. Thomas Stevenson, who had a capital lot of bright, clear blooms, some of which were scarcely yet at their best. A few of special merit were F. S. Vallis, Mrs. Gilbert Drabble, Queen Mary, Superbe, Thomas Lunt, Miss Roope, His Majesty, Hon. Mrs. Lopes, Wm. Turner, W. See, Gladys Herbert, Lady Talbot, and Frances Joliffe. Mr. G. Hunt came second, and he was not far behind Mr. Stevenson; while third place fell to Mr. E. Guile, gardener to Sir Carl Meyer, Bart., Shotgrove, Newport, Essex; and fourth to Mr. C. Wood, gardener to E. J. Thal, Esq., Frensham Place, Farnham.

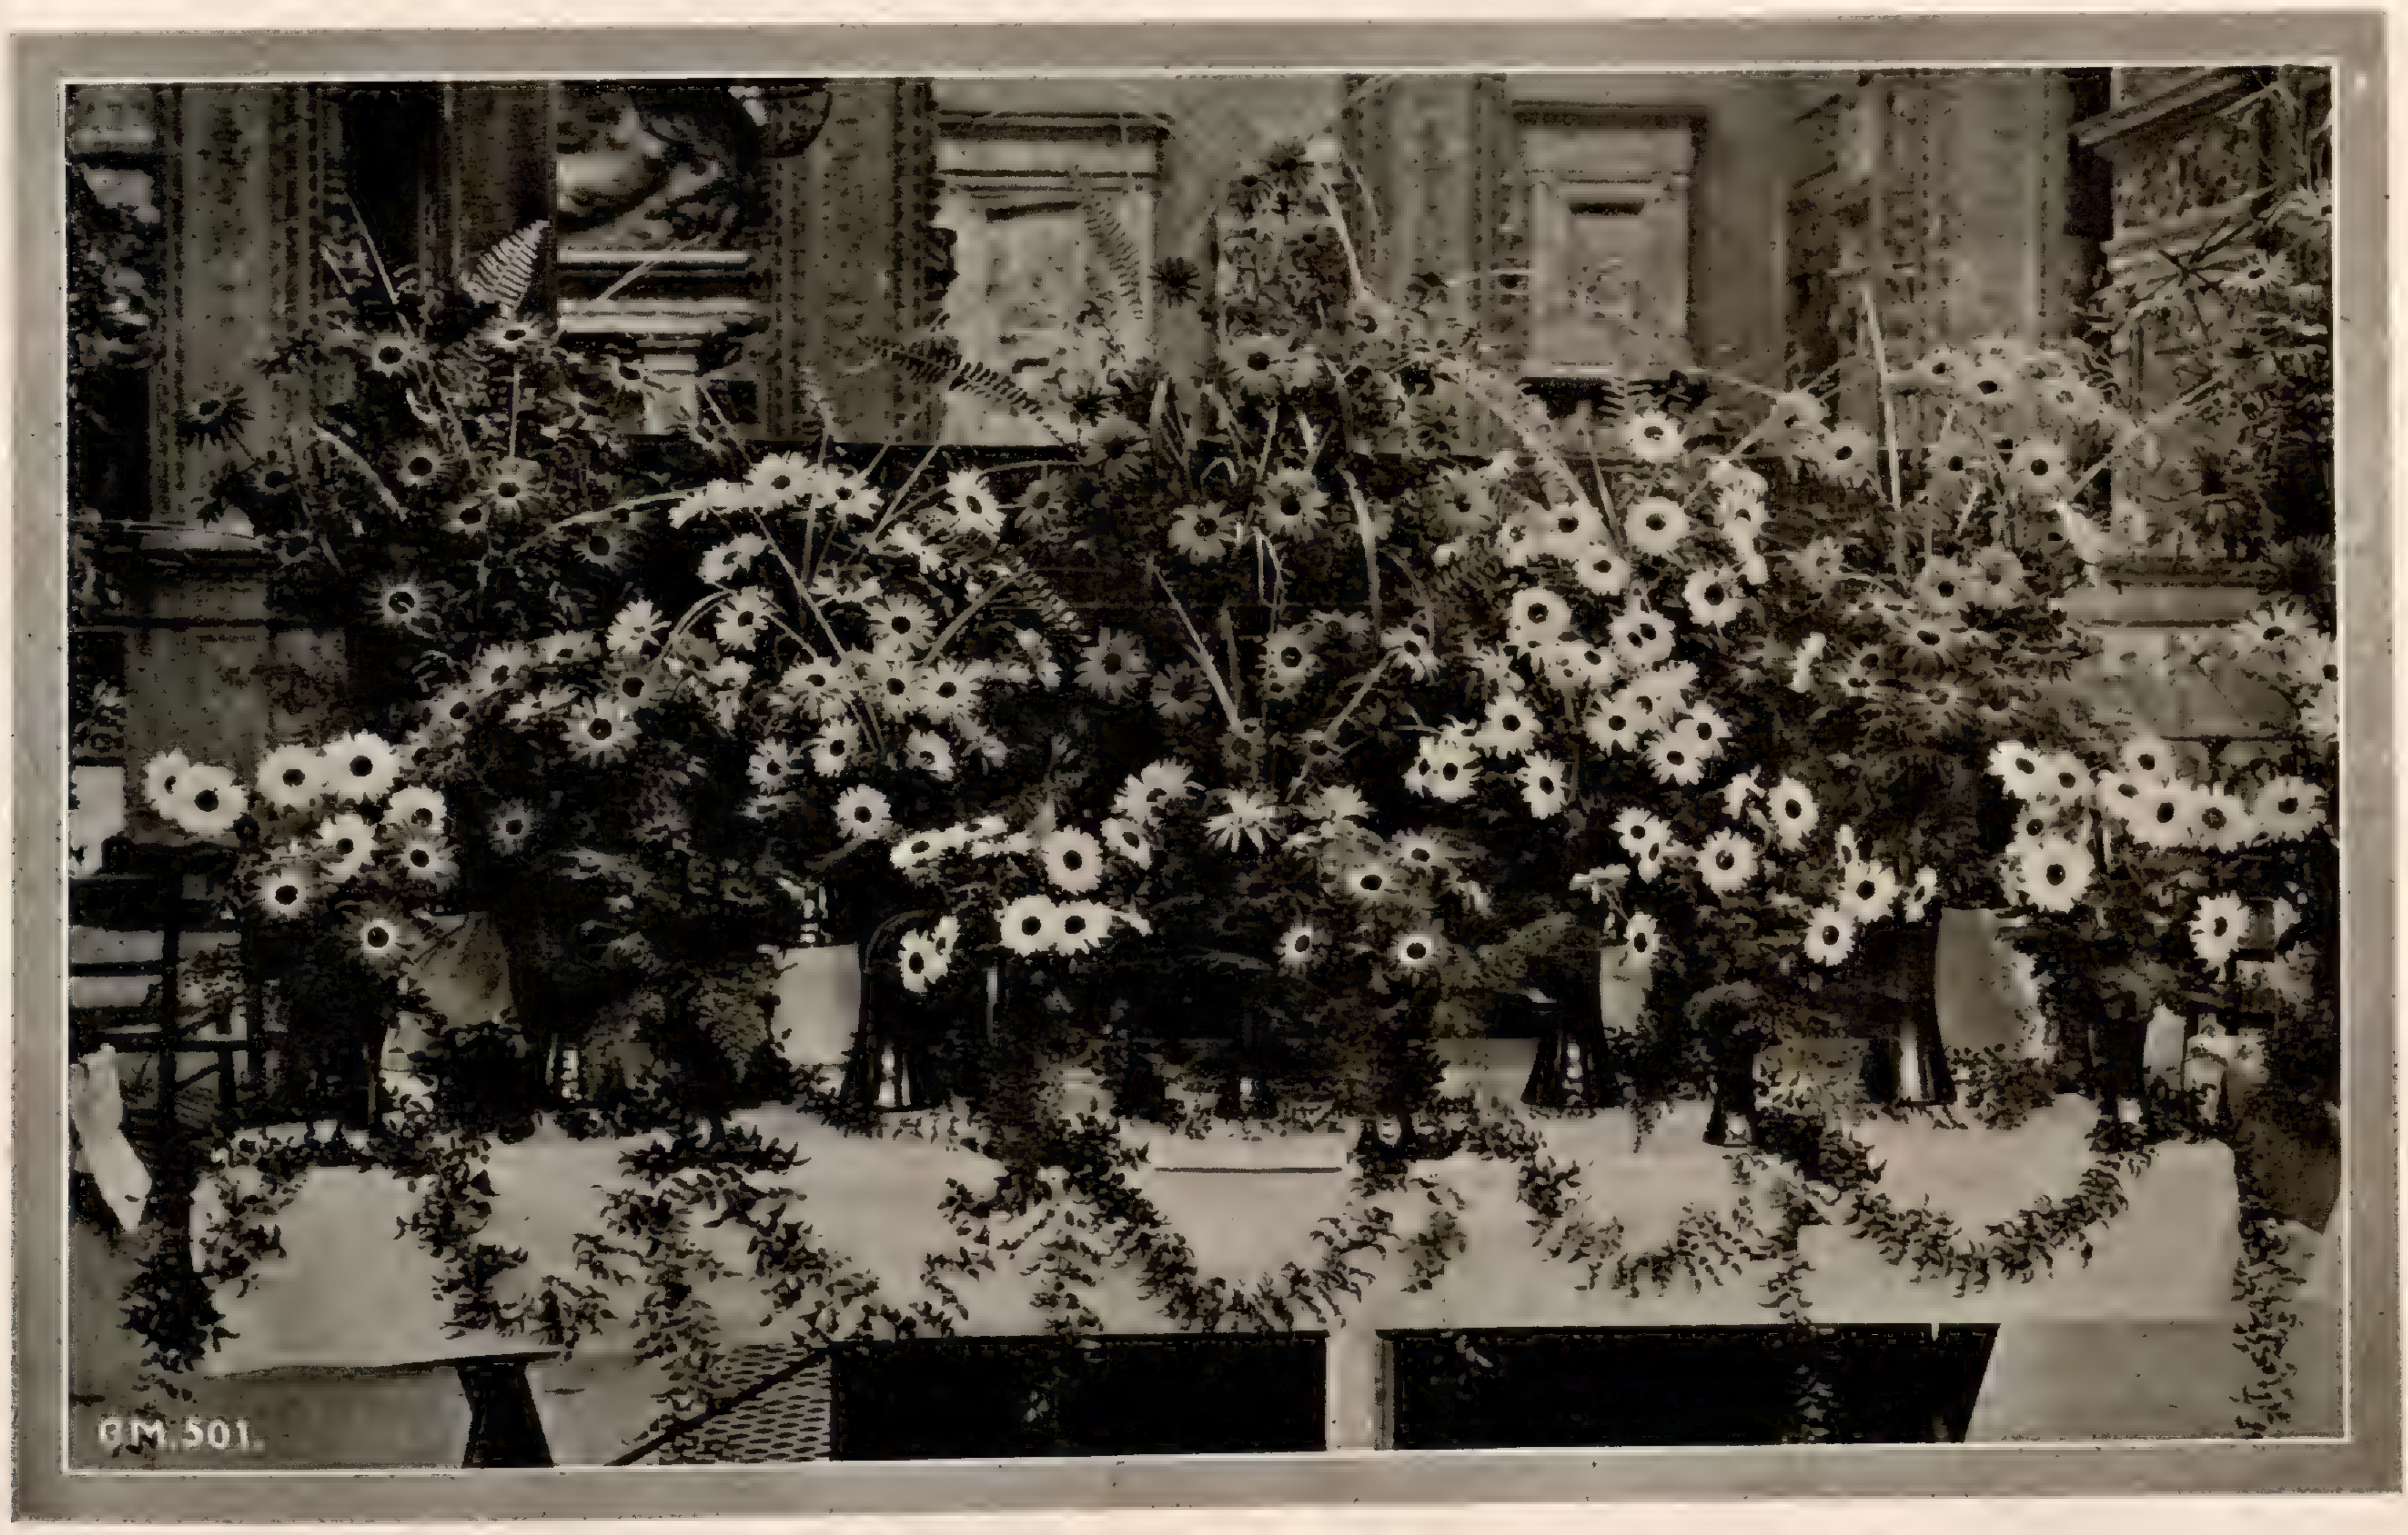
### THE SOCIETIES' CLASS.

The Challenge Trophy, offered for competition among affiliated societies, was won by the Dulwich Chrysanthemum Society. This year the class was for three vases each of single Japanese and incurved varieties; the Dulwich Society staged a grand lot of blooms, and their big vases of fine single flowers were especially good. Second prize fell to the Finchley Chrysanthemum Society, and third to the Reigate and District Chrysanthemum Society.

### SINGLE, INCURVED, AND ANEMONE VARIETIES.

The silver rose bowl presented by C. E. Shea, Esq., for the best table of single varieties, the flowers to have been grown by the exhibitor and arranged for effect, was won by Mr. A. Robertson, gardener to F. J. Yarrow, 18, Abbey Road, St. John's Wood. Good blooms of Mensa, Mary Richardson, and other popular sorts, were set up pleasingly with suitable foliage, and over-crowding had been carefully avoided. None of the varieties were labelled, consequently the exhibit lost a great deal of its educational value. The second prize, given by friends of the Society, fell to Mr. F. G. Bealing, Bassett, Southampton. Five tables were staged.

For the best display of singles, not less than three varieties, Mr. Thomas Stevenson was a capital first with large vases of grand blooms of White Pagram, Edith Pagram, Ceddie Mason, Snowflake, Chas. Dickens, Bronze Pagram, Yellow Purity, and Miss



FIRST PRIZE TABLE OF SINGLE CHRYSANTHEMUMS.

Staged at the Crystal Palace on October 29, by Mr. A. Robertson, gardener to F. J. Yarrow, Esq., Abbey Road, St. John's Wood, N.W.

**Royal Botanical & Horticultural Society of Manchester and the Northern Counties.**
PATRON: HIS MAJESTY THE KING.
**CHRYSANTHEMUM**
**And Autumn Exhibition,**
TO BE HELD IN THE
**Town Hall, Manchester,**
**On November 12th, 13th, and 14th.**
**SPLENDID PRIZE LIST.**

This will be the most important Exhibition held in Manchester in recent years, and His Majesty has graciously approved the design of New Medals, which will be awarded to competitive and non-competitive Exhibitors in various sections. Schedules and particulars of space, etc., free on application to
P. WEATHERS, Secretary, Old Trafford, Manchester.

---

BRADFORD CHRYSANTHEMUM
EXHIBITION,
In ST. GEORGE'S HALL, on
FRIDAY and SATURDAY, NOVEMBER 15th & 16th.
£50 for CUT BLOOMS ON BOARDS,
besides other valuable Prizes for open competition.

Schedules, with entry forms, post free from
H. SPENCER, Hon. Secretary.
Horton Park, Bradford.

---

HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY'S SHOW,
In the CITY HALL, HULL,
20th and 21st November.
Entries close 13th November, 1912.

Schedules on application to—
JAMES DIXON, Hon. Secretary,
County Buildings, Hull.

---

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Mabel Booth; Mr. F. G. Bealing was a good second, and Mr. G. Mileham third out of four entries.

A very interesting class, for six vases of anemone varieties, attracted considerable attention. Mr. T. J. Broom, gardener to Miss Langworthy, Gays House, Holyport, lew with good blooms of Mrs. H. Eland (very fine), La Marguerite, Miss A. Lowe, John Bunyan, Mrs. N. Bunn, and Mdme. C. Lebocqz; second prize fell to Mr. W. Parsey, gardener to C. O. Clark, Esq., Ackray, Shortlands, and third to Mr. J. Foster, gardener to Lady Yule, Hanstead House, Bricket Wood. There were seven competitors, and yet many people had imagined that anemone varieties had practically gone out of cultivation!

Anemone pompons were very pleasingly shown by Mr. F. Fitzwater, Bushey Lodge Gardens, Teddington, who gained first prize for a pair of vases, and was followed by Mr. T. J. Broom. For six vases of these pretty flowers, Mr. Fitzwater was again first, showing Antonius, Rose Marguerite, Perle, Mrs. Astie, Marie Stuart, and Emily Rowbottom; Mr. J. Foster second, and Mr. T. J. Broom third. Pompon varieties were very well and freely shown. For six vases, Mr. J. W. Hussey, Bouverie House, Exeter, was a fine first with shapely blooms of Mdlle. E. Dordan, W. Westlake, Black Douglas, and Prince of Orange; Mr. F. Fitzwater came second, and Mr. J. Foster third; eight competitors.

The best dozen incurved blooms staged on boards were from the veteran Mr. G. Hunt, who scored with good examples of Buttercup, Mrs. G. Denyer, Romance, Mrs. F. Judson, W. J. Higgs, Clara Wells, Lady Isabel, Bocace, Duchess of Fife, G. F. Evans, and Marjorie Shiea; Mr. A. Jones, gardener to Miss Wybury, Hadley Manor, Barnet, second, and Mr. T. G. Broom third. For six incurved blooms, one variety, Mr. T. Beeson led from seven entrants with massive brilliant flowers of Buttercup; Mr. R. Evans, gardener to Miss Flattery, The Orchard, Marlow, second, and Mr. A. Jones third.

## DECORATIVE EXHIBITS.

There were two classes for table decorations, one for yellow and bronze blooms and one for other colours. In the former there were nine competitors, and Mr. A. W. Trossell, Albemarle Road, Twickenham, scored with an elegant arrangement of bronze and pale yellow blooms; Mr. T. W. Stevens, Laurie Park Gardens, Sydenham, second, and Mr. R. F. Felton, Hanover Square, third, the latter showing a low design of flowers in small, silvered baskets. Twelve competed in the other class, and Mrs. A. R. Bide, Farnham, scored with a pleasing arrangement of pink flowers; Mr. T. W. Stevens second, and Mr. L. Wheeler, The Gardens, Wood Hall, Dulwich, third.

For a vase of single blooms, Mr. D. B. Crane, Woodview, Highgate, scored easily with a very pleasing arrangement of fine blooms; if the design had been a few inches higher it would have been better. Mr. W. Dennis, Woodhall Gardens, Dulwich, second, and Mr. Robertson third; nine entries.

Five hand baskets of chrysanthemums were displayed, and premier honours fell to Mrs. Brewster, St. Peter's Street, Canterbury, for golden Japanese and single sorts, associated with croton leaves; Mrs. S. A. Cole, Addiscombe Avenue, Croydon, came second with yellow and bronze flowers, and Mrs. A. R. Bide, Highlands, Farnham, was third with light bronzy-buff flowers.

Mrs. Brewster scored for a basket of autumn foliage and berries with a striking design, composed largely of Honesty seed vessels, clematis fruits, and physalis, symphoricarpus, privet, and pyracantha berries; Mrs. R. Allen Hope, Devonshire House, Addlestone, second, and Miss A. Bashford, Barrow Hedges Farm, Carshalton, third.

## AMATEURS' DIVISION.

Mr. J. Bedson, gardener to R. Barber, Esq., South Hill, Bromley, led in the amateurs' division for a dozen Japanese blooms with a capital set of even flowers; Mr. C. Pullen, gardener to G. Fores, Esq., Blenheim, Raynes Park, second, and Mr. W. Rigby third. Mr. Loo Thomson, Ailsa Craig, Formby, Liverpool, had a fine half-dozen vases of singles, securing first prize for grand flowers of Felix, Bronze Pagram, J. H. Greswolde Williams, Ceddie Mason, and Mrs. H. J. Hampson.

Six fine flowers of Lady Talbot won first prize for Mr. C. Pullen in the class for six flowers of one variety; Mr. W. Parsey, Ackray Gardens, Shortlands, second, with Mrs. R. H. B. Marsham, a fine white. Mr. C. Fox, Tunbridge Wells, scored in another class for a dozen Japanese blooms, with Mr. Gooding, Edenbridge, second.

Out of eight entries for six Japanese blooms Mr. H. E. Campkin, Bournemouth Park Road, Southend-on-Sea, led with fine flowers of Master James, Hon. Mrs. Lopes, Mrs. G. C. Kelly, Frances Joliffe, Master David, and Mrs. A. T. Miller; Mr. C. Fox second, and Mr. H. W. Mason, Ferndale Road, Banstead, third. For six blooms in three varieties, Mr. Campkin was again first, followed by Mr. C. Fox and Mr. L. White, Thornton Heath; seven competitors.

Other successful competitors in the smaller amateur classes were: Mr. C. Fox, Mr. Rigby, Mr. T. W. Stevens, Mr. J. W. Martin, Addlestone (fine vase of singles), Mr. L. Dyer, Upper Norwood; and Mr. J. Vanstone, Hollymead, Tulse Hill; Mr. C. Libberty, Howood Lodge Gardens, Bromley; Mr. J. W. Hussey; Mr. D. B. Crane; and Mr. Loo Thomson.

## FRUITS AND VEGETABLES.

In the fruit classes Mr. W. Howe, gardener to Lady Tate, Park Hill, Streatham, was awarded first prize for three bunches of black grapes; and Mr. A. Jefferies, Moor Hall Gardens, Harlow, was placed second with three very fine clusters of Appley Towers that seemed to be worthy of a better position. Mr. Jefferies was first for white grapes with good bunches of Muscat of Alexandria; Mr. E. C. Wickens, Tewkesbury Lodge Gardens, Forest Hill, second. Mr. Wickens was first for Gros Colmar grapes.

Apples were well shown, and leading awards fell to Mr. A. Smith, Mr. W. Lintott, and Mr. A. Basile, Woburn Park Gardens, Weybridge.

Mr. A. Basile, gardener to the Rev. McMurdie, Woburn Park, Weybridge, had things all his own way in the only class for a collection of vegetables, winning Mr. Sydenham's prize with a grand lot of leeks, onions, tomatoes, parsnips, carrots, Factor potatoes, celery, and Autumn Giant cauliflowers, and Brussels sprouts.

## TRADE EXHIBITS.

In front of the Royal box, and facing the orchestra, Mr. Norman Davis, Framfield, staged a magnificent group of cut chrysanthemums, associated with palms, crotons, ferns, and autumn foliage. This was a great effort, and both in its artistic disposition and the high quality of the blooms it was a display of the very highest merit. From end to end the group was about thirty yards long. In general outline it consisted of a large semi-circular central group, a smaller group on either side, and then larger groups at each end. In the central feature the rich crimson His Majesty was grouped in the foreground, and behind it were large vases and growing plants of Mrs. Lopes, Amber Queen, Mrs. Totty, D. B. Crane, Lady Talbot, Mdme. Paolo Radaelli, Buttercup, H. J. Thorp, J. W. Molyneux, and White Queen. A dozen or so of splendid large anemone-flowered varieties filled one of the small groups, and these graceful flowers attracted a great deal of attention. Pompons in variety, incurved sorts of the Rundle section, and some reflexed flowers filled the other small group. The right-hand end was filled with decorative and market varieties, represented both by plants and stands of cut flowers. At the opposite end Mr. Davis grouped a grand lot of single varieties, and here Mensa, Miss Mary Pope, Sussex Yellow, Celia, Ideality, and Mrs. Loo Thompson were very finely shown. The beauty of this exhibition was unquestioned, but its great interest lay in the fact that every section of the flower was well represented, from the most diminutive sort up to the largest Japanese varieties. It was probably the largest and finest exhibit ever contributed to an exhibition of the N.C.S.

Another splendid group was the one staged in very bold style by Messrs. W. Wells and Co., Merstham. This was 72ft. long by 10ft. deep, and tall stands of wonderfully fine blooms were the outstanding feature, these being arranged over smaller stands, and vases of single and decorative varieties, though some tall stands of bright singles figured in the background. Of course, full use was made of ferns, palms, and coloured foliage, and every attention was paid to the production of a pleasing effect. Particularly fine were the glorious flowers of the splendid Japanese varieties Queen Mary, a magnificent white; Mrs. R. Luxford, chestnut; Wm. Turner, white; H. E. Converse, buff and red; Mrs. L. Thorn, yellow; Mrs. C. H. Totty, pink; Mrs. G. Lloyd Wigg, pale yellow; and D. B. Crane, deep yellow. For size of blooms this exhibit was unsurpassed.

A large and very effective group of cut chrysanthemums, arranged with great taste by Mr. H. J. Jones, Ryecroft, Lewisham, extended across the front of the orchestra. Palms, ferns, Helxine Solieroli, and autumn-tinted foliage were all freely used to produce a pleasing display. The outline of the group was pleasingly curved, and there was an excellent finish to the whole. Towards the back were tall stands, each containing about two dozen show blooms of Japanese varieties, smaller stands of singles and reflexed varieties being placed to right and left. In the centre large vases and baskets of fine flowers of Miss Roope, Frances Joliffe, Bob Pulling, Miss Elsie Davis, Joan Stretton, J. Surrey, Mrs. R. C. Pulling, Don Q. (a new incurved), G. J. Beer, Mrs. Tickle, and Francis Rowe were set over ferns and crotons, and produced a grand effect. Single varieties were very pleasingly disposed in the flanking groups, and these included a number of new and promising seedlings. Mrs. H. J. Jones, an immense new yellowish-green Japanese variety, was very conspicuous in this fine exhibit.

A very attractive and interesting exhibit from Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow, was arranged on the floor.

A few palms and crotons were used, and the setting was of ferns. Rising over the latter were about four dozen very big vases of single, Japanese, and incurved varieties, as grown for market by the Heston firm. The flowers were very firm, on long stems, and from a dozen and a-half to three dozen in each vase. The singles were notably good, and we were specially struck with Mensa, Portia, Jessica, Miss M. Walker, Merstham Gem, Florrie King, White Pagram, Celia, and Ceddie Mason.

Messrs. H. Cannell and Sons, Swanley, showed apples and pears in fine condition and in considerable numbers, and this firm also made a bright display with pelargoniums and chrysanthemums. Roses are indeed perpetual in these days, and we have them exhibited all the season through. Messrs. Hobbies, Lim., Dereham, showed a quite nice lot of blooms from the open, including such varieties as Madame Abel Chatenay, Madame Ravary, General McArthur, Mdme. M. Soupert, and Mrs. B. R. Cant. Perpetual carnations were prettily displayed by Messrs. Young and Co., Hatherley, who disposed their flowers of Marmion, Geisha, May Day, Enchantress, Mrs. Greswold Williams, and Scarlet Glow very elegantly.

Choice ferns and good strains of cyclamen and Primula obconica made up an interesting exhibit from Messrs. H. B. May and Sons, Edmonton. Other trade displays included a few new varieties from Mr. W. J. Godfrey, Exmouth; a stand of blooms from Messrs. J. Stredwick and Son, St. Leonards; a table of fruit from Messrs. J. Peed and Sons, West Norwood, and floral arrangements by Mr. T. Williams, Oxford Road, Ealing.

### MEDALS.

Large Gold Medal and Messrs. Clay and Sons' Gold Medal for the best non-competitive exhibit.—To Mr. Norman Davis, Framfield.

Gold Medal.—To Messrs. W. Wells and Co., Merstham; to Mr. H. J. Jones, Ryecroft, Lewisham.

Small Gold.—Messrs. J. Peed and Son, West Norwood.

Silver-gilt.—To Messrs. H. Cannell and Sons, Swanley—one for fruits and one for flowers.

Large Silver.—To Messrs. J. Peed and Sons, West Norwood, for fruit.

Silver.—To Messrs. Young and Co., Hatherley, Cheltenham, for perpetual carnations.

### FLORAL COMMITTEE'S OUTING.

The members of the Floral Committee were kindly invited to visit Woburn Place, Addlestone, by E. G. Mocatta, Esq., on Saturday afternoon, October 26, to view the chrysanthemums. The party was met at Addlestone Station by Mr. Thomas Stevenson, who has charge of the gardens, and is so justly celebrated for his culture of sweet peas and chrysanthemums, but these are by no means the only specialities at Woburn Place. The chrysanthemums were flowering in three houses, and the committee were fortunate in seeing the collection before the flowers had been cut for the shows. Mr. Stevenson cultivates about 320 plants of Japanese varieties in large pots, and about 140 in smaller sizes.

In addition, a large number of decorative and single varieties are grown for house and conservatory decoration, and right well are they done, too. Market Red was in splendid form, as were also the dwarfer types, such as Caprice du Printemps, Kathleen Thompson, White Cap, Yellow Cap, and Primrose Cap, while the single varieties producing masses of flower were Manor House, Terra Cotta, very free; Snowflake, a fine white; Charles Dickens, deep yellow; White Pagram, Bronze Pagram, a very rich colour; Edith Pagram, Sylvia Slade, and many others.

The incurved varieties are not grown now, but the Japanese varieties include all the latest novelties, while, needless to add, the cultivation displayed was of the highest possible order, and called for much commendation from the visitors. The bulk of the plants are arranged in a long, narrow peach house, where they seem to flourish under ideal conditions. To guard against damping the entire floor was covered with short-cut straw, which evidently answers well in this case, for not a sign of damping was noticed. The following varieties are but a few of the best specimens noticed: Mrs. R. E. Witty, reddish terra cotta, good throughout the collection; Wm. Turner, pure white, will surely make Mrs. Gilbert Drabble look to her laurels, it is a magnificent flower; H. E. Converse, very fine; Fred Chandler, red with a gold reverse; Fred Green, a rich velvety-purple, very fine in colour; Marie Loomes, rich terra cotta; Master James, carrying excellent flowers of a rich hue; while Lady Talbot, with long, narrow petals, was very handsome; Bob Pulling, a fine rich yellow; and the Hon. Mrs. Lopes were carrying very heavy, deep flowers. Francis Joliffe appeared to be a favourite, for it is largely grown. Japan was equally striking. Queen Mary is a most promising variety, while His Majesty fully bears out its promising character. W. Gee was very deep in colour, as was also Mrs. R. Luxford, a fine Indian-red, with a gold reverse; while Bessie Godfrey has still to be reckoned with as a yellow. There were numbers of other varieties, all deserving notice, but the foregoing are enough to give a general idea of the collection.

The rose garden is very extensive, and planted with all the most modern varieties, which are represented by six or twelve plants of each sort, while the pergolas, covered, as they are, with all the best varieties, must be a fine sight in the summer and autumn months. The water garden is large and most artistically arranged, not that one wanted to admire anything in the water line that afternoon, for with typical floral committee weather it rained most persistently the whole afternoon. In the kitchen garden an arch of fruit trees runs the entire length of the garden, and as only two or three trees of each variety are grown, the collection must be a very comprehensive one. The gourd arch or pergola is a most substantial erection, and must be a novel sight when carrying its collection of fruits, as exhibited by Mr. Stevenson last year at Vincent Square. In the houses the same thoroughness prevails. At the time of the visit salvias, primulas, cyclamen, cinerarias, acalyphas, Begonia Gloire de Lorraine, with crotons, dracænas, abutilons, etc., were all in splendid condition. Orchids are now being added; already two houses are devoted to them, and another another one is in course of construction.

The Committee were kindly entertained to tea by Mr. Mocatta, to whom the best thanks of the Committee were accorded.

## Hereford Fruit and Chrysanthemum Society.

OCTOBER 23 and 24.

A fine show was held by this society on the above dates in the Shire Hall, Hereford. The schedule provided upwards of 120 classes, which were, with few exceptions, well filled with produce of excellent quality. Apples had the lion's share of classes, and made a remarkably fine display. Of other fruits, pears and grapes were present in very good quality, while vegetables and farm roots were largely staged in splendid condition. Chrysanthemums are at no time a very prominent feature at this society's show, but the classes devoted to them are for blooms arranged in vases, and these do much, together with trade exhibits of a similar character, to beautify the hall, and relieve monotony. The arrangements were, as is invariably the case at Hereford, perfectly carried out, and the judging commenced punctually, for which credit is due to Mr. E. S. Jones, the secretary, and his assistants.

### OPEN CLASSES.

In the class for collection of fruit, six dishes, three creditable exhibits were staged, the leading one coming from Mr. G. C. Liddle, gardener to Sir J. Cotterell, Garnons. His dishes were Gros Colmar grapes of excellent quality, Muscat of Alexandria grapes, Cox's Orange Pippin apples, a fine dish of Doyenne du Comice pears, Coe's Golden Drop plums, and a melon. Mr. Sykes, gardener to Colonel Henry, of Hatfield, followed with almost equally good dishes, and H. F. Hollins, Esq., Maidstone Court, was third. Mr. Liddle was first for Gros Colmar grapes, and staged splendidly coloured large bunches; General Clive, Perrystone Court, was second, and Mr. Sykes a close third. The prizes for any other black grapes were taken by Mr. Liddle, Mrs. Woodhouse, and H. F. Hollins Esq. There was only one exhibitor of white grapes, and Mr. Sykes was deservedly awarded first prize.

For fifty dishes of culinary and dessert apples, arranged with foliage decorations, Mr. C. W. Powell, Warham Court, took the lead with good examples of leading varieties, nicely arranged in white baskets. The following dishes were noted as specially good: Rival, Blenheim Orange, Ribston Pippin, Charles Ross, King of the Pippins, Crimson Queening, Adam's Pearmain, Cox's Orange Pippin, King of Tomkins County, Devonshire Red, Allington Pippin, King Edward VII., Lord Nelson, Hoary Morning, Cornish Giant, Sandringham, Bismarck, Twenty Ounce, Cox's Pomona, Emperor Alexander, Warner's King, King's Acre Bountiful, Hollandbury, Hambling's Seedling, The Queen, and Newton Wonder. Messrs. Pewtress Brothers, Tillington Nursery, came second, losing ground amongst their dessert varieties.

The class for thirty dishes of apples brought only one exhibitor—Mr. Stenefield, gardener to Mrs. Hill, Moreton Court, who, however, secured first prize for clean, large fruits of leading varieties arranged with foliage decorations. Twelve dishes of culinary apples made a capital class, in which five exhibitors competed, and there was little difference in the quality of the prize-winner's fruits. Mr. Kelly, gardener to Messrs. Getting and Newton, Glewston Court, Ross, was placed first with the following good set: Bismarck, Warner's King, Ecklinville, Hambling's Seedling, Peasgood's Nonsuch, Gloria Mundi, Tibbett's Pearmain, Lord Derby, Newton Wonder, Bramley's Seedling, Cox's

We are retaining this column week by week to take our readers on "flying visits" to our new Warehouses and Testing Grounds at Raynes Park, S.W., which are always open to the public.—James Carter and Co., The King's Seedsmen.

2.—FIVE MINUTES WITH THE BULBS.

Bulbs by the billion.

Bulbs representing practically every hardy flowering variety that exists.

Sent out from Raynes Park by the single bulb, or by tens of thousands.

Last year's order for bulbs for the various Palace Gardens of his Majesty the King, the Royal Parks, and the L.C.C. Gardens amounted to 66,000 Hyacinths, 171,000 Narcissus bulbs, 170,000 Tulips, and 116,000 Crocuses.

Only by paying a visit to Raynes Park can one gain any idea of the fascination of bulb cultivation. Innumerable little stories might be told as wonderful as that of the Lily of the Valley crowns, which spend from six to nine months in the freezing chambers, and are brought out in solid lumps of ice, to spring into the purest of blooms within three or four weeks.

Here, at Raynes Park, one may purchase a bulb for a five-pound-note, or a thousand for a guinea—and every bulb carries an insurance policy in the actual trials to be seen at our Trial Grounds in the spring.

We recently paid £76 for 20 Narcissus bulbs. The world-renowned King Alfred Daffodil, the bulbs of which are now marketed at 2s. each, was sold in its first year at several guineas each.

Like most other things, bulbs may be had at all prices; but only good bulbs from a house of prestige repay their cost in the abundant realisation of long months of anticipation. It is no use *wishing* one had paid a little more when springtime brings its disappointments.

Next Week: "Indoor Gardening."

James Carter & Co.

Pomona, and Sandringham. Captain W. S. R. Cox, Ashe Leigh, Ross, followed, and Mr. H. Taylor, gardener to John Riley Esq., Putley, was third.

For eight dishes of dessert apples, Mr. G. H. Holden, gardener to A. G. Burney, Esq., took the lead among four competitors, with good fruits of Adam's Pearmain, Cox's Orange Pippin, Egremont Russet, Rival, King of the Pippins, Wealthy, Charles Ross, and James Grieve; Mr. Taylor, gardener to J. Riley, Esq., Putley, second, and Mr. Kelly third.

In the single dish classes many of the best fruits were to be found. The leading prize-winners were: For Cox's Orange Pippin, Captain W. S. R. Cox; Ribston Pippin, the Rev. G. H. Devonport; Blenheim Orange, Messrs. Pewtress Brothers; King of the Pippins, E. N. Caddick, Esq.; Warner's King, Captain Cox; Bramley's Seedling, Mr. Kelly; Lane's Prince Albert, Mr. Kelly; Wellington, Messrs. Pewtress Brothers; Gascoigne's Scarlet, E. W. Caddick, Esq.; Peasgood's Nonsuch, A. G. Burney, Esq.; Newton Wonder, J. Riley, Esq.; Annie Elizabeth, Mr. C. W. Powell; Lord Derby, Mr. C. W. Powell; Allington Pippin, R. M. Whiting, Esq.; Rival, R. M. Whiting, Esq.

Apples packed in boxes, for which five classes were devoted, created considerable interest, and were also instructive. One prize was offered in each class. Splendid boxes were in the Newton Wonder class, the best being brought by Mr. Stevens, gardener to Captain Clive, Whitfield. His fruit was of very high quality, and firmly packed without being bruised; Captain W. C. R. Cox secured the prize for Lane's Prince Albert, and also for Cox's Orange Pippin, staging in each case a fine lot of fruit; Bramley's Seedling brought Mr. C. W. Powell again to the front, and Messrs. Pewtress Brothers scored with Blenheim Orange.

For a dozen dishes of pears arranged with foliage decorations, Mr. Parrott, gardener to A. W. Foster, Esq., Brockhampton Court, was placed first. He had moderately large and clean fruits of Doyenne du Comice, Beurre Bosc, Marie Louise d'Uccle, Pitmaston Duchess, Marie Louise, Emile d'Heyst, Josephine de Malines, Charles Ernest, Beurre Alexander Lucas, Durondeau, Brown Beurre, and Glou Morceau; the Rev. G. H. Devonport was second, and Sir R. Lucas Tooth, Holme Lacy, third. In the class for eight dishes of pears six good lots were staged, the best coming from Sir J. Cotterell, Garnons, who had fine fruits of Marie Louise, Doyenne du Comice, Pitmaston Duchess, Easter Beurre, Beurre Bosc, Nouvelle Fulvie, Beurre Superfin, and Le Lectier. Mr. C. W. Powell was a close second. Mr. Sykes was third.

### CHRYSANTHEMUMS, ETC.

J. Corner, Esq., Mr. Parrott, A. G. Burney, Esq., and C. F. Holford, Esq., were the most successful exhibitors of chrysanthemums; the Hon. Mrs. Wilmot, Mrs. Ramsden, and Mrs. W. T. Cook, scored for baskets of outdoor ornamental foliage, grasses, and berries; and Mrs. W. Spencer, Goodrich, Mrs. Griffiths, and Mrs. Hyde led for table decorations, and secured prizes in the order named.

Among trade exhibits, Mr. Wilson, Hereford, had a large stand of choice wreaths, crosses, bouquets, etc. The King's Acre Nursery Company, Hereford, staged about seventy dishes of apples and pears in fine condition, together with many beautifully arranged floral devices; while Messrs. Young and Co., Hatherley, Cheltenham, had choice carnations in variety, which attracted considerable attention.

### CHAMPION CLASSES.

The best dish of pears was one of Doyenne du Comice staged by Sir R. Lucas Tooth, Among dessert apples King of the Pippins from C. W. Caddick, Esq., was the best, while the best culinary apples were example of Bismarck staged by Captain W. S. C. Cox. The best dish of dessert apples shown by a cottager was of Cox's Orange Pippin from Mr. A. Webb, Glewston, Ross.

## Croydon.

OCTOBER 30 and 31.

The Croydon Society has once more changed the venue of its exhibition. Some years ago the show was held in the Public Hall, where the light was not good, and the display spread over several rooms. Then the Adult School was occupied for several years, but the available space was not sufficient. This year the Public Baths, Scarbrook Road, were utilised, and as the hall is finely lighted from the top and high up the sides, and as room seems ample, it is very likely the show will be held here for some years to come.

The exhibition was of varied character, flowers, plants, fruits, and vegetables being all well represented, and, on the whole, the competition was good, as the Croydon gardeners are a very enthusiastic set. It should be remembered that there are no classes for flowers on boards at Croydon.

There were a few non-competitive exhibits, these including a fine lot of apples from the Barnham Nurseries, Barnham; an interesting set of photographs of the Royal International Horticultural Exhibition, from Mr. T. A. Terry, St. James Road, Croydon; and a small set of the newer chrysanthemums from Messrs. W. Wells and Co., Merstham.

Mr. F. Oxtoby (the secretary), gardener to J. J. Reid, Esq., Coombe Lodge, Croydon, contributed a collection of bottled fruits, and a quite large group of decorative chrysanthemums. Mr. Boshier, sent bottled fruits and vegetables, and Mr. W. Veness, George Street, also sent bottled fruits and preserves —these three exhibits were of great interest and educational value.

### OPEN CLASSES.

The new Challenge Cup, value twelve guineas, offered for the best eighteen chrysanthemums, in vases, was won by Mr. W. Howarth, gardener to Wickham Noakes, Esq., J.P., Selsden Park, with a very fair set, consisting of Maud Jeffries, John Peed, Henry Poulton, Rev. R. R. Coet, Pockett's Crimson, Mrs. L. Thorne, Sir A. Rollit, Rose Perfection, Evangeline, Valerie Greenham, F. S. Vallis, Splendour, Sir F. Crisp, Lady Talbot, Shanklin, White Queen, Mary Poulton, and Reginald Vallis. The second prize fell to Mr. W. Fleet, gardener to G. A. Allen, Esq., Wynnstow, Limpsfield, for smaller but very fresh flowers. The cup will be held only for the year ensuing, but the winner will have a silver shield, suitably engraved, to commemorate his win.

In the open class for ten blooms in not fewer than two varieties, Mr. Fleet was the only exhibitor, and he was awarded the first prize for capital examples of Reg. Vallis, Mrs. A. T. Miller, White Queen, and Frances Joliffe. Mr. T. Finch, gardener to G. H. Fisher, Esq., Down's View, Godstone Road, Purley, led for two vases of incurved blooms, with Mr. W. Pauley, gardener to Dr. Jackson, Brigstock Road, Thornton Heath, second; and Mr. A. G. Osmond, gardener to C. H. Wells, Esq., Avenue Road, South Norwood third, all showing very well.

Single chrysanthemums are always well shown at Croydon, and this year they were finer than ever. Mr. G. Fisher, gardener to C. Lazenby, Esq., Oakfield, Eden Park, Beckenham, staged the best three vases, and his flowers included Mensa, Ceddie Mason, Edith Pagram, Mary Richardson, and Bronze Pagram. Mr. T. Finch was a close second, and Mr. F. J. Hainge, gardener to H. Hales, Esq., Elmwood, Kenley, third; four good entries.

### LOCAL CLASSES.

Five competitors entered for the silver cup presented by Mr. and Mrs. G. J. Allen. The class was for fifteen Japanese blooms, set up in three vases. This is a local competition, and the cup is the fourth of its kind given by Mr. and Mrs. Allen. A competitor who comes first two years out of three holds the cup for good. Mr. R. Gladwell, gardener to A. Gosheron, Esq. Tennison Road, South Norwood, was placed first, and he showed fine flowers of Frances Joliffe, Madame Paolo Radælli, Mrs. Gilbert Drabble, Alice Lemon, Reg. Vallis, and Master David. Not fewer than three varieties had to be shown. Mr. W. Howarth, who won the cup in 1911, came second, and was several points down; Mr. W. Pauley third.

Mr. Mills was first for six vases of decorative chrysanthemums, the flowers undisbudded, and cut from the open ground; he had immense bunches associated with autumn foliage, but, like two other competitors, failed to label his varieties. Mr. Finch was a close second, and Mr. F. J. Hainge third. For ten Japanese blooms, in two vases, Mr. T. Finch led, and showed Lady Talbot and Mrs. A. T. Miller in good form; Mr. G. Fisher had White Queen, Sir Frank Crisp, and Hon. Mrs. Lopes in his second prize set; and Mr. L. Gooch, Frocester, South Norwood, came third; eight entries.

Mr. Finch, Mr. L. Gooch, Mr. A. J. Hart (gardener to Mrs. Thrale, Coombe Road), Mr. Howarth, and Mr. C. C. Hunt, Stroud Road, were prominent prize winners in other classes.

### GROUPS AND PLANTS.

Mr. T. W. Collyer was placed first for a group of chrysanthemums, and he made good use of well-grown material, though his stakes were somewhat obtrusive. Mr. F. J. Hainge came second, and his well-flowered single varieties gave him a great advantage over Mr. A. Edgerton, gardener to W. Valder, Esq., Beechwood, Croham Park Avenue, who was third.

Three miscellaneous groups were arranged, but the competitors were rather at a disadvantage, as they had to stage their plants on the broad tiers at the side of the hall. Mr. G. Lewry, gardener to Miss Blake, Duppas Hill, Croydon, gained first prize, and used chrysanthemums, cyclamens, begonias, bouvardias, cypripediums, and cattleyas with suitable foliage plants. Mr. F. J. Hainge came second, and Mr. T. H. West, Rydal Mount, Croham Park Avenue, third. Mr. T. Finch, Mr. F. J. Hainge, and Mr. Collyer were placed as named for three plants of single chrysanthemums, Mr. Finch scoring with very fine, freely-grown specimens of Mary Richardson.

Mr. W. Lintott was easily first for nine table plants with eight beautiful crotons and Dracæna Marden Gem. Mr. G. Fisher just managed to beat Mr. Mills for six begonias of the Lorraine type, among five competitors.

### FRUITS AND VEGETABLES.

Mr. W. Pauley scored for six dishes of dessert and three of culinary apples, and had excellent dishes of Bramley's Seedling, Lord Derby, Cox's Orange Pippin, and Ribston Pippin; Mr. H. J. Alderman, gardener to H. H. König, Esq., Ardenrun Place, Blindley Heath, second. For six dishes of pears, Mr. Pauley was again first, followed by Mr. Lintott, gardener to Sir Walpole Greenwell, Bart., Marden Park.

Mr. Lintott led for two bunches of grapes with large clusters of Alicante; Mr. F. W. Collier, gardener to A. H. Allen, Esq., Wandle Court, Beddington, second, with Muscat of Alexandria; and Mr. J. H. Alderman third with Alicante, the bunches somewhat unevenly berried.

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1⅜ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 30, Sutton Coldfield.

# ANSWERS TO CORRESPONDENTS.

CALANTHES.—A. M.: Can you tell me what is wrong with the calanthe bulbs I am sending?—Everything is wrong, indeed we do not remember to have seen such miserable specimens of calanthe bulbs. It might be possible to bring the plants back into a healthy condition, but several years of patient care would be necessary. The best advice we can give you is to burn all the puny specimens, and obtain a few strong bulbs to start with as soon as the flowering season is over, taking care to secure clean, healthy stock. We commend to your regular notice our weekly article on orchid culture, appearing under "Work for the Week."

RIDGING SOIL.—H. W., Rye: I wish to ridge a plot of ground this autumn, and shall be much obliged if you will kindly inform me, through the Gardeners' Magazine, how to proceed.—There are several methods of ridging soil, and the basal idea of every method is to dig the soil so as to leave as great a surface exposed to the elements as possible. One method is to dig is a straight line across the plot, merely inverting each spit of soil in the line; then place every spit from the next spade-wide line on top of the line previously dug. If this is continued over the whole plot there will be a series of ridges and furrows, as no soil is placed in the trenches from which soil is taken to form the ridge; in other words each ridge will expose about two spits' depth of soil on either side. Another method is to mark out the plot and arrange for the ridges and furrows to be each two spits wide.

HIRING LANTERN SLIDES FOR HORTICULTURAL LECTURES.—In addition to the information we have already given to correspondents desirous of hiring lantern slides illustrative of horticultural subjects, we may state that Mr. G. Gregory, 60, Canterbury Road, Croydon, has over a score of sets, these varying from 50 to 100 slides and representing a wide range of horticultural activities. Mr. Gregory is an Old Kewite, was for many years a head gardener in the Midlands, and his intimate association with the institution and management of the Croydon Gardeners' Mutual Improvement Association renders him especially conversant with the needs of similar societies.

HOW DODDER GROWS.—S. E. J., Baddow: I shall be very glad if you will publish a brief account of the germination and growth of dodder.—There are several species of dodder, but they all grow in a similar manner. The embryo of the dodder seed is simple and thread-like, and coiled spirally round the fleshy albumen, while the radicle is thickened. The seeds seem to germinate best during damp seasons. At a suitable temperature they will germinate in five to eight days. When a seed germinates the thread-like coil unwinds gradually, the radicle end taking root in the soil, the remainder meanwhile lengthening, and when it reaches a suitable host commencing to twine itself round the stem, to which it attaches itself firmly by means of the suckers or haustoria. Should the thread-like stems fail to reach a suitable host plant, they die. The plant now extends its thread-like stems to neighbouring plants, and large patches may rapidly become infested and overcome, the dodder soon leaving its hold of the soil, and living wholly on the host plant. On becoming firmly established the dodder grows and spreads rapidly, produces flowers, and, if nothing be done to prevent it, seeds are formed and the soil is re-sown. Small fragments of the stems, constituting veritable cuttings, may suffice to establish new centres of infestation, attaching themselves to fresh plants. It is believed that dodder may also be spread by means of little tubercles, which are formed in winter. Dodders are annual seed-producing plants, and are no doubt chiefly distributed by seed included amongst agricultural seeds. The harm by dodder is best explained by stating that the plants possess no chloroplasts, and are unable to take up carbon dioxide from the air like ordinary green plants, but after leaving their hold of the soil, they depend entirely for food material on the ready-made products absorbed from its host plant, which therefore becomes exhausted and dies.

### NAMES OF PLANTS.

N. J., Brough.—1, Jacobinia chrysostephana; 2, Tabernamontana coronaria fl. pl.

L. S. S., Torquay.—1, Choisya ternata; 2, leaves of Taxodium distichum; 3, Exacum affine.

H. H. M., Romsey.—1, Skimmia japonica; 2, Begonia Haageana; 3, Cypripedium Actæus; 4, Nertera depressa.

R. E., Totnes.—1, Pittosporum Tobira; 2, Maxillaria picta; 3, Odontoglossum Pescatorei; 4, Masdevallia Tovarensis; 5, Ruscus racemosus; 6, Areca lutescens.

M. E. C., Kenilworth.—1, Terminalia elegans; 2, Oncidium cucullatum; 3, Irisine Lindeni; 4, Eriostemon myoporoides; 5, Pothos celatocaulis; 6, Carpinus betulus.

### NAMES OF FRUITS.

W. C. J., Brecon.—Emile d'Heyst.

T. H. W., Gomshall.—Doyenne du Comice.

T. G., Woodbridge.—1, American Mother; 2, New Hawthornden.

E. C., Bletchley.—1, Peasgood's Nonsuch; 2, a very fine King of the Pippins; 3, London Pippin.

M. W., Sunbury.—1, Hambledon Deux Ans; 2, Rambour Franc; 3, Washington; 4, Norfolk Beefing; 5, not recognised.

F. S. R., Fareham.—1, Cornish Aromatic; 2, Gloria Mundi; 3, probably Adam's Pearmain; 4, a deformed specimen, not recognised; 5, Beurre Diel.

# OBITUARY.

### DR. M. C. COOKE.

We record with regret the death of Dr. M. C. Cooke, for twelve years in charge of the Cryptogamic Department of the Herbarium of the Royal Botanic Gardens. According to the "Kew Bulletin" "Cooke was born at Honing, in Norfolk. At the age of nine he went to reside with an uncle at Ilford, and commenced the study of botany, being, as a child, first interested in flowering plants. His attention was soon attracted to fungi, at first from an edible standpoint, but soon, as Cooke himself often stated, the fungi exercised such a spell over his entire existence, that his interest in these plants ceased only when he peacefully passed away at his residence in Kentish Town, a few days after his 87th birthday. Being dependent on his own resources from an early age, Cooke was, in turn, an assistant in a drapery establishment, teacher in a National school, and a lawyer's clerk. He afterwards obtained a more congenial appointment as assistant in the India Museum. On the abolition of this institution, Cooke spent some time at the South Kensington Museum, in the Mycological Department, and afterwards came to the Herbarium at the Royal Botanic Gardens, Kew, where he was also placed in charge of the mycological section. Cooke remained at Kew from 1880 to 1892, when he retired on a pension. During this time Cooke incorporated his own herbarium, containing 46,000 specimens, with the existing collection at Kew as well as the collection of fungi presented to Kew by the Rev. M. J. Berkeley. Cooke's figures of fungi, mostly coloured, and numbering 25,000 plates, are also at Kew.

"His first important work was the 'Handbook of British Fungi,' in two volumes, published in 1871, followed by 'Mycographia,' or coloured figures of fungi from all parts of the world, 113 plates; 'Handbook of Australian Fungi,' and 'Illustrations of British Fungi,' 1,200 coloured plates. In addition to the above, over 300 articles on mycological subjects are credited to Cooke by Lindau and Sydow: for a period of 15 years he also edited 'Grevillea,' a journal devoted to cryptogamic botany."

We would add that this distinguished mycologist was for many years a member of the R. H. S. Scientific Committee.

# CITY OF LONDON ROSE SOCIETY.

A meeting of those interested in the proposed rose society for the City of London was held at the Cannon Street Hotel on Wednesday evening. Mr. Stewart Hogg occupied the chair, and there were present: Mr. Arthur E. Protheroe, Mr. Howard Straker, Mr. J. B. Ellis, Mr. Gerald W. Butcher, Mr. P. S. Fitter, Mr. Norris Gibson, Mr. C. Palmer, Mr. A. E. Gregston, Mr. Henry Beard, Mr. P. G. Howlett, Mr. John Collingridge, Mr. H. V. Lucas, Mr. W. Stevens, Mr. A. Turner, Mr. F. W. Harvey, Mr. G. Drayson, Mr. E. M. Lunn, Mr. E. B. Kelley, Mr. C. W. Edwards, and Mr. R. Escofet.

The meeting decided to form a society with the title of "The City of London Rose Society," the membership being limited to bona fide workers in the City of London, i.e., those regularly attending or having offices in the City. It was resolved to ask the Lord Mayor to accept the office of president. Mr. A. E. Protheroe, of 67 and 68, Cheapside, E.C., was appointed secretary and treasurer, and Mr. P. Goddard assistant secretary. A committee was chosen, and a minimum subscription of five shillings agreed upon. The aim of the society is to encourage rose growing amongst City men, and to provide an opportunity of exhibiting to many who, although enthusiastic growers, do not exhibit at the large shows now held.

## FORTHCOMING ENGAGEMENTS

TUESDAY, November 5.—Southampton Chrysanthemum Show; two days.
Chelmsford Chrysanthemum Show; two days.
Brighton Chrysanthemum Show; two days.
Bournemouth Chrysanthemum Show; two days.

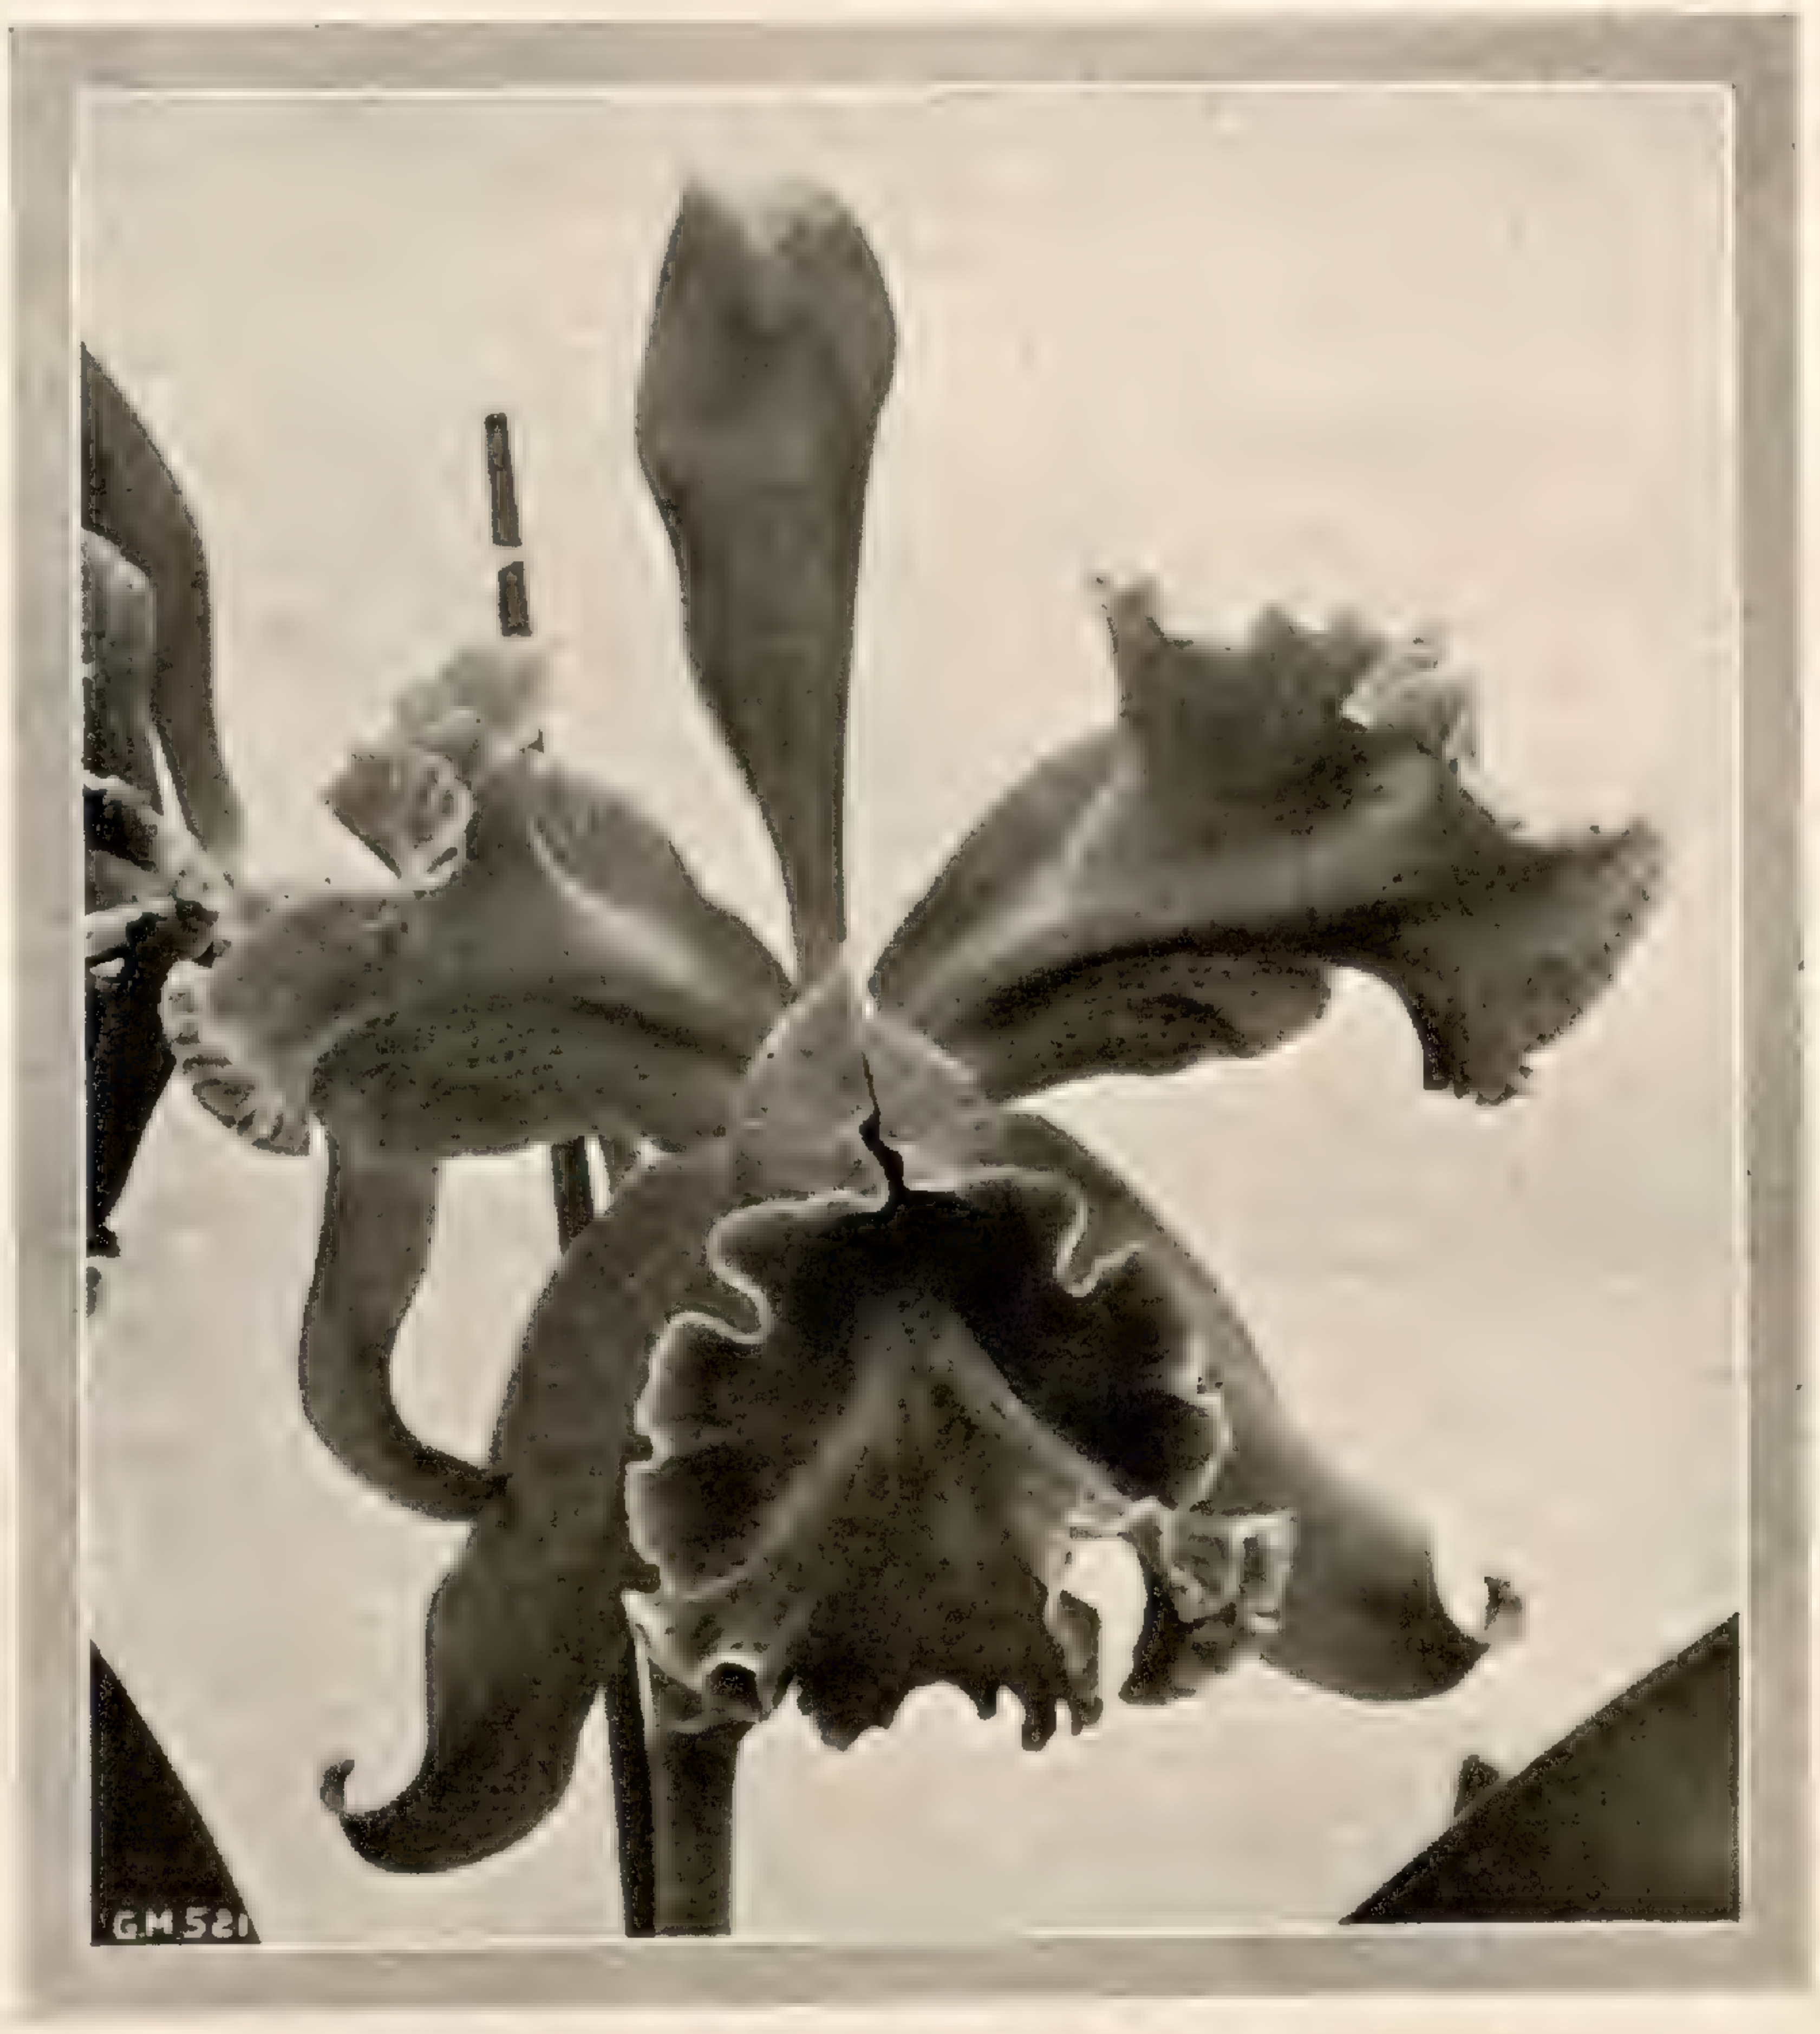
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

◆

### The Orchid Cult.

The exhibition of orchids that yield the most freely of their floral wealth during the autumn months, which has been held by the Royal Horticultural Society during the past week, and the conference associated therewith, have been of immense interest as evidence of continued progress in the development of these fascinating plants, and of the great value of those flowering at this season of the year for contributing to the attractions of the garden under glass, when the flowers in the herbaceous border and on the rockery have reached the vanishing point. These two functions have again brought into prominence the high position to which orchids have attained in gardens, not only in those whose owners have no occasion for considering overmuch the question of cost, but in those where economy has to be carefully studied, many of these belonging to amateurs who are actively engaged in business or professional work, and do much of the work themselves. We are also reminded of the high position orchids have taken in connection with the Temple Shows, and of the assistance they have rendered these exhibitions in attaining the high degree of popularity they have so long enjoyed. It is hardly necessary to recall the fact that the collections of orchids formed one of the most interesting and attractive features of the Royal International Horticultural Exhibitions held at Chelsea in May last; but it may be mentioned as a point of some importance that immense advances are also being made on the Continent, as evidenced by the large and beautiful displays seen at Ghent and elsewhere on the occasion of the great exhibitions. The more beautiful of the kinds, whatever may be their season of flowering, can hardly fail to obtain full appreciation from genuine flower lovers; but those kinds that bloom during the autumn months have special claims for consideration, and, happily, these claims are recognised, if not quite so fully as one could wish. The greater proportion of them are not only wondrously beautiful, but they represent much thought, rare judgment, and persistent effort on the part of those who are engaged in the interesting, and, we would hope, profitable work of creating new forms among orchids. Especially do we find proof of the great beauty of the hybrids flowering in autumn, and the remarkable success that has been achieved by hybridists, in the hybrids which have the attractively-coloured Cattleya labiata as one of their parents. Some twenty-five years have elapsed since the autumn-flowering variety of this species was re-introduced to European collections, and during this comparatively short period it has been so freely utilised by raisers that, apart from the varieties, the hybrids now form a large and beautiful group. If we turn from the cattleyas and the lælio-cattleyas, that are now producing such rich colour effects, to the cypripediums we shall find that immense advances have been made in these, and that a very considerable proportion of the newer forms are of much value for contributing to the attractions of plant structures in which an intermediate temperature is maintained from early in autumn until the season of spring is well advanced. The list of hybrids at the command of the cultivator is a long one, and it includes some that, because of their rarity, are high in price, but a representative collection possessing much merit may be made without their inclusion. There is no great difficulty in the successful cultivation of cypripediums, and a structure well adapted to their requirements can be provided at a comparatively small cost. The form of their flowers may not be in accordance with the taste of some owners of gardens, and when this is the case no useful purpose would be served in growing them. To many the distinctive shape of their flowers is an added charm, and this being so, attention may with advantage be directed to the fact that a considerable proportion of the cypripediums suffer but little from the effects of the fogs experienced in the neighbourhood of large towns. In addition the flowers retain their freshness and beauty for a long time upon the plants, and they will remain in good condition for a fortnight or so after they have been cut, and their stems put in water. The extension of the cultivation of orchids in gardens of moderate size has proceeded somewhat rapidly within recent years, and it is now a quite common occurrence to meet with from one to three houses wholly devoted to orchids in gardens in which but a few years since they were wholly absent. It is of interest also to find that increased attention is being paid to the raising of seedlings in gardens in which orchids are not regarded as a speciality, and if hybrids of exceptional excellence are not frequently raised in such gardens it may be attributed to the inability of those in charge to utilise the finer forms in their work of hybridisation. In gardens where orchids are appreciated the selection made should not be limited to the autumn-flowering kinds, or indeed to the cattleyas, lælio-cattleyas, or cypripediums, for if this is done much of the pleasure that may be derived from them is lost. Where it is not desired to do more than grow orchids for beautifying the plant houses and supplying cut flowers, the kinds that require ultra-tropical conditions, or cannot be readily grown with success owing to some constitutional



LÆLIO-CATTLEYA ORION VAR. OTHELLO.

A beautiful hybrid, with bronzy sepals, soft crimson petals, and rich ruby-crimson lip. F.C.C., R.H.S., November 5. Messrs. Charlesworth and Co., about two-thirds full size. (See p. 863.)

peculiarity, and the costly hybrids should be left to the specialists. There are more than sufficient for the purpose indicated without them. It would indeed be well were cultivators to give more attention to the many dendrobiums, odontoglossums, oncidiums, and the summer-flowering cattleyas and lælias, all of which are at once beautiful and inexpensive, for they would derive much pleasure from them. Especially does it appear desirable that the many beautiful dendrobiums which the hybridists have placed at their disposal should be more largely grown, for their value is great from the decorative point of view, and the exquisite beauty of their flowers may be fully enjoyed without the necessity of being subjected to a tropical heat, which is certainly not pleasant. We have no wish to exalt the orchids at the expense of other meritorious classes of plants, but with a full knowledge of what has been accomplished by the strenuous endeavour of the hybridist, and the great extension of their culture, it has not been less a duty than a pleasure at the present time to acknowledge the indebtedness of those who appreciate the charms of orchids to the raisers, and to suggest that to many gardens their introduction would give an added charm. The magnificent exhibition at the Horticultural Hall will have had the effect of focussing attention on the numerous, highly interesting, and immensely attractive kinds flowering late in the year, a point of no small importance, seeing that they bloom at a time when the flowers are very few in the open, and the genial warmth of the structures in which they are grown is usually much appreciated.

---

**Dr. M. C. Cooke.**—On the authority of the "Kew Bulletin," we recorded in our issue of the 2nd inst., the death of Dr. M. C. Cooke, and gave a brief sketch of his life and work. We now find that the announcement of the death of this distinguished fungologist was premature, and we are pleased to learn from Dr. Cooke that he is in the enjoyment of good health.

**Garden Clubs.**—At the recent conference of societies in affiliation with the Royal Horticultural Society, the question was raised with regard to the advisability of forming garden clubs for the purpose of assisting allotment holders in purchasing tools, manure, seeds, etc., under the most favourable conditions. As stated by Mr. Jay, of St. Barnabas, Sutton, a club has been formed in connection with the local society with which he is associated for the purpose of affording allotment holders and occupiers of cottage gardens facilities for saving, during the periods in which employment is brisk, the money necessary for the purchase of the manure, seeds, etc., necessary in the cultivation of their allotments and gardens, which have usually to be obtained at a dull season. Sir Daniel Morris, who presided, briefly referred to what had been done in the West Indies in this direction during his administration of the Agricultural Department of these dependencies. In subsequently discussing the question of garden clubs with us, Sir Daniel Morris expressed the opinion that, conducted on proper lines, such clubs would prove most helpful to those whose earnings are somewhat variable, and who are not well acquainted with the best methods of procedure in obtaining seeds, etc., provided they are conducted on proper lines. From his experience, it is essential to success that the treasurer should be of some position in the district. It would be useful, as well as interesting, to know what has been already done in this matter in the United Kingdom, and also to learn the views of those who are interested in cottage gardens and allotments, and we shall be very pleased to hear from those of our many friends who are in a position to give any information of the matter.

**Pæony-flowered Dahlia.** — Mr. C. E. Pearson writes as follows with reference to pæony-flowered dahlias: "C. T. D." appears to have stirred up trouble by his outspoken remarks on these wretched abortions, but I think every word he wrote was true and to the point. Mr. Cobb says we must suit a wider range of taste than was formerly the case, but is it not rather a want of taste that our unfortunate growers have to cater for? Many of those who grow and exhibit these coloured rags for commercial reasons abhor them in their own souls, but must provide what the public asks for. Admiration for crude colour is a primitive instinct, but appreciation of "form" is a much higher and rarer endowment, as may be seen every year by comparing the crowd in the Academy picture galleries with the solitude of the sculpture rooms. In horticulture, the limited appreciation of the numerous lovely forms of our British ferns tells the same tale. The pæony-flowered dahlia makes a fine splash of colour, and may be endured at such a distance that its colour effect alone is seen; but that any true flower-lover can permit a closer approach is a marvel passing comprehension.

**Dahlia Useful.** — About ten days since we received somewhat of a surprise in the form of a box of blooms of Dahlia Useful, from Mr. J. T. West, of Brentwood, for at Kew the frost had cut dahlias down to the ground some days previously. This variety belongs to the decorative section, and received the first-class certificate of the National Dahlia Society, and the Royal Horticultural Society's Award of Merit at the meeting of the Joint Committee of the two societies that was held at Westminster at the end of September. The variety is remarkable for its short-jointed growth, and for its long and erect flower stems. The blooms are about four inches in diameter, of a rich rose-pink hue, and produced in the most profuse manner.

**Northern Fruit Congress**, 1913. —The arrangements for the Fruit Congress that will be held in co-operation with the North of England Horticultural Society at Kendal, October 15 and 16, 1913, are being proceeded with, and already considerable progress has been made. A large and representative meeting was recently held at Kendal to form an Executive Committee to carry out the arrangements for the show and congress, when the acting-secretary, Mrs. F. W. Crewdson, reported subscriptions and guarantees (including £30 guaranteed at the meeting) to the amount of £70; also a challenge cup from the High Sheriff, W. D. Crewdson, Esq.; this in addition to the Straker and Voss Cups already in hand. It was also reported that Lord Henry Bentinck has promised to open the Congress. The Royal Horticultural Society have promised to send delegates and award medals. The Department of Agriculture of the Board of Agriculture is arranging to put up an exhibit of potatoes and diseases of potatoes. Papers on the following subjects will be included in the programme: "Land Tenure and Fruit-growing," "Diseases of Potatoes," "Organisation of the Damson Industry," "Conditions Necessary to Successful Fruit-growing" (local). The Rev. J. Bernard Hall has been asked to lecture on "Apple Culture," at 2.15, in the Town Hall, Kendal, on the 16th inst., in order to arouse interest in the congress and show.

**Saltaire Rose Society.**—We are pleased to learn that this enterprising society continues in a flourishing condition. A few evenings since the society held its annual dinner at the Victoria Hotel, Bradford, and, in responding to the toast of his health, the President (Mr. H. Sutcliffe Smith) said that the society had made rapid progress of late years, both as regards its members and exhibitions. He stated that in 1910 the entries and exhibitors at the show numbered 575 and 109; in 1912 they reached 781 and 143, the number of entries being a record in the history of the society. Owing to the dull weather which had attended the last show, however, the gate receipts had shown a decrease, having fallen to £294, as compared with £369 in 1911, but the society was in a sound financial position, and it now had a total of no fewer than 723 subscribers. Next year, said Mr. Smith, it was intended to hold the show about July 8, and it had been arranged that in conjunction with it the show of the North of England Horticultural Society should again be held.

**An Additional Public Park for Maxwelltown, Dumfries.** — Next year the Parish Council of Troqueer, which parish includes the Burgh of Maxwelltown, Dumfries, enters upon the possession of a park of about twenty acres. The park lies close to the river Nith, and was bequeathed to trustees to be handed over to the Parish Council by the late Mr. J. Gibson Starke, of Troqueerholm, of which estate it forms a part. The testator also left £100 as the neucleus of a fund for laying out the park, and the rents of the land, which are occupied under lease by an agricultural tenant, are being accumulated for the same purpose. Some difficulty arose on the question of power to administer, the parish not being a Landward, but a combined Burghal and Landward one, and therefore having no power to rate the burgh for the maintenance of a park. The Local Government Board has given its opinion that the Council can administer the trust; and in the meantime the Council, of which Mr. S. Arnott, J.P., one of our contributors, is chairman, will endeavour to do so, although some of the members have been in favour of the Council leasing it to the Town Council, which has power to rate for the purpose.

**National Chrysanthemum Society.**—The arrangements for the Special Show and Conference to be held at Essex Hall, Essex Street, Strand, London, W.C., on Wednesday, November 20, 1912, are as follows: The show will be open to the members and the public at one p.m. The novelties submitted to the Floral Committee will be on view in the Lower Hall at four p.m. The committee will meet at three p.m., and all exhibits for this meeting must be staged by 2.30 p.m. as usual. The conference will be held in the Lower Hall, and will commence at seven p.m. Dr. E. J. Russell will deliver a lecture on "Soil Sterilisation" (illustrated by lantern slides), to be followed by a full discussion. The president of the society, Sir Albert Rollit, D.C.L., LL.D., will take the chair. The annual dinner will be held at the Holborn Restaurant, W.C., on Wednesday, November 27, 1912, at 6.15 p.m. for 6.45 p.m. Sir Albert Rollit, D.C.L., LL.D., president of the society, will preside, and the challenge trophy, the Holmes memorial cups and medals will be presented to the winners during the evening.

# CONFERENCE ON ORCHIDS.

It is many years ago, in 1885 to be correct, since the Royal Horticultural Society held a conference in connection with Orchids, their cultivation and hybridisation. This conference was held at the society's old gardens at Chiswick.

On the present occasion Mr. J. Gurney Fowler, the society's treasurer, presided, and at the opening of the Conference, at 10 a.m. on Wednesday, November 6, referred to the splendid autumn exhibition of orchids in the Royal Horticultural Hall, below, and pointed out that when the exhibition was suggested the idea of holding a conference in conjunction with it was well received, and now carried into effect.

There was a fair attendance, including: Sir G. Holford, Sir Harry J. Veitch, Messrs. R. A. Rolfe, De Barri Crawshay, J. Fraser, W. Cobb, F. Hanbury, J. O Brien, W. H. White, H. Alexander, Gurney Wilson, F. J. Chittenden, H. G. Thwaites, Briscoe, Curtis, Hatcher, J. Cypher, etc.

CATTLEYA PEETERSI WESTONBIRT VARIETY.

A magnificent cattleya, the deep purple colouring and gold-marked throat of the labellum being admirably set off by the white sepals and petals. F.C.C., R.H.S., November 5. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester. (See p. 863.)

## PHYSIOLOGY OF FERTILISATION OF ORCHIDS.

Professor F. Keeble, M.A., D.Sc., dealt with this intricate and vastly interesting subject. He pointed out that a long series of events occurred beween the application of the pollen to the stigma, and the harvesting of the seeds. He covered fairly well-understood ground when, by means of slides, he showed how the pollen germinates on the stigmatic surface and sends its pollen tubes down the column, carrying its nucleus down to the ovary, entering the ovule (or unfertile and embryo seed), and discharging that nucleus (male element) into close contact with the female nucleus. He showed how the nuclei remained in close contact for a while and then fused intimately. From this fused mass, forming a single cell or zygote, arose the material that eventually produced the desired plant. Professor Keeble pointed out that it was formerly believed that the egg cell of the ovule could not develop without the influence of the male element (pollen). But it was now found that unfertile eggs of sea urchins could be made to produce young by means of chemical stimulus and without the intervention of the male element (spermatozoa). Many plants do produce seeds without pollination, as in the case of hawkweeds, alchemillas, and other parthenogenetic plants, and here, it would seem, that development was due to mechanical stimulus. Frogs had been produced from unfertile eggs stimulated by puncturing, and in the case of Zygopetalum Mackayi, fertilised with pollen of odontoglossum, the resulting seedlings showed no hybrid influence at all, but came true Zygopetalum Mackayi, thus also suggesting stimulative influence only. Professor Keeble pointed out that the effects of pollination might be threefold—(1) fertilisation; (2) stimulative; and (3) chemical.

Mr. O'Brien referred to several instances of the stimulative influence of grit or dust upon the stigma of flowers. An interesting matter arose in the discussion, and it was whether there was any possibility of two pollen tubes fertilising one ovule. Professor Keeble said not. Then arose the question of whether a flower could be successfully fertilised with several kinds of pollen (i.e., pollen from different species or genera), with the result that distinct hybrids could be produced from the same pod of seeds. Professor Keeble considered it possible, and Mr. De Barri Crawshay pointed out that he had proved this problem in one case, as he crossed Odontoglossum Harryanum with O. Lambeanum, and the fine, slightly spotted O. crispum Angel, and the results were O. crispum-Harryanum and O. Rosefieldiense, these representing distinct hybrids.

## APPLICATION OF GENETICS TO ORCHID BREEDING.

Major Hurst, F.L.S., one of our leading workers in Mendelism, read a highly technical paper upon the above subject. He paid tribute to the great work of the R.H.S. to propagate the science of genetics at several conferences, and then pointed out that among orchids 40 genera and 300 species had been already used in breeding, and there were no fewer than 2,000 primary hybrids, while secondary hybrids and varietal forms were beyond computation. Major Hurst pointed out how few fine hybrids were obtained from the large batches of seedlings raised, and it would be a great advance if things could be so managed that there were fewer "weeds" in proportion to the "desirables." The only way, said Major Hurst, was along the lines of Mendelian principles, and already good work was being done in this direction. Major Hurst considered that it was necessary to secure pure breeding orchids for stud purposes, and so label them that they could always be identified, and the divisionally propagated plants of a known good breeder would acquire a value and reputation such as that possessed by a fine sire or brood mare among horses.

A good-looking orchid that gained a F.C.C. need not necessarily prove a good stud plant, but the parents of such a high-class orchid were worthy of the greatest care as breeders. Seeing what splendid orchids were now produced in England, Major Hurst considered that by the application of Mendelian laws, and the production of fine plants, there was no good reason why British raisers should not provide all the finest stud orchids for the world, just as now Great Britain provides the finest stud animals in horses, cattle, etc. Major Hurst tabulated a great deal of his findings respecting hybridisation and future possibilities, and the publication of these tables will be eagerly looked forward to. Major Hurst considered that the mating of complex hybrids was scarcely likely to prove economically useful, and he advised sticking to the mating of primary hybrids.

His final conclusion was that the application of the principles of genetics to orchid breeding leads one to conclude that from the economic and eugenic point of view, the only sound method to adopt in orchid breeding is to make a fresh start, by selecting a choice stud of the best individuals of the best varieties of the best species of the best genera, due preference being given to those stud individuals that have already bred a winner of the F.C.C. at the Royal Horticultural Society, and have also proved themselves to be homozygous in their good qualities. These selected stud orchids should be combined by crossing in every possible way in order to make superior primary stud hybrids. Finally, these superior stud hybrids can be combined in any way that the breeder may think fit, in accordance with the particular subjects he may have in view.

Mr. De Barri Crawshay very highly complimented Major Hurst upon his paper, and referred to the great value of a fine stud parent in breeding orchids, and he said that Odontoglossum crispum Luciani had never produced a poor offspring.

The morning's proceedings concluded with thanks to Professor Keeble and Major Hurst for their excellent contributions to the conference.

### AFTERNOON SESSION.

The afternoon session commenced at two o'clock, Mr. J. Gurney Fowler again presiding. The attendance was again moderate, but rather larger than in the morning. The proceedings opened with a paper on

### SOME EPIPHYTAL ORCHIDS.

This was an essentially practical paper, and in it Mr. H. Alexander, orchid grower to Sir George Holford, Westonbirt, gave valuable hints upon the cultivation of such orchids as cattleyas, lælias, dendrobiums, and other epiphytes. Needless to say, this paper was listened to with close attention because of Mr. Alexander's splendid reputation as a grower, and also because of his popularity, for success has not rendered him dogmatic.

We may refer to just a few of the points emphasised. He said that the soft, sappy, and strong growth produced by the use of soft rooting material, such as leaf-soil, was by no means the best for orchids. Lighter houses for the plants were needed, and the admission of greater light than usually afforded was desirable. The value of fresh air he very strongly emphasised, and he pointed out that ventilation at night was quite as beneficial and important as ventilation by day; closing the ventilation at night to keep up temperature was a fallacy, a reasonable temperature and plenty of fresh air being far more desirable. A suitable condition of the atmosphere as regards moisture was, Mr. Alexander stated, of far more importance than any special rooting compost. Excessive watering at the roots was answerable for a vast number of failures. Rainwater was to be preferred to tap water. Mr. Alexander strongly objected to the use of any manures, as experience had shown him that these stimulants had a bad effect on epiphytic orchids. Excessive drying during the resting season Mr. Alexander deprecated, and he stated emphatically that heat, air, light, and moisture, with close observation and light houses, held the secret of success with epiphytic orchids.

Mr. Alexander's paper was not a long one. Mr. O'Brien, who, long years ago, had charge of the Westonbirt collection, referred to the splendid cultivation of the collection under the care of Mr. Alexander. He considered that the retention of old back bulbs in so many epiphytic orchids was detrimental to the fullest success, and he believed he was one of the first to appreciate this fact. He suggested that an under-supply of water to cattleyas would prove far more successful than an over-supply. Mr. J. Fraser spoke of the great value of clear light and pure air to orchids, and considered that the roots of epiphytes should not be covered up in the same way as those of terrestrial orchids. In answer to a question, Mr. Alexander said that the minimum temperature during the winter for Vanda cærulea should be 50 degrees. Sir Harry Veitch asked what other orchids were grown in the same house as the Westonbirt vandas, but Mr. Alexander said he had a house devoted to V. cærulea, but, though abundance of air was always provided, the best plants were invariably those nearest the ventilators. Good light and plenty of air were necessary to produce substantial flowers and brilliant blue colouring. He stated that all the vandas shown that day had been under his care for from five to thirteen years. The discussion on Mr. Alexander's paper was very brisk, and he had to answer a number of questions.

### ALBINISM IN ORCHIDS.

The final paper, by Mr. H. G. Thwaites, was on "Albinism in Orchids." This was a very difficult subject and a rather controversial one. Mr. Thwaites stated how he had tried to produce white seedling orchids, and had secured many coloured ones in the progeny of two white parents. Some whites seemed to contain a colour factor not discernible to the eye, but rendered very obvious in the progeny. He found it difficult, if not impossible, to differentiate between the pure white and the apparently pure white, save by experience in the progeny of each.

Mr. Thwaites put forward the theory that, as white was a combination of all the colours in the spectrum, so white in orchids was, in some wonderful way, built up by colour. He had produced white flowers by crossing purple with yellow flowers. Dendrobium nobile virginale, fertilised with its own pollen, invariably produced white flowers, and the same could be said of Cattleya labiata alba crossed with another white, C. labiata. Other examples were also given, but in other cases where the white forms were only apparently white, the progeny invariably came with some amount of colouring. A plant which flowers white one year and comes slightly coloured the next, could be made to give white flowers the third year if the buds were opened in the dark. A plant that gave pure white flowers year after year under good cultivation was the only true albino, and only by mating true albinos could true albino seedlings be produced. Mr. Thwaites asserted that plants proved to be true albinos after several years' cultivation would never, if mated, produce coloured progeny.

Major Hurst suggested that "white" in orchids was not white in the sense of a proper combination of the colours of the spectrum, but was rather due to the entire "absence" of colour. Mr. J. Fraser, Prof. Bateson, Mr. de Barri Crawshay, and others took part in the discussion, but they seemed to miss the point Mr. Thwaites had in view, i.e., the production of true albino hybrids with certainty

Sir George Holford, at the conclusion, said that orchids could only be grown to the highest perfection if the houses were well-built, and set in an open, light, and airy position, and failures were often due to bad housing and bad positions rather than to the want of care on the part of the grower. He moved, and Mr. de Barri Crawshay seconded, a vote of thanks, that was heartily accorded the chairman and those who had read papers.

The proceedings were carried through with briskness, and concluded promptly at 4 p.m.

## SPANISH AND ENGLISH IRISES.

The bulbous irises known respectively as Spanish and English varieties are among the handsomest in a family replete with good garden plants, while their decorative qualities, whether disclosed among border subjects or employed as cut flowers, appeal to everyone. One occasionally hears them described as the "Orchids of the Garden," and certainly, having regard to their rich and varied colours, the term is not inappropriate; in one respect, however, they differ in a marked degree, for whereas orchids are relatively costly to purchase and maintain, these irises are among the least expensive of garden plants.

The Spanish Iris (Iris xiphium) is the earliest of the two to flower, being in season toward the end of May and throughout June. It is more slender in growth, more graceful in flower, and produces a smaller bulb than the English iris, and, although it does not exhibit the same diversity of colouring as the latter, yet a large number of its varieties have flowers of a yellow shade, a colour singularly absent from the English section. Spanish irises succeed best in a light, loamy soil, in well-drained positions, either exposed to sun or with light shade, the latter having distinct merit in affording successional flowers.

The English Iris (Iris xiphioides) is characterised by having large massive flowers on stout stems that, in the self varieties, produce a rich effect when grown in mass; many of the varieties have mottled flowers, while in not a few the standards are distinctly coloured from the falls. The varieties succeed best in medium, heavy loam, being partial to a greater degree of moisture than the Spanish type. When planting either kind, it is advisable to choose ground that has been well manured for a previous crop, rather than employ fresh manure when planting the bulbs. The best season for planting is from September up to November, for although late planting may prove successful, early planting is advisable, as it gives a long growing season that invariably results in a good floral display. Both Spanish and English irises lend themselves to grouping in many informal ways, such as in shrubbery beds and borders, or in open positions in wild gardens, while they afford a desirable change and welcome addition to the choice flower border; when accommodated in perennial borders, however, the bulbs should be interplanted with violas, campanulas of the carpathica or even persicifolia types, or pentstemons of the Newbury Gem class, so that no blank occurs when the irises pass out of flower, while the further claims of indoor decoration should be specially provided for by planting a bed to cut from in the reserve garden, as these are among the most elegant and lasting of cut flowers in their season. It is not necessary to lift and replant the bulbs every year; as a rule, Spanish irises require replanting every second year, and the English every third year. Only the larger bulbs should be replanted to flower the following season.

Numerous varieties of both Spanish and English irises are offered in all good bulb merchants' catalogues, so that it is comparatively easy to choose colours that appeal to individual tastes. Where only a few bulbs of a kind are required, it is a good plan to purchase a collection of named sorts, as by this means greater variety is obtained, while it enables one to appreciate the wide range of colouring these beautiful bulbs exhibit.

THOMAS SMITH.

Coombe Court Gardens.

# MESSRS. HUGH DICKSON'S ROSES.

Nearly fifty years have elapsed since the late Mr. Hugh Dickson became a citizen of Belfast and established the Royal Nurseries, which for a considerable portion of this somewhat lengthy period have occupied a prominent position among the establishments in the United Kingdom that are especially associated with roses. Although it is not intended to deal with the history of the firm, interesting as it would undoubtedly be, it will be of interest to recall the fact that the late Mr. Hugh Dickson was a brother of Mr. George Dickson, as it reminds us that he shared with him a strong affection for the rose, and that his son, the present members of the firm of Hugh Dickson, Lim., have, like their grandfather, the late Mr. Alexander Dickson, given much attention to cross-fertilisation, and as the result have achieved a brilliant success in the creation of new roses.

The nurseries, which are remarkable alike for their extent, the judgment shown in their planning, and for their high keeping, are situate on the southern boundaries of the city, and about two miles from the centre thereof. This distance is readily covered by means of an excellent service of tramcars which pass the main entrance, and the short journey is not without both pleasure and interest. The route is for the most part through Belmont, one of the most delightful of the residential suburbs of Belfast, and affords abundant evidence that not only is business in a flourishing state, but that those who are engaged therein and sufficiently prosperous to live in the suburb are for the most part keenly interested in gardening. Many are the residences passed on the way that possess architectural features of a high order, and not less numerous are the tastefully-designed and skilfully-planted gardens in which, among other suitable subjects, roses of various classes are fully represented. Excellent object-lessons in the utilisation of roses as aids in beautifying the garden may indeed be obtained in the majority of the leading gardens that are passed. Not less noteworthy in this respect are the nurseries, which can hardly fail to possess much value educationally to the passer-by, as well as to those who take advantage of their opportunities for making a more or less prolonged visit. Roses are freely used in forming a setting to the residence of Mr. Hugh Dickson, not in such manner as to suggest that they have been planted for the purposes of advertisement, but rather for the purpose of demonstrating their great value for beautifying the immediate surroundings of the house, and suggesting the manner in which they can be most successfully employed.

On the breadth of turf that separates the residence from the road are several beds devoted to dwarf roses, which here, as elsewhere, have been placed under the conditions favourable to their full development, and, in consequence, make a vigorous growth and produce a profusion of finely-developed blooms. To the south-west of the entrance are numerous big beds of roses with a pergola as a background, this being quite distinct in design, characterised by lightness and elegance, and affording a splendid opportunity for demonstrating the charms of the polyanthas, the wichuraianas, and other rambling roses. As will be readily seen, the sides of the pergola are formed with a series of arches supported by stout uprights, and lightly connected at the top by cross-pieces. The design has much to recommend it to the notice of those who devote any considerable share of their attention to rambling roses. It is picturesque, and by almost wholly dispensing with the cross arches as generally used, the spaces between the two sides is so light that the roses grow and bloom freely on the inner sides, and thus afford much entertainment to those who use the walk. Readers will be able to determine how far such a pergola is adapted to their tastes and requirements from the illustration given herewith, for the photograph from which it was reproduced was taken from a point which included one of the arches that had been recently replanted for the purpose of showing the design of the woodwork. The arrangement of the beds alongside the pergola is good, and, with reference to them it will be hardly necessary to point out that, when dwarf roses are associated with pergolas it is far preferable to arrange them in beds separated by narrow walks than to plant them in borders flanking the woodwork. Not only is the crowding up of the climbing roses to an injurious extent avoided, but the plants can more readily receive any attention that may be necessary, and the flowers be more freely enjoyed.

PORTION OF FIELD CONTAINING 80,000 PLANTS OF NEW ROSES
In the Nurseries of Messrs. Hugh Dickson, Lim., Belfast.

A walk through the houses devoted to the all-important work of cross-fertilisation, the ripening of the crops of rose seed, and the raising of seedling roses, was of intense interest; and, with Mr. Hugh Dickson and Mr. Alex. Dickson as guides, one could have wished that the time available had been longer. Both, as so well-known, are the keenest of rosarians, both are fully conversant with the scientific and practical aspects of cross-fertilisation in its relation to the rose, and they are equally ready to discuss the various points of interest connected therewith. Consequently an hour or so was all too short for obtaining information first-hand on various points that suggested themselves as one passed through the several structures. In the earlier days of raising seedling roses it was the practice of many, more especially on the Continent, to depend upon plants growing in open beds and borders for the supplies of seed. Now all this in changed, and the seed is wholly saved from plants grown under glass, and with but few exceptions in pots. The plants selected for seed-bearing are mostly grown in six-inch pots, and presumably started into activity somewhat in advance of the plants growing in the open, with the assistance of a moderate amount of artificial heat. Plants started under such conditions in a structure that is freely ventilated bear flowers that are less double than usual, are more readily pollinated, and produce liberal crops of seed.

ROSES AT BELFAST RIPENING THEIR CROP OF SEED.

It is gratifying to be able to illustrate some fruiting plants and several seedlings that were raised from seed sown early in the year, and had reached the flowering stage. One of these is bearing a bloom that suggests some degree of promise, but what the final results will be has yet to be determined. Much weeding out is done the first year, the others being grown two or more years, and, it may be, be decided whether they shall be placed at the disposal of the flower-loving public or consigned to the lethal chamber. This final decision must be a difficult matter under any circumstances, and especially so in the case of this firm, who, in accordance with their existing rule, do not introduce to cultivation more than four varieties in any one year.

Turning from the plants bearing this year's crop of seed, so rich in potentialities, the seedlings in various stages of development, and the many interesting questions associated with the creation of new forms, it was a pleasure to find oneself, after a very short walk, in the midst of the new varieties that had created so much interest among rosarians at the exhibitions of the current year. These were growing in large fields, and in one of them there were at least 80,000 plants of new roses, these including the varieties that were brought into prominence during the past summer, and such as are being grown on for presentation to public notice next year or for further trial. Eighty thousand plants is a big number, and it is of interest as showing how great is the demand for new roses of merit ,and how strenuous is the endeavour that is being made to meet it. The huge expanse of plants impressed me in another way, and to assist my readers in realising how great are the operations of the firm in connection with novelties, an illustration is given herewith of a portion of the principal field. Unfortunately a heavy rain was sweeping across the field when the photograph was taken, and heavy rains, whatever may be their merits in other respects, are not favourable to photography. However that may be, the illustration conveys a fairly good idea of the extent of the culture of new roses by the firm.

Naturally the varieties that were first looked for were those that had received distinction at the exhibitions held by the National Rose Society, and one of the earliest to come under notice was Coronation, a glorious hybrid tea that had received a gold medal of this society at Belfast a few days previously. There is full justification for the belief that it will be of much value for exhibition, the large blooms being of grand form, and the colour a delightful shade of peach-pink. The breadth of plants in the field afforded ample evidence that the constitution is robust, and the flowers freely produced, while the foliage is so stout and leathery in texture as to suggest the difficulty which mildew will have in becoming established on the leaves. Of the value of Coronation for exhibition there can be no doubt, and, judging from the appearance of the plants growing under ordinary conditions, it cannot well fail in rendering good service in the garden. H. E. Richardson, a distinct hybrid tea, which also received the award of a gold medal at Belfast, is very different both in character and colour to the foregoing, and may be described as a valuable addition to the crimson roses already in cultivation. The blooms are of medium size, fine form, delightfully fragrant, and of a deep yet glowing crimson hue. Rather strong in growth and free in flowering, it should be most valuable in the garden, both for decorative effect and supplying blooms for indoor decorations.

Very beautiful in its shade of colour is Mrs. Mona Hunting, a distinct hybrid tea, which had an Award of Merit made in its favour at the R.H.S. Holland House show, and received the N.R.S. silver-gilt medal the following week at the Royal Botanic Society's Gardens. The flowers are of large size and superb form, and the colour an exquisite shade of chamois-yellow. The habit is good, and the flowers freely produced; and, as seen growing in the nursery quarters, it gave promise of proving a fine garden rose, as well as being valuable for competitive purposes. Mrs. R. D. McClure, a beautiful hybrid tea, with blooms of a rich salmon-rose hue, should make a fine garden rose, and also be able to render good service on the exhibition stage. The colouring reminds one of the Lyon Rose, and the habit is good. This received the N.R.S. gold medal at Belfast, and Mrs. James Lynas, a distinct, free-blooming hybrid tea, with large blush-pink flowers of fine form, that is highly attractive as seen growing in the open, received a silver-gilt medal.

The extension of the operations of the firm having rendered the acquisition of additional land necessary, a large farm a short distance from the nurseries was purchased two or three years since, and is being turned to good account. It occupies an ideal site for roses, the country being so open that the plants have the fullest exposure to sunlight and air, and the soil is deep and friable. Already some eighty acres are occupied by roses, and the fields of dwarfs and standards bearing many thousands of blooms produced an impression that will not be readily effaced from the mind of the writer. Here were found all the finest varieties in cultivation, without reference to place of origin, and a whole day might have been profitably spent among them in an endeavour to clear up doubtful points relating to the relative merits of varieties that closely approach each other in some of their principal characteristics. This, however, was not possible, and the time at disposal was devoted to a critical inspection of some of the most noteworthy of the varieties that have been raised by the firm. Especially noteworthy were those famous crimson roses, Hugh Dickson and J. B. Clark, which were introduced some years since, and are still two of the finest roses of their colour, and of the highest value for culture in standard form

The four varieties distributed by the firm this year are fully justifying the distinctions they received during 1911. King George V. (H.T.) is proving a fine addition to the dark crimson roses, the flowers are large, full, and of good form, and the colour is rich velvety crimson. Mrs. David Baillie (H.T.) has a strong, free-branching habit is profuse in blooming, and the flowers are of a rich carmine hue. As seen in the nursery, it is an excellent garden rose. Mrs. Richard Draper (H.T.) is a remarkably fine exhibition variety, the flowers are of large size, and superb form, and the colour an exquisite shade of satin pink. Last, but certainly not the least of the four, is Mrs. Sam Ross (H.T.), a highly meritorious variety with large and finely formed flowers, remarkable for their stout and handsome petals; the colour ranges between pale straw and chamois-yellow. Having regard to its high quality and exquisite colouring, this may be considered one of the finest roses of its year. With the exception of Mrs. David Baillie, for which a silver medal was awarded, the foregoing varieties received the distinction of a gold medal.

The quarters devoted to the roses of 1911 were especially interesting, as the varieties are, as a matter of course, to be seen in much larger numbers than in the year of their introduction. Very beautiful was Countess of Shaftesbury, a grand exhibition hybrid tea with flowers of large size, superb form, and a charming carmine-pink hue. It has the merit of having a good habit, and being free in flowering. Leslie Holland is a hybrid tea, so fine in form and brilliant in colour that when shown at the R.H.S. exhibition at Olympia in 1911 it quite startled the rosarians. The blooms are large, and the colour scarlet-crimson. Mrs. Charles E. Allan is a fine hybrid tea, of much value for the garden, the habit being good, and the flowers produced in great abundance, the colour being pale orange passing in the process of expansion to deep yellow in the centre and yellow-buff at the margins of the petals. Mrs. Frank Workman, a hybrid tea with large rose-pink flowers, is also a fine garden rose.

The older varieties of special merit include Lady Pirrie, a hybrid tea of immense value for massing in the flower garden. The habit is free-branching, the flowers are borne in profusion, and the colour is an effective combination of copper, salmon, and apricot-yellow. Marchioness of Waterford, a hybrid tea with large, finely-formed flowers of a bright salmon-pink; and Mrs. James White, a hybrid tea of a rich crushed-strawberry hue, are both of much merit, and evidently appreciated by rosarians.

The value of single roses in the garden and home have not been overlooked by the firm, and mention must be made of the two charming varieties they have introduced under the names of Miss Muriel Jamison and Simplicity. The first-named has large bright orange-yellow flowers, and the flowers of the other are pure white.

**Fuchsias as Basket Plants.**—Although fuchsias are largely used for various decorative purposes, it is questionable if their merits for suspended baskets are recognised to the extent that they might be. Owing to their pendulous nature, the flowers are seen to considerable advantage when viewed from below.—W. T.

## NOTES ON ALPINE FLOWERS.

### Malvastrum Gilliesi.

This was more frequently called Modiola Gilliesi long ago, but the recognised name of Malvastrum Gilliesi appears to be taking hold better than others which have been substituted for well-known garden appellations to satisfy the botanist. It is a pretty little trailing plant, with neat flowers, like those of some of the hardy geraniums, and borne in a satisfactory way if the plant is in a sunny position in light soil. Sun and a dry soil appear to be essential. One would also add shelter, and, in most places, winter protection, as the tuberous roots will not stand much frost. The flowers are red, and the whole plant does not rise to more than six inches or so high. I have called it "trailing," because it sends out runners, and these will sometimes root and can be taken off when rooted. I regret to say that its want of entire hardiness is too pronounced to make it a plant for northern or midland gardens. It may possibly be kept in the garden without protection in winter for a year or two, but, sooner or later, it is sure to perish.

### Campanula Zoysi.

Every now and then we read glowing accounts of the ease with which this very choice and distinct dwarf bellflower can be grown. Unfortunately, it is not everyone who has justification for writing with enthusiasm of the gem-like C. Zoysi as a plant which gives boundless and perennial satisfaction. Not that we can well find fault with its hardiness, as it seems hardy, so far as endurance of our winters is concerned, while it does not specially affect any soil.

Nor does it call for the nice dispensing of composts and top-dressings which seem the elixir vitæ of many alpines. Neither does aspect make much difference to it. Its failing is that it is a toothsome morsel for the slug, and that vile enemy is too generally present in the rock garden, slaughter him as we may. The curious thing is that a plant of C. Zoysi may be exempt from the attentions of the slug for years, and may grow into a nice clump as much as two feet across, to make us wax proud and forget the Nemesis which is awaiting us. Then some spring we may wake up and find C. Zoysi all cropped to the ground, and looking as far removed from life as the good Queen Anne of proverbial quotation. We may be cheered by an apparent revival of the plant by fresh growths from the cropped crowns, but the gourmand slug is usually so gratified by his repast that he is certain to return to repeat his enjoyment, with the almost unfailing result that our delightful plant is no longer in the land of the living. Yet C. Zoysi is such a lovely thing, with its dainty leaves and its exquisite blue, curiously bottle-shaped flowers, that we are always hoping against hope and replacing our plants, only to meet again with the same disappointment, without, in many cases, having time to enjoy its beauties for long. And so we cry "Ichabod," and try something else instead of this delightful native of Styria.

SEEDLING ROSES AT BELFAST BEARING THEIR FIRST FLOWERS.

### Veronica repens.

The native island of the Great Napoleon —Corsica—has given us at least one charming speedwell, which to know is to love, and which to lose makes "an aching void," which must be filled at the earliest possible opportunity. The writer well recollects his first plant of this exquisite little veronica. It found its way into his garden some six or seven-and-twenty years ago, and ere it came into flower it was held in but scant regard. Its little leaves on the small creeping branches were neat, and made a nice green carpet, but one did not expect to see a completed effect of the kind which followed. In spring this carpet of green became thickly dappled over with the most charming tiny flowers of white, pencilled with lilac in such a manner that they looked like pale blue stars on this earth-veil of verdure. Then the quiet, gentle beauty of this speedwell was revealed, and it leaped at once into the affections of its grower. One found that it disliked drought; and it was in very dry soil, and the east winds of spring sought to parch it up. This caused its removal to a half-shady, moister place, where it throve well, but until then it received many a good canful of water, to its great delight and to the benefit of its owner. To those who know it not one would say: "Do not expect a showy speedwell, but only a dainty little alpine."

### Lady Larpent's Leadwort.

This is the old alliterative English name of Ceratostigma plumbaginoides, which in former days we were wont to call by the easier name of Plumbago Larpentæ. It also is one of the long-known and long-loved plants which one would not like to have absent from our gardens. In autumn, when we have begun to find our rock gardens grow less attractive because of the waning away of our flowers with the shortening days, it then comes with its exquisite blue flowers, and affords us delight on sunny rockwork, especially if well among the stones and in a dry place. The lover of the gentianella and other gentians thinks of these as he studies the colouring of Lady Larpent's leadwort. Nor is his gratification ended then, for as the season advances these comparatively unattractive leaves assume gorgeous colouring of red, maroon, and other tints. Truly a valuable plant, this ceratostigma should find its way into all rock gardens where its delights can be enjoyed as September and October come round.

### Dianthus Freyni.

If the reader looks up a catalogue in which Dianthus Freyni is listed, he will probably find that the price is such as will make him shake his head and turn away with the thought that for the cost of one small plant he could regale himself with three, four, or five other beauties. Not that it is as costly as many alpines, but it is generally expensive enough to make the would-be purchaser pause before he decides to buy it. Yet he had better consider well ere he ties his purse-strings against the call of Dianthus Freyni. It is well to warn him, however, that some fail with it, and that, like many other charming things, this pink has to be studied in its way if it is to become and to remain a happy occupant of the garden. Yet it is worth some trouble, for does it not make one of the daintiest cushions imaginable of small leaves, close-set together, adorned in due course with small rose flowers of gem-like character? It is not now in the writer's garden, succumbing to some unavoidable neglect, caused by entrusting his pet plants during a short absence to the tender mercies of a willing, though unlearned friend. But it throve for years in a flat pocket of the rockery, in sand, grit, and loam, with small grit and stones about it, and with plenty of water in dry weather and top-dressings of almost pure sand twice a year—in spring and autumn. Though absent now, it will not be long a stranger to the writer's garden. S. Arnott.

---

## THE BLUE ASH.

Among the numerous kinds of ash suitable for planting in the British Isles, this is very distinct on account of its four-angled branches, which suggested the specific name of quadrangulata.

Fraxinus quadrangulata is a native of the United States, where, in the rich moist valleys of Southern Indiana and Illinois it is said to attain a height of 120ft., with a trunk 3ft. to 4ft. in diameter, although in less favourable localities its maximum height is given as 75ft., and its trunk diameter as 2½ft. There is no reason to suppose that it will be of service for forest planting in this country, although it may well be used for gardens and parks. In America, however, it enters into the various uses to which other ash wood is put. Except for its young branches being remarkable for their well-developed angles there is nothing to stamp it as very distinct from some other kinds, the popular name having nothing to do with the general aspect of the tree, but on account of a blue dye which is obtained by soaking the inner bark in water. A figure and description of the tree occurs in "Hough's Handbook of Trees of the Northern States and Canada," p. 389. W. D.

---

**Abelia rupestris.**—Also known by the names of Abelia chinensis and Abelia uniflora, this is an exceedingly pretty little shrub, that flowers during the late summer and early autumn months. It forms a neat twiggy bush, with slender shoots, clothed with shining green-pointed leaves. The funnel-shaped flowers are borne in partially drooping clusters at the points of the shoots. They are in colour white, shaded with pink. It is a choice little shrub that must not be placed in conjunction with strong-growing subjects.—W.

## THE POSSIBILITIES OF A SCHOOL GARDEN—IV.

### As a Means of Education.

Not long ago a body of school managers of the average rural type, consisting of the vicar of the parish, several local farmers (it is strange, by the way, but nevertheless true, that agriculturists quite overwhelm horticulturists in point of numbers as school managers), the village grocer, and so on, were discussing the desirability of establishing a gardening class at the village school. It may be said in passing that the vicar was the only educated man amongst the managers, and perhaps, in fact, the only one who really believed in education, and it was at his instigation, prompted by the schoolmaster, that the proposal was brought forward. The farmers could not quite see what good it was to go to the expense of buying tools and seeds, and renting ground for the purpose of letting the boys grow a few potatoes, onions, and other things, and if work was the idea they would rather favour the idea of letting the boys leave school at twelve years old instead of keeping them a year longer. "Besides," urged the farmers, and this was a great point with them, "the lads can learn gardening at home."

I have already pointed out in a former article what the learning of gardening at home amounts to in the majority of cases, and I mention this instance now just to illustrate how limited is the vision of a great many rural school managers as regards the possibilities of a school garden. To them it means nothing more than planting a few potatoes and sowing sundry seeds on very much the same haphazard lines as these operations are often performed in village allotments, but as for school gardening having any educational value, well, they have no conception of it. I repeat what I have said before, that if school gardening was nothing more than a manual process, qualified to make boys handy in the use of tools, and teaching them how to work, it would be worth its place in the school curriculum, but in the hands of a capable teacher it goes much further than this, and its bearing on general education may be very marked.

Even the attitude of a good many people as regards gardening as a manual process is difficult to understand, for when, after grumbling about the same type of education being applied to the country as the town school, and claiming that it is all book work and nothing practical, eminently practical subjects like gardening and allied woodwork are introduced, they turn round and say that the time-table is overcrowded, and these things—the very subjects they have been clamouring for—are taught at the expense of something else. Dear, dear! What are education authorities to do to suit everybody?

Referring, however, to the possibilities of a school garden as a means of education, the very-much-discussed, and I am afraid, also, the very-much-misunderstood word correlation comes in. And what does the word mean? Simply making use of the material offered by the garden for teaching other subjects in the school, and those teachers who have gone the furthest in this direction realise how much further it is possible to go, their only trouble being that the boys leave school too soon for them.

The teacher who thoroughly grasps the true spirit of correlation begins at the commencement of the gardening year by drawing up a scheme and asking himself, so to speak, how can I use the garden in teaching, say, composition, nature study, drawing, mensuration, arithmetic, and developing, along with the above, powers of observation and habits of tidiness and good order? One may go one way to work, another may take a different course, and no dogmatic lines should be laid down, but with his scheme at the teacher's elbow as his guide, the school garden may be the best in the parish in point of cultivation, and be made such an aid to education that you can see evidence of it all over the school. Neither in point of education need the garden be confined to the boys who work the plots, and when you see a class of tiny infants learning to count by means of the number of plants in a row on a garden plot, you may depend that this is far more real to them than sitting on a form in a class-room using their fingers or a string of beads for the purpose.

What would some of us have given in our own school days, if, instead of writing compositions on Æsop's fables until we grew weary of the very name of the book, or painfully set down sentence after sentence in dictation lessons, we had had a garden to write about, the progress of crops to record, and that garden, mind you, our very own. I have seen, too, how this writing habit, when it is about something that is living and real, grows, for I have observed boys at the beginning chewing their pens and asking the teacher what they shall put, but later they have not been able to say half what they want in the time set aside for this task.

Don't you remember those freehand drawing cards we had? How we used to rub out and measure and measure and rub out until the leaves of the drawing-book were riddled with holes, and the copies looked as if they had been brought into close contact with a blacklead brush. We could not have drawn anything from Nature to save our lives, but now in drawing lessons the boy goes to his garden, takes a leaf, a seedling, a root, a flower, or a plant, puts it in front of him, and draws the object as Nature made it, either with pencil, pen or directly in colour with a brush. There were those mensuration lessons, too, those plans on the board for scale drawing, that belonged only to the board, as they did not teach us how to measure a piece of land out of doors, and make a plan of it. The boy now puts reality into his scale drawing, for he measures the school garden, makes his plan of it to scale, and does the same thing in respect of the cropping arrangement of his plot.

There was the old arithmetic, too, the dealing with impossible figures, and the working out of problems relating to things we had never seen or hardly heard of. In many cases now the garden provides material for arithmetic, the problems dealing in the seasons for different operations with measurements, digging, and cultivating, seed sowing, thinning, planting, quantities per perch and acre, values, and so on, and the figures are not imaginary, but real, for it is customary to keep accurate records of weight and quantities of the produce obtained from the garden.

Even geography is associated with the garden, the history of different crops being studied, their native countries being discovered, and their wanderings traced in such a way that the geographical features of this and other lands are impressed on the mind of the boy from the fact that the plants and crops grown in the school garden were first obtained from this, that, or the other place. As a case in point, take the potato! How closely it is associated with the geography of this and other lands, while it also has a connection with the history of different peoples and different times. To know all about the origin and wanderings of our most important vegetable commodity is a fascinating story to put before a school boy if it is done in an interesting manner, and it will be a wonder if at the end of it, the potato does not appeal to him in a different light than it ever did before. I pointed out in a recent article what a field for Nature study the school garden may be with its soil, its plants, its insects, its weeds, and the rest, so I need add nothing under this heading, but, writing as one who modestly claims to know something about school gardens, though I never had a school plot of my own, I contend that this addition to the school curriculum, quite apart from its practical and strictly utility value, has added a distinct means of education which never existed before. H.

## ROSE NOTES.

The splendid and steady manner in which our roses are ripening promises to carry them happily through any but an exceptionally severe winter. That roses are by no means confined to the summer months was again most unmistakably demonstrated at the autumn show of the National Rose Society, which was about the finest of a series of good autumnal exhibitions. At that date, and a little before, a large number of our most useful roses were in as full growth and flower as at any time during the season, but the second week of October quite finished them here in Mid-Sussex.

From present appearances there is a good prospect of early transplanting, which almost all agree to be the best, providing soil, weather, and the efficient ripening of wood are suitable. The great need for making up fresh beds in an efficient manner cannot be too strongly recommended, for the permanent qualities of any beds and borders greatly depends upon the condition of the lower soil, which will then be permeated with roots, and we can only secure the proper conditions when preparing the beds before planting takes place.

To loosen the ground is in itself a good thing, but to do this and encourage the roots to occupy what is not of permanent benefit to them cannot be so wise as seizing such a favourable opportunity to make this lower soil more desirable. Top roots can be fed at any time.

It may not be out of place to call attention to the great benefits of firmer planting than is generally practised, and a little more consideration should be given to the natural growth and habits of different varieties, as well as their colours. To plant rows or beds of any given colour without some attention to growth frequently results in disappointment that cannot be excused when we have such a vast choice to select from, and many otherwise excellent collections of roses lose much of their beauties for want of a little care in this direction.

It is the same with climbers upon walls, fences, or buildings, a more careful selection as regards growth and average times of flowering being necessary. One can so easily have a grand show at almost any given time, or a continuous feast, that is not quite so gorgeous, throughout the season.

The cutting back of coarse roots and the careful trimming of any bruised ends does not receive enough attention. A clean cut means a clutch of healthy roots. Nor do we cut away enough of the wood at the time of planting. It is of no benefit to leave so much that will be a great strain upon the sap and unestablished roots, especially as most of this wood will have to be cut away at early spring pruning. I would partly prune at planting-time for this reason. Rosarian.

## THE COLUTEAS.

The genus colutea is composed of a few species of strong-growing shrubs of the easiest possible culture, natives chiefly of Southern Europe and Asia Minor. The popular name of Bladder Senna is often applied indiscriminately to all the species, though it appears to have originally been used in connection with C. arborescens only. This name was apparently suggested by the bladder-like fruits, and by the leaves possessing properties akin to those of the true senna, which is the dried leaves of various species of cassia.

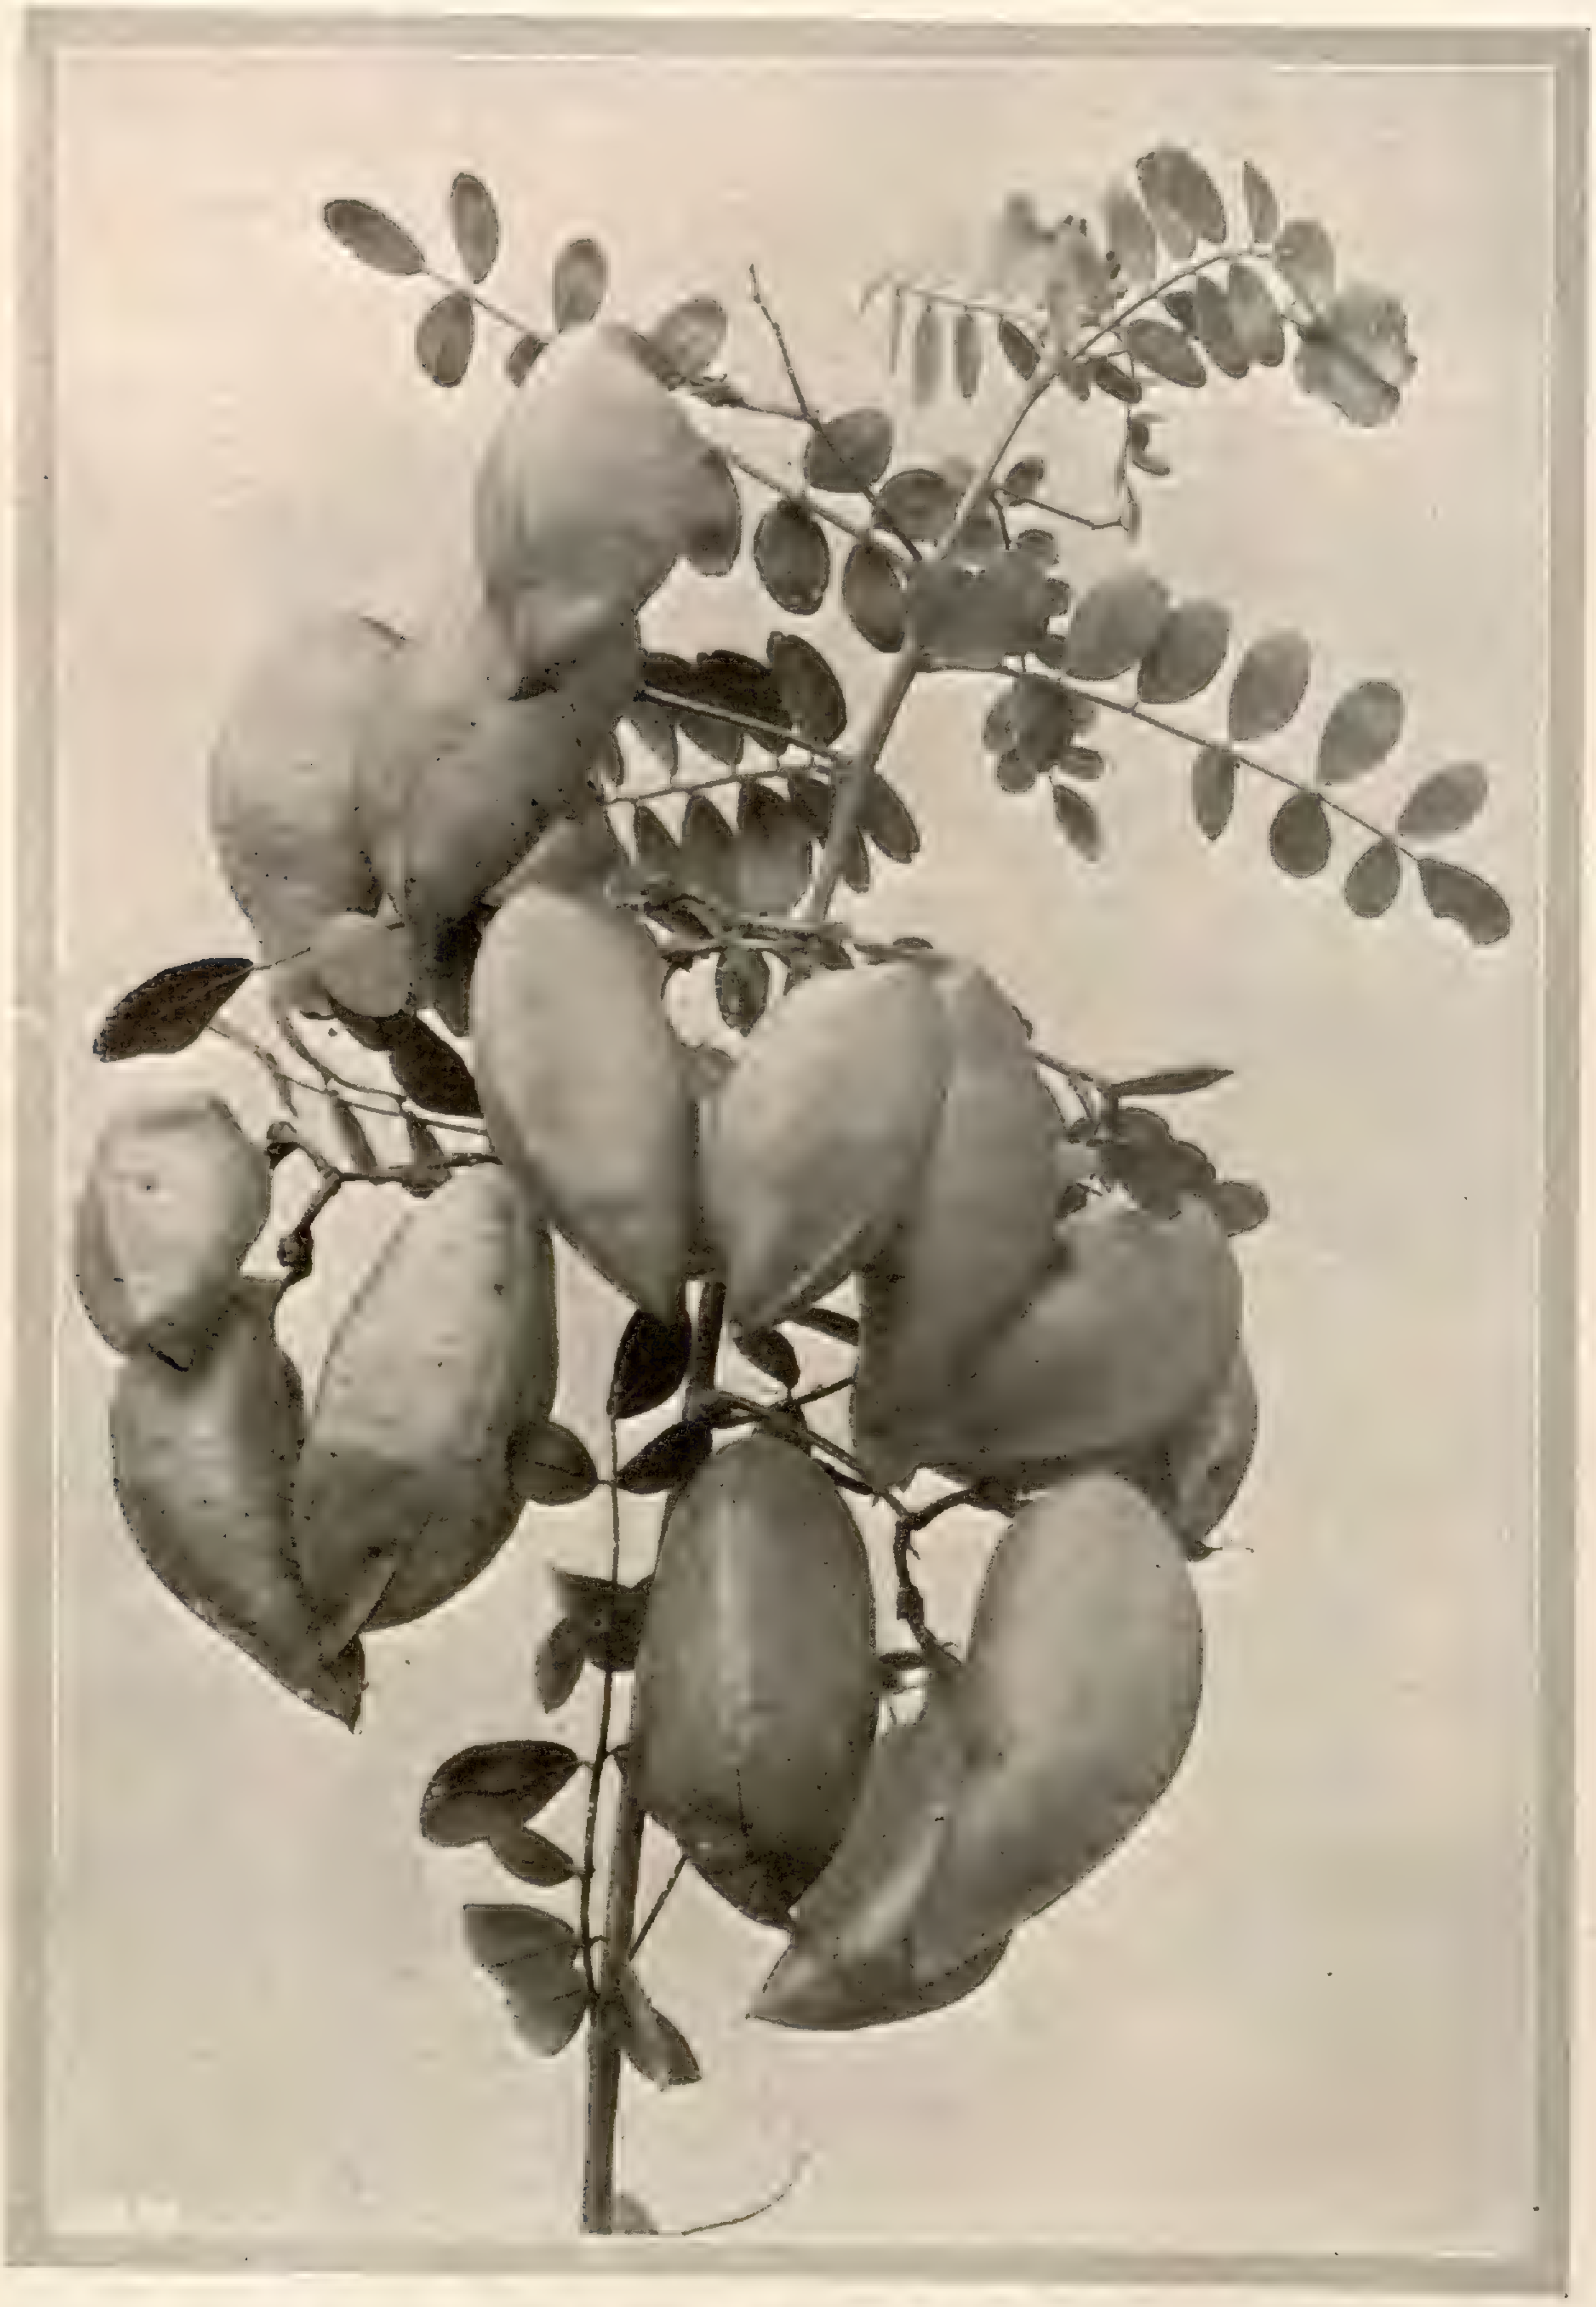
The principal use to which the coluteas are put is that of garden decoration, although they are of value in the reclaiming of poor and waste ground; for it has been found that the stronger-growing kinds are among the easiest shrubs to establish on the waste heaps near collieries, than which it would be difficult to find more unlikely material for plant growth. For shrubbery planting, the coluteas may be used for town or country, and they may be depended on to blossom well, and be interesting afterwards by reason of their curiously-inflated, parchment-like seed-pods. The wilder parts of the garden are more appropriate for them than prominent positions on lawns, for there are many neater shrubs. Therefore care should be taken not to make them too conspicuous. When left unattended, they form large and fairly dense bushes, but the most flowers and largest seed-pods are obtained from plants which are cut back annually in spring. These produce very vigorous shoots, which blossom well.

The commonest species is C. arborescens, a native of the Mediterranean region. It is said to have been grown in this country for about 350 years. It is well known as a bush from 8 to 12ft. high, with long pinnate, rather glaucous, leaves, yellow pea-shaped flowers, and fruits from 2 to 3½in. long, and from 1 to 2½in. wide. A couple of varieties are attributed to it. These are crispa, with smaller leaves, which have wrinkled margins; and bullata, a stiff-growing plant, of stunted appearance, which is only of value on account of its singular habit, for it blossoms indifferently.

C. cilicica has much in common with the last-named. A difference may be observed in the flowers, however, for in this case the wing petals exceed the keel petals in length; while in C. arborescens the reverse is the case. It is a native of Asia Minor, and is sometimes called C. longialata. C. cruenta, an Oriental species, has rather small, rounded leaflets, and brownish flowers; and it is really more decorative than the type.

An illustration of the fruits of C. istria accompanies this note, and gives a good idea of what a plant covered with mature fruits looks like. It belongs to Asia Minor, and is distinguished by its small glaucous leaflets, and brownish or copper-coloured flowers, a certain resemblance being noticeable between it and C. cruenta. Like most of the other species, it has several synonyms, of which one of the best known is C. halepica. Although one or two other kinds are known, these are the most distinct for general planting.

W. Dallimore.



COLUTEA ISTREA.

An interesting species, remarkable for the large size of its bladder-like fruits.

## NEW PLANTS.

### CEROPEGIA THORNCROFTI.

A very curious twining plant from the Transvaal. The flowers are in small axillary clusters. Individually the blooms are about 1½in. long, inflated at the base, cylindrical along the middle, and with curved lobes at the top, which are connate at the tips. The colour is white and purple. "Bot. Mag.," t. 8,458.

### OSMANTHUS DELAVAYI.

A pretty, hardy evergreen shrub from the mountains of Lankong, in Yunnan. It is freely branched, and has small deep green leaves that are sharply serrated along the margins. The small white flowers are carried in terminal clusters, and they are quite fragrant. "Bot. Mag.," t. 8,459.

### ELSHOLTZIA STAUNTONI.

A Chinese plant bearing considerable resemblance to a veronica. It is hardy, and forms a shrub 4ft. to 5ft. high, with broadly, lanceolate, acuminate leaves. The rose-purple flowers form a dense erect spike from 3in. to 6in. long. Should prove a useful plant for pleasure grounds or the semi-wild garden. "Bot. Mag.," t. 8,460.

### FURCRÆA ELEGANS.

A Mexican plant closely allied to the agaves. The spine-tipped leaves are sometimes as much as 8ft. long, while the inflorescence may rise to a height of 25ft. The flowers are about 2½in. across, pale green, shaded with brown on the outside. "Bot. Mag.," t. 8,461.

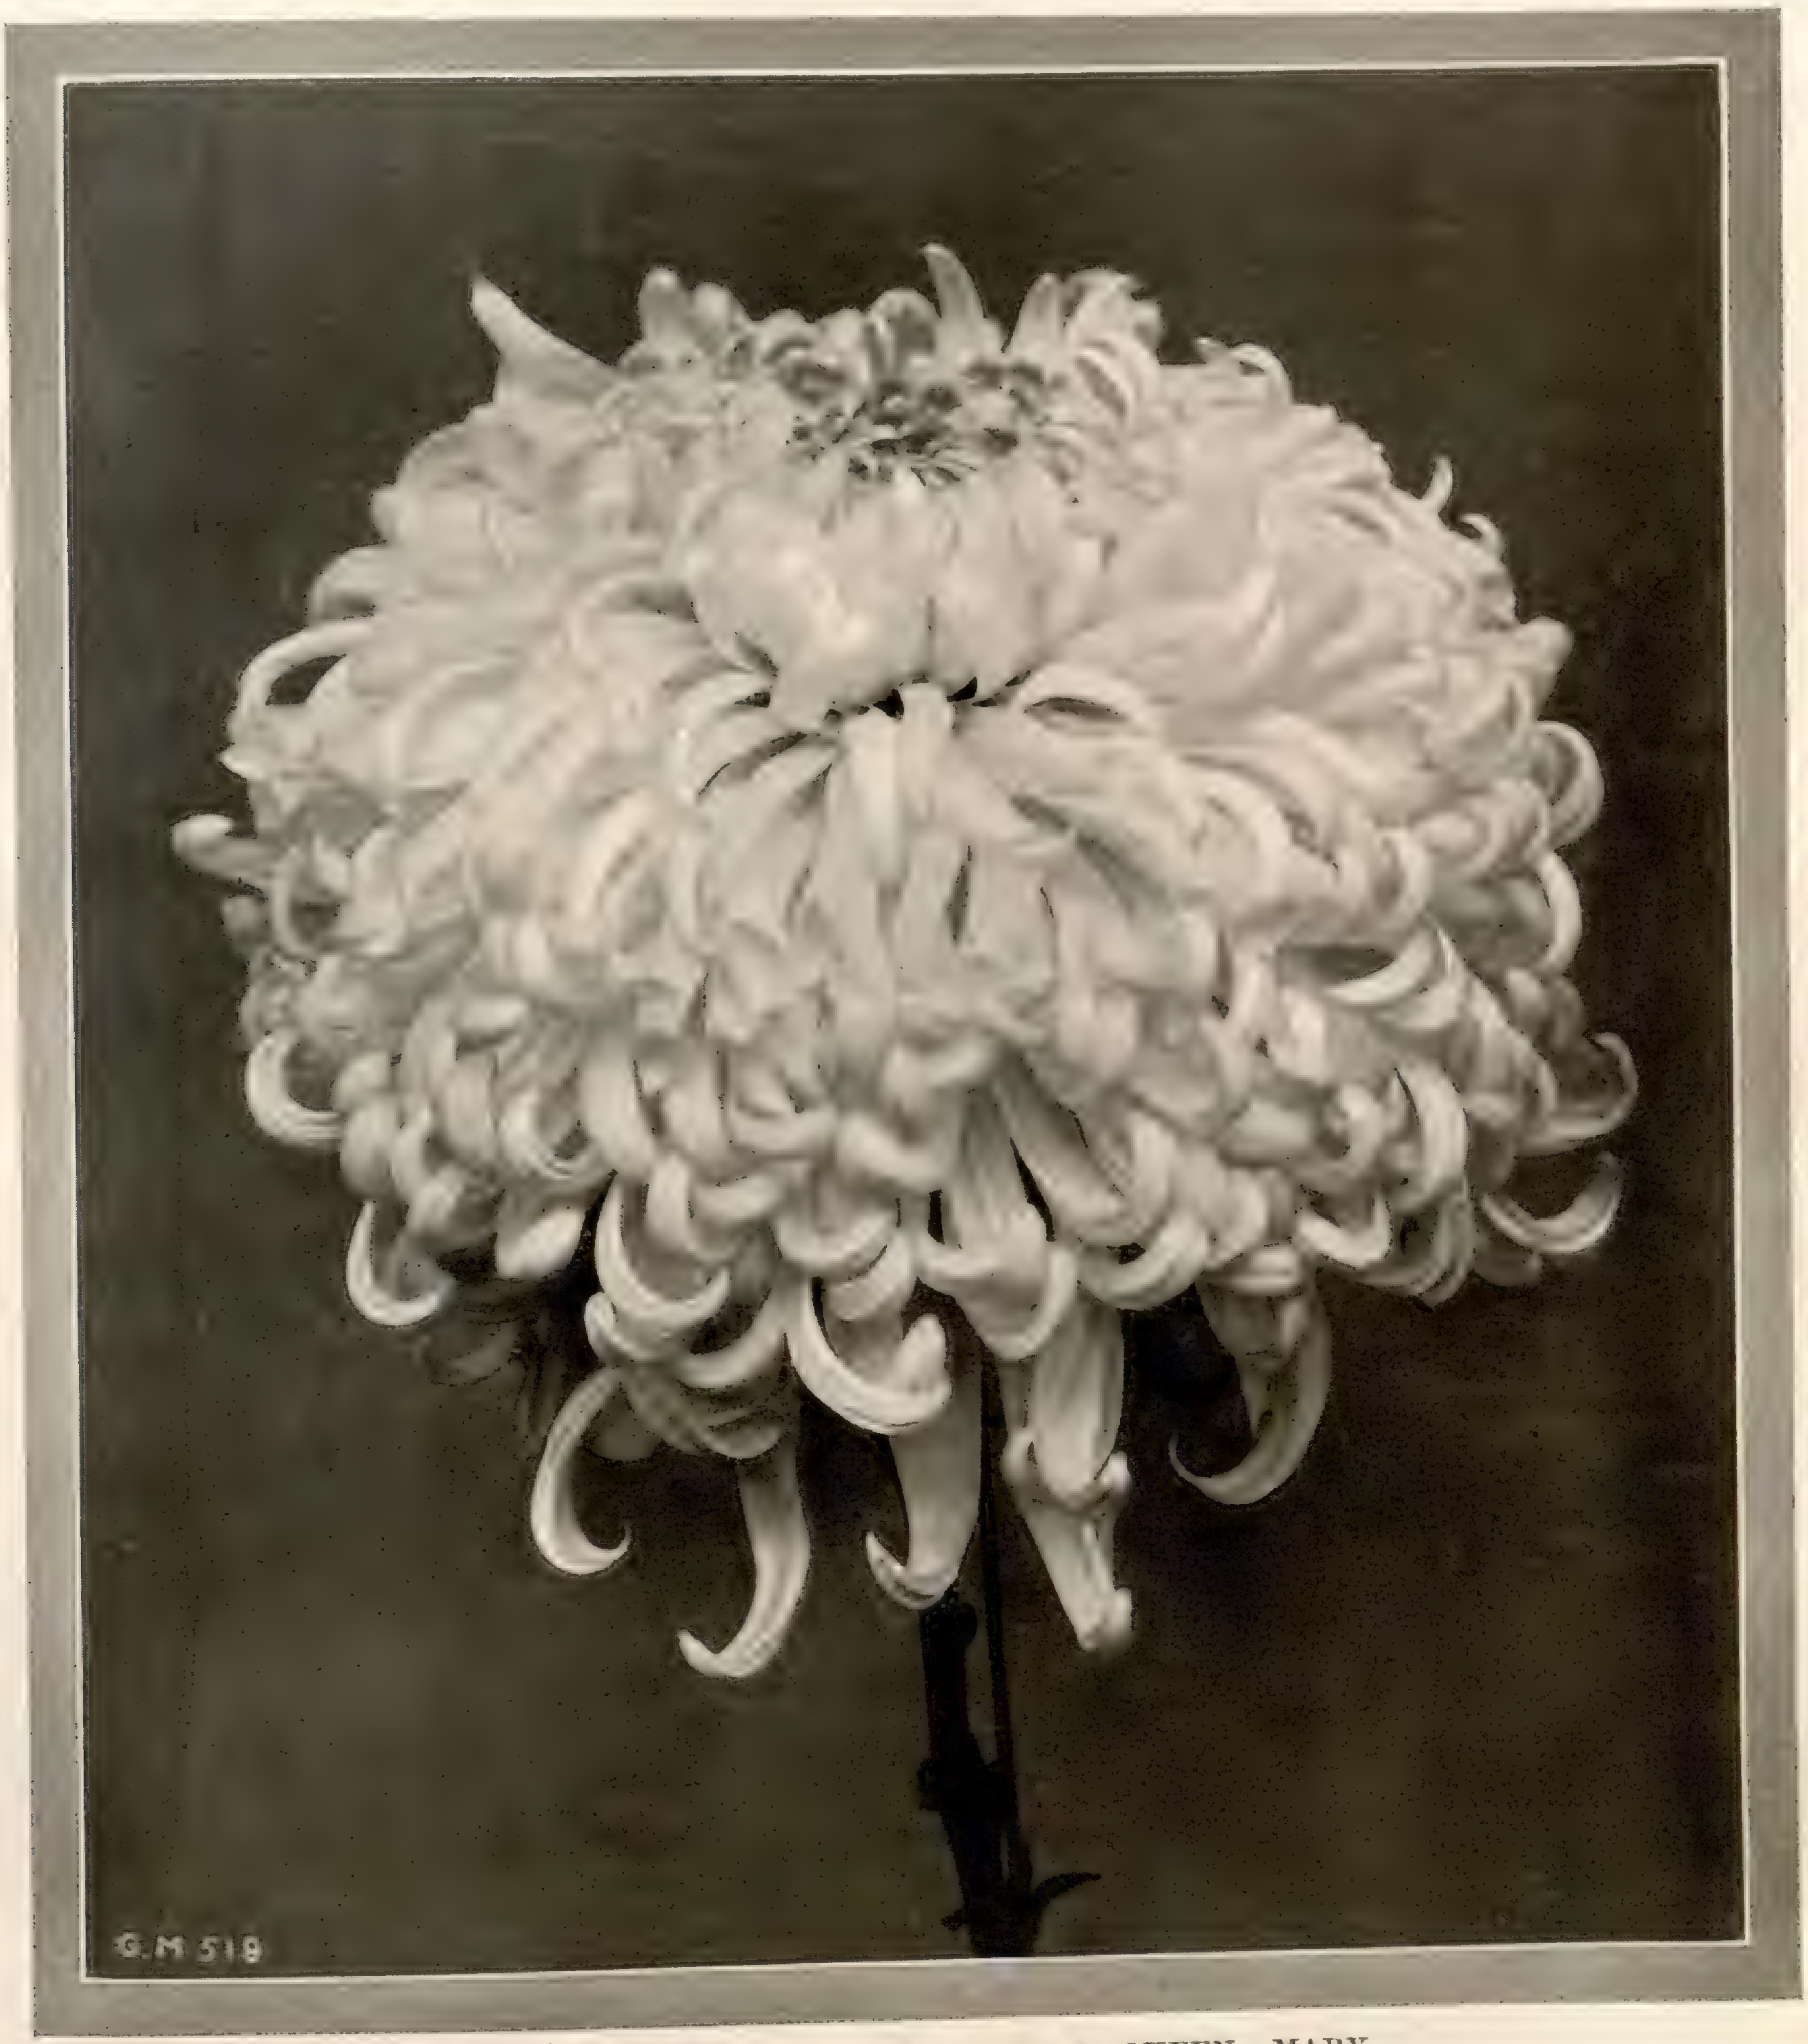
### CHRYSANTHEMUMS.

Gladiator.—A large and elegant single variety, with rich red flowers, and a narrow yellow zone round the disk. Commendation, N.C.S., October 29. Mr. Thos. Page, Hampton.

Ivernia.—A very beautiful and refined Japanese variety, of show size. The drooping florets are buff, freely suffused with rosy-bronze. F.C.C., N.C.S., October 29. Messrs. J. Stredwick and Son, St. Leonards.

Miss Thelma Hartman.—A very large and shapely incurved variety that promises well for exhibition purposes. The colour is blush. F.C.C., N.C.S., October 29. Mr. W. Jinks, Thames Ditton.

Miss N. Borrer.—A beautiful pink single variety, previously described. Commendation for colour, N.C.S., October 29. Mr. Chapman, gardener to L. F. Harrison, Esq., Orchards, East Grinstead.



NEW JAPANESE CHRYSANTHEMUM QUEEN MARY.

Flowers pure white. F.C.C., N.C.S., October 29 Messrs. W. Wells and Co., Merstham. The bloom illustrated is about two-thirds its full size.

**Jessica.**—A very handsome large-flowered single variety It belongs to the Pagram section, and is of a bright rich red-bronze shade, with some yellow showing through. Commendation, N.C.S., October 29. Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow.

**Sidney Lawrence.**—A good-sized single variety, with from three to four rows of florets The colour is a pretty shade of light amber. Mr. I. Lawrence, Shoreham, Sevenoaks.

**His Majesty.**—A superb Japanese variety, with fairly broad, evenly drooping florets. The blooms are of large size and of the richest deep crimson shade imaginable. A refined flower of great beauty. F.C.C., N.C.S., October 29. Mr. Norman Davis, Framfield, Sussex.

**Calgary.**—A large single variety of good form and substance. The colour is Indian red, with a narrow deep yellow zone around the disk. Commendation, N.C.S., October 29. Messrs. P. Ladds and Son, Swanley Junction.

**Miss Gertie Ladds.**—Another fine large single variety of good form. The colour is very bright chestnut-crimson. F.C.C., N.C.S., October 29. Messrs. P. Ladds and Son, Swanley Junction.

**Charles Hall.**—A medium-sized, elegant single variety of the most brilliant crimson-scarlet colouring. Commendation for colour N.C.S., October 29. Messrs. P. Ladds and Son, Swanley Junction.

**Frances Rowe.**—A large, long-petalled Japanese variety, with reddish-bronze colouring and golden reverse. A promising and distinct variety. F.C.C., N.C.S., October 29. Mr. H. J. Jones, Ryecroft, Lewisham.

**Miss A. E. Roope.**—A first-rate yellow Japanese variety, with broad, curling florets that make up a large and bold flower. The yellow shade is very rich. F.C.C., N.C.S., October 29. Mr. H. J. Jones, Ryecroft, Lewisham.

**Miss Elsie Davis.**—This is a bold incurving Japanese variety of amaranth colouring, and with silvery-rose reverse, the latter shade being most in evidence. F.C.C., N.C.S., October 29. Mr. H. J. Jones, Ryecroft, Lewisham.

**Queen Mary.**—A magnificent pure white Japanese variety of grand form and wonderful size. It has broad florets, and these incurve loosely and gracefully at the tips. The florets are stout, so that the flowers should keep well and travel well. F.C.C., N.C.S., October 29. Messrs. W. Wells and Co., Merstham.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

PLEIONES are among those orchids that have to be especially attended to during the present month. Most of these pretty species are natives of India, and grow chiefly on rocks in mountainous regions, and are commonly known as "Indian Crocuses." Their flowering season extends from the end of September to the middle of November, and there is one species, P. humilis, which produces its flowers in the spring. Such well-known species as P. laginaria, P. Wallichiana, P. præcox, P. concolor, and P. maculata, are now in bloom, and will make a delightful show for a week or two to come, providing no water is allowed to settle on them. On examination it will be observed that the green shoots from which the flowers have sprung are in reality new growths, and, under proper treatment, will form bulbs. These shoots, within a short time after flowering, will produce numerous young roots from their bases, and then is the proper time to repot. The young roots lengthen rapidly, and are easily broken when handled, therefore the plants should be repotted directly roots are formed.

POTTING.—Pots or pans must be provided with plenty of clean crocks for drainage, as it is important the water should pass through the compost quickly. Over the crocks place a thin layer of rough sphagnum moss.

COMPOST.—The potting compost may consist of loam, peat, and Osmunda fibre in equal parts, with all the earthy particles removed, and a quantity of sphagnum moss equal to one of the fibre, with a fair sprinkling of crushed crocks or coarse silver sand. The Osmunda fibre should be cut up moderately fine, and pulled thoroughly to pieces, as it mixes better with the other materials treated in this manner, than when used in a coarse, rough state. Before repotting, turn the plants carefully out of their pots or pans, carefully pick out the old potting material, and remove the decayed and worthless bulbs. In fixing them in their new receptacles it is not advisable to break the clumps up more than is necessary, but each bulb must have room to develop, and they should be so arranged that when in flower they cover the whole of the surface with their lovely blooms. Pot the plants with moderate firmness, and the spaces between the pseudo-bulbs should be filled in with the roughest of the compost, which is easily accomplished by starting from one side of the pot or pan, and working to the other. When repotting is finished the plants may have a slight watering to settle the compost around them, and they should be placed in a moist position, where they will receive all the light possible, in a house having an intermediate temperature.

CULTURE.—For a few weeks very little water will be required, but as the new roots enter the compost and the foliage begins to extend, the supply must be gradually increased; but when thoroughly established and the pans are full of roots, weak liquid manure may be given occasionally with beneficial results.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

PALMS.—To maintain the warmth-loving palms in a healthy condition it is necessary to keep the foliage scrupulously clean, as well as the structure in which they are grown. A general overhauling of the palm house should be carried out at least twice a year, viz., in the spring and about this time. Should circumstances not allow of emptying the house while the glass and wood-work is being thoroughly cleaned, then the plants may be tied up loosely and placed at one end of the house, afterwards moving them back to the clean part for the completion of the work. The most troublesome insect pests are red-spider and small scale. The latter is very injurious, and when allowed to become numerous is difficult to eradicate. The best plan is to brush or sponge the affected parts with a fairly strong solution of one of the insecticides recommended for the purpose, and leave this upon them for a few days. The insects will then be loosened and easily sponged off with warm, soapy water. Examine the drainage of the receptacles in which the plants are growing, and, if faulty, rectify it. Although it is inadvisable to give any of the plants a large shift at this season, yet, if any are cramped for root-room, they should receive a slight shift Others will be benefitted by pricking over the surface and top-dressing with loamy soil, to which is added a little dried cow-manure and a sprinkling of soot and bone-meal. When the work is completed, give a heavy syringing with tepid rain water. Watering palms during the dull season requires great care, for while some species should not become at all dry, others are very impatient of an excess of water. The cultivator can, by close watchfulness, acquire experience as to the requirements of the various species in this respect, and will act accordingly.

POINSETTIA PULCHERRIMA. — The brilliant scarlet bracts will now be showing, and the plants should be so arranged that they are seen to the best advantage. Care must be taken that there is no drip from the roof, or the bracts will be disfigured. Keep the heads of the plants well up to the light, and avoid overcrowding, or the bottom leaves will turn yellow and fall. Well-grown plants should be clothed with green leafage to within a few inches of the surface soil. Use water of the same temperature as that of the house, and apply it in the morning. Continue to give periodical applications of weak manure until the bracts are nearly developed, for if this manurial assistance be discontinued too soon, there will ensue a check, consequently the heads will not be so fine. A golden rule to bear in mind is to keep the roots active by judicious watering and feeding.—H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

EARLY PERMANENT VINES.—Where it is necessary to obtain ripe grapes in April, the house should be closed not later than the middle of this month; tie the rods down so that the buds will break evenly the whole length of the canes. At this season of the year, when vegetation is slow to respond to artificial means, it is necessary to commence with a night temperature of 50 to 55 degrees and a day temperature of from 55 to 58 degrees; lightly spray the rods several times a day, and to assist in maintaining a moist atmosphere in the house, keep the evaporating trays filled with water. Carefully examine the borders, and if water is required, give the whole bulk of soil a good soaking with clean water, heated to a temperature of 85 degrees. Exercise care when damping down, otherwise the soil will become sour. Admit air when possible to sweeten the atmosphere of the house, but not in such a manner as to cause cold draughts or any serious lowering of the temperature. When the young growths appear the night temperature must be about 60 degrees with a day temperature ranging from 65 to 68 degrees. Great care must be exercised when forcing vines in the winter months; attend assiduously to every detail or failure will be the result. If there are outside borders to the vineries that are to be forced at this season of the year, they should be covered a foot thick with oak or beech leaves, finishing the surface off, with a few inches of long stable litter to prevent the leaves from being blown about.

EARLY POT VINES.—In many gardens the practice of using vines grown in pots is adopted for supplying the early crop of grapes. Presuming the vines were pruned back to their proper length last month, they should be thoroughly washed with warm, soapy water to which a little flowers of sulphur has been added. Make sure that the drainage is in perfect order; this is very essential, as large quantities of water will be given as growth develops and the days lengthen. Many ways and means are adopted to provide the bottom heat, which is absolutely essential for the vines at this season of the year. It can be provided by the use of stable litter and leaves well mixed together, and the pots plunged in this material, which must be renewed occasionally to maintain a gentle heat. The method we adopt here is to remove the soil from the melon or cucumber beds in a span or lean-to house, which is provided with hot-water pipes to give bottom heat; the stable litter and leaves are placed in these chambers, and made very firm by treading. The pots are plunged into this material, and the hot water-pipes are not made use of until the heat from the fermenting material is exhausted. Where a house of this description is not available, the pot vines can be plunged in 20in. pots, and placed upon the hot water-pipes in the house; we adopted this plan some few years ago, and the results were all that could be desired. When the pots are placed into position the canes should be tied down to ensure an even "break."—HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

PLANTING ROSES.—With the advent of November it is time to commence this work, and where the ground is not already prepared no time should be lost in making it ready. Roses prefer a deep rich loam, but when the natural soil is not of such a suitable nature, it is necessary to suitably enrich it with well-rotted farmyard manure, and, in the case of light, open soils, the addition of some good heavy loam, even approaching clay in consistency, will be an advantage. Deep cultivation is preferable to ordinary digging, as it must be remembered the plants are to occupy the ground for some time, and a little extra care in preparations will be amply repaid. Roses usually succeed best where the subsoil is well drained; in low-lying situations it is frequently necessary to provide artificial drainage by placing broken bricks or some similar material in the bottom of the trench two feet deep as cultivation proceeds. It is, of course, essential to have the ground in a moderately dry condition at the time of planting. Make the holes wide enough to spread out the roots fully, and if the soil is at all lumpy, it is an advantage to have some fine compost at hand to place immediately over the roots. Make the soil firm about the plants as the work proceeds, and, after planting, apply a top-dressing of short half-rotted manure.

PROTECTION.—In many districts it is necessary to protect tea roses and hybrid teas during the winter. Nothing is more suitable for the purpose than dry bracken, which should be neatly twisted around the plants at the present time. When it is necessary to give shelter to tender shrubs, a few spruce branches placed around them will usually be sufficient. Heavy coverings are not recommended, as they are liable to make the plants rather tender, in which case they suffer upon the removal of the protecting material in the spring. Gunneras should be well protected with leaves or long stable litter, the latter for preference. Finely-sifted coal ashes placed over herbaceous plants is the best form of protection for those that need it.

GENERAL WORK.—Border chrysanthemums must be taken up, placed in boxes, and kept in cold frames for the winter. See that each variety is labelled correctly. Salvia patens should be treated in the same way. Take up gladioli and montbretia corms, and store them in a frost-proof shed. It is quite necessary to take up the latter, as when exposed to excessive wet and cold they frequently perish. Give air to violets and bedding plants in frames on favourable occasions, and protect them from frost at night by covering them with mats or straw.—J. GARDNER, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## ROYAL HORTICULTURAL SOCIETY'S EXHIBITION OF ORCHIDS.

On Tuesday and Wednesday, November 5 and 6, the Royal Horticultural Hall presented an unusual appearance, because the general arrangement of long tables was largely dispensed with and smaller tables of varying size and shape were used, to the very great advantage of the exhibition. This novel arrangement was at the suggestion of the Orchid Committee; indeed, this committee practically ruled affairs on this occasion, and orchids in a great array of glorious colouring and wondrous grace and beauty filled the greater part of the big hall.

Right well did amateurs and nurserymen turn out to support the efforts made to produce an autumn display of these useful and bright flowers, and the Orchid Committee is to be congratulated upon their work in arranging for this exhibition. Orchid lovers know the value of autumn-flowering orchids, but a large display of this kind was necessary to bring the fact in a striking fashion before the general public.

Thirty-two classes were provided, and several sets of judges commenced their work promptly at eleven o'clock, and were finished in about an hour. In some classes there were no entries, while in others the competition was keen. Every group staged was competitive, and awards were made in accordance with their value, the prizes being cups and medals.

Some idea of the extent and importance of the orchid display may be gathered from the fact that it exceeded the largest combined display of orchids ever made at the Temple Show by fully 1,000ft.

### OPEN CLASSES.

In the open class, for a large group of orchids there were two entries. Messrs. Charlesworth and Co., Hayward's Heath, put up a brilliant group, the whole of the centre being filled with the vivid Epidendrum vitellinum majus; from this mass of orange colour rose a few fine spikes of the white Odontoglossum armainvilliersense xanthotes. Vanda cærulea, Oncidium varicosum Rogersi, and Cattleya labiata, and C. Portia figured largely on the left of each, with L.-c. Bella alba, the rich L.-c. Orion Othello, and the beautiful yellow and purple Cattleya Rhoda The Jewel. On the other side graceful oncidiums, combined with Cattleya labiata, C. Bowringiana, Brasso-cattleya Mariæ, while in the foreground were beautiful plants of Cattleya Venus Princess, yellow and crimson; Odontoglossum Aireworth, and the white, yellow-spotted Odontoglossum eximium xanthotes. A gold medal was awarded.

In the same class came Messrs. Sander and Sons, St. Albans, who won a gold medal with a very fine and interesting exhibit. In the centre a lovely lot of Cattleya Fabia was grouped over maidenhair ferns, and in this set C. Fabia Her Majesty, with white sepals and petals, was notably beautiful. At each end of the display outstanding groups of Cattleya Fabia, C. labiata, C. l. La Vierge (white), C. McMastersi, the handsome L.-c. Prism, and Brasso-cattleya Mdme. Chas. Maron were effectively set. Between these imposing portions there were bays with a low groundwork of cypripediums, and here we noticed good specimens of C. insigne Sanderæ, C. i. Harefield Hall, C. Edith Lucas, C. Mandiæ, C. Leeanum, C. Chas. Richman, etc. Rising over the cypripediums were L.-c. Walter Gott, rich mauve and purple, the free-flowering pale mauve Cattleya Ashtoni, Dendrobium Goldei, Cattleya Mrs. Pitt, Odontioda Bradshawiæ, and nestling in the foreground was a lovely little group of Indian crocuses—Pleione præcox and P. lagenaria.

One of the very finest of the many splendid groups in the hall was that composed of cattleyas, lælio-cattleyas, and brasso-cattleyas in an open class. It merited and received the highest awards (a gold medal and a silver-gilt Lindley medal), and included five certificated plants. Every plant was set apart from its neighbour, as is usual in the case of exhibits from Westonbirt. Such an exhibit of the cattleya family has never before been staged in November, and Sir George Holford and his grower, Mr. Alexander, are to be heartily congratulated upon the magnificent collection. Purple, mauve, crimson, gold, yellow, cream, ruby, orange, and white were colours gloriously represented. This cattleya group occupied an area of about 350 square feet, and contained about 200 plants, all of them as nearly perfect as possible. Of the splendid autumn-flowering C. Fabia there were no fewer than fifty-five plants, carrying a total of over seventy spikes and 260 gorgeous blooms. The white forms of C. labiata—Mrs. E. Ashworth, Gilmouriæ, G. G. Whitelegge, and Madame Louis de Hemptinne were especially choice, while C. Peetersi Westonbirt var. (F.C.C.), with white, purple, and gold flowers; C. Hardyana La Perle (A.M.), a fine form, with white sepals and petals, and a glowing purple and white lip, were two outstanding gems. Lælio-cattleya Golden Fleece (A.M.), vivid yellow; L.-c. Cappei Charlesworthi, extra fine and brilliant; L.-c. Neleus, from L.-c. Iris and C. Ophir; L.-c. Amber, a fine new yellow; and L.-c. Golden Beauty, formed a group of most decorative orchids; while of special fine form, lovely colouring, and elegance were Brasso-cattleya Euterpe, B.-c. Pluto, B.-c. Siren, and B.-c. Gigas Digbyana, all with fringed lips. Cattleya Dusseldorfei Undine, and C. fulvescens, Westonbirt var., are two other beautiful orchids that cannot be omitted from this brief reference to a glorious exhibit.

Only one group of Vanda cærulea was forthcoming in the open class for this orchid, but it was a superb one, and consisted of about forty-five grand specimens, splendidly grown and beautifully arranged over about fifty spikes of Oncidium variocosum Rogersi by Mr. H. Alexander, orchid grower to Sir George Holford, Westonbirt, Tetbury, Gloucester. The blue vandas over the golden oncidiums provided a rare and beautiful effect. Rarely have finer examples of V. cærulea been seen, and not only was the culture fine, but every plant represented a first-rate form, the flowers large and shapely. Many of the spikes carried twenty flowers, the largest having thirty blooms. One specimen—Vanda cærulea Lady Holford (F.C.C.)—stood out prominently, and it carried two of the seventy spikes that composed this splendid group. A gold medal and a silver-gilt Lindley medal were awarded.

Messrs. Mansell and Hatcher, Rawdon, Leeds, presented a fine arrangement, and grouped their plants in two bold and wide mounds and three low bays. In the loftier portions the outstanding features were Cattleya labiata, the glorious C. Fabia, C. aurea, C. Mrs. Pitt, C. Armstrongiæ, and golden oncidiums in great sprays. In the bays, cypripediums were much in evidence, a large plant of C. insigne Harefield Hall standing out prominently. Odontoglossum eximum, O. Lambeauianum, and O. crispum were well represented, and Platyclinis Cobbianum, Cattleya labiata alba, and Odontioda Devossiana were other good things. The Rawdon firm received a large silver cup.

### AMATEURS.

Four exhibits were to be found in the amateurs' class for a group of orchids arranged on a space of 150ft., and here G. F. Moore, Esq., Chardwar, Bourton-on-the-Water, gained a gold medal with a charming group, in which varieties of Dendrobium phalænopsis Schroderiana were largely and gracefully disposed in three mound-like groupings. Cattleya labiata, C. Mantini, C. Portia, and C. Fabia occupied the intervening spaces, and the groundwork was composed of cypripediums, and here there were splendid lots of C. insigne Sanderæ, C. Mandiæ, C. Niobe superbum, C. Clio, C. Thalia Mrs. F. Wellesley, C. Arzia Fairieanum, and C. The Baron.

In the same class a large group of orchids, finely arranged by Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, lacked brilliant colouring, and the central mound of Cattleya Portia cærulea gave the display a cold appearance. This variety looked as though it had tried to emulate Vanda cærulea, and failed. Dendrobium phalænopsis and Vanda cærulea figured well in other parts of the exhibit, and L.-c. Rothschildiana, Cattleya labiata, C. Peetersi, and C. Portia were good. Cypripediums were presented in great variety, and a few good odontoglossums were on view, while Odontioda Bradshawiæ Gattonensis, rich orange-scarlet (F.C.C.), was the gem of a fine contribution. (Large Silver Cup.)

H. S. Goodson, Esq. (gardener, Mr. G. Day), Fairlawn, Putney, contributed a goodly group, but somewhat formal. Purple cattleyas and lælia-cattleyas were associated with odontoglossums to form a background, but almost all the forward part of the exhibit consisted of cypripediums, and among the latter C. Mandiæ and C. insigne Sanderæ were very much in evidence; a few Sophro-cattleyas and Sophro-lælia-cattleyas, with deeply-coloured flowers, occupied a central position. (Small Silver Cup.) J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford, put up a high pyramidal group, composed chiefly of cypripediums surrounded by Cattleya labiata, oncidiums, and odontoglossums. The exhibit was very formal in outline, but it contained good examples of Cypripedium Hera Eryades, C. insigne Harefield Hall, C. Ville de Paris, C. Corona, and large numbers of forms of C. insigne.

A group of special importance was contributed by E. R. Ashton, Esq. (gardener, Mr. A. Young), Broadlands, Camden Park, Tunbridge Wells, in the amateurs' class for a display not exceeding 100 square feet. Well-grown plants were capitally arranged with palms, ferns, and moss, and crowding was avoided. Cattleya aurea, C. Fabia, the new white, purple, gold and crimson C. Oberon (A.M.), Brasso-cattleya Hyeæ (A.M.), a fine substantial hybrid between Cattleya Harrisonæ and Brassavola Digbyana; L.-c. Luminosa, L.-c. Beryl, L.-c. Beacon, golden-orange and ruby-crimson; and the fine old L.-c. callistoglossa were a few of the gems in this collection. A Silver Cup was worthily won. Around the groups set up by F. Du Cane Godman, Esq., South Lodge, Horsham, the beautiful yellow-flowered Oncidium cheirophorum was used as an edging, and this old species was well shown and greatly admired. Vanda cærulea, golden oncidiums, and odontoglossums filled the raised centre, while Cattleya aurea, C. Fabia, Cypripedium Mandiæ, C. Rossetti, and Cattleya Mantini nobilior were of special merit in other parts of the group. (Silver Flora Medal.)

Only one group was forthcoming in the amateurs' class for a display of cypripediums. This was from the Westonbirt collection, and a few oncidiums and palms served to enhance the effectiveness of the exhibit. It was a very interesting group, set up on a diamond-shaped table. There were fine examples of C. Mandiæ, C. insigne Sanderæ, C. nitens-Leeanum Hannibal, C. Actæus Benoia, very fine; the pure white C. Boltoni with four flowers, and such extra special sorts as C. Muriel, finely formed; C. Lucifer, C. Prism, C. Leeanum Corona, C. Chapmani, Westonbirt var., and C. Niobe, Westonbirt var.

The chief award for three specimen orchids (a Silver-gilt Banksian Medal) fell to Mr. H. J. Chapman, gardener to Mrs. Norman

Cookson, Oakwood, Wylam-on-Tyne, for Calanthe Angela, rich dark crimson; C. Cooksoniæ, large, pure white; and Odontioda Bradshawiæ Cooksoniæ, brilliant orange-scarlet, purple, and pink—one of the very finest odontiodas.

Botanical orchids were shown only by Sir Jeremiah Colman, Bart., Gatton Park, Reigate, and his group attracted not a little attention from lovers of the curious; Dendrobium Cœlogyne, Stenoglottis longifolia, Ornithidium sophronitis, and Angræcum distichum were a few notable species. This interesting collection gained a Silver Cup.

### NURSERYMEN.

A large circular group, occupying a central position in the hall, was greatly admired. It was from Messrs. Stuart Low and Co., Enfield, and its towering structure, as well as the grace and beauty of its arrangement, attracted everyone. The white Dendrobium formosum giganteum crowned the group, and springing out from below these were many long sprays of the golden Oncidium varicosum, with plants of Cattleya labiata, C. Harrisonæ, and Dendrobium Phalænopsis Schroderiana. The latter orchid was also arranged in outstanding vases at intervals around the group, other vases being filled with golden oncidiums. In the body of this circular pyramid plants of particular interest were Brasso-cattleya Imperatrice de Russie, with a long white and yellow lip; the chaste Cymbidium erythrostylum, the gorgeous Lælio-cattleya Luminosa, Cattleya Endora gigas, C. aurea, C. Octave Doin, and Vanda Kimballiana. The Messrs. Low were awarded a well-deserved Gold Medal.

A particularly pleasing group from Messrs. J. and A. McBean was especially graceful because of the host of arching spikes of Odontoglossum crispum, with O. eximum McBean var. (A.M.), and Odontioda Charlesworthi, it contained. Rich colouring was provided by Cattleya aurea, Epidendrum vitellinum majus, Cattleya labiata, C. Bowringiana, C. Fabia, and the handsome Vanda Sanderiana, while Cypripedium insigne Sanderæ, finely grown, filled the central foreground. This exhibit gained the premier award in the class for nurserymen, the space occupied not to exceed 100 sq. ft., and it gained a Silver Cup.

In the same class a very pleasing group of orchids, especially noticeable for the tasteful arrangement of flowering and foliage plants, maintained the reputation of Messrs. J. Cypher and Sons (Silver-gilt Flora Medal). Good use was made of the graceful Dendrobium Phalænopsis Schroderiana, Oncidium varicosum, and odontoglossums, while under these a fine selection of cypripediums was disposed advantageously, with Platyclinis Cobbiana, Odontoglossum grande, Cattleya Bowringiana, C. Fabia, L.-c. Luminosa, and Oncidium ornithorhynchum. The ever-popular Cypripedium insigne Sanderæ filled a large part of the group from Mr. E. V. Low, Hayward's Heath, and formed a good setting for the white-flowered Cattleya labiata Le President, C. l. Daphne, C. l. La Vierge, and C. I. W. R. Lee, the latter carrying eight lovely blooms. (Silver Flora Medal.)

The group in this class from Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, was prettily arranged; Odontoglossum crispum, Vanda cærulea, Cattleya Fabia, Oncidium varicosum, and cypripediums were the leading subjects. (Silver Banksian Medal.) Very interesting plants were grouped by Mr. S. W. Flory, Tracey's Nursery, Twickenham, and of special importance were Cymbidium Tracyanum, with very large spikes, Odontioda Charlesworthi, Odontoglossum Lambeauianum, and Brasso-cattleya Meroniæ. (Silver Banksian Medal.)

The beautiful Calanthe Harrisi with pure white flowers, was largely and well shown in a group from Messrs. J. Veitch and Sons, Chelsea. This was not a large group, but it contained good examples of Lælio-cattleya Queen Alexandra, Brasso-cattleya Ilene, with a gold-throated lip; L.-c. Lamorna, a promising hybrid between L.-c. Dominiana and C. Hardyana; L.-c. Nysa, and L.-c. Priam. (Silver Banksian Medal.) The little group from Messrs. W. Baylor, Hartland, and Sons, Cork, suffered in the matter of arrangement, and in many cases the paper-bound sticks used for packing and carriage had not been removed. A little batch of Cypripedium triumphans in this group attracted attention. (Bronze Banksian Medal.)

Messrs. J. Cypher and Sons, Cheltenham, invariably show cypripediums well, and on this occasion they had a handsome exhibit of these plants, and used palms and ferns and crotons with their orchids. At all four corners they had delightful batches of the lovely yellow and white C. insigne Sanderæ, while in the centre were C. i. Harefield Hall, C. Fulshawense, C. Sir Redvers Buller, the pretty C. Minos Veitchi, and the bold C. Felicity. (Silver Cup.) Mr. G. W. Miller, Clarkson's Nurseries, Wisbech, contributed cypripediums in this class, and the chief kinds staged were C. insigne Sanderæ, C. triumphans, C. Spicerianum, C. Mandiæ, and C. Massaianum. (Silver Banksian Medal.)

The best specimen orchid in the nurserymen's division was a large Cymbidium Tracyanum, carrying several sturdy spikes of large cream and red-brown flowers. This was shown by Mr. S. W. Flory, Twickenham, and gained a Silver Banksian Medal.

---

## Royal Horticultural Society's Miscellaneous Show.

The Floral Committee had numerous novelties to consider, but the groups coming under their adjudication were few, as the hall was, as already notified, given over largely to orchids.

An exceedingly bright bank of winter-flowering begonias from Messrs. J. Veitch and Sons, Chelsea, again demonstrated the value of these flowers; B. Elatior, B. Mrs. Heal, and B. The Gem are all first rate, while in B. Emita (A.M.), orange-apricot; and B. Optima (A.M.), buff-pink, the firm has two fine new introductions that show a break-away from the commoner carmine shades. The same firm exhibited a famous lot of dwarf chrysanthemums in pots, finely grown and freely flowered. On several occasions we have referred to these wonderfully decorative specimens so finely grown at the firm's Feltham nursery.

Winter-flowering begonias were largely shown by Messrs. William Cutbush and Son, Highgate; a bright bank of plants from this firm included batches of B. Julius, B. Emily Clibran, B. Beauty of Hale, the very useful B. Ensign, B. Winter Cheer, and the new white, B. Lady Waterlow. Mr. G. Reuthe showed a number of nerines and saxifrages. Perpetual carnations in considerable variety were well shown by Messrs. Allwood Bros., Haywards Heath, and Messrs. Stuart Low and Co., Enfield, had a small exhibit of these popular flowers.

The bertolonias and sonerilas from Mr. L. R. Russell, Richmond, were delightful, and we wish we had space to refer more fully to these elegant and brilliant foliage plants. A fine orange tree, grown from a pip, without grafting, and cultivated within seven miles of Charing Cross, was submitted by Messrs. Felton and Sons, Hanover Square; its fine crop of fruits attracted no small attention. The grand Queen Mary chrysanthemum and the scarcely-less fine Mrs. Gilbert Drabble were conspicuous in the exhibit from Messrs. Wells and Co., Merstham. Viscount Ridley, Blagdon, contributed perpetual carnations; and Messrs. Cragg, Harrison, and Cragg sent some splendid new single chrysanthemums.

The large group of ferns from Messrs. H. B. May and Sons, Edmonton, contained many of the newer things, notably Adiantum micropinnulum, Nephrolepis exaltata muscosa, N. e. Willmottæ (A.M.), very graceful and finely divided; N. Whitmanni compacta, and Osmunda palustris undulata. Begonia Carmen and B. Pink Beauty, two fibrous-rooted varieties of great beauty, were submitted by Messrs. Blackmore and Langdon, Twerton, Bath; the pink variety is very charming, and it is the result of a secondary cross, B. semperflorens gracilis being the predominant parent.

Mr. H. J. Jones, Ryecroft, Lewisham, and others sent a few new chrysanthemums.

### CERTIFICATES AND AWARDS.

We hope to describe the following in our next issue:

First Class Certificate.—To Odontoglossum Aurora (Lambeauianum x Rossi rubescens), from Messrs. J. Veitch and Sons, Chelsea; to Cattleya Peetersi, Westonbirt var., and to Vanda cœrulea Lady Holford, from Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester; to Odontioda Bradshawiæ Gattonensis, from Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate; to Lælio-cattleya Orion var. Othello, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Lælio-cattleya Walter Gott, from Messrs. Sander and Sons, St. Albans; to Cattleya Fabia Gloriosa, C. Fabia Sunset, C. Hardyana La Perle, Lælio-cattleya Golden Fleece, and Cypripedium Muriel, from Sir George Holford; to Cattleya Venus var. Princess, and Cattleya Rhoda The Jewel, from Messrs. Charlesworth and Co., Haywards Heath; to Brasso-cattleya Hyeæ, and Cattleya Oberon, from E. R. Ashton, Esq., Broadlands, Camden Park; to Cypripedium Latamianum, from J. Gurney Fowler, Esq., Glebelands, South Woodford; to Odontoglossum eximium McBean's var., from Messrs. J. and A. McBean, Cooksbridge; to Begonia Emita and B. Optima, from Messrs. James Veitch and Sons, Chelsea; to Chrysanthemum Queen Mary, from Messrs. W. Wells and Co., Merstham; to Hoheria populnea, from the Countess of Ilchester; to Carnation St. Nicholas, from Mesrs. Stuart Low and Co., Enfield; to chrysanthemums Miss A. E. Roope and Hector Menzies, from Mr. H. J. Jones, Lewisham; to chrysanthemums Portia and Snow Queen, from Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow; to chrysanthemum Mr. Leonard Harrison, from Mr. Harrison, East Grinstead.

### MEDALS.

The following awards were made to miscellaneous displays:

Silver Gilt Banksian. To Messrs. James Veitch and Sons, Chelsea, for winter-flowering begonias and chrysanthemums.

Silver Flora.—To Mr. L. R. Russell, Richmond, for bertolonias and sonerilas.

Silver Banksian.—To Messrs. William Cutbush and Son, Highgate, for winter-flowering begonias; and to Messrs. H. B. May and Sons, Edmonton, for ferns.

---

## R.H.S. Scientific Committee.

BORDEAUX INJURY.—Mr. A. W. Hill showed, on behalf of Mr. Massee, some apples to illustrate the russeting due to the action of Bordeaux mixture upon their skins.

ANTIRRHINUM SPORTING.—Mr. Chittenden showed from a garden near London stems of an antirrhinum bearing short, leafy growths in the axils of the bracts instead of flowers. The leaves were very small. A similar specimen was subsequently sent by Messrs. R. Veitch, of Exeter, like the former in every way.

JAVANESE RHODODENDRON SPORTING.—Sir George Holford exhibited a small rhododendron raised from the cross R. javanicum Ruby × R. j. Ne Plus Ultra. It bore two inflorescences, one having bright red flowers, the other not quite so deep in colour and with yellow corolla tubes. The two parents had both crimson-scarlet flowers of slightly different shades. The flowers on the two trusses were of the same age. Ten plants of the cross had flowers, each bearing flowers of a richer colour than either of the parents, but none of the others had shown similar sporting proclivities.

GREY OAK.—Dr. Voelcker sent a piece of oak wood of a peculiar greyish-blue colour from a tree struck by lightning. The committee thought the coloration was probably the result of exposure to sun and air, especially as the tint approached that of weathered oak palings.

BRADFORD CHRYSANTHEMUM EXHIBITION,
In ST. GEORGE'S HALL, on
FRIDAY and SATURDAY, NOVEMBER 15th & 16th.
£50 for CUT BLOOMS ON BOARDS,
besides other valuable Prizes for open competition.

Schedules, with entry forms, post free from
H. SPENCER, Hon. Secretary.
Horton Park, Bradford.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## Birmingham Chrysanthemum Show.

A good show? Yes; but not a show to compare with those of former years. Such was the general verdict of those who attended the exhibition in Bingley Hall, which opened on November 5 for three days. With that verdict we agree; but, let it be understood, the comparison with bygone shows must not be taken to imply that there is anything wrong at Birmingham, but that, in common with other chrysanthemum shows, the changes that have been made in the style and character of the exhibitions have resulted in an entirely different sort of show, and, in consequence of the fact that shows apparently have now less attraction for the general public than they had twenty, or even ten, years ago, diminishing patronage entails restrictions in one form and another that make the standard of all-round excellence difficult to maintain.

Birmingham for years held the foremost position among chrysanthemum shows in the provinces, and even yet it is questionable whether any show out of London surpasses the Bingley Hall Exhibition. One certainly misses the big classes for Japanese and incurves shown on boards, although the flowers in vases make a bold and more artistic display.

Chrysanthemums, however, are far from being the only feature here, it being as much of a fruit and vegetable show as anything else. There used to be big exhibits of floral designs, but these have passed away. Perpetual carnations are now provided for, but the primula and cyclamen classes do not nowadays bring the strong entry they did when the whole of the spacious gallery was utilised for the strongly-contested classes of pot plants. Mr. Alfred Noakes is still the secretary, and we were pleased to see most of the old faces among the officials of the society; and, as has ever been the case, the whole arrangements were carried out in a methodical and business-like manner, everything working smoothly, and to the general satisfaction.

### PLANTS.

In each of the two classes for groups of chrysanthemums there were two entries, and really fine the exhibits were. The biggest class was for a group occupying 16ft. by 10ft., and cut blooms in addition to plants were allowed, ferns and foliage being used for furnishing. The first prize was awarded to Mr. Alfred Cryer, gardener to J. A. Kenrick, Esq., Berrow Court, Edgbaston. Mr. Cryer has won many a prize at this show, and it may at once be said that the group which faced the judges on Tuesday was in his best style, the quality of the flowers being enhanced by tasteful arrangement. Mr. G. Corbett, gardener to Hume Pinsent, Esq., Harborne, was worthily awarded second prize, just a touch of weakness being evident in the finishing off of his group in front.

The other groups each occupied 12ft. by 8ft., exhibitors in the preceding class being excluded. The winner was Mr. L. Fewkes, gardener to H. Green, Esq., Gravelly Hill, who had excellent plants, arranged in rather formal style. His follower was Mr. Bullock, gardener to T. W. Piggott, Esq., The Lions, Moseley, the arrangement in this exhibit being of a looser, lighter character, while many grand flowers were staged.

Big specimen plants have lost the prestige they once held, and there was but one entry in the class for six plants of large-flowering chrysanthemums, the exhibitor being Mr. A. Cryer, who showed Mrs. J. B. Bryce, John Wainwright, Mdme. Ferlat, H. W. Thorp, Frank Trestian, and Souvenir de Wm. Clibran. Mr. Cryer also had everything his own way with three Japanese, and for single specimens, scoring also for three singles over two other competitors; Mr. Bostock, gardener to E. Martineau, Esq., Edgbaston, being second; and Mr. Bullock third.

### CUT FLOWERS.

Six vases of Japanese varieties, each containing three blooms, but all distinct, had four entries, and it was here that one found the quality, and saw the true results of skilful cultivation. The coveted first prize was won by Mr. J. R. Tooley, gardener to H. Andrews, Esq., Toddington Manor, Winchcombe. Among the finest of a glorious set of flowers were Master James, A. T. Miller, and Mrs. Lopes, which occupied one vase in front of the stand, but Lady Talbot and F. Joliffe were also splendid blooms. Mr. H. Woolman, Shirley, was a close second, the whole of his flowers being particularly bright and fresh. Third place was taken by Mr. E. J. Brooks, gardener to Lieut.-Colonel Beech, Coventry; fourth prize being awarded to C. W. Catt, Esq., Duffield, Derby. Four vases of three blooms each, in four distinct varieties, found Mr. Brooks at the head of the prize-winners, with immense but beautifully developed flowers of Hon. Mrs. Lopes, Lady Talbot, F. S. Vallis, and Francis Joliffe. Three yellows and an amber-coloured variety did not make so varied an exhibit as we should like to see, but we have nothing but praise for the quality of the flowers. Mr. W. H. Westbury, gardener to J. H. Wheatley, Esq., Berkswell Hall, who was placed second, showed a vase of Mrs. G. C. Kelly, one flower of whch was just a bit too open in the centre; D. B. Crane, Mdme. G. Rivol, and Hon. Mrs. Lopes were his other varieties. Mr. Tooley accounted for third prize; Mr. Alex. Hoyle, Coventry, taking fourth.

An excellent and well-filled class was that for twelve vases, each containing one bloom of a distinct Japanese variety, set up with small plants and foliage. The chief award was secured by Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Umberslade. The exhibit contained flowers of medium size, quite large enough to show their individual charms to advantage, and the small crotons and maidenhair ferns used made a beautiful setting to the flowers, which were of pleasing shades of colour. Second prize went to Mr. Tooley, who arranged his exhibit against a background of green baize, and used Asparagus Sprengeri with copper-coloured berberis foliage to show off the flowers. Mr. E. Avery, gardener to J. B. Brooks, Esq., J.P., Finstall Park, Bromsgrove, took third.

Incurved varieties have sadly fallen away from the high position of former days, and the classes provided on this occasion failed to bring really good competition, the best exhibitors being Mr. Bullock, Mr. A. Cryer, and Mr. H. F. Keep.

Local and amateur classes were provided with a liberal hand, and there were some good exhibits in the Japanese and decorative classes, whilst in that for twelve vases for market varieties, Mr. Norman Davies, Framfield, scored with some splendid bunches of very serviceable kinds, such as True Gold, Black Prince, Christmas Gift, Felton's Favourite, and others of a like character. Mr. Davis's exhibit of a group of cut chrysanthemums, Japanese and incurved, arranged with ferns and foliage on table space 18ft. by 5ft., was awarded a first prize, which it richly deserved. Beautiful flowers of Thomas Lunt, His Majesty, a new mahogany-crimson variety, Amber Queen, and other Japanese were well supported by Clara Wells, H. W. Thorpe, Romance, and other good incurves. A challenge shield accompanied the cash prize of £8 for this exhibit.

### FRUIT.

There was abundant evidence from the manner in which visitors lingered around the fruit exhibited that its attractions were almost, if not fully, as great as were those of the floral and purely ornamental exhibits, and the trade exhibitors who put up their exhibits for commercial purposes appeared to be meeting many people who were prepared to do business. The most attractive class was one for a 10ft. by 5ft. table of British-grown fruit, including grapes, the principal winner being Mr. Geo. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury. Mr. Mullins had some beautifully coloured bunches of grapes, including Gros Maroc, Gros Colmar, Alicante, and Muscat of Alexandria. The bunches, although not extremely large, were beautifully balanced, and carried in every instance most perfect bloom. Some melons and quite a collection of the best dessert apples and pears made up the stand, which was decorated with small plants, autumn foliage, and rowan berries.

A table of hardy British-grown fruits found Mr. E. Parry, gardener to Sir R. L. Lucas Tooth, Bart., Holm Tracey, Hereford, at the top of the list. The space occupied was 12ft. by 8ft., affording room for a goodly number of dishes, and there were splendid examples of Doyenne du Comice, Beurré Diel, Beurré Hardy, Beurré Berkmans, and other pears, many kinds of apples, and such things as medlars, walnuts, white currants, and Coe's Golden Drop plums.

Mr. Mullins, Eastnor Castle Gardens, led the way with six bunches of grapes, showing Muscat of Alexandria of rich amber colour and good size. Black Alicante and Gros Maroc were the black varieties shown. Mr. J. R. Tooley followed for second place. Mr. Tooley's three bunches of Black Alicante were awarded first in their class, Mr. Mullins taking second place, but leading again in the whites, Mr. Henry Taylor, gardener to the Right Hon. Lord Hatherton, Teddesley Park, Penkridge, following.

### MISCELLANEOUS PLANTS AND FLOWERS.

Messrs. Young and Co., Cheltenham, took first prize for a collection of perpetual-flowering carnations, the quality of the flowers, selection of varieties, and blending of colours being worthy of the award; second prize winner in this class was Mr. Mortimer, Farnham. Mr. John Farmer, gardener to L. Spiers, Esq., Edgbaston, had the best dozen plants of Begonia Gloire de Lorraine, and nice stocky plants they were, literally smothered in bloom; second prize went to Mrs. R. Peyton, Edgbaston, whose plants were well flowered, but not so nicely trained. Mr. Foster's six plants were even better specimens than his dozen. Some really good cyclamen were shown by the Rev. H. Buckston, Sutton Hall, Derby, most of the flowers being of the fringed or crested type. Pink, white, salmon, and crimson were all good, and the foliage was attractively marbled.

### TABLE DECORATIONS.

There was a class for dinner table decoration on an 8ft. by 4ft. table, and there were no less than nineteen entries, occupying the whole width of the hall, standing side by side with just a pathway between each pair. The judges must have had a very difficult task to pick out the winners, but the table arranged by Mr. J. V. MacDonald, gardener to Sir C. H. Kenrick, Edgbaston, was awarded first. Bronze-crimson chrysanthemums, selaginella, and croton leaves were used with good taste. Mrs. Batchelor, Hampton-in-Arden, used a single yellow chrysanthemum with trails of ampelopsis and small sprays of maidenhair fern. Her effort was rewarded with second prize; whilst Mrs. Greaves, Wormington, took third with a prettily-coloured single chrysanthemum in a lilac shade.

### VEGETABLES.

The whole of the vegetable classes were provided by various seed firms, and, taking the exhibits all round, they made a big and very meritorious display. The biggest array was to be seen in the classes provided by Robert Sydenham Limited, Birmingham, the exhibits in which occupied table space from one end of the hall to the other. In the open class for a collection of nine varieties there were six entries, the winner among whom was Mr. Thomas Jones, Bryn Penylan, Ruabon, followed by Mr. J. White, Bampton, Oxon. In the local class, restricted to a seven-mile radius of Birmingham, there were seven entries, the winner being Mr. E. Deakin, Hay Mills, Birmingham; Mr. F. Whitbread, Yardley, coming second.

Other classes were provided by Messrs. Sutton and Sons, Reading, who had ten entries in their class for nine dishes. The winner was Mr. E. Beckett, Aldenham House, Elstree, who showed in his own inimitable style produce of high excellence. Second prize went to Mr. J. Hudson, Leicester; and third to Mr. J. F. Barratt, Overton. Messrs. Dickson and Robinson's prizes were offered for exhibits of nine Premier onions, won by Mr. Thomas Jones, Ruabon, his bulbs being perfect specimens. Other classes for Moneymaker tomato and Exhibition leeks were also won by Mr. Jones; carrots being won by Mr. E. Winchester.

Messrs. Webb and Sons' collection brought nine good entries, the winner being Mr. J. F. Barratt, Overton, his carrots and parsnips being extremely good both in type and colour. Mr. J. Hudson, Leicester, second, and Mr. H. Andrews, Toddington Manor, Winchcombe, third. In all the exhibits it was noticeable that the potatoes and the Brussels sprouts were very strong points, whilst most of the exhibitors also staged good dishes of Webb's Emperor tomato.

### NON-COMPETITIVE.

The non-competitive exhibits added greatly to the extent and interest of the show, being as varied in character as they were excellent in quality. One of the first of the stands to attract attention was that put up by Messrs. Dickson and Robinson, Manchester, who made a bold and striking display of the newer perennial asters, together with tall stands of single and decorative chrysanthemums. The group was arranged upon the ground, the many varieties and extensive range of colours in both the subjects named being so displayed as to show to great advantage both their individual merits and a charming gradation of colours. Messrs. Clibrans' winter-flowering begonias, arranged on a table, were so brilliant in colour as to immediately arrest attention, and one heard spontaneous exclamations of delight from visitors on all hands.

From Messrs. E. Webb and Sons, Wordsley, put up in their accustomed style, a stand of finely-grown vegetables, celosias, begonias, and cut flowers of chrysanthemums being used to set off the exhibit. Another excellent display of vegetables came from Messrs. W. H. Simpson and Sons, Birmingham.

Conifers and shrubs have always been well shown at Birmingham, and once more capital exhibits were staged by Messrs. J. Waterer and Sons, Lim., Bagshot; Messrs. Bakers, Wolverhampton; and Messrs. Hewitt and Co., Solihull.

Among the exhibitors of large-flowering chrysanthemums, Mr. H. Woolman, the local grower, staged an exhibit of high-class flowers, the satin-pink flowers of Miss Cora Stoop, the deep-tinted Pockett's Crimson, and a big stand of White Queen making a trio of distinct and very pleasing varieties. The biggest flowers in the show were artistically arranged by Messrs. W. Wells and Sons, Lim., Merstham. Their blooms of Queen Mary were of immense size, but full of refinement, other good ones being Mrs. Lloyd Wigg, Mrs. G. Drabble, and a most charming new variety named Mrs. Drexel. This is a delicate satin-pink of very pleasing form and all-round excellence. Singles of good colours were plentifully used to advantage as a setting to the big blooms.

Mr. W. J. Godfrey, Exmouth, had a nice lot of flowers, the crimson and bronze shades being intermixed with yellows. Godfrey's Success, an improved form of Bessie Godfrey; Mrs. N. Molyneux, a soft amber, overlaid with carmine; and Frank Molyneux, a very promising crimson, were all excellent. Pelargoniums were also shown by Mr. Godfrey, Scarlet, Captivation, vivid orange scarlet; His Majesty, rich crimson, being a few among the many good sorts.

King's Acre Nurseries, Lim., Hereford, were large exhibitors of fruit. The centre of their stand was occupied by tall epergnes, furnished with beautifully-coloured apples and pears, whilst piled-up baskets of both dessert and culinary apples were set up in great numbers. It is sufficient to say that few really good varieties were missing from the collection, the quality of the fruit being superb. Mr. C. W. Powell, Warham, showed packed boxes of apples, the boxes containing an average of forty pounds of picked fruit. It was a very good exhibit, bearing testimony to the fact that our agriculturists—Mr. Powell is a farmer—are entering thoroughly into the spirit of high-class culture and careful handling of fruit. The Herefordshire Fruit Growers' Association were large exhibitors, but their packing left room for improvement, and it seemed to us that the use of blue paper considerably detracted from the colour of the fruit. Still another exhibit of apples was brought by Messrs. Pewtress Brothers, Tillington, Hereford, Cox's Pomona, Adam's Pearmain, and other choice dessert varieties being of good quality. A long length of tabling was filled with choice ferns by Mr. H. N. Ellison, West Bromwich, who showed also hybrid gerberas and bowls of lily of the valley. A perfect blaze of colour was produced by a big batch of Begonia Ideal, one of the most attractive of the winter-flowering hybrids exhibited by Mr. Arthur Shambrook, gardener to Rev. Henry Buckston, Sutton Hall, Derby.

### SUNDRIES.

There were a number of elaborate exhibits of all manner of garden requisites, prominent among which was a big display of useful articles arranged by Messrs. Robinson Bros., Lim., Ryders Green, West Bromwich. Their recently-introduced liquid insecticide or soil steriliser was one of the principal lines. Pine Spray Fluid, Carmona Fertilisers, and many other excellent preparations were on view, as well as Alpha spraying machines. The Four Oaks Spraying Machine Company, Sutton Coldfield, had not only their knapsack machines, but also a variety of tank machines, including some on wheels with attachments to meet the requirements of hop and potato growers, as well as for orchard work. The well-known undentable syringes in various patterns were likewise displayed.

Messrs. Wm. Wood and Sons, Lim., Wood Green, London, had what may be described as an all-round collection of gardeners' requirements, ranging from peat and loam to highly-concentrated chemical manures and insecticides, also from twine and stakes to high-class cutlery. Hagon's moth trap, exhibited on this stand, received a special Certificate of Merit.

Mr. A. Edwards, Arnold, Nottingham, showed examples of his Edwardian ware, which, tastefully furnished with single chrysanthemums and perpetual carnations, made a cheery display, and demonstrated their value as suitable receptacles for these and similar flowers. The Patent Safety Ladder Company, Peterborough, showed their adjustable ladders, which are so admirably adapted for use in fruit gathering, pruning, and creeper training operations.

### AWARDS.

Large Gold Medals.—Messrs. Waterer, Lim., Bagshot, Surrey; Messrs. Webb and Sons, Stourbridge; Messrs. Clibran and Sons, Altrincham; The King's Acre Nurseries, Hereford; Messrs. Dickson and Robinson, Manchester; the Rev. Buckston, Sutton Hall, Derby.

Small Gold Medal.—Mr. W. J. Godfrey, Exmouth; Messrs. Hewitt and Co., Birmingham; Hereford Fruit Association; Messrs. Pewtress Bros., Tillington, Hereford; Mr. C. W. Powell, Warham; Messrs. Wells and Co., Merstham; Mr. H. Woolman, Shirley, Birmingham; Messrs. Wood and Sons, Wood Green, London.

Silver-gilt Medal.—Messrs. Dickson and Robinson, Manchester; Mr. H. N. Ellison, West Bromwich; Messrs. Simpson and Sons, Birmingham; and Messrs. Thomson and Co., seedsmen, Birmingham.

Silver Medal.—Messrs. Bayliss and Co., Birmingham; Messrs. Bakers, Wolverhampton; Messrs. Hewitt and Co., Birmingham; The Patent Ladder Company, Peterborough; Messrs. J. Peed and Son, West Norwood; Messrs. Robinson Bros., West Bromwich; Messrs. Turton and Co., Greet, Birmingham; Miss Thompson, Sparkhill; and Messrs. White and Co., Worcester.

First-class Certificates (new chrysanthemums).—Mr. W. J. Godfrey, Exmouth, for Crimson Velvet, Godfrey's Success, and Mrs. N. Molyneaux; Messrs. Wells and Co., Merstham, for Mrs. Drexel and Owen May; Mr. Norman Davis, Framfield, for His Majesty (Japanese) and Mrs. Geo. Thomson (single).

## Torquay Chrysanthemum Show.

The chrysanthemum show of the Torquay District Gardeners' Association was held on October 31 in the large hall of the Bath Saloons, Torquay, and was in every way a very successful exhibition. The entries were even in excess of those of last year, which constituted a record, and the plants and flowers shown were particularly fine, while the competition was exceptionally keen, and in many cases there was little to choose between the first and second prize winners.

The prize for a group of chrysanthemums in form of a semi-circle, 9ft. across, was won by Mrs. Lyon, who also took the National Chrysanthemum Society's Certificate, with a splendid collection of immense blooms, many of which would have easily qualified for the show board. The second prize set, from Mrs. Richardson, was very little inferior. In the class for a group of single chrysanthemums, first prize was won by Mrs. Lyon, with a mass of beautiful plants fully 10ft. high, topped by a tall palm. For six trained chrysanthemums Mrs. Lyon won the first prize with very large and well-flowered plants, and in the class for three trained chrysanthemums, singles, she was again to the fore with good plants. For six flowering table plants first prize was won by Colonel Cary, and first prize in the class for six foliage table plants was won by Dr. Quick. First prize for three flowering table plants was won by Dr. Quick, and that for three foliage table plants by Dr. Leon. The first prize for six winter-flowering begonias was won by Mr. H. G. Cumming, and that for three solanums by Dr. Leon.

The cut blooms were of a very high order of merit, and were far larger and more perfect than those exhibited last year. The leading prize for twenty-four Japanese was won by Mrs. Lyon, who also obtained the prize for the best bloom in the show. First prizes were also won by Mrs. Lyon for eighteen Japanese, for twelve Japanese in vases, for six Japanese, yellow; for six Japanese, any colour; for six vases of single chrysanthemums, and for six Japanese, distinct; while Colonel Cary won first prize for six Japanese, white. For a vase of cut chrysanthemums, double, first prize was won by Mr. F. Perrett, and for a vase of single chrysanthemums first prize went to Mr. W. H. Veale, and for a basket of wild flowers and foliage, first prize was won by Mr. F. Perrett.

The class for table decorations attracted six entries, and the first prize was won by Mr. H. Damarell with a very light and graceful arrangement of small bronzy-red chrysanthemums and grasses. In the artisans' and cottagers' classes, first prize for six Japanese blooms was won by Mr. J. B. Daniels, who also took first prize for two dishes of apples. In vegetables Colonel Cary was to the fore, winning eight first prizes, but Mr. P. P. Alexander took first prize for a collection of twelve varieties. In the fruit classes Mr. P. P. Alexander took seven first prizes, and Colonel Cary six.

The exhibits of nurserymen added materially to the attractions of the show. The Devon Rosery, Torquay, furnished a very beautiful stand, with hundreds of cut roses, of great excellence, considering the lateness of the season, and numbers of cut carnations. They also showed Citrus sinensis in fruit, Cocos Weddelliana, Geonoma gracilis, Phœnix Roebelini, Nerine Bowdeni, Erica nivalis, E. autumnale gracilis, E. caffra, Pandanus Veitchi, tuberoses, Lilium longiflorum, crotons, Nephrolepis compacta, quantities of Begonia Gloire de Lorraine, Turnford Hall and B. Rothschild, with numbers of chrysanthemums. Their display of fruit was magnificent, over fifty dishes of superb apples being staged.

Messrs. Robert Veitch and Son, Exeter, had an interesting collection of plants, among which were Eugenia Ugni, Grevillea longifolia, Apera arundinacea, Jasminum nudiflorum, Pernettyas, Potentilla fruticosa, Plumbago capensis, Physalis alkekengi, P. Bunyardi, Liquidambar stryraciflua, Clematis Nellie Moser, Coronilla pygmæa, Acacia platyptera, Pentstemon heterophyllus, Berberis Wilsoni, Brachysema acuminata, Gnidia carinata, Primula malacoides, Acacia ovata, Symphoricarpus occidentalis, covered with white berries, Rhapiolepis Delacouri, Stransyasia undulata, Pancratium macrostephana, and numbers of winter-flowering carnations.

Mr. W. B. Smale, Torquay, staged Chinese primulas, cinerarias, Æschyanthus pulcher, pelargoniums, florists' abutilons, Cytisus racemosus, Salvia fulgens, dracænas, and chrysanthemums, among which were the new Mrs. M. Brockman, bright pink, and Harry Wood, crimson-scarlet. Messrs. Burridge and Sons, Torquay, showed Lilium speciosum rosea, ericas, spiræas, and a collection of chrysanthemums, while Mr. R. W. Hodder, Torquay, had some very fine cyclamen.

## Portsmouth.

OCTOBER 30, 31, and NOVEMBER 1.

The twenty-sixth annual autumn display was held in the Town Hall, and was quite one of the best of the series. Cut blooms were numerous and of excellent quality, and groups of chrysanthemums were a strong feature, adding much to the attractiveness of the display. Fruits and vegetables were abundant, and trade displays were prominent and excellent in their composition. The arrangements were of the best order in the hands of Messrs. Gill and Terry, the secretaries, and an influential committee.

Cut blooms were well provided for in seven open classes, as well as an adequate number for growers in Portsea Island only.

For thirty-six Japanese in not less than eighteen varieties and not more than two of any one variety, a silver cup value £20, with substantial money prizes, was offered, which brought out eight competitors. Mr. W. Baxter, gardener to Captain Dalgety, Lockerby Hall, Romsey, was easily first with a set of remarkable flowers, large, richly-coloured, and effectively staged. Some of the finest varieties were F. S. Vallis, Hon. Mrs. Lopes (extra fine), G. Hemming, Kara Dow (deep and attractive in colour), White Queen, D. B. Crane, Master James, W. A. Etherington, Mdme. G. Rivol, Eclipse, William Turner, and Colonel Lawrence. Mr. A. E. Usher, gardener to Sir R. Baker, Bart., Ranstone, Blandford, was second, with smaller, uneven blooms; Kara Dow, Mrs. A. T. Miller, W. Rawlings, Mrs. G. C. Kelly, and the Hon. Mrs. Lopes were the most striking. Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, third.

In a class for two dozen Japanese, five entered, the best coming from Mr. Martin Silsbury, Shanklin, Isle of Wight, and naturally his was an interesting exhibit, containing many of the newer sorts, such as Fred Green, a rich velvety-purple colour; White Queen; Thomas Lunt, a huge crimson flower with gold reverse to the broad florets; Queenie Chandler, soft primrose; Mrs. Gilbert Drabble, marble white, said to be one of the largest varieties in cultivation; Queen Mary, white, flushed with blush; F. T. Mew, rich wine-crimson; Japan, with incurving florets, deep yellow with an orange suffusion. The second award was made in favour of Mr. Hunt, who had smaller but handsome blooms of Mrs. G. C. Kelly. Mr. H. Herbert, gardener to Sir F. Fitzwygram, Leigh Park, Havant, third.

For twelve Japanese, distinct, five competed, and with a bright set Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Moreton House, Martyn Worthy, Winchester, won easily with high-class specimens of Master James, Frances Joliffe, the Hon. Mrs Lopes, and Maud Williamson (deep rose with silver reverse). Mr. Edwards, gardener to W. Garton, Esq., Sarisbury Court, Southampton, second. The last-named annexed the premier award in a combined class for a dozen Japanese, and as many incurved blooms with an even set; Mr. Herbert following closely.

Incurved blooms were not numerous, owing to the early date. Mr. G. Hunt was first for twenty-four with a surprisingly good set of such sorts as Romance, C. H. Curtis, Buttercup, Frank Trestian, Calypso, Triomphe de Montbrun, and the newer Mrs. Percy N. Wiseman. Mrs. Marsh won with twelve specimens, incurved, with huge flowers, quite on the side of coarseness; Mr. Edwards second with smaller, more refined specimens. Single-flowered varieties were remarkably well staged. Six competed in the class for six bunches, distinct, and Mr. Marsh led with an unnamed set of high quality flowers; Mr. C. Johnson, 10, Garner Street, Southsea, coming second.

Local classes were well filled. For twelve Japanese, distinct, Mr. F. Hope Terry, 139, Francis Avenue, Portsmouth, was easily first with handsome flowers. Mr. C. White, Garden Terrace, Southsea, won in the incurved section with medium-sized blossoms. Pompons were well staged, as they usually are here, by Mr. H. Snook, 52, Fitzroy Street, Portsmouth.

Plants were plentiful, especially in the group classes. The chief of the latter was one to occupy a space of 60 square feet, for which a silver cup was offered. Five competed, the premier award going to Mr. R. Burridge, Portsmouth, for dwarf plants, neatly arranged, and carrying fairly good blossoms; Mr. J. Jeffreys, 37, Clarence Parade, Southsea, was second with much finer flowers, but a faulty arrangement. In a smaller class Mrs. Hope Terry won a silver cup with a meritorious arrangement of well-grown plants; Mr. C. White second.

Mr. Papworth, gardener to the Parks Committee, arranged the best group of miscellaneous plants, his crotons, palms, ferns, chrysanthemums, primulas, etc., having an effective edging of Primula obconica of varied colours. Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was easily first for table plants.

The most tastefully arranged dinner-table was carried out in chrysanthemums, Mary Richardson (bronze) and Kitty Bourne (yellow), with bronze-tinted selaginella and asparagus, from Mrs. Rapley, Warblington, Havant. Mrs. Sturt, Stanstead Park Gardens, won for a basket of chrysanthemums and foliage, with an arrangement that left little to be desired.

Fruit was not largely shown, but it was good. Mr. Baxter, in a stiff competition, won for two bunches of grapes with Muscat of Alexandria. Mr. Ellwood had the best six dishes of apples, and Mr. G. Hoare, Woodfield, Havant, won for six dishes of pears.

Vegetables were fine. In one class, that for Messrs. Toogood's prize for six kinds, Mr. G. Hoare, Woodfield, Havant, was placed first with poor celery, leeks but nine inches long, onions three inches in diameter, and small tomatoes, but he had good cauliflowers and good King Edward potatoes. Mr. Ellwood was placed second with leeks fifteen inches long, good cauliflowers, superior celery, Ailsa Craig onions five inches in diameter, good tomatoes, and moderate potatoes. The judging in this class met with much criticism during the day. Mr. Ellwood was easily first for six dishes in the classes provided by both Messrs. Sutton and Sons and Messrs. E. Webb and Sons.

Among trade exhibits Messrs. Sutton and Sons, Reading, had an extremely good display of vegetables, consisting of about eighty dishes. The Barnham Nursery Company had three dozen dishes of excellent apples and pears.

## Bournemouth.

NOVEMBER 5 and 6.

The twenty-sixth annual exhibition of autumn flowers, fruits, and vegetables was held in the spacious winter gardens pavilion on the above dates. Sir Albert Rollit, president of the National Chrysanthemum Society had promised to formally open the show, but, unfortunately, illness prevented him being present. Sir Daniel Morris, V.M.H., F.R.H.S., president of the Bournemouth Horticultural Society, expressed, on behalf of Sir Albert Rollit, great regret that he was unable to attend. He also stated, at the opening ceremony, that Sir Albert had presented a medal to be awarded to the most meritorious exhibit in the show, and it had been won by Mr. Tooley, gardener to Hugh Andrews, Esq., who staged some wonderfully fine vases of chrysanthemums in a very effective manner. The Mayor of Bournemouth, in the place of Sir Albert Rollit, opened the show, and emphasised what Sir Daniel Morris had said relative to the excellence of the products, the greater proportion of which were locally grown. Orchids alone were scarce, on account of the great orchid show in London drawing to it many of the large growers.

### GROUPS.

Six large groups were arranged, consisting of miscellaneous plants and cut flowers. Mr. Usher, gardener to Sir Randolf Baker, Bart., was the winner, once more securing the silver challenge cup offered by G. H. Rolls, Esq., J.P., vice-chairman of the council. Palms, poinsettias, oncidiums, cattleyas, and crotons

NEWS FROM HEADQUARTERS.
WEEK BY WEEK.

Were the founders of our old-established city firms to come back to life and pay a visit to the scenes of their enterprises, what of all the latter-day changes would most surprise them ?

Possibly the marvels of the telephone; possibly the clattering typewriting machines or the wonders of the electric appliances; but, most probable of all, the "office-gardens"—the gay bowls and shapely glasses of delicately-scented hyacinths, nodding daffodils and graceful narcissus, presenting so daring a relief to the sombre atmosphere of the offices.

And if it be true that the spirits of our ancestors attend our Yuletide festivities, what must they think to see, in the depth of winter, windows, odd corners, and feast-laden tables beautifully decorated by a brave show of Lily of the Valley and Roman Hyacinths ?

For winter is no longer blossomless. Be the world outside never so barren, unpromising, or heavy with gloom, we may yet have the golden glory of the daffodil, the waxen beauty of the hyacinth, and the graceful charm of the narcissus, throughout the dreary months to Easter!

Twenty-five years ago Messrs. James Carter and Co. received from their China agents the first parcel of the Chinese Sacred Lily. This happy chance was the birth of Indoor Gardening, the Chinese Sacred Lilies doing so well in drainless bowls that experiments were undertaken, and to-day we have a list of Daffodils and Narcissus which give a home-beautifying hobby which every autumn finds its captivated followers vieing with each other to possess the most beautifying display of blossoms.

An almost inexhaustible variety of artistic bowls and glasses for indoor gardening attracts the admiring visitor to Raynes Park; and courteous members of the staff give him in a nutshell the whole of the fascinating story of indoor gardening.

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
Raynes Park, London, S.W.

were prominent in this group. Mr. Barrett, late secretary of the society, was a close second, having grandly-grown chrysanthemums and palms, set in cork pockets, crotons, dracænas, and a groundwork of ferns. Third honours went to Mr. Bridle, gardener to Lord Alington, who staged a lovely group containing cattleyas, carnations, begonias, and Francoa ramosa. This was very lightly arranged, and most effective. Mr. Evans, gardener to G. J. Fenwick, Esq., was a good fourth. The group arranged by Messrs. G. Watts and Sons, Limited, was also very attractive, and contained some lovely fresb plants of liliums, crotons, and chrysanthemums.

### CUT BLOOMS.

Mr. J. Stevenson, gardener to G. Mocatta, Esq., Woburn Place, Surrey, won easily in the class for twenty-four cut blooms on boards, not fewer than eighteen varieties. His blooms were: W. Turner (2), Mrs. R. A. Witty, Hon. Mrs. Lopes, F. S. Vallis (2), Queen Mary (2), Master James (2), William Gee, Thomas Lunt (2), Madame G. Rivol, Queenie Chandler, Frances Jolliffe, Frances Rowe, Fred Chandler, His Majesty, Lady Talbot (2), W. Mease, Miss A. E. Roope. The same exhibitor scored in the class for twelve Japanese incurved cut blooms on boards, having massive and fresh specimens of William Turner (2), Mrs. A. T. Bott, Willie Rawling (2), Mrs. W. Iggulden, Madame G. Rivol (2), Miss A. E. Roope, and Queen Mary. Mr. Usher was second, W. Rawlings, W. Turner, G. Mileham, 1908, and Madame R. Radaelli, being good. Mr. J. Stevenson, Wimborne, was a close third. As previously stated. Mr. Tooley won in the class for nine Japanese cut blooms in vases. He had massive, well-coloured ones of F. S. Vallis, Master James, Lady Talbot, Madame G. Rivol. Purity. Mrs. Mease, Hon. Mrs. Lopes, O. H. Broomhead, and Frances Jolliffe, all well set up. Mr. J. Stevenson was second. Mr. Kitcher, gardener to Major Wyndham Pain, had the best two vases of nine blooms in a vase, one variety in each, Reginald Vallis and Mrs. R. H. B. Marsham respectively. Mr. Cox, gardener to E. G. Duberley, Esq., being second.

Mr. Galpin, gardener to Mrs. Telfer, won in the class for six vases, distinct, Master James and R. Vallis being good; Messrs. J. H. Piggot and E. G. Cox being second and third respectively. Mr. Barrett, gardener to E. Howard May, Esq., had the best three bush plants; Mr. Evans was a close second. Singles in vases were lovely. Mr. C. Honey, gardener to J. T. Rayner, Esq., staged fine flowers; Mr. Burge, gardener to Rev. C. H. Burrows, was a close second, with lovely clean specimens; Mr. Galpin came third. The last-named scored in the class for six vases of undisbudded singles. Mr. Kitcher won in the class for twelve blooms on boards, not fewer than eight varieties; White Queen and Pockett's Crimson were really grand in this stand.

### TABLE DECORATIONS.

Twelve table decorations were in competition, the prizes going to Mrs. Cape, Messrs. J. H. Cape, Burge, and Geo. Garner respectively. The last-named won in the classes for shower bouquets and ladies' sprays.

### FRUIT.

Fruits were good, and extensively shown, nearly fifty bunches of grapes being staged. Messrs. Tooley, Garner, and Barrett being the chief prize-winners in the five classes. The bunches were of high quality. Mr. Usher had the best four dishes of pears, Mr. T. Stevenson was second. The last-named had the best four dishes of apples.

### VEGETABLES.

In the principal classes for collections Mr. Usher was invincible, putting up wonderfully fine leeks, celery, onions, and cauliflowers.

The amateurs' and children's sections were well filled, competition throughout being keen.

### NON-COMPETITIVE.

Gold Medals were awarded to Messrs. Stuart Low and Co. for carnations and orchids; and to Walter Child Clarke, Esq., for orchids and begonias.

Silver Medals.—To Mr. V. Slade, for zonal pelargoniums; to The Winter Gardens Management, for chrysanthemums and miscellaneous plants; to Messrs. Toogood and Sons, Southampton, for onions and marrows; to Mr. Welch, Park Nurseries, Bournemouth, for fibrous begonias and ericas; and to the Christchurch French Gardening Company, for vegetables and salads.

Highly Commended. — Messrs. Jarman and Co., for apples; Mr. J. Stevenson, for chrysanthemums; and Mr. Ingram, Parkstone, for miscellaneous plants.

## Southampton Horticultural Society.

NOVEMBER 5 and 6.

In the Coliseum the annual autumn show was held, and proved a success. Entries were fairly numerous. Cut blooms were well shown, and, as usual, the arrangements were of a satisfactory nature.

### PLANTS.

For a group of decorative, single, and other chrysanthemums, arranged with palms, ferns etc., there were no entries. For six plants, with not less than five blooms on each, suitable for conservatory decoration, Mr. C. Hosey, gardener to J. C. E. D'Esterre, Esq., Elmfield, Southampton, was first of three competitors, with well-flowered examples of popular varieties; Mr. F. G. Bealing, Bassett, second. Single-flowered varieties were provided for at Southampton in six varieties, the best coming from Mr. Allan Cooper, 115, Hill Lane, Southampton, an amateur —a remarkably fine exhibit of freely-flowered plants; Mr. Bealing, florist, second. Bush-grown plants were best shown by Mr. Hosey, who won for four varieties in quite an easy manner.

### CUT BLOOMS (OPEN).

In competition for twenty-four, in eight varieties, of Japanese blooms, three of each, to be staged in vases, Mr. W. Hall, gardener to Major Chichester, Embley Park, Romsey, was first, with full, solid blooms, well displayed, of such varieties as Mrs. L. Thorn, Frances Joliffe, Master James, F. S. Vallis, and W. Turner; Mr. C. Hosey second. The best vases of two white varieties, in an entry of four, came from Mr. W. Hall, Mrs. A. T. Miller and W. F. Lever were well represented; Mr. Hosey was here again second. In a class for three vases of any two varieties other than white, Mr. W. Hall followed up his previous successes by winning the premier prize with Lady Talbot and D. B. Crane.

Decorative varieties were provided for in a class for four distinct kinds, in sprays of not less than three blooms, excluding singles. Five competed, and the several arrangements made an interesting class. Mr. Bealing was first with a really fine display, Cannell's Late, Freda Bedford, Market Red, and Louise d'Or were capitally represented; Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, second. In competition for the six vases of single-flowered varieties, distinct, to be shown disbudded, there were four entrants, the best coming from Mr. Bealing, who staged grandly-developed blooms of popular varieties; Mr. A. J. Marsh, gardener to M. Hodgson, Esq., Moreton House, Kingsworthy, Winchester, second.

A class was provided for three Japanese, incurved, anemones, or singles, arranged in a space 6ft. by 6ft., any foliage plants with a centre palm being allowed. Quality and effective arrangement were considered the leading features, and Mr. Bealing was the only exhibitor, and had an interesting display. Six vases of undisbudded single varieties were best shown by Mr. C. Dymott, Freemantle; Mr. A. J. Marsh a close second.

Cut blooms arranged on boards had seven classes allotted them, the leading one being for twenty-four Japanese in not less than sixteen varieties, or more than two of any one variety. There were four competitors, and Mr. W. Baxter, gardener to Captain F. G. Dalgetey, Lockerley Hall, Romsey, was an easy first, staging fully-developed blooms of F. S. Vallis, D. B. Crane, Lady Talbot, and Master James; second, Mr. W. Hall, with much smaller flowers. The best twelve Japanese, distinct, came from Mr. D. Edwards, gardener to W. Garton, Esq., Sarisbury Court, Southampton; and Mr. T. Hall, gardener to Ellen Lady Swaythling, South Stoneham House, second.

Incurved varieties had one class set apart for them, and this was for eighteen blooms in not less than twelve varieties. Mr. A. J. Marsh obtained the premier award with C. H. Curtis, Mrs. G. Denyer, and Romance were of high quality; Mr. Edwards second. The premier incurved bloom in the show was C. H. Curtis, from Mr. A. J. Marsh, a really good specimen of that old and still popular variety. Mr. W. Hall secured a like position in the Japanese section with a handsome specimen of A. Turner.

### LADIES' CLASSES.

The most elegant stand of chrysanthemums arranged with autumn foliage, etc., was one from Miss M. Snellgrove, London Road, Southampton—quite an effective effort; Mrs. E. Ladhams, Shirley, second; six entries. Baskets of autumn leaves, berries, etc., were numerous, the best coming from Mrs. Bealing; Miss Taylor, Bemerton Rectory, Salisbury, second.

### FRUIT.

Fruit was plentiful and good. The first prize for black grapes was won by Mr. W. Hall, who had Appley Towers in fine condition, a like honour falling, in the class for any white grape, to Mr. W. Baxter, who staged Muscat of Alexandria in remarkably fine condition. Dessert apples were numerous, and for four varieties Mr. T. Hall won with really typical examples of what dessert fruit should be. The premier award for four dishes of kitchen apples fell to Mr. D. Edwards. The leading award for pears in four sorts went to Mr. W. Hall; Mr. T. Hall second.

### VEGETABLES.

These were best shown by Mr. G. Ellwood, who won the premier award in Messrs. Toogood's class for six dishes, seven competing, and also for Messrs. Sutton and Sons' class for six dishes with excellent examples of cauliflowers, leeks, celery, carrots, and potatoes; Mr. H. Keep, Cottages, Aldermaston, Reading, second in Messrs. Sutton's class. Messrs. J. Carter and Co., London, had a remarkably fine display of vegetables, not for competition.

## ANSWERS TO CORRESPONDENTS.

WM. KENT AND LANDSCAPE GARDENING.—D. F. D., Southport: I have read somewhere that Kent was the father of landscape gardening. Will you kindly explain this statement?—William Kent, who died in 1748, and was buried at Chiswick, was a contemporary of Horace Walpole. He found gardens laid out and planted in a very formal and artificial manner, topiary at its height, and water made to flow between rigidly straight banks. In Walpole's words, Kent was "painter enough to taste the charms of landscape, bold and of opinion alive enough to dare and to dictate, and born with a genius to strike out a system from the twilight of imperfect essays. He leaped the fence, and saw all nature was a garden. Thus the pencil of his imagination bestowed all the arts of landscape on the scenes he handled. But of all the beauties he added to the face of this beautiful country, none surpassed his management of water. Thus, dealing in none but the colours of nature, and catching its most favourite features, men saw a new creation opening before their eyes." Stowe, Claremont, and Holkam are among the places where Kent exercised his genius. Kent, Bridgman, Pope, and Addison have been styled the fathers of landscape gardening, as they successfully fought against the rigid formalism of the gardening seen in their earlier years.

YELLOW DESSERT PLUMS.—P. G., Abergavenny: Please give me the names of the best yellow dessert plums.—The following are all good yellow or yellowish dessert plums: Coe's Golden Drop, Bryanston Gage, Oullins Golden, Jefferson, Transparent Gage, and Washington.

OOLITIC ROCK.—M. L. D., Clifton: A few days ago I was told that some material I had always regarded as limestone was oolitic rock. I did not wish to confess my ignorance to the person who gave this information, but I should be glad if you will tell one of your regular readers just what oolitic rock is.—Some rocks, particularly some limestones, are composed of rounded particles, varying in size like mixed beads, but rarely exceeding the size of a pea. These particles generally consist of a grain of sand or bit of shell, around which some other substance has accumulated. In the case of oolitic limestone the bits of grit have become covered with layer after layer of carbonate of lime until the Oolites have formed. Another name for Oolites is Roestones, because of the resemblance small granules bear to the hard roe of a fish.

BEURRE CLAIRGEAU PEAR.—F. N. C., Brimscombe: I have a fine old tree of Beurre Clairgeau pear, and it generally bears well. Can you give me any information concerning the history of the variety?—Beurre Clairgeau pear was raised by M. Clairgeau, a gardener at the Rue de Bastille, Nantes. The variety was distributed by M. de Jonghe, of Brussels, who purchased the original tree in the early part of the nineteenth century.

HARDY EUCALYPTUS.—L. O., Brentwood: Are any species of eucalyptus hardy in this country; and, if so, will you kindly name them in the GARDENERS' MAGAZINE?—None of the species of eucalyptus can be considered really hardy in this country. Some few will thrive in very sheltered positions in favoured districts, but even then very severe weather may kill a big plant right out or cut it back to the ground. We have seen E. globulus reach a height of 25ft. at Wimbledon, but a severe winter killed it. In Cornwall and South Devon, and in some parts of Ireland, eucalyptus will assume considerable proportions, but they usually succumb after a few years to the cold and wet of our winters. As far north as Prestonkirk, at Whittinghame, the residence of the Right Hon. A. J. Balfour, M.P., we saw a very fine eucalyptus tree a few years ago, with trunk several feet thick. This particular plant has been referred to as Eucalyptus urnigera, but it is supposed to be a natural hybrid, and so has been named E. Whittinghami. Seedlings of this form have been planted freely on the estate, and no kind has proved so hardy. Eucalyptus coccifera, E. urnigera, and E. Gunni, with E. Whittinghami, are the hardiest known kinds, but, as already stated, their hardiness depends upon district, position, and the clemency of the winters.

HORSERADISH.—B. G., Bexley: We have a very large demand for horseradish, and the powers that be require the sticks to be as large as possible. By the fuss that is made one would imagine horseradish was to be served up like salsify or scorzonera. In the ordinary course of things horseradish is easily enough grown, but I want to do something better than ordinary, and so seek your advice.—Thoroughly trench a plot of ground that can be spared, and place a good layer of manure in the bottom of each trench. As soon as the soil has settled sufficiently and weather permits, lift a goodly portion of the old stock of horseradish and place the stout usable roots in fine soil or sand for use. Select the best of the roots left, and plant the straight one a foot apart in rows eighteen inches apart, leaving the crown six inches below the surface of the soil. Further, choose the straightest of the thong-like secondary roots, trim them, and plant them in similar fashion. Every portion of horseradish root will make a crown and grow. If a plantation is made in this fashion every year there will be no lack of good roots, provided the size of the plantation is in accord with the demands.

### NAMES OF PLANTS.

N. G., Banbury.—Cupressus Lawsoniana albo-spica.

T. B. C., Harpenden.—1, Chironia linoides (ixifera); 2, Lælia anceps.

O. F., Bungay.—1, Begonia rex; 2, B. imperialis; 3, Pilea muscosa; 4, Skimmia japonica.

S. G. P., Aberdeen. 1, Cypripedium Milo; 2, Cattleya labiata; 3, Cypripedium Actæus; 4, C. insigne, a very good form.

### NAMES OF FRUITS.

H. G., Bristol.—1, Probably Lamb Abbey Pearmain; 2, Margil; 3, Duchess's Favourite; 4 and 5, both rotten, the latter is probably Beurre Diel.

E. B., Tunbridge Wells.—1, Doyenne du Comice; 2, Beurre Diel; 3, Durondeau; 4, Forelle; 5, Beurre Superfin; 6, not recognised—a fine set of specimens.

## OBITUARY.

### MR. WILLIAM WATTS.

It is with much regret that we record the death, which occurred on October 29, after a short illness, of Mr. William Watts, a member of the firm of Messrs. G. Watts and Sons, Lim., Palace Nurseries, Bournemouth, in his 52nd year. Mr. Watts was an enthusiast in all that pertains to horticulture, and was a most successful propagator and plant grower. New plants always had a fair trial at his hands, and he was much interested in trials of both plants, fruits, and vegetables.

## GARDENING ENGAGEMENTS.

Mr. A. Beckett, of Myton Hall Gardens, York, has been appointed head gardener to J. Dymond, Esq., Burntwood, Barnsley.

Mr. Henry Newson, over two years gardener to the late B. E. Fletcher, Esq., Marlingford Hall, near Norwich, has been appointed head gardener to Edmond De Poix, Esq., Broome Place, near Bungay, Norfolk.

WEST'S PATENT GARDEN SUNDRIES have been invented during 30 years of practical experience. By better cultivation, and pleasure by which gardens are kept in order, their expense is doubly repaid. Samples and Illustrated Catalogue free. C. E. WEST, Higham Hill London, N.E.

# WAKELEY'S *celebrated* HOP MANURE

THE MOST PERFECT FERTILIZER FOR GARDENS, GREENHOUSES, LAWNS, Etc.

PATENTED.

## THE ONLY RELIABLE AND COMPLETE SUBSTITUTE FOR STABLE MANURE

SCIENTIFICALLY AND CHEMICALLY PREPARED in the form of a leaf-mould, ready for use at any time, in the same way, and for all purposes that stable manure is put. Goes further (1 cwt. equalling 15 cwts.), gives better results, is clean to handle, sweet smelling, and free from weeds, worms, etc.

THE GARDENERS' MAGAZINE states: The difficulty of obtaining really good stable or farmyard manure is overcome by using Wakeley's Hop Manure. This supplies just the materials required for improving the condition of a soil, furnishing with needful humus, and providing the crops with the essential plant foods they require, viz., nitrogen, phosphates, and potash. **THOUSANDS OF TESTIMONIALS. PARTICULARS POST FREE.**

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

---

ARTISTIC HERBACEOUS BORDERS.

"Colour is meant for the perpetual comfort and delight of the human heart."

—RUSKIN.

THE MOST BEAUTIFUL COLOUR EFFECTS it is possible to obtain with flowers are those provided by the Kelway Borders.

LET US SUGGEST A SELECTION of plants for the space you have, whatever its size, and we will make it a picture of continual bloom for many years.

Write at once for "Gardens of Delight," 6d., post free.

From Mr. ——, Castle Gardens, Rosneath, Dumbartonshire. (H.R.H. Princess ——.)

"I take the liberty to write you and to let you know that the herbaceous plants you sent have done exceedingly well—Gladioli, Hollyhocks; Delphiniums especially good. I have not lost a dozen of the plants. The Princess was also very pleased with them when here, and all that saw them said they never saw any better." (Planted April, 1911.)

KELWAY and SON, The Royal Horticulturists, LANGPORT, SOMERSET.

---

KELWAY'S PÆONIES.

NOW IS THE TIME TO PLANT Pæonies—the best time in the whole year. No garden is complete without the new Pæonies. Kelways recommend the following collection, (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden.

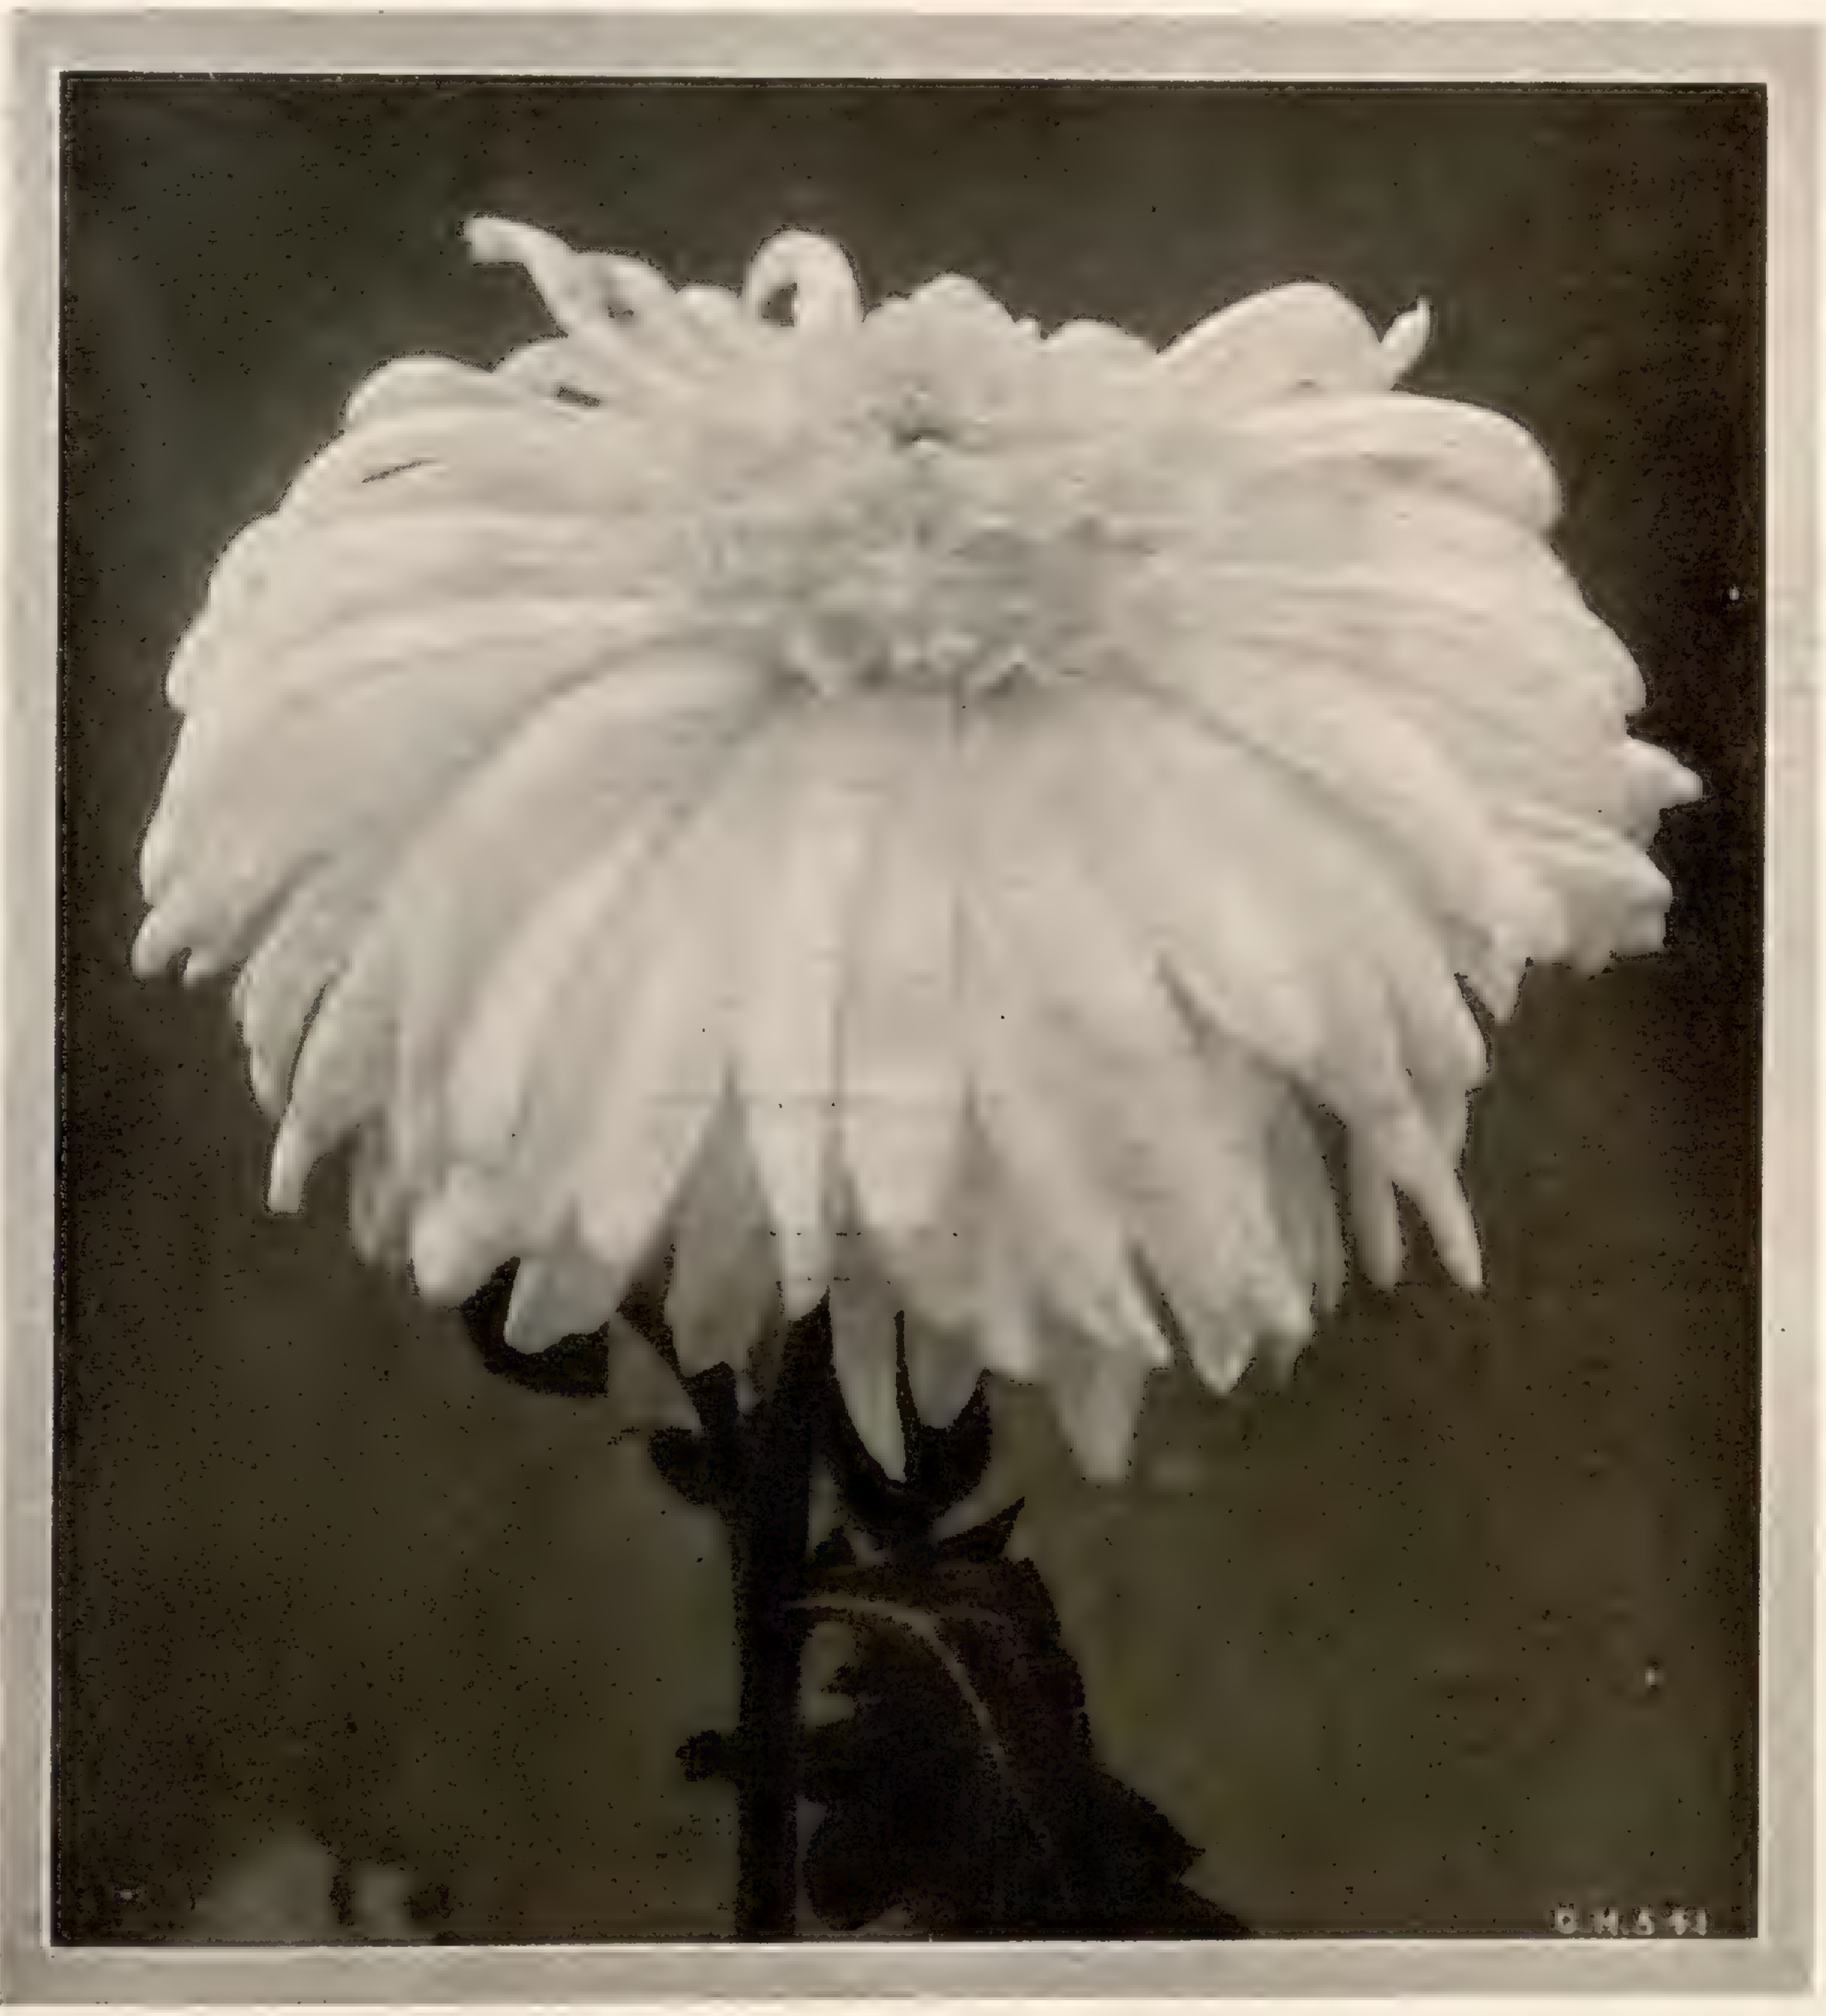
# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Plant Locomotion.

The popular idea of a plant is that, unlike an animal, it is a fixed individual, which for the whole period of its existence is confined to the spot where it originated, being anchored thereto by its roots, and therefore devoid of locomotive powers. Like all such assumptions as regards Nature's creations we are, however, bound to find exceptions, and in this case there are many. In the first place, since adventitious plants produced by the strawberry, for instance, at the terminals and in the axils of long rambling runners or stolons are absolutely parts of the individual which produces them, we see here exemplified a travelling process which carries the plants over considerable areas. This is the type of an immense number of plants of many diverse genera, which by virtue of this power can propagate themselves widely without the aid of seed. So clearly is this locomotive faculty recognised that we have a so-called walking fern (Camptosorus rhyzophyllus), which, by means of terminal buds on the fronds, takes, as it were, stride after stride over the soil, rooting in as it proceeds, and thus justifying its popular name. Woodwardia radicans does precisely the same on a larger scale, and many others do the like. Then in another direction we have a large number of plants which travel by means of underground stolons, so that fresh individuals, but yet integral parts of those which produce them, crop up at greater or smaller distances, and so travel freely on their propagating mission. We have even in some cases plants which travel absolutely individually. The so-called Resurrection plant (Selaginella leptophylla), for instance, a native of dry, sandy areas, subjected only to occasional rains. This, when the drought sets in, contracts its pretty green rosettes into a compact ball, and, becoming detached from the soil, rolls about on the surface, until it drops into some sheltered nook, where, on the recurrence of the rainy season, it unfolds and roots in, and re-establishes itself unharmed, a true traveller indeed. It is, however, in connection with the seed that plants best exhibit their locomotive power. The seed, we must remember, is practically a plant packed up in a protecting husk of its own, independent altogether of the further protection afforded by pods, capsules, or other receptacles, and we have only to study the innumerable methods and contrivances by which these seeds are disseminated far and wide to see that Nature is a past master in locomotive construction. The balsam and woodsorrel adopt a sort of explosive method, forming capsules constructed of segments so arranged that as they ripen a greater and greater strain is exercised upon their curvature and elasticity until, yielding to this strain, they suddenly collapse and scatter their numerous seeds, catapult fashion, in all directions. A form of locomotion worthy of Jules Verne's invention, and, indeed, foreseen by him in his story of a journey to the moon—i.e., the aeroplane—is to some extent exemplified in the dandelion, and all the multitude of plants which use the air for the distribution of their seed. Here we see the seeds deftly attached to a sort of feathery parachute, so contrived that at the right moment they are let loose and borne aloft by the breeze to travel, it may be, miles to literally "fresh woods and pastures new." Many seeds, apparently devoid of any such adjuncts, are cunningly provided with means of profiting by the locomotive powers of other organisms. We walk, for instance, down a country lane, brushing the hedges and wayside weeds as we pass, and every here and there the cunning gorse grass seizes the opportunity to attach a dozen or so of its little kidney-shaped green seeds, clothed with tiny hooks, to our clothes, and possibly some playful companion may pelt us with the larger and pricklier ones of the burdock. In both cases we may unwittingly convey these seeds for miles before the clothes brush detaches them, and the dust bin or the wind completes the operation by finding them fresh quarters for development. In all



CHRYSANTHEMUM SNOW QUEEN.
A new anemone-centred single variety. Flower wholly pure white. A.M., R.H.S., November 5. Messrs. Cragg, Harrison, and Cragg. (See page 881.)

these and a myriad other instances we see, even where the plant itself seems devoid of locomotive power, it is nevertheless so contrived as to acquire it indirectly, if not directly, and to that extent our superficial idea of "plant fixture" must be modified.

---

**Hardy Fruit Culture.**—The cultivation of hardy fruits will receive prominent attention in our next issue (November 23), and the articles for which arrangements have been made will have special reference to matters that have to be dealt with at this season of the year. The contributions to the issue will include articles on "Selection of Sites for Orchards," "Some Newer Apples," "Cultivation of Plums under Glass," "Bush Pear Trees," "Loganberries and Raspberries," "Estate Fruit Plantations," and "Dessert Apples for the North." The issue will be freely illustrated.

**The New Lord Provost of Edinburgh.**—Mr. R. K. Inches, who was appointed Lord Provost of Edinburgh on November 8, has been for the past three years the Convener of the Parks Committee of the City, and has, before and during his term of office as such, taken the warmest interest in the parks and open spaces of Edinburgh. Mr. Inches has been one of the warmest supporters of the different improvements recently carried out by the Parks Committee, and some of these have been of an important character, and have done much to beautify the city and to immensely improve the facilities for recreation for the inhabitants. Lord Provost Inches is a native of Edinburgh, and is the head of a firm of jewellers, and the Lord Provost himself is the personal holder of the ancient appointment of clockmaker to the King. The Lord Provost has been for a number of years a member of the Town Council, and has been at the head of several important committees, none, however, being more heartily taken up than that of Convener of the Parks Committee. A golfer himself, his interest in the game has been useful in his Convenership of the Parks Committee.

**New Director of Singapore Botanic Gardens.**—We learn from the "Kew Bulletin" that Mr. I. H. Burkill, Reporter on Economic Products to the Government of India, and Curator of the Industrial Section of the India Museum at Calcutta, has been appointed Director of the Singapore Botanic Gardens, in succession to Mr. H. N. Ridley, C.M.G., F.R.S., now retired.

**Women Gardeners** will soon have charge of the gardens in this country if all the statements that are made with reference to them are based on fact. Dr. Hamilton, the head of the Studley College, is reported to have stated, at a public meeting held a few days since, that women are gradually supplanting men as under-gardeners, because of their being neater-handed, more careful, and psychologically to have a greater affection for the plants they have to handle than have men. If this be the case, women will, in course of time supplant the men as head gardeners, for no man who has not had some experience as an under-gardener would venture to offer to take charge of a garden. This statement notwithstanding, neither head gardeners or under-gardeners need be greatly alarmed, for in writing and speaking on gardening women generally use the terms of gardeners and under-gardeners in a very loose manner. For example, Dr. Hamilton is said to have also stated that some women gardeners were making over £1,000 a year, but obviously she had not in her mind women who were annually receiving over £1,000 in wages as head-gardeners, but those who were growing for market, and should be spoken of as market growers. We hope the women who are "making" over £1,000 a year are more numerous than the women we have met with in private gardens who occupy the position of under-gardeners.

**Temperatures of August and September.**—With reference to the low temperature that obtained in London during the greater part of August and September, Dr. Mill states in "Symons's Meteorological Magazine" for October that the long record at Camden Square, dating from 1858, contains no instance of any previous August or September with a lower mean temperature. The mean for August, 57.9°, was 4.4° below the average, and it was the coolest August in the fifty-five years' record. In September the mean was 54.1°, or 3.6° below the average. In August the mean shade maximum was 66.6°. August, 1860 and 1912, are the only corresponding months in which the shade temperature failed to reach 77°. In 1912 the highest record was 73.2°. In September the mean maximum, 62.4°, was the lowest on record for that month, and the absolute maximum, 69.4°, was the lowest record in any September. It is of considerable interest that fifteen consecutive months with mean temperatures above the average, May, 1911, to July, 1912, should be followed by two months of unprecedentedly low temperature.

**Chrysanthemums at Wolverhampton.**—At the present time the spacious conservatory in the West Park, Wolverhampton, is rendered highly attractive by the large, splendidly-flowered collection of chrysanthemums arranged therein. For the first time since the initiation of these shows a group has been arranged in the centre of the building, and the addition of the 500 plants used in its composition greatly enhances both the interest and attractiveness of the display. Mr. Felstead, the able parks superintendent, evidently appreciates the distinctive charms of the several classes, for the large-flowering varieties contain due proportions of both the Japanese and incurved varieties. It was, indeed, quite refreshing to see the incurved varieties so well represented, and the single and other varieties with small or medium-sized blooms freely utilised in the several groups. Altogether there are 150 varieties represented in the exhibition, and as these consist of the best in their several classes and colours, visitors have an excellent opportunity for making selections adapted to their requirements.

**New Open Space for Birmingham.**—An important addition has been made to the open spaces of Birmingham by the conversion of an area of about five acres in the St. Bartholomew's Ward into a recreation ground. The site was previously occupied by slum property, and the difficulties that were met with in laying it out for the purpose to which it is now put must have been very great, for the old foundations had to be removed and the ground broken up to below their depth. This new open space, which is known as the Callow Fields Recreation Ground, has been divided into two portions; one has been laid out as a park, with trees and shrubs, gravel walks, band stand, and bowling green, and the other has been specially arranged and fitted up as a playground for children. The work of preparing and planting the ground has been carried out by Mr. Morter, the Parks Superintendent, and is striking testimony to his taste and skill. It is evident the authorities fully appreciate the success he has achieved, for at a recent meeting the Parks Committee unanimously passed the following resolution: "This committee desires to place on record their high appreciation of the excellent manner in which this work has been carried out by Mr. W. H. Morter, the Parks Superintendent, and his staff."

**A Youthful Medallist in Gardening.**—Thomas Hicks, of Oxford, who is in his thirteenth year, has been awarded the gold medal by the Oxfordshire Education Committee for progress in gardening during the current year. We heartily congratulate the boy on his success.

**British Potato Trade.**—Writing in reply to Sir G. Parker, Mr. Runciman says: "The potato yield of the United Kingdom, exclusive of the Isle of Man and Channel Islands, was as follows: 1905, 7,185,745 tons; 1906, 6,089,292; 1907, 5,223,973; 1908, 7,117,296; 1909, 6,877,272; 1910, 6,347,966; 1911, 7,520,168. The yield for 1912 in England and Wales was estimated on October 1st to be about 87 per cent. of an average. No estimates from Scotland and Ireland have yet been published." Sir G. Parker has asked the President of the Board of Trade whether he has had any communication from potato growers in England asking for his intervention to secure the same kind of facilities for British potato growers as the Board of Trade Journal affords to a Danish cooperative society by advertising its facilities free of charge in the Board of Trade Journal. Mr. Buxton writes:—"We have had no communication from potato growers in the United Kingdom desirous of disposing of their goods in Great Britain."

**The Wolverhampton Floral Fete**, which was held in July last, resulted, we are pleased to learn, in a profit of nearly £350. The committee were fortunate in having fine weather during the period over which the exhibition extended, and the several classes of the community in and around this great industrial centre were not slow to take advantage of their opportunities for seeing the exhibition, which is invariably of great excellence.

**The Season in the North.**—The chief features of the past summer and autumn, writes our Aberdeen correspondent, have been dull days and cold nights. Yet, strange to say, although the great majority of people have an idea to the contrary, the rainfall experienced has not been abnormally heavy; indeed, as has been proved from carefully-kept and correctly-compiled statistics at our northern observatories, the rainfall of the past summer and autumn has been actually below the average of these seasons in general by about 1¼ inches, the total from March to October inclusive being 18½ inches, as compared with the general average of 19¾ inches. With the exception of August and October, the rainfall did not show any abnormal excess over the average, and in both these months by only 1½in. respectively. In the midsummer month—well-named the "Sunless June"—the rainfall was only ¼in. above the normal, but the dull, foggy, damp, and cheerless weather then prevailing gave the man in the street the impression that the month was a particularly wet one. In March, April, May, July, and September, the rainfall was actually below the normal in each case. The weather now prevailing is cold, wet, and cheerless in the extreme. As indicative of the general coldness prevailing throughout the season, it may be mentioned that snow fell on a greater number of occasions during the past summer and autumn than in former years. The hills were capped on two occasions in September, and again at the beginning of October. Thus we had the somewhat unusual spectacle of snow on the hills and uncut grain in the fields with trees on which the rich tints of autumn were just beginning to appear.

**Proposed Tree-planting Scheme for Worcester Park.**—Worcester Park lies between Wimbledon and Epsom, and is a pretty, well-wooded Surrey village, not far from Kingston. It has an Amateur Gardeners' Society, and this society possesses a modest cash balance of £13 6s. 3d. Assuming that the summer flower show of 1913 proves successful, the society proposes to increase the amenities of Worcester Park by planting trees and erecting seats in suitable positions. This proposal would have delighted the late Mr. Alex. Dean, who took a keen interest in the society's doings.

**October Weather.** — As was the case in August and September, the temperature in October was below the average. At Greenwich the mean temperature for the month was 48 deg., or 2 deg. below the average. The mean maximum temperature was 57 deg., and the mean minimum temperature 39 deg., or 1 deg. and 4 degs. respectively below the average. The highest day temperature was 66 deg., which is the lowest October maximum during the past seven years. During the month 123 hours of bright sunshine were recorded, which has only been exceeded twice in October during the past thirty years. Rain fell at Greenwich on fourteen days, and the aggregate rainfall was 1.86in. or 0.99in. below the average.

**Success in School Gardening.**—The Bathurst Shield, which is offered for the best-arranged school garden in Wiltshire, has been won by the school of the small village of Corsley. The competition for the shield is open to all the schools in the county where instruction in gardening is given, and Mr. A. E. Leatham, the head master, may be heartily congratulated on the success the school under his charge has achieved.

**The Larch Saw-fly.**—Owing to the failure of the efforts that have been made to check the ravages of this pest, an immense amount of damage is being done in the plantations of larch in the Lake District. Thousands of larch trees that are infested with the larch saw-fly are being felled, the number of injured trees that have been cut down during the past three years exceeding 30,000. Need it be said that the felling of so large a number of trees represents a serious loss to the owners?

**A Multiplicity of Societies.**—On several occasions we have directed attention to the desirability of a concentration of effort in the endeavour to further the advance of horticulture, and in connection with this question the following cutting from the "Sussex Daily News" is of much interest: "Horticultural affairs in Mid-Sussex afford an interesting study. At Cuckfield there are no fewer than three separate organisations at work, one society operating the chrysanthemum interest, another roses and sweet peas, and the Cottagers' Horticultural Society providing the chief exhibition of the year. At Burgess Hill, one society runs the several horticultural events, and Haywards Heath's chief horticultural institution is its summer show, which is now about a quarter of a century old, and the same society organises the chrysanthemum or autumn interest. For several years a Gardeners' Mutual Improvement Society has existed as an independent organisation, yet in full sympathy with the greater society. A suggestion has been made that the two societies should amalgamate, and organise monthly competitions to stimulate general interest in horticulture. It is feared, however, that the chief horticultural society already has its hands full as regards its growing magnitude and responsibilities, and will not want to multiply its labours. If there is strength in amalgamation, why not go further and have a district amalgamation of horticultural societies?"

**Movements of Plants.**—At the first of the series of popular lectures that is being given at the Sheffield University, Mr. A. W. Bartlett, M.A., B.Sc., dealt with the various types of plant movement. With the aid of lantern slides, he described the manner in which plants seem to indicate the possession of some rudimentary forms of sensitiveness and almost intelligence, in their search for the essentials of their life and growth—light and food. Mr. Bartlett pointed out that movement was evidence of living as distinguished from dead matter, and the only reason that the movements of plants were not generally recognised was their slowness. After referring to the movements of bacteria and microscopic aquatic plants, which are actually able to progress through the water, the lecturer showed that while trees and plants firmly rooted in the soil are not able to change their location in this way, they move their limbs towards the required food and light. This was illustrated by means of a slide showing a plant in a pot, the position of which during growth was changed from vertical to horizontal, with the result that the stem and root respectively changed their direction upwards and downwards. The plant's search for light was also shown by means of a photograph of a fungi throwing off its spores in the direct path of a narrow beam of light, such spores being gathered on a sheet of glass through which this beam of light passed. In one of the pictures thrown on the screen plants were seen growing upside down—showing that the stimulus of light was greater than that of gravitation. The tip of the root was also sensitive to touch, thus avoiding stones and other hard substances in its growth through the soil, the movements of plants not being haphazard, but always with the purpose of assisting growth. The movements of insect-devouring plants and the sleep movements of those that open and close their flowers with each recurring day and night were also fully dealt with.

**School Gardens in Wiltshire.**—The report of the Education Committee of the Wilts County Council on the school gardens in the county, contains much interesting information relating to the progress that has been made in the teaching of gardening in elementary schools. The report states that there are now 96 schools where gardening is taught as a specal subject, last year there were 78, and in 1902 only five; 10 were at town schools and the rest in villages. There are still 27 village schools where no school gardens exist. In the northern Parliamentary division there are eight; north-western area, 12; eastern, 27; western, 23; southern, 26. The total area is 12 acres 3 roods, so that the average garden is 21 perches. The number of children under instruction for the full course was 1,211, of which number 1,146 are boys and 65 girls. The report says it is as yet impossible to conduct classes in every rural school, for in many of them the head teachers know nothing of the subject, and the employment of the practical gardener as teacher is open to many objections. The vacation courses for women teachers arranged by the Agricultural Education Committee should, it is considered, do much to overcome this difficulty. It is encouraging to note that the work of two women teachers is so good as to merit the awards as scheduled.

## NOTES FROM KEW.

### Calceolaria Forgeti.

Quite a batch of this comparatively new species is now in flower in the greenhouse. Compared with many others the flowers are small and unassuming, but they are very freely borne, and that, too, at this season of the year. Added to this it may prove of considerable value to the hybridist. Calceolaria Forgeti forms a low, dense, freely-branched sub-shrub, clothed with dark green leaves; while the flowers, which are of a pale sulphur tint, are almost round, being, in fact, quite bead-like in appearance.

### Lycoris aurea.

It is now getting on for twenty years since this bulbous plant attracted a very large share of attention, owing to the fact that a considerable number of imported and well-ripened bulbs flowered with a freedom to which we were hitherto unaccustomed. Taken altogether, however, this lycoris has not proved very amenable to cultivation, though, planted out in a border in the Succulent House, some flourishing examples are just now flowering freely. The conditions of plenty of light and sunshine that there prevail, together with a genial warmth, seem to suit it perfectly.

### Diospyros Kaki.

This, the Japanese Date Plum, which is in its native country so much valued as a fruit, is also of a highly ornamental character, as may be seen in the Succulent House, where a specimen planted out in one of the beds is bearing about forty of its large, showy, reddish-orange fruits. Another desirable feature is the fact that these retain their freshness for a considerable time.

### Senecio canalipes.

This forms such a bright annual feature in the Succulent House that it is surprising the species is not more generally met with. Unlike most of the senecios, it is a vigorous growing climber, clothed with lobed, rich green leaves; the flowers, which are freely borne at this season, being disposed in loose terminal corymbs. Individually they are just over half an inch in diameter, and of a rich deep yellow colour. Fully exposed to the sun, as in this house, it forms a very desirable rafter plant. It is in every way quite distinct from another climbing species, namely, Senecio macroglossus, sometimes popularly referred to as the German ivy.

### Begonia acuminata.

This old, yet uncommon, species from Jamaica is seen to considerable advantage as a basket plant in the T range. It is not particularly showy, but its habit of growth and profusion of bloom eminently fit it for such a position. It is one of the fibrous-rooted class, and forms a freely-branched plant, with spreading or partially drooping shoots. The leaves are from two inches to three inches in length, and taper towards the point, and the flowers, which are not more than an inch across, are white. The male blossoms are the more attractive. Though introduced as long ago as 1798 it is rarely seen outside of a botanic garden.

### Beloperone oblongata.

Among the more uncommon acanthads that flower at this season this beloperone must be included. It is just now in bloom in the intermediate portion of the T range. It is of a freely-branching, bushy habit of growth, and may be readily accommodated in a pot five inches to six inches in diameter.

The dark green leaves are oblong-lanceolate in shape, while the colour of the flowers is a kind of magenta-purple. Like most acanthaceous plants, it is of comparatively easy culture.

### Clerodendron splendens.

This climbing species, a native of tropical Africa, is now flowering with great freedom on one of the rafters of the T range. In this fashion it stands out as one of the finest climbers that we have for such a structure, the panicles of bright scarlet flowers supplying a wealth of colour quite distinct from any of the other occupants of the same house.

### Leianthus longifolius.

Formerly known as Lisianthus longifolius, this gentianwort, which is a native of the West Indies, is in flower in the intermediate portion of the T range. It forms a freely-branched plant about eighteen inches in height, clothed with ovate-lanceolate leaves about a couple of inches long. The flowers, which are borne in loose terminal panicles, have unusually long and weak pedicils, so that a plant in ful flower has a singularly lax appearance. The tube of the flower is funnel-shaped, expanding at the mouth into a five-pointed star about an inch across. The colour is clear yellow. An allied kind that I have not met with for a long time, but which was much talked about when first shown in the forties of last century, is Leianthus (Lisianthus) nigrescens, an almost black flower, which, when expanded, has the same firework-like contour as Leianthus longifolius itself.

### Pinguicula Kewensis.

Some two or three years ago a very distinct pinguicula was flowered at Kew under the name of P. Rosei. The general appearance of the plant suggests the well-known and charming Pinguicula caudata, but the flowers were of a purplish-violet tint. The flowers of P. Rosei are decidedly less attractive in colour than those of the older kind, but at the same time they afford a pleasing variety thereto. A hybrid between the two, and bearing the name of P. Kewensis, is now in flower in the orchid house. It is, in the colour of its blossoms, about midway between the two species above referred to.

### Callicarpa purpurea.

This has long been grown for the sake of its clusters of deep violet-purple berries. It is seen at its best when the long, flexible willow-like shoots are allowed to develop to their full extent, as they are then wreathed with berries for a considerable distance. For this reason the plants are usually grown as loose, open bushes, or as standards. A decided break away from this mode of treatment is to be seen in the Victoria Regia house, where a planted-out specimen is trained to the roof, and in this way it forms a very striking feature. The branches, six feet or more in length, are clothed with berries, which have acquired an unusual depth of colouring. Though the berries are so pretty the flowers are quite insignificant. For furnishing the end of a sunny structure, providing the requisite amount of heat is available, this callicarpa would form a pleasing break away from the different subjects generally employed for the purpose. K.

---

**Pleione humilis** is now at rest, and should be kept suspended at the warm end of the cool house, or the cool end of the intermediate house, and should have sufficient water afforded to prevent the pseudobulbs shrivelling. It will flower early in the New Year.—J. T. Barker, The West Hill Gardens.

## CORONILLA VARIA.

If anyone wants a plant which will very soon spread into yards, and give a multitude of pink pea-shaped flowers in summer, let him try Coronilla varia. If, on the other hand, he wants a plant which will keep to its own quarters, and will not trouble him by invading the territories of other plants, let him keep this coronilla out of his garden. It is, truly, an inveterate wanderer, and will soon find its way among other flowers to their detriment, but to its own aggrandisement. Withal, it is handsome and graceful, and produces shoots of pretty leaves, which are adorned with charmingly coloured rose coronets. But for its habit of spreading at the roots and taking possession of too much space, it would be prized in every garden. As it is, however, it is wiser to plant it only in odd spots and in places where it can do no injury to other and less aggressive flowers. Planted on a dry bank it is quite at home, and is a charming picture in its season. It likes calcareous soil, though this is not essential. This coronilla comes as readily from seeds as any common annual, but is a true perennial in its way. S. Arnott.

---

## STANDARD APPLE TREES ON GRASS.

Among the many good phases of gardening at Aldenham none is more striking than the orchard of apple trees on grass.

When Mr. Beckett took charge of these gardens, some twenty-seven years ago, the trees had been planted a few years in well-prepared stations, but the roots had reached the circumference of the stations, and were unable to enter the natural soil, which is clay. Therefore the trees were showing signs of "going back." Mr. Beckett decided to thoroughly overhaul the orchard, and in so doing trenched the whole of the ground to his customary depth of three feet, and added other trees to bring the varieties up to date.

With regular attention to pruning and surface culture the trees have made satisfactory progress, so that now it would be difficult to find a better grass orchard. The trees have ample space, and as they are regularly pruned the branches are not crowded but have space enough to develop fully; in many cases the branches sweep the ground gracefully. With such healthy trees Mr. Beckett does not find it necessary to spray at all in the summer, as aphides, scab, etc., are practically unknown here. When trees in many parts of the country were crippled with greenfly, and gave only small fruits, the trees at Aldenham House were pictures of health, and heavily laden with handsome fruit. Two years ago the grass was removed some four feet from the stems, so that the trees could be assisted in perfecting their heavy crops of fruit by the aid of copious supplies of sewage, which, naturally, during a season like that of 1911, was a boon to the trees.

The most remarkable trees in the orchard are those of Wellington, as they never fail to give full crops of handsome fruit; consequently Mr. Beckett regards this as the most desirable of all kitchen apples. Certainly I have not seen this variety succeed anywhere as it does here.

The following are the dimensions of some few of the trees: Wellington (Dumelow's Seedling), stem, 13 inches in diameter four feet from the ground. This tree has a circumference of 35 yards, and gave this season 21 bushels of handsome fruit. Hambledon Deux Ans is here thought most highly of; at five feet high the stem has a diameter of 14 inches, and has a branch circumference of 40 yards. An exceptionally handsome tree is one of Cox's Orange Pippin, 20 feet high, with a spread of branches eight yards in diameter; Blenheim Pippin, a superior form, has a branch circumference of 37 yards, and produced nineteen bushels of fruit this year. Fearn's Pippin is an exceptionally fine tree, 35 yards in circumference, and was loaded with highly-coloured fruits. Needless to say, most of the popular and desirable varieties, as Bramley's Seedling, Norfolk Beauty, Gascoigne's Scarlet, Bismarck, and Lane's Prince Albert, are fast growing into productive trees.

Swanmore Park. E. Molyneux.

## CERCIDIPHYLLUM JAPONICUM.

It was with much pleasure that I read your special number, which was chiefly devoted to flowering trees and shrubs, and being much interested in it, and at present in the Kew Arboretum, you will permit me to correct a slight incorrectness on page 813 in the note on Cercidiphyllum japonicum. Your correspondent describes it as a rare shrub to be planted rather in a sheltered position, not being vigorous, and generally ranging from four to five feet high. As a matter of fact I have seen this tree many times and in many places. At Northampton I saw a tree about 15 feet high; at Hastings (Alexandra Park), 30 feet high, and in other English gardens I have seen trees of considerable dimensions. I have also seen it very often on the Continent. There are some remarkably fine specimens in the Imperial Gardens at Potsdam, fully half a dozen ranging from 30 to 50 feet high. In the Berlin Botanic Gardens at Dahlem are fast-growing trees that make two feet of growth every year. In Belvoir Park at Zurich, Switzerland, are plants on the open lawn 30 feet high, the temperature every year dropping down to 10 deg. Fahrenheit. Many fine specimens are found along the lake of Geneva, and in the parks of Paris. Professor Schwappach writes in the "Year Book" of the Dendrological Society of an experimental forest fifty miles from Berlin with an area of two acres. The trees therein are twenty years old and 45ft. high, the diameter of the stem 11ft. 5in., with most valuable timber. In the same book Mr. L. von Gniewosz, Konty, Poland, Russia, writes that Cercidiphyllum japonicum is the only deciduous tree on his estates not infected by fungoid diseases or attacked by insects. Beissner, the author of "Handbuch der Coniferen," writes of a tree 60ft. high, that was planted 1830 in a tree nursery near the Baltic Sea. In all other points I quite agree with your correspondent, more particularly with what he writes in praise of this most beautiful tree. E. Richli.

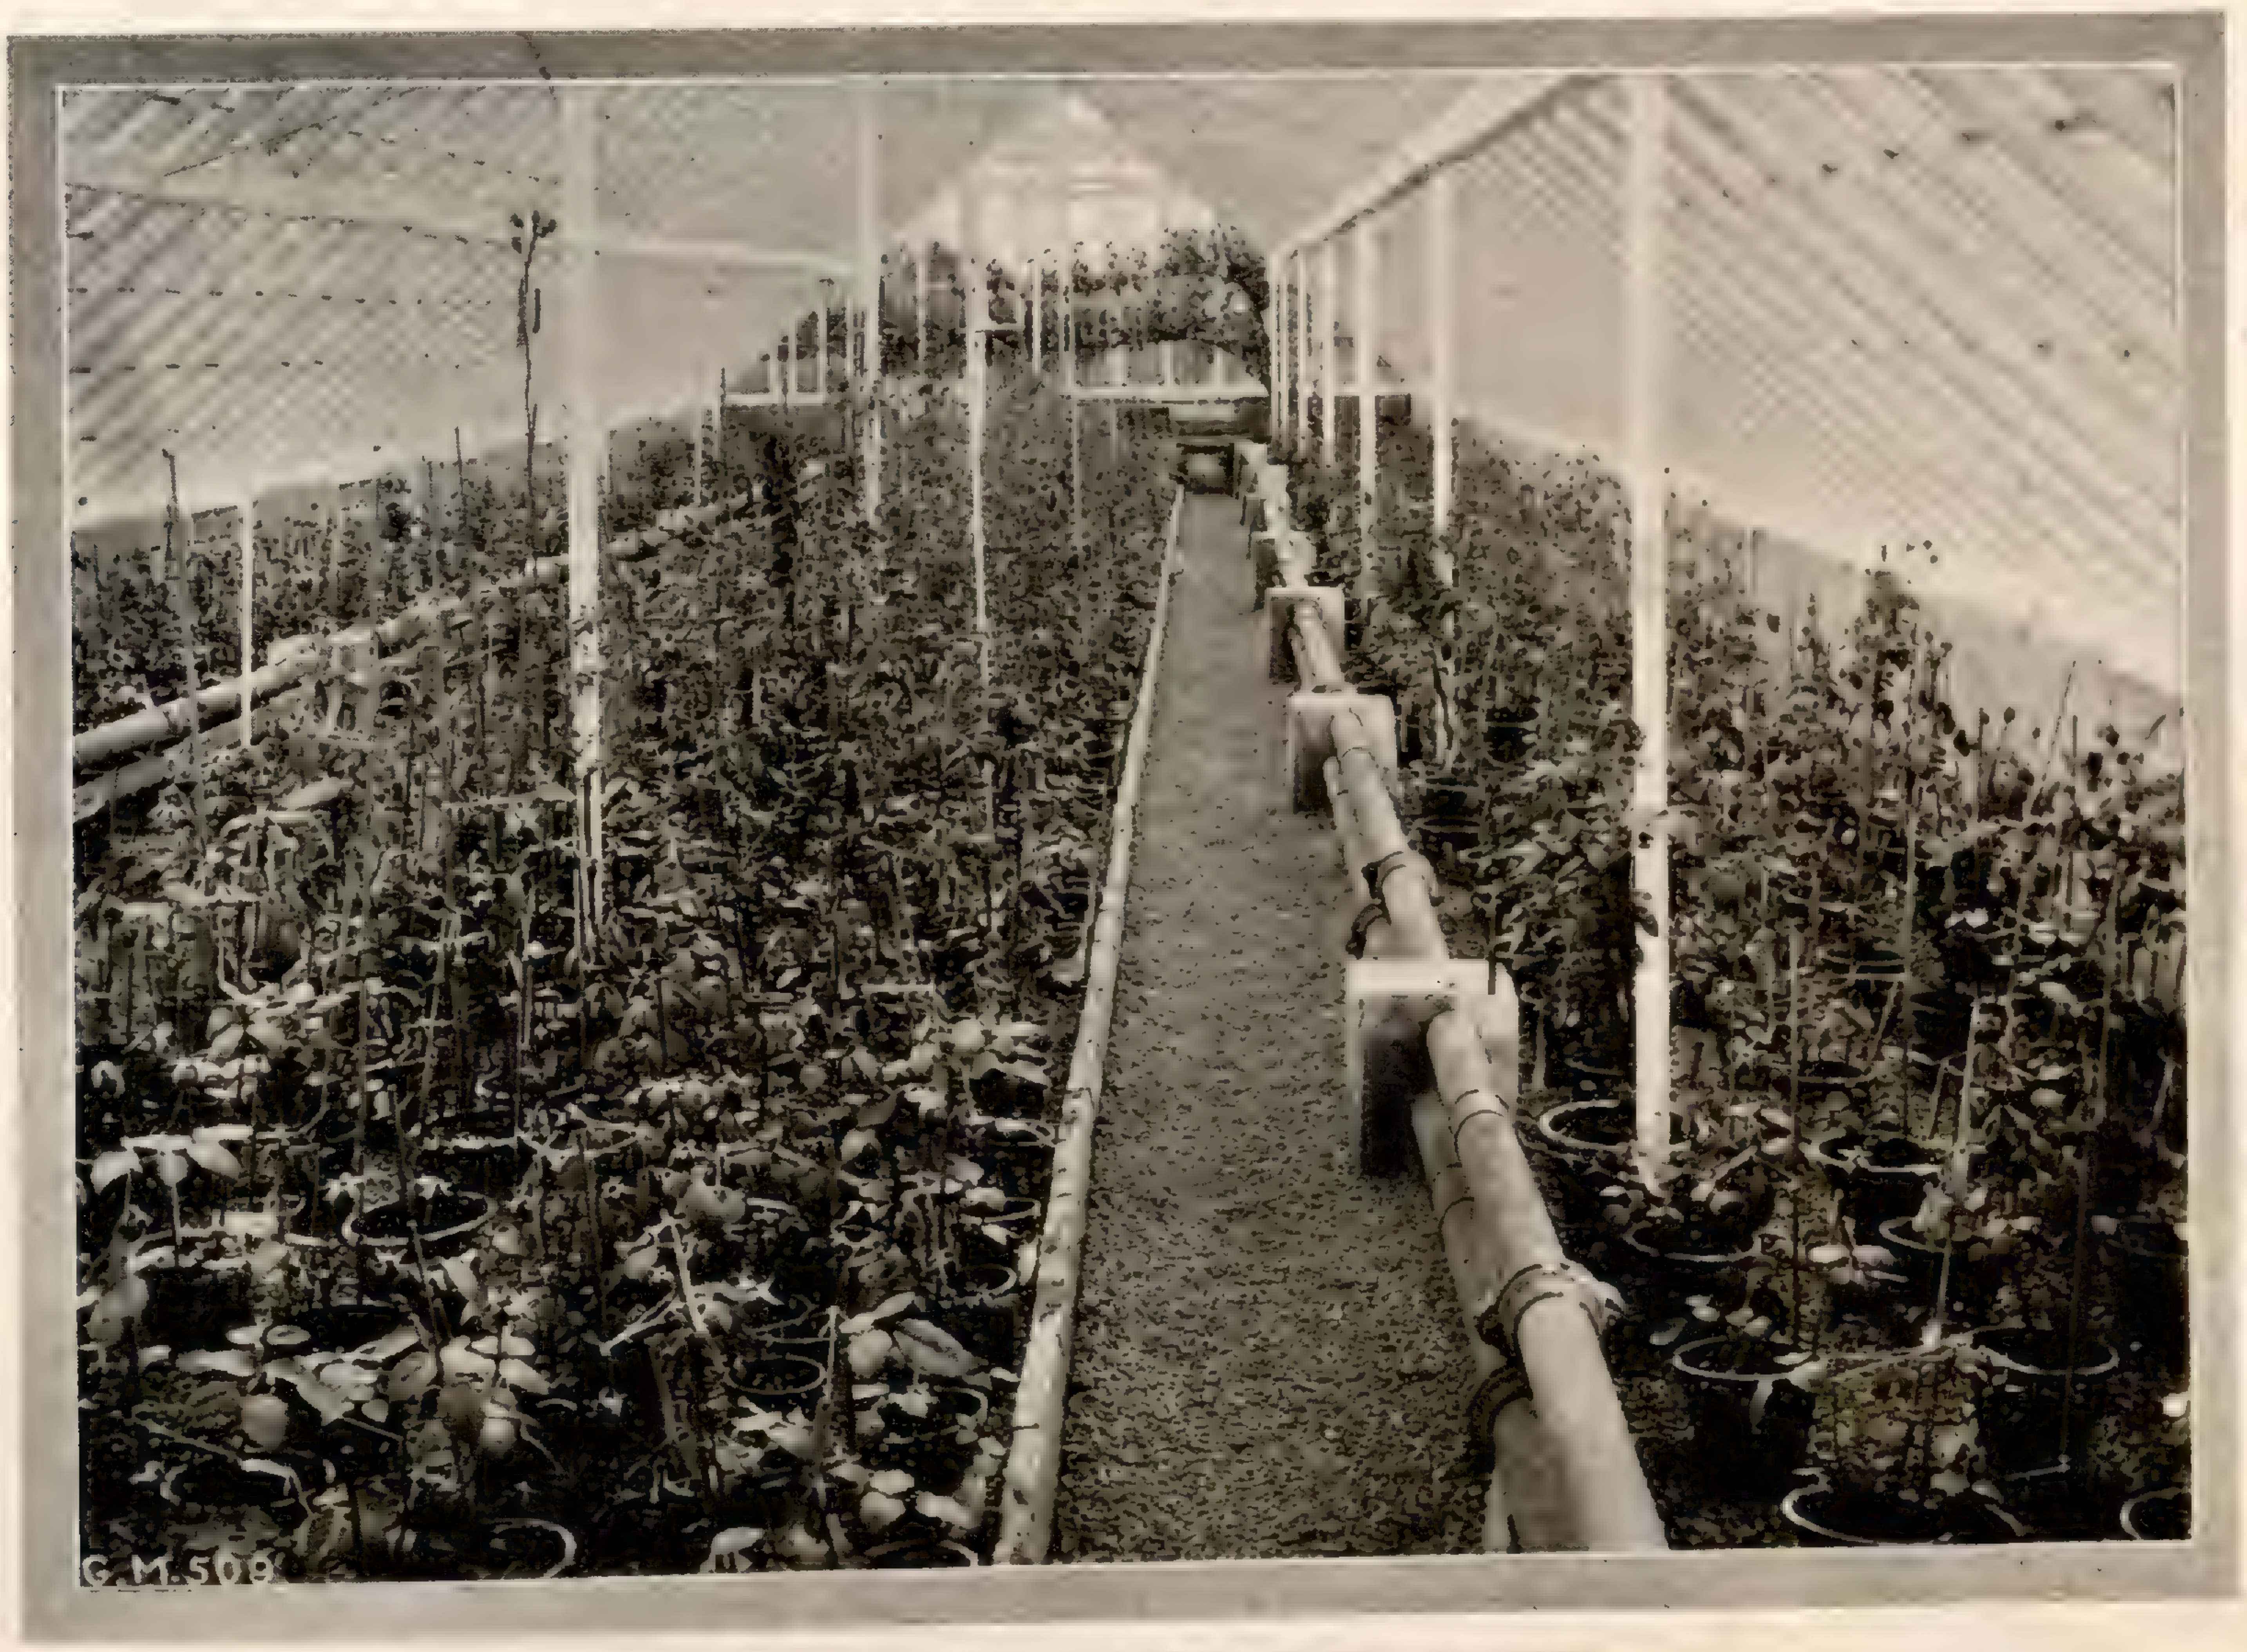
---

**Caustic Alkali Wash.**—Most fruit growers buy the powder in tins, prepared for use, and this will be found a handy way; those who may be desirous of making their own mixture may adopt the following formula: Take 1lb. caustic soda and 1lb. crude potash; dissolve by pouring boiling water over the chemicals, then add sufficient hot water to make ten gallons, and use while warm. Apply by means of a sprayer, and wear rubber gloves to prevent the wash from burning the hands.—W. Messenger.

**Forcing Asparagus.**—Asparagus is perhaps the easiest of all vegetables to force, especially where a good supply of crowns is available. It will force quite readily from November onwards on mild hotbeds, or in warm pits; a gentle bottom heat is required, and the bed must be fairly near the glass. When the bed is ready, lift and plant the crowns with the least possible delay, as the roots will quickly suffer from exposure. Place over the crowns from three to four inches of light soil, water well in, and syringe daily.—G. Ellwood.

# MESSRS. S. McGREDY & SON'S ROSES.

Long engaged in the cultivation of roses on a large scale for trade purposes Messrs. S. McGredy and Son turned their attention some years since to the raising of new varieties from seed. With clear views as to what they desired to accomplish they entered on this branch of their business with some degree of enthusiasm, and, proceeding in accordance with a well-devised plan, they achieved so high a degree of success that the roses which have had their origin at Portadown have brought the firm many high awards, and taken a prominent position in the rose garden. Portadown is a thriving town in Ulster, some twenty-five miles or so to the south-west of Belfast, and the nurseries occupy a fine position on the high ground a short distance to the north of the town. In that part of the nurseries in which business of a general character is carried on, and the offices are situate, there is much to interest, for there is a considerable area of glass, and both in the plant houses and in the open, good culture is strongly in evidence. To the rosarian, whose devotion to his favourite flower is such that he has but little room in his thoughts for other occupants of the garden, the great fields of roses, within a short walk, will be the chief attraction. Indeed, to visitors generally, the attractions of these immense areas of roses must, during the summer months, be very great, for therein may be seen, not only all the best varieties in cultivation, but tens of thousands of plants of novelties, there being in one plot alone upwards of 60,000 plants of the latter.



HOUSE OF SEED-BEARING ROSE PLANTS.

The department in which the glass-houses have a place is not wanting in interest to those who are more or less immediately concerned with roses, for here are the structures in which the important work of cross-fertilisation is systematically carried on, the annual crop of seed brought to maturity, the seedlings raised and nursed through the earlier stages, and those which pass the primary test are prepared for being transferred to the open quarters. Each of the several structures possess some point that attracts immediate attention, but to myself that in which the pollination of many hundreds of flowers is annually effected and the resulting crop of seed harvested is especially interesting. This was not the first time I have had the pleasure of being in a house well equipped for such work, but the fact did not lessen my appreciation of what was in progress in the Portadown nurseries, and it is with much satisfaction that the accompanying illustration of the seedling house is given. The photographic reproduction would, perhaps, have presented a more attractive appearance had specimen roses in bloom been grouped on the floor and the roof draped with climbing roses in bloom, but the purpose is not to give an object-lesson in the arrangement of roses, but to present in graphic form the method by which the seed is obtained and ripened. This, it may be added as a point of some interest, is the first time an illustration of a house of seed-bearing roses has been published in this or any other country.

The house is about one hundred feet in length by twenty feet in width, and the angle of the roof is such that the plants have full advantage of every ray of light. The intensity of the light is still further accentuated by the use of the whitest of white paint, and evidently no shading material is used at any period. With the exception of the large specimen at the north or far end of the house, the whole of the plants are in pots, those six and seven inches being the most generally used. Every one bears one or more heps or seed pods, the largest proportion having two, it not being considered advisable to tax the plants beyond their power of bringing to maturity seed of the highest possible quality. It is interesting to observe the variation in the shape of the heps, and also to note how greatly these even of the smallest plants exceed in size those produced in the open. Even with this increase many heps have not sufficient power of expansion to comfortably accommodate the seeds, and some of the latter may, in the case of not a few of the pods, be seen emerging from the opening at the top when the heps have attained their full size. The large specimen was carrying three hundred and ten heps, and, as it bears a heavy crop of seed each year, it may in these days of popular names, be described as the "mother of thousands." It is an unnamed variety, and is the seed-bearing parent of more than one gold medal rose. The raising of the seedlings commences early in the year, and the seed is sown in six-inch pots, and placed in a spacious span-roof house without side-lights. The illustration shows the manner in which the pots are arranged on the stages, and it might suggest that the photograph from which it has been reproduced was taken soon after the seeds were sown. This, however, was not the case. The seeds vary considerably in the length of time required for their germination, and the young plants are lifted out with the aid of a pointed stick and put singly into small pots when two or three inches high. Hence but few seedlings are seen at one time.

Proceeding to the fields of roses in quest of the varieties that received distinction during the past summer, it was gratifying to find that in their development the importance of a strong free-branching habit had not been overlooked. One of the first of these to attract attention was British Queen (H.T.), which evidently has a great future before it both in the garden and on the exhibition stage. It has a very free-branching habit, and, as a result, the pure white, finely-formed flowers are produced freely and continuously throughout the summer and autumn. The variety was awarded a silver-gilt medal at Belfast on July 19; after the exhibition several of the members of the N.R.S. Council saw the big breadth of which a portion is herewith illustrated, and when blooms were staged at the society's autumn show the higher award of a gold medal was given it. Colleen (H.T.) is a distinct variety, with large deep flowers of the richest pink, and remarkable for freedom of flowering. Lady Mary Ward (H.T.), which received a gold medal at Belfast, is dwarf in growth, and has medium-sized flowers of a rich orange colour, shaded yellow. Mrs. C. E. Pearson (H.T.) received the distinction of a gold medal at the N.R.S. autumn show, and is a valuable addition to what is known as the Pernetiana section; somewhat similar in colouring to the Lyon Rose, it is more effective, and has a strong, free-branching habit. Mrs. E. Part (H.T.) was made note of as a fine decorative rose, the blooms of good form and of a pleasing shade of salmon-red. This received a silver-gilt medal at Belfast, as did Mrs. F. Vanderbilt, H.T., a decorative variety of great promise, the flowers of medium size and the colour rich orange-red. Old Gold (H.T.), which attracted so much attention at the N.R.S. Metropolitan Show, when it received the distinction of a gold medal, was making a brilliant display, and demonstrating its usefulness for decorative purposes when the writer was at Portadown at the end of July, a day or two after the heavy storms of rain and wind had played havoc with roses throughout.

RAISING SEEDLING ROSES.

The varieties that were distributed by the firm this year were, it need hardly be said, of special interest from the fact that the big breadths afforded an excellent opportunity for formulating an opinion upon their habit, constitution, and freedom of flowering. British Queen, to which reference has been made, is one that was distributed in June last, and the others are Earl of Gosford (H.T.), a deep crimson variety of much merit, the blooms large, of excellent form and fragrant, and the growth strong; Mrs. Muir Mackean (H.T.), a charming variety, the flowers of full size, fine form, and freely produced throughout the season. It is regarded as suitable both for the exhibition stage and the garden, and it amply justifies that opinion. Mrs. W. H. Rowe (H.T.), a beautiful variety, remarkable for its bright rose-mauve colour, and also for the fine form of the flowers, which are freely produced. Prominent among the varieties sent out from Portadown in 1911 is the distinct and handsome Edward Mawley (H.T.), which has flowers distinct in form, with large petals and of a glowing crimson colour. Although of a high degree of utility for exhibition, it is of value in the garden, for it blooms freely, as evidenced by the large breadths of plants in the nurseries. Dorothy Ratcliffe (H.T.) is a pleasing rose, the blooms rather large, full, and well-finished, and the colour an attractive shade of coral-red. Mrs. Amy Hammond (H.T.) is a remarkably beautiful rose of much value, both for exhibition and garden decoration. The blooms are large and of superb form, and the colour a delightful combination of ivory and amber, passing to apricot in the centre; the growth is good, and the flowers freely produced. Mrs. J. H. Welch (H.T.) is a charming addition to the pink roses, the colour bright and the flowers large in size and good form, and the growth such as to render it most useful in the garden.

In walking through the large areas devoted to roses that have been in cultivation several years, it was interesting to note that the rich salmon-pink Countess of Gosford (H.T.), one of the first of the varieties raised by the firm to receive the distinction of a gold medal, was holding its own as one of the best of the varieties in its distinctive shade of colouring. Another rose of great excellence is Ethel Malcolm (H.T.), a charming ivory-white variety, with blooms of large size and high quality, and produced so freely as to place it in the front rank of garden roses. His Majesty (H T.), a handome crimson rose of high value for competitive purposes, with the added merit of possessing a delightful perfume. Mrs. Alfred Tate (H.T.), a beautiful rose, with long, pointed, fragrant blooms, the colour copper-red, shaded fawn, orange-yellow in the centre. It is free and continuous in flowering, and a good garden rose. Mrs. E. J. Holland (H.T.) is proving useful for exhibition, and the freedom with which it produces its handsome salmon-rose flowers suggests that it has much value for the garden. Mrs. Arthur E. Coxhead (H.T.) has fully justified the high opinion that was formed of its merits when submitted to public notice in 1910, and is proving useful alike for the garden and exhibition stage. The flowers, which are borne erect, are of a rich claret-red, and delightfully fragrant, the fragrance possessing the sweetness of the old Damask rose.

One other variety must be mentioned for its great value, and that is Mrs. Herbert Stevens, one of the most recent of the additions to the tea-scented section. The flowers are of good depth and substance, and are white, suffused with fawn in the centre, and produced freely and continuously throughout the season. Its hardy constitution, and abundant flower production, render it one of the best bedding roses in its class and colour. G.

## LILIUM SPECIOSUM.

This must be regarded as one of the most useful of all lilies, for though the flowers are not so gorgeous as those of Lilium auratum, it is by no means so erratic in its behaviour as the Golden-rayed Lily. Whereas at one time Lilium speciosum could only be had in flower during late summer and early autumn, its charming blossoms are now, owing to the system of retarding to which it readily lends itself, available practically throughout the entire year. When planted out in the open ground it will often continue to bloom till the nights become too cold for the flowers to open properly.

Time was when we obtained nearly all our supplies of this lily from Holland, but now immense importations are sent here every year from Japan, and reach this country during the winter months. The bulbs, as a rule, travel remarkably well, and under favourable treatment can be depended upon to yield satisfactory results.

Several of the Japanese forms are remarkable for their richly-coloured blossoms, some very fine ones being often sold under the name of Melpomene. In this form the bulb is often composed of two or three crowns, so that one accustomed to their handling can often, with fair accuracy, pick out Melpomene while in the bulb state. The principal white form is Krœtzeri, though album novum is finer, but much scarcer.

The bulbs from Holland are principally composed of rubrum and roseum, both with pink flowers varying in depth of colour, and album, whose expanded flowers are white, with the exterior chocolate. The flowers of the Japanese bulbs are a little later in expanding than those from Holland, but the Japanese ones flower somewhat earlier after the first season.

We are sometimes told to purchase these bulbs in early autumn, but as far as my experience goes, the finest bulbs from Japan do not, as a rule, reach this country before December. Of course, earlier ones are obtainable, but they are, generally speaking, not the equal of the later ones.

S. W.

## PLUMS.

The plum may be regarded as second only to the apple as an all-round useful fruit, as its use in a fresh state extends from midsummer to the end of October, and provides us with supplies of the highest excellence alike for the kitchen and the dessert table. Some kinds are the hardiest of our tree fruits, blossom sometimes enduring as much as ten degrees of frost without injury. There is hardly any soil or situation such as is usually met with in gardens, where some varieties of the plum cannot be grown with more or less success, so that we can often plant it where it would be of little use to plant any other fruit. One very profitable use to which some of the hardiest plums can be put is that of wind breaks to the orchard or plantation, some of the best kinds to plant for this purpose being strong, upright growers like Czar, Monarch, Orleans, Pershore, and Pond's Seedling, while an excellent belt outside these may be made of damsons planted rather closely together.

SPECIMEN SEED-BEARING ROSE WITH 310 HEPS
In the Royal Nurseries, Portadown.

Another good use to which plums can be put in country districts is as hedgerow trees around fields or meadows adjoining the house, and it is a common thing to see trees doing well along the margin of the horse pond. In such positions one must expect them to be raided at times, but when grown in such wholesale fashion this drawback may be ignored. The bullace is especially valuable for this purpose, as it is not such a temptation to the farm hands; it needs little, if any, attention, and the gathering of the main crop may be done at any time in mid-autumn when there is a slack season. I used to know a stock-yard at a farmhouse where bullace trees grew in the hedge and along the side of the pond, and in some seasons many bushels were gathered; and, as nothing else would have been growing there, the returns were clear profit, the purchaser picking them as he wanted them. Damsons lend themselves to use in the same way.

While very many cooking plums, and even some which are very fair for dessert, may be grown in any out-of-the-way place, it is very different with choice dessert varieties, especially those of the gage class, some of which are decidedly tender and their blossom very susceptible to frost, the pistils turning black after three or four degrees. Plums are very greedy of lime, and this is not to be wondered at when we consider the amount of solid matter removed by the stones, of which lime is an important constituent, and it is largely owing to the richness of the soil in this element that the fame of Kent and the valley of Evesham as plum districts is due. Though the commoner sorts may be grown anywhere with some degree of success, no matter what the soil or situation, with choice sorts favourable conditions are necessary if they are to do well. The old green gage is especially particular, as many know to their cost. Thus, if the soil is poor in lime this element must be applied in some form, such as old mortar rubbish, basic slag, or lime itself, while in a situation exposed to the wind between north and east a shelter of hardier trees must be planted.

The form of tree to be planted is an important point to consider. Most varieties succeed as standards, except the late dessert varieties, which need a wall if they are to acquire any flavour in most seasons. It is often recommended to grow plums in bush form, but they are by no means always the success claimed for them, especially with varieties belonging to the strong-growing gage class. Unless the soil is of a calcareous nature, and the situation fairly warm, so that they are likely to crop heavily, it would be better not to plant any but the surest bearers, such as Rivers' Early Prolific, Victoria, and Czar, in this form, or the planter will have a constant struggle with the laborious process of root pruning. With all forms of dwarf trees it is a good plan to take them up and root-prune them after the second year's growth, and with some strong growers, such as Oullin's Golden Gage and Monarch, even after the first season. The horizontal espalier form is sometimes recommended, but it is rather risky, branches often dying away, or at best becoming very weak, when depressed to get them into line with the rest of the tree. When buying fan-trained trees, those with a strong, upright central branch should be avoided if possible, as this will grow stronger than any of the other branches, and so make it difficult to maintain a well-balanced growth, a condition which it is especially desirable to maintain with trees of stone fruits. Some varieties do very well in the cordon form when they are properly attended to, but rank growers should not be chosen unless the district is an exceptionally favourable one to the plum.

Varieties are all too numerous, but there are a few which stand above the others for those with limited space. There are no varieties to beat Coe's Golden Drop, Jefferson, and Denniston's Superb, for dessert, but they need a wall or fence for the best results in any but the most favourable seasons. Golden Drop needs a good autumn in any case, and cracks badly in unsettled weather in late August and early September. Of cooking varieties Victoria is, of course, generally voted the most useful on account of its enormous cropping powers, but it is of indifferent quality, either as a dessert or kitchen plum. Rivers' Early Prolific is a contrast to this, being one of the best flavoured of all when cooked, and very fair for dessert when fully ripe. Czar is an excellent bearer, and, for late use, Monarch can hardly be improved upon.

ALGER PETTS.

## ROSES AFTER RAIN.

In a charming essay on "Bad Weather," Leigh Hunt tells us "It is not by grumbling against the elements that evil is to be done away, but by keeping oneself in good heart with one's fellow creatures. . . ."

We all know what pleasant companions and fellow travellers are those of our friends who can be cheerful in spite of the many minor evils the elements may introduce into a day's journey. We also know how depressing are those others whose philosophy succumbs to the first touch of misfortune or discomfort.

A walk round my garden after a pouring wet October day, followed by a gusty night, suggested to me the idea that roses are very like human beings in this respect, and that as we are fortunate if we include in our household some at least who "keep in good heart" through good and evil fortune, so we are wise if we plant liberally in our gardens those roses which look bright and cheerful even after stress of autumn storms and rains. Those who only grow exhibition varieties will find their rose borders looking rather melancholy as soon as any wet weather comes in autumn. There may be plenty of buds on such varieties as Madame Maurice de Luze or Mrs. Myles Kennedy, but the moist and cool nights have prevented them from opening quickly, and so their petals become stuck together and the bushes are made unsightly by the brown spongy balls, which is all the buds can develop into. Now and then we may find a brave Hugh Dickson or Frau Karl Druschki, but if we want to see how gay a rose garden can be in late October we must take a peep at one in which decorative roses are grown in quantity, though even among these there are many that lose their colour, and with it one of their chief charms, when the leaves begin to take to themselves autumnal hues.

Most of the yellow and cream roses are disappointing at this time of year. The two best of these shades in the garden are Sulphurea and Mrs. David Mackee. It is astonishing how such delicately coloured roses can keep fresh and clean looking after heavy rain, but these two varieties have discovered the secret, and I feel very grateful to them for yielding their soft creamy blossoms so late in the year. Sulphurea, indeed, seems to reserve itself for the autumn; in the summer it is rather niggardly in the matter of flowers. Of the flesh-coloured roses the stately Pharisaer and the deeper tinted Dorothy Page Roberts are two of the most rain-resisting. Dorothy Page Roberts is far more beautiful in late autumn than it was in the summer; it possesses the qualities that tend to make a good wet-weather rose, namely, a small number of very substantial petals. In cool weather these unfold gradually and curve themselves into most fascinating shapes. The only fault to be found with this variety as a rose for the garden is that it is not sufficiently free flowering.

But, beautiful as many of these light-coloured roses are in themselves and as cut flowers, in the autumn garden, they cannot compare in value with the bright pinks and crimsons, whose glowing flowers make spots of warmth and colour in the garden landscape, even in late October. Among the pinks, Gustav Grünerwald, Corallina, and Mrs. Wakefield Christie-Miller are good; while Grüss an Teplitz, Marquise de Salisbury, Ecarlate, and Liberty should all have a place for the sake of their late crimson blossoms. General MacArthur does not stand the rain so well as those I have mentioned. A newer variety, Mrs. Edward Powell, has been flowering very continuously this autumn, and it is well worth growing, as the bright clear crimson of its large petals is well set off by the very dark bronzy-green of the handsome foliage.

But were my "bad-weather" rose garden to be restricted to two varieties, I should have no hesitation in choosing what to plant. My pink rose would be Mrs. E G. Hill, and my crimson would be Richmond. Richmond is so well known there is no need to waste words in describing it; its bright crimson, fragrant buds open a better colour and shape in cool weather than they do in the heat of summer, and it blossoms with the freedom of a China rose. The brilliant coral-pink, Mrs. E. G. Hill, ought to be in every garden, for it is the only rose I know which really merits the description I read in some optimistic catalogue of a variety which "revels in all weathers!" October has almost passed away as I write, and its last days have been stormy and very wet, yet our groups of Mrs. E. G. Hill still hold erect their big sprays of glowing pink expanded blossoms and deep carmine buds. Yesterday I picked enough flowers from one group to make a table decoration entirely with this variety, and they lend quite a look of summer to our dining-table; and this morning (October 29), on visiting the same group after a rain-storm of unusual severity, I found fresh flowers and buds had opened, and there was scarcely a trace on the great shell-like petals of the bad weather which had worked havoc among the neighbouring roses.

It is surely a wonderful record for any plant to flower freely and continuously, as these two roses, Richmond and Mrs. E. G. Hill, have done here, from early June till the end of October, and to show promise, as they do, of blooming for many more weeks if only the frost will withhold its "icy hand." I would, before closing, remind readers that such generous output must be met by generous treatment. Such roses deserve the best soil of turfy loam and well-rotted manure that we can devise for them, and through May and June they appreciate weekly doses of well-diluted liquid manure. Insect pests, mildew, and other fungoid diseases must be kept under by constant hand-picking and syringing. In a word, we must give them our constant attention and they will repay us throughout the long summer and autumn months with their "bright, consummate flowers."

WHITE LADY.

---

**A Muscat Vine Fruiting Late.**—Last spring I accidently broke away a lateral growth from a vine rod when the shoots were being tied down. For a time the spur remained without growth, then, well, back, a young shoot grew from it and bore a bunch of grapes. With the exception of once stopping the shoot and thinning out the berries nothing was done to this growth, sub-laterals being allowed to grow as they were not strong. The berries set as freely as Black Hamburghs, and, although they are rather under-sized and the bunch is small, the grapes have coloured very well indeed.—G. B.

**Rose Gruss an Teplitz.** — One often reads that roses should be pruned this way or that way, but I have a grand bush of Gruss an Teplitz that has scarcely been pruned at all. It was raised from a cutting, and, occupying an isolated position on grass, it was simply allowed to grow naturally. The result is a handsome bush, full of richly-coloured, highly-fragrant flowers and buds. Stout shoots are continually being produced from the base, and each is terminated by a large head of blossoms. The only pruning it gets is to shorten back two or three of the longest shoots in spring, and to cut out any exhausted wood.—S. W.

## HOLLOW TREES.

### The Prevention and Stopping of Hollow Stems.

There is no doubt that hollow places in the trunks and limbs of trees formed by decay are better filled up. If the cavity be a large one the appearance of the trunk is thereby improved, and if it be small and properly treated decay is often arrested and new bark encouraged to grow over the filled-up cavity. It prevents the entrance and accumulation of moisture, and thereby removes one of the chief predisposing conditions of decay.

The majority of such decayed hollows have their origin in snags left by branches broken off that have rotted back into the trunk because the new bark has not been able to grow over and seal up the wound. Branches removed by design, or broken off by wind or accident, should always be sawn off close to the trunk, and the sawn surface should then be coated over with ordinary coal tar. If a snag or stump is left the bark cannot grow over it; damp, fungoid parasites and decay sooner or later follow and gradually find their way towards and eventually into the trunk. Such is the most frequent beginning of cavities in the limbs and trunks of trees. The coating of tar renewed every two or three years, makes the wound watertight and fungus-proof; its object being to serve as a temporary bark until a new natural covering is formed. It is certain that the life of many trees, historically famous or otherwise notable, might be much prolonged if a close watch against the intrusion of decay into the trunks and main branches was maintained.

With regard to hollows that have already formed the following treatment is recommended: First clean out all the decayed material, especially the soft brown crumbling wood and the soppy mass frequently found at the bottom. Sound dead wood that has become dry and hard does not matter. Then wash the surface of the wood that is left exposed with a strong solution of carbolic acid. After allowing this a day or two to dry, a good thick coating of ordinary tar should be laid on. This antiseptic treatment is intended to destroy, as far as possible, fungoid parasites. It now remains to fill up the cavity. If this be a small one Portland cement may be used, and for round holes like those made by woodpeckers a plug of oak, cut to fit, will do. But if the hollow be large, the aid of the bricklayer may be obtained. After the bricks are laid the whole should be surfaced with cement. In the case of black trunks lampblack may be mixed with the outer layer of cement or it may be dusted over thickly with soot whilst wet. An intelligent workman may be able also to imitate the characteristic corrugations or markings of the trunk.

These, however, are mere refinements. The chief points are, the keeping out of moisture and the provision of a surface over which the new bark may grow. If a tree is in a state of vigorous growth, as many hollow trees are, the bark will in time close over the "stopping." But unless some surface is provided on which the new wood can set itself it forms the thickened rolls usually seen in hollow beech trees. In very hollow trees open on one side a curious spiral growth of wood is sometimes seen in place of these thickened rolls, which is due to the new wood continually being deposited on its own inner surface. A remarkable example of this curious growth is exhibited in No. IV. Museum at Kew, presented by Lord Iveagh. It is a section of elm trunk that was so hollow as to be merely a shell a few inches thick. On one side of the trunk was a longitudinal slit. The tree appears to have a good growth and to have made vigorous efforts to close up the opening, but having no surface on which to deposit a new wood and bark, and thus bridge over the gap between the two lips, it eventually formed by its continual growth on the inner side two remarkable spirals suggesting a pair of scrolls.—W. J. BEAN, in "Kew Bulletin."

# THE EDUCATION OF YOUNG GARDENERS.

Not for a long time have I read anything so cheerfully optimistic as the recent article in the Gardeners' Magazine on the education and training of young gardeners, by Mr. James Hudson, V.M.H., and it comes at a moment when certain severely practical men are apt to belittle the advantages of education where a gardener is concerned. The article carries weight because it is written by a gardener, an old gardener, and I may say one of Britain's most successful gardeners. The last time I saw the Gunnersbury veteran was at the International Show, when he was putting the finishing touches to that unique exhibit of fruits which won the admiration of all who saw it. If I mistake not Mr. Hudson then informed me that he had been exhibiting for half a century, and proposed to finish with the International. If I am correct, it was a fine finish, worthy of the man.

When you hear a gardener of Mr. Hudson's ability and reputation regretting that he never had the opportunities for education that young men have to-day you may depend that there is something in it; and, mind you, this regret is not confined to gardeners, for successful men in every walk of life express the same wish, i.e., that they had been given the opportunity of learning more when they were young.

Every line of the article written by Mr. Hudson is good, and the whole might well be taken as a guide by any young gardener who wishes to get on. It will do him more good than all the croakings of the pessimistic section who have been saying for years that gardening is going to the dogs, and the end to be achieved is not worth the effort that is required in order to take advantage of the educational facilities that are offered at the present day. Now, as in the past, the best men almost always come to the top, and the best men in the future will be those who educate themselves on the lines laid down by Mr. Hudson.

Let me support Mr. Hudson in his view that every young gardener should take a pride in his writing, and become competent in spelling and composition, because it is in these very things that so many fail. Very often a man's abilities as a gardener are measured, perhaps wrongly measured, by a badly-written, badly-composed, and incorrectly-spelt letter of application, and if some gardeners knew that they had lost their chances of obtaining a berth through this failing they would set out to improve themselves. Not long ago I had to read through about fifty letters of application from young gardeners for a post that was advertised, and, but the the pity of it, some of them might have been framed as humorous curiosities. But, what is perhaps more to the point, the writers of the four best letters were the individuals selected for interview.

I do not think it much matters whether a young gardener begins his practical training in a large establishment or a small one, as long as the training is thorough, but I do think it is good for him to have a year or two in the atmosphere of education, such as an establishment like Kew offers. I do not say that a year or two at Kew necessarily makes a man a better gardener than if he put in that year or two somewhere else, but Kew is a public school where young gardeners are concerned; its influence is broadening; in a word it is educational, and it has the effect of rubbing off the rough corners which are the natural consequence of no other experience than that obtained in a private establishment. I further contend that employers do not want in these days menial, cringing, servile individuals as gardeners; but men who are alert, well-educated, and intelligent; men who know their business as gardeners, and are able to express themselves in the King's English.

We hear a good deal in these days about the desirability of raising the status of gardeners; I ask—who are largely responsible for keeping that status down? The fault does not rest with the men who train themselves (and, after all, it is a matter of self-training) on the lines suggested by Mr Hudson, but rather those who have never thought the effort worth making.

Too often, I am afraid, it is men who call themselves gardeners that set out to discourage beginners where education is concerned, and as a case in point a course of horticultural instruction was given recently in a certain place. A local gardener was asked why he did not attend, and he answered, with a look of disdain, "Me attend; I shouldn't think of it. I've forgotten more than that man (the teacher) ever knew." And yet that veritable walking encyclopædia of horticultural knowledge has never aspired to anything above a situation as a single-handed gardener, or rather he has one boy under him, and he did his best to persuade that boy not to go to the class.

Unless I have read it wrongly, the train of thought running all the way through Mr. Hudson's article is "aim high." You may not get all the way, but you will get on the road and somewhere near to the goal. I cordially agree that it is gardeners themselves who must raise the social status of gardening, for no one else can do it, but it will not be done by trades unionism and menace so much as by education and self-improvement.

H.

PLOT OF H.T. ROSE BRITISH QUEEN
In the Royal Nurseries, Portadown.

## NEW PLANTS.

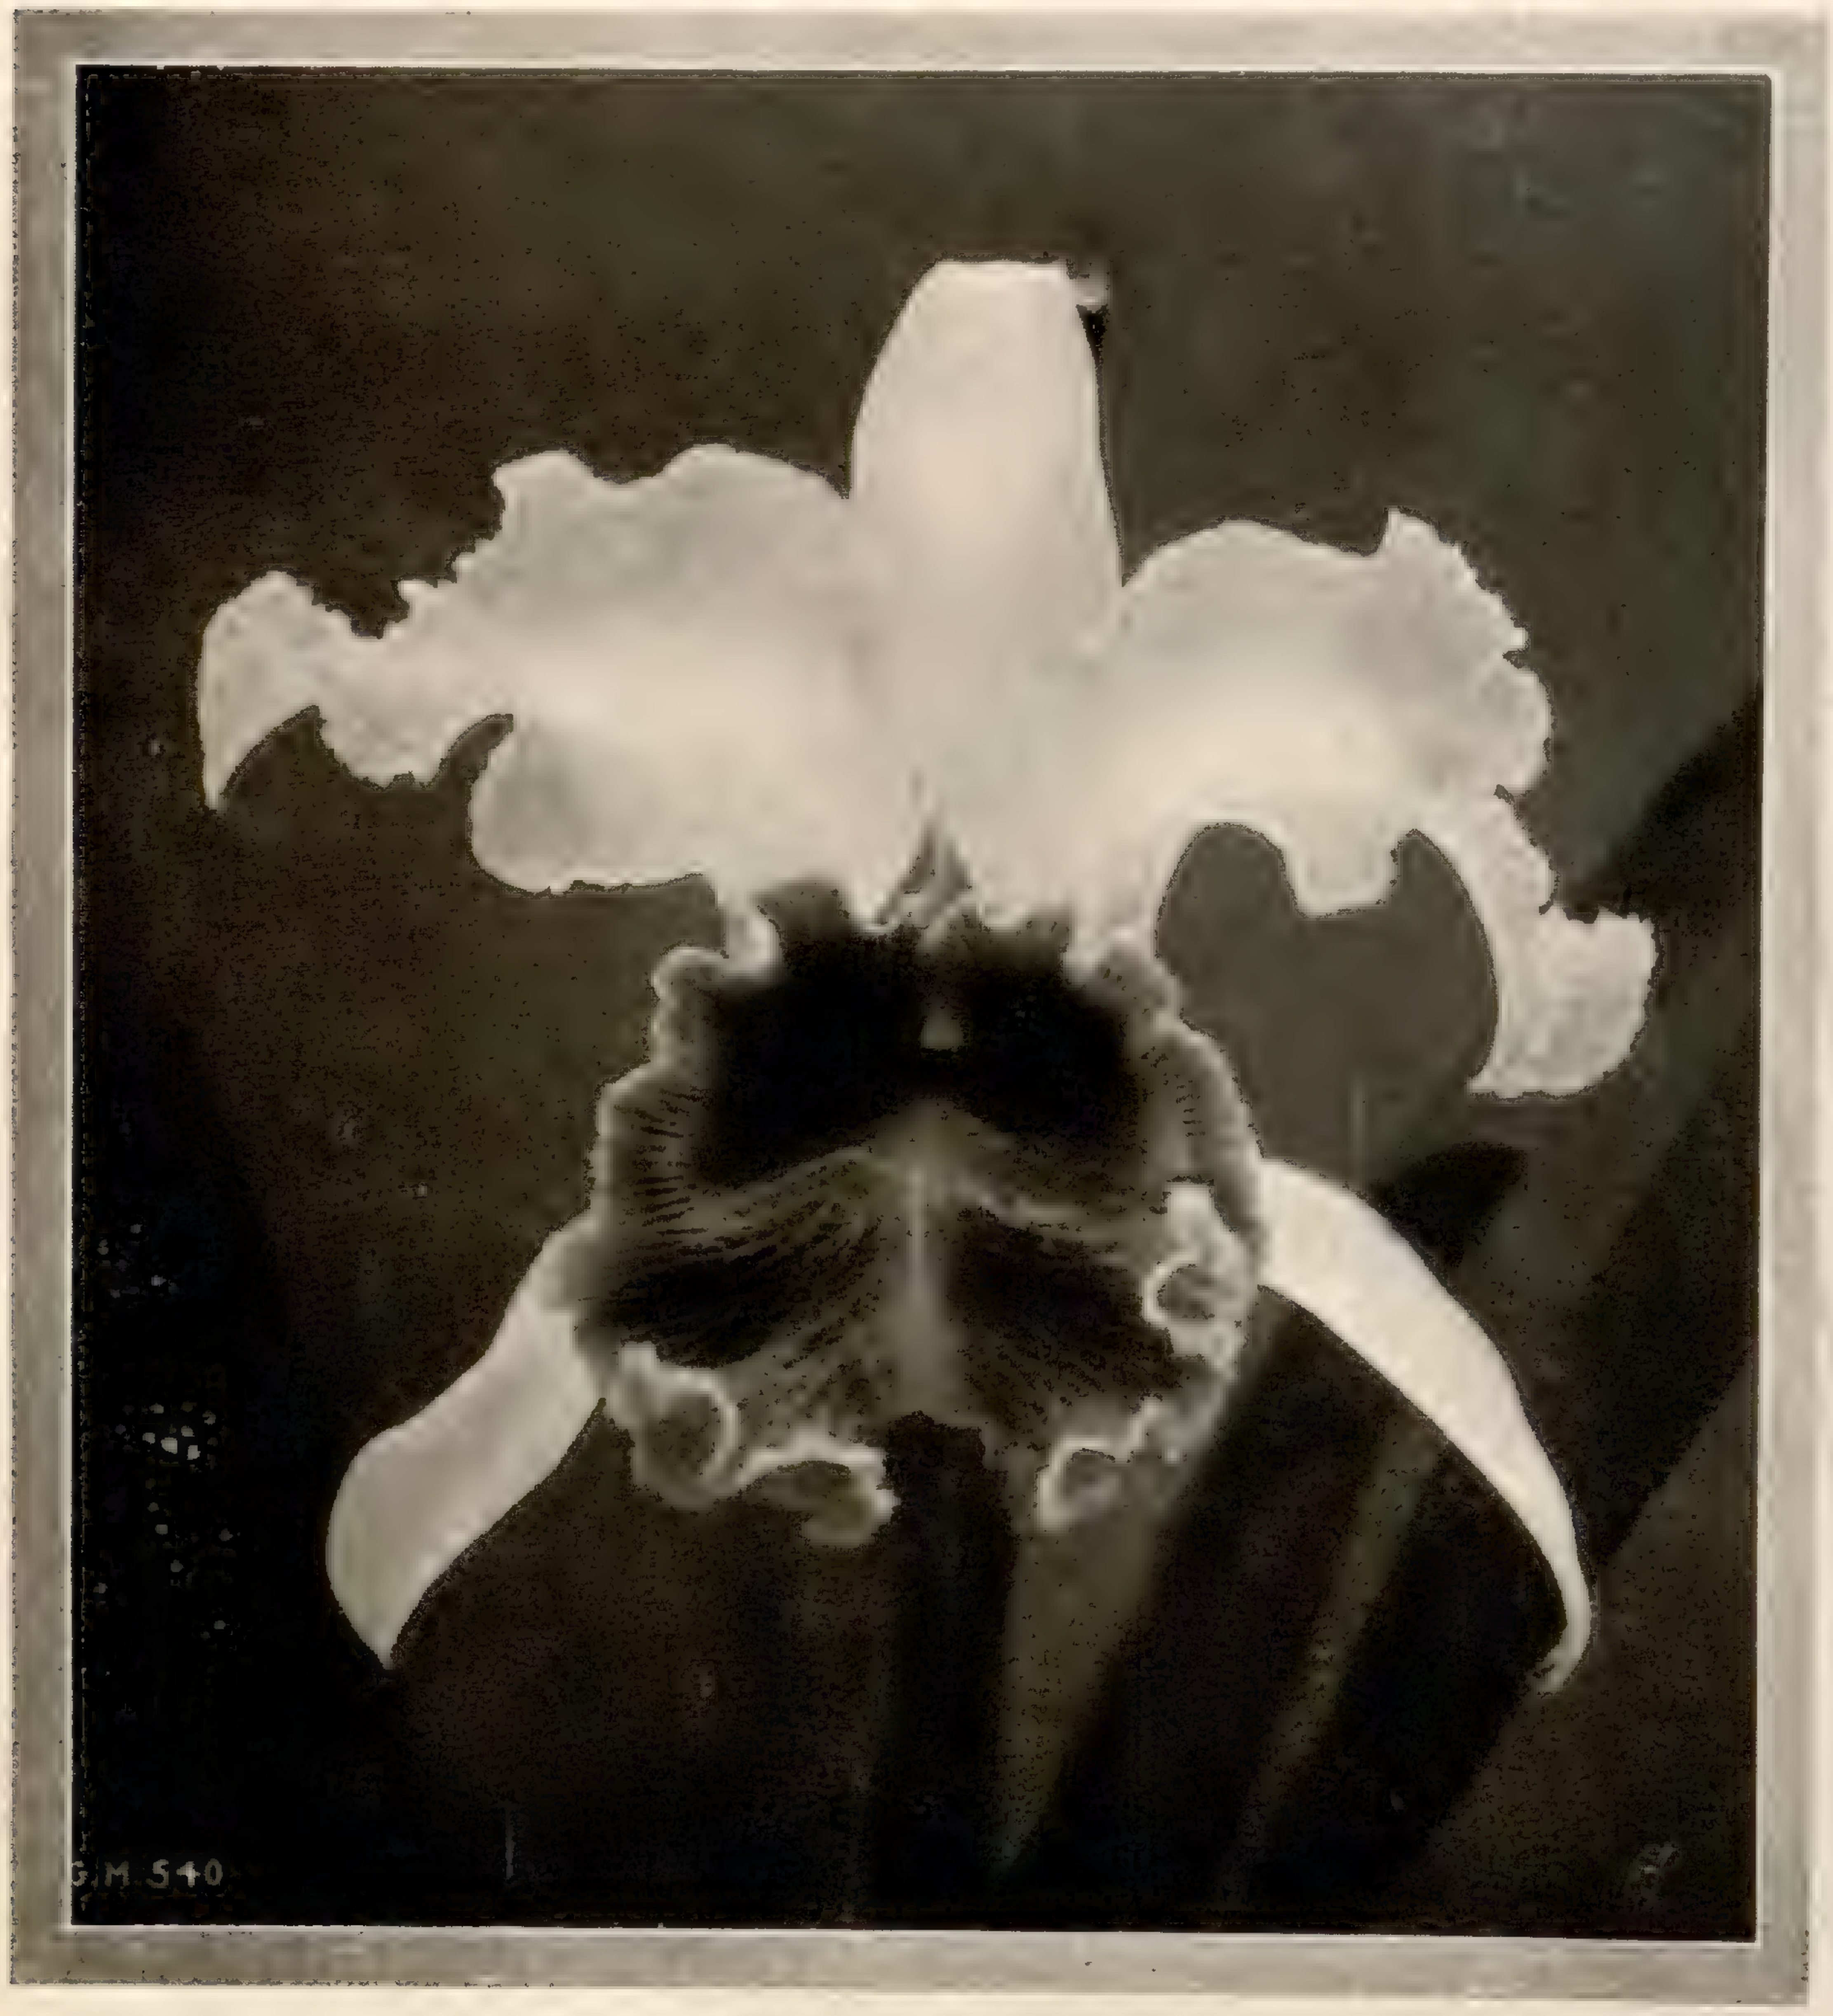
◆

### CATTLEYA PEETERSI WESTONBIRT VAR.

This very beautiful orchid has large blooms composed of white sepals and petals and a large lip, in which the gold veining at the base and throat combines finely with the deep ruby-purple apex. F.C.C., R.H.S., November 5. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester. (See p. 853.)

### CATTLEYA ORION VAR. OTHELLO.

The wonderful colouring in this hybrid attracted general attention. The petals are rich wine-purple, the sepals deep bronze, shaded with crimson, and the lip intense maroon, lightened with gold. This was illustrated on p. 851, and we regret that it was inadvertently described as a lælio-cattleya. F.C.C., R.H.S., November 5. Messrs. Charlesworth and Co., Haywards Heath.



CATTLEYA OBERON.

A handsome hybrid with a brilliant crimson purple, and gold lip, and light, broad petals, stained with bluish-rose at the margins. A.M., R.H.S., November 5. E. R. Ashton Esq., Broadlands, Camden Park.

### CATTLEYA RHODA THE JEWEL.

A very useful and effective variety, obtained by crossing C. Iris with C. Hardyana. The colouring is very pleasing, sepals and petals being rich deep yellow, while the lively crimson of the lip is accompanied by gold shading and veining. F.C.C., R.H.S., November 5. Messrs. Charlesworth and Co., Haywards Heath.

### VANDA CÆRULEA LADY HOLFORD.

A delightful variety, carrying large and shapely flowers, with clear blue shading on a lighter or electric-blue ground. The plant carried two grand spikes. F.C.C., R.H.S., November 5. Lieut.-Colonel Sir George Holford.

### ODONTIODA BRADSHAWIÆ GATTONENSIS.

A brilliant form, with large orange-scarlet flowers. One of the best varieties seen. F.C.C., R.H.S., November 5. Sir Jeremiah Colman, Bart. (gardener, Mr. Collier), Gatton Park, Reigate.

### ODONTOGLOSSUM AURORA.

A splendid Rossi hybrid, the parents being O. Rossi rubescens and O. Lambeauianum. The colouring is particularly rich. The sepals and petals are broad for the size of the flower, rosy at the margins, and crimson-bronze down the centre. The lip is wide and shapely, intense rose-purple, with a yellow crest on the small white disk. F.C.C., R.H.S., November 5. Messrs. J. Veitch and Sons, Chelsea.

### CATTLEYA HARDYANA LA PERLE.

This is a very fine form, the large flowers having white sepals and petals and a broad, handsome royal purple lip, with yellow throat and basal markings. A.M., R.H.S., November 5. Lieut.-Colonel Sir George Holford.

### CATTLEYA FABIA GLORIOSA.

One of the finest forms of this splendid autumn-flowering cattleya, and one in which purple, mauve, and golden colouring are wonderfully combined. The lip is very large and brilliant. A.M., R.H.S. Lieut.-Colonel Sir George Holford.

### CATTLEYA FABIA SUNSET.

Another beautiful orchid that must have been obtained from very fine forms of C. labiata and C. aurea. In this the purplish-rose of the sepals and petals forms a fine setting for the purple and yellow of the broad and frilled lip. A.M., R.H.S., November 5. Lieut.-Colonel Sir George Holford.

### CATTLEYA VENUS PRINCESS.

One of the very useful set of yellow autumn-flowering hybrids, C. Iris and C. Dowiana aurea being the parents. The sepals and petals are light yellow, and the lip is bright crimson with gold veining. A.M., R.H.S., November 5. Messrs. Charlesworth and Co., Haywards Heath.

### CYPRIPEDIUM MURIEL.

A shapely hybrid between C. Euryades and C. Cynthia. It is most like the first-named, and has red-purple marks on the white dorsal sepal, and brown and green colouring on the lip and petals. A.M., R.H.S., November 5. Lieut.-Colonel Sir George Holford.

### ODONTOGLOSSUM EXIMIUM McBEAN'S VAR.

This closely resembles a finely-blotched O. crispum; the flowers are rounded, white, and coloured freely with rich red-purple. A.M., R.H.S., November 5. Messrs. J. and A. McBean, Cooksbridge.

### CATTLEYA OBERON.

A large-flowered hybrid between C. Fabia and C. Hardyana. It resembles the latter very considerably, especially in the crimson-purple and gold lip. The broad petals are blush coloured, heavily shaded in a curious fashion with bluish-rose at the margins. A.M., R.H.S., November 5. E. R. Ashton, Esq., Broadlands, Camden Park.

### BRASSO-CATTLEYA HYEÆ ASHTON'S VAR.

A very useful and showy hybrid between Brassavola Digbyana and Cattleya Harrisonæ. The plant exhibited carried two large and very substantial flowers, with rosy sepals and petals, and a broad, fleshy, creamy-white lip that shows the influence of Brassavola Digbyana in its frilling. A.M., R.H.S., November 5. E. R. Ashton, Esq.

### LÆLIO-CATTLEYA WALTER GOTT.

In this handsome hybrid rich colouring is added to excellent shape and substance. The parents are L.-c. Bletchleyensis and C. bicolor. The sepals and petals are deep reddish-mauve, and the lip is dark rosy-crimson. A.M., R.H.S., November 5. Messrs. Sander and Sons, St. Albans.

### CYPRIPEDIUM GLEBELANDS.

A large cypripedium very like C. insigne Harefield Hall in size and colouring, but with deeper spotting on the dorsal sepal. The latter organ inclines forward somewhat. C. Lathameanum and C. insigne Chantini are the parents. A.M., R.H.S., November 5. J. Gurney Fowler, Esq. (gardener, Mr. Davis), Glebelands, South Woodford.

### BEGONIAS.

Optima.—A very distinct advance among winter-flowering begonias. The habit of the plant and its freedom of flowering are excellent, while its large single flowers are buff-pink or salmon-pink. A.M., R.H.S., November 5. Messrs. Jas. Veitch and Sons, Chelsea.

Emita.—This is even more striking than the foregoing, and a distinct break away in the matter of colouring. The flowers are of good size, and the colour is a curious shade of orange overlaying buff-pink. A very attractive variety belonging to the semi-tuberous class derived from B. Socotrana and the tuberous-rooted forms. A.M., R.H.S., November 5. Messrs. Jas. Veitch and Sons, Chelsea.

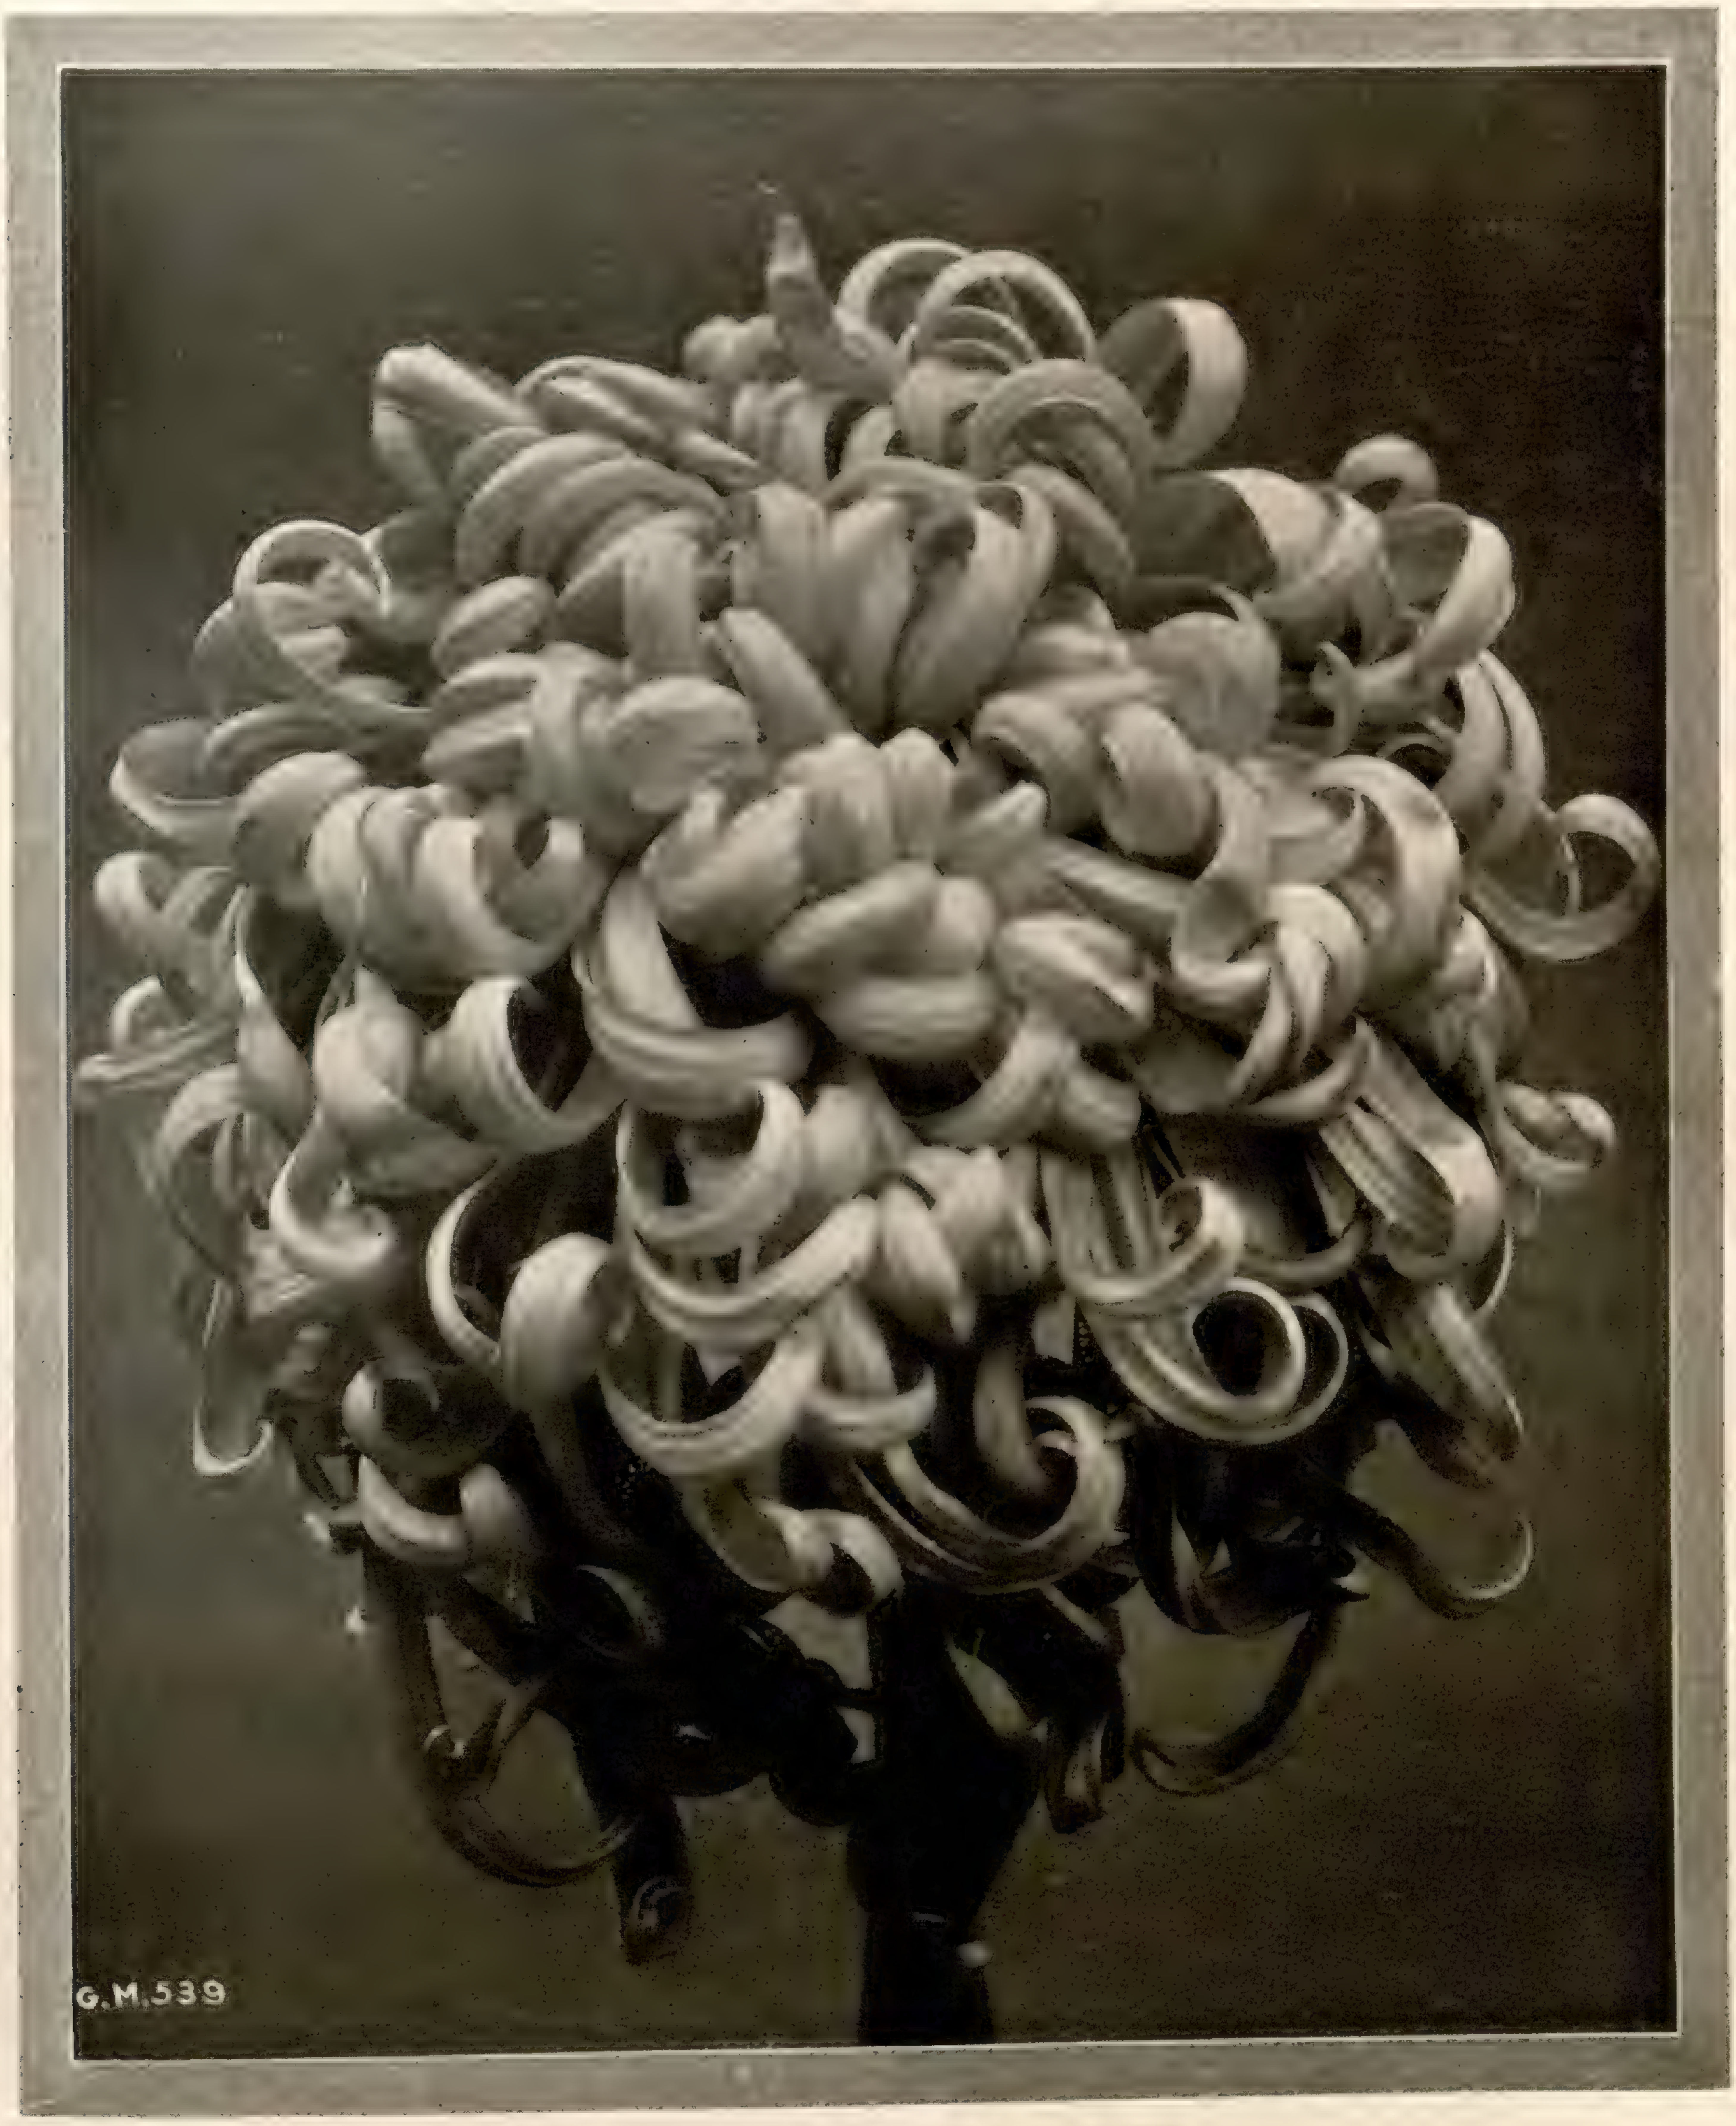
### HOHNERIA POPULNEA.

A malvaceous shrub from New Zealand and allied to Plagianthus Lyalli, and hardy only in favoured places in the southern counties. The flat, leathery leaves have the margins very prominently toothed. The white flowers, about half an inch across, are freely borne in little axillary clusters. A.M., R.H.S., November 5. Mary Countess of

Ilchester (gardener, Mr. H. Kempshall), Abbotsbury, Dorset.

### CARNATION.

St. Nicholas.—An American-raised perpetual variety of large size, good calyx, and rich carmine scarlet colouring. A.M., R.H.S., November 5. Messrs. Stuart Low and Co., Enfield.



CHRYSANTHEMUM MISS A. E. ROOPE.

A striking Japanese variety, with broad curling florets of very intense yellow colour. F.C.C., N.C.S., October 29; A.M., R.H.S., November 5. Mr. H. J. Jones, Ryecroft, Lewisham.

### CHRYSANTHEMUMS.

Miss A. E. Roope.—A splendid yellow Japanese variety, with broad curling florets (see p. 861). A.M., R.H.S., November 5. Mr. H. J. Jones, Ryecroft, Lewisham.

Hector Menzies.—A large single variety, with two or three rows of elegant light-yellow florets. A.M., R.H.S., November 5. Mr. H. J. Jones, Ryecroft, Lewisham.

Mrs. Leonard Harrison.—A fine single variety, with broad, brilliant chestnut-red florets, and a narrow yellow zone round the disk. A.M., R.H.S., November 5. Mr. L. Harrison, The Orchards, East Grinstead.

Snow Queen.—A charming white anemone variety of great grace and beauty. The disk or cushion is of modest proportions and the ray florets are ample and elegant. It is the result of an effort to create a new race of anemone-centred singles. A.M., R.H.S., November 5. Messrs. Cragg, Harrison, and Cragg, Hounslow.

Portia.—A splendid single variety of large size and fine form. The colour is reddish terra-cotta, with a yellow reverse that is occasionally evident. A.M., R.H.S., November 5. Messrs. Cragg, Harrison, and Cragg, Hounslow.

Enchantress.—A refined Japanese variety of medium size. It has fairly long drooping florets, the centre of the flower is white, but the outer florets are shaded with rose-pink, and some of the florets are edged with pink. F.C.C., N.C.S., November 11. Messrs. J. Stredwick and Son, St. Leonards.

Mrs. W. T. Smith.—A pleasing white Japanese variety, with loosely incurving florets. There is a pearly whiteness about the flower that gives it a very refined appearance. F.C.C., N.C.S., November 11. Mr. A. Smith, Convent Gardens, Roehampton.

Mrs. W. E. Tricker.—A very fine solid incurving Japanese variety, with broad, but pointed florets of a deep blush shade. Very handsome. F.C.C., N.C.S., November 11. Messrs. W. Wells and Co., Merstham.

Queen Mary.—Described and figured in our issue of November 9. A.M., R.H.S., November 5. Messrs. W. Wells and Co., Merstham. (See p. 861.)

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

CATTLEYAS.—Among the species of cattleyas which bloom at this season, C. labiata undoubtedly is one of the most useful, and the varieties include some of the most beautiful flowers imaginable. There are other species, such as C. Dowiana, which also produce their flowers at this season, all of which are most useful, and assist the cultivator in making his houses gay and attractive. Among the hybrid cattleyas and lælio-cattleyas, which, from a cultivator's standpoint, can be treated in the same way. there are numerous varieties which produce their blooms at this dull season of the year. I do not intend occupying space here by giving a long list of names of these hybrids, but would suggest that anyone who is an admirer of these most beautiful plants should pay a visit to an up-to-date nursery, or a private garden where a representative collection of these plants is grown. Many of these lovely plants are now in their full beauty, and the fine size, and their wide range of colour, bear testimony of the hybridist's art. The flowers should not exhaust the plants by being allowed to remain upon them too long, but after being open for a reasonable time they should be removed. Those pushing new roots from the base of the pseudo-bulbs may be repotted, if the compost in which they are growing is at all sour or decomposed.

WATERING.—All plants that have been repotted must be carefully watered until re-established. The watering of cattleyas, lælio-cattleyas, and also lælias during the winter is often a difficult matter, especially to the amateur and beginner. So varied are the conditions under which the plants are grown that I venture to give a few details to show how difficult it is to advise either on the application or reduction of water. In the first place, it is desirable to know the nature of the compost in which the plants are growing; secondly, if the plant is well rooted or not; thirdly, if the plant is potted firmly or loosely. Again, are the plants growing in a dry or humid position? All these points seem of minor importance, but all have a bearing on the amount of water which should be applied to the roots. As regards potting, this should all be done firmly. A great many users of Osmunda fibre have made the mistake of not potting firmly enough; all loose composts retain moisture much in the same way as a sponge.

SECONDARY GROWTH.—Many cattleyas at this season make secondary growth, but I have not found any ill effects from this, providing the plants are kept active until this growth is completed; it is often the means of the plant making extra leads. When once growth has started nothing is gained by checking it, therefore every encouragement should be given to develop the growth by placing the plants well up to the light, and watering them whenever they require it.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

MIGNONETTE.—This delightfully sweet-scented annual is always appreciated, and especially so when grown in pots for the decoration of the conservatory. It is of easy culture. Seeds sown in the first week of August, as advised, have germinated well, and the seedlings are now strong and healthy. These should be thinned out, leaving five plants in each five-inch pot to develop. They should now be removed to a cold vinery or peach-house, and be placed on a shelf near the glass, where abundance of air can be obtained, as this will tend to harden the plants, and keep them dwarf and sturdy.

CAMPANULA PYRAMIDALIS. — With the advent of frosts plants of this useful campanula should be lifted from the border, where they had been during the summer, and potted at once. Owing to the wet season the plants have grown well and will therefore require rather larger pots than usual. It will be found they are coarse-rooted, and care must be taken in lifting to maintain the ball of soil and roots intact, or the plants will suffer badly. Most of the plants will need a ten-inch pot. Ram the soil firmly, and after potting place in a cold frame or peach-house. Those grown in pots should also be placed under shelter; they will require very little water until growth again becomes active in the spring.

DIELYTRA SPECTABILIS. — A very valuable old favourite is this perennial, but to my mind it never looks so beautiful as when grown in pots and slightly forced. Plants can be purchased at very little cost at this season; they like a rich, fibrous compost, and after they are potted should be placed for a short time in a cold frame. They commence to root at once, and when well established may be placed in more warm and congenial quarters, where they quickly respond. The fine racemes of heart-shaped flowers are very effective, and the plants are most useful for placing in vases for house decoration. There is also an albino form of this, but the flowers are not pure white, but a bad cream; the constitution is not so good, and it is not nearly so effective and valuable as the type.

CLIMBERS.—Many of these will now have done flowering for this season, and need a period of rest. Plants which have been trained up the back wall and over the rafters of the roof may be slightly pruned back and tied together. Water should be withheld from the roots. Climbers always do best when planted out, and should any additions be required the present time is most opportune for planting. Most of the climbers like a rich compost with a good root run, but in the case of lapagerias a bed of peat must be prepared.

GENERAL REMARKS.—During wet days and when frost and snow occurs, the staff should be drafted into the houses to clean plants, woodwork, and glass. Get everything forward ready for the rush of work that always comes with the advent of the New Year.—Lewis Smith, Cadland Gardens, Southampton.

## HARDY FRUITS.

PLANTING FRUIT TREES AND BUSHES.—The planting of all kinds of fruit trees and bushes should be energetically proceeded with, taking advantage of every apportunity when the soil is in a suitable condition for the operation. By planting early, while the soil still retains a certain amount of warmth, quick root action is induced, and the trees will break freely next year, and make a stronger growth than would be the case were planting delayed until later period. When dealing with soil of a heavy, retentive nature care must be taken to avoid the great mistake of treading it down in such a manner as to make it resemble soft putty: the best plan is to have ready to hand some light material such as old sifted soil from the potting shed or well-rotted rubbish-heap material, and when planting place some of this over and about the roots, also adding a good portion to the soil for filling up; this will allow of firm planting. Half-standard trees should be immediately secured to a stout stake, which should be placed in position prior to planting the tree. Fruit trees, when they come to hand from the nursery, should be quickly unpacked and laid in, in moist soil or leaf-mould; should the roots happen to be dry—which may occur through delay in transit, plunge them in a tub or tank of water for two or three hours, and then lay them in, but the sooner, however, they are placed in their permanent quarters the better it will be for the future well-being of the tree. Carefully examine the roots before planting, cutting back the broken or bruised roots with a sharp knife.

PRUNING.—Having completed the pruning of Morello cherries, plums may be taken in hand. Young trees which have received due attention during the summer months will only need to have the chief shoots cut back somewhat, and a little thinning done to the young shoots that must be laid in for extension of the young trees. Trees which have filled their allotted space should have the spurs shortened back, particularly those which point outwards from the wall, even if by so doing a few bloom buds have to be sacrificed. Crowded spurs should be well thinned out, bearing in mind that the nearer the spurs are to the wall the more warmth and protection they will receive. The main branches should have ample space allowed for proper development of the foliage, and overcrowding should be strictly avoided. In some instances it is advisable to cut out some of the old and exhausted branches, and train in young growths from the base, and where the tree is still of a vigorous habit, it is possible to gradually replace old and exhausted branches with vigorous and fruitful young growths. Trees which have been neglected, and which have spurs standing out to some considerable distance from the wall, should have half of the spurs cut back to within one inch of their base and the remaining spurs treated in a similar manner the following winter.

DESSERT CHERRIES should be pruned on much the same lines as the plums; they are very impatient of the knife, and unless the cuts are clean and done with a sharp knife there is always a danger of gumming occurring. When the shoots are well pinched back during the summer, the use of the knife is reduced to a minimum. If the growth on dessert cherries is excessive, the root action must be restricted by root pruning.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

CAULIFLOWERS.—The May-sown batch will now be turning in, and will be found most useful to prolong the season of this delicious vegetable, for without a doubt cauliflowers are superior in flavour to the majority of the broccolis. Protect the small forming curds by tying them up. If a shortage in the supply occurs, take up a quantity with good balls of earth and roots attached, and plant thickly in pits or deep frames, giving a good watering. Use the lights as necessary. Both cauliflowers and broccolis should be treated in this way to maintain a regular supply of heads throughout the winter. Sutton's Winter Mammoth broccoli is one of the very best, as it follows the cauliflowers, and a good batch will last well into February. Prick off autumn-sown cauliflowers without delay in a cold frame.

GLOBE ARTICHOKES.—These will now require attention to safeguard them against much rain and frosts. Remove all old flower stems and decaying leaves, then place a good supply of cinder ashes around each plant; or, if preferred, long litter or bracken fern could be used. If the stock needs increasing, now is the time to proceed by dividing the plants, potting good suckers, or divisions, into ten-inch and twelve-inch pots, placing these for the winter in cold frames, plunging the pots in ashes.

FRENCH BEANS.—Wherever room is available, make a sowing now, using 60-sized pots, and placing five seeds in each. Eventually pot them into 24-sized pots for cropping. Maintain a temperature of 50 degrees in cold weather.

POTATOES.—Wherever a little room can be spared for a few early potatoes, it should be made use of. Proceed to prepare the sets, if not already done, by placing small tubers of May Queen and Express on end in boxes in a warm house. When sprouting has commenced place in pots or bloater boxes.

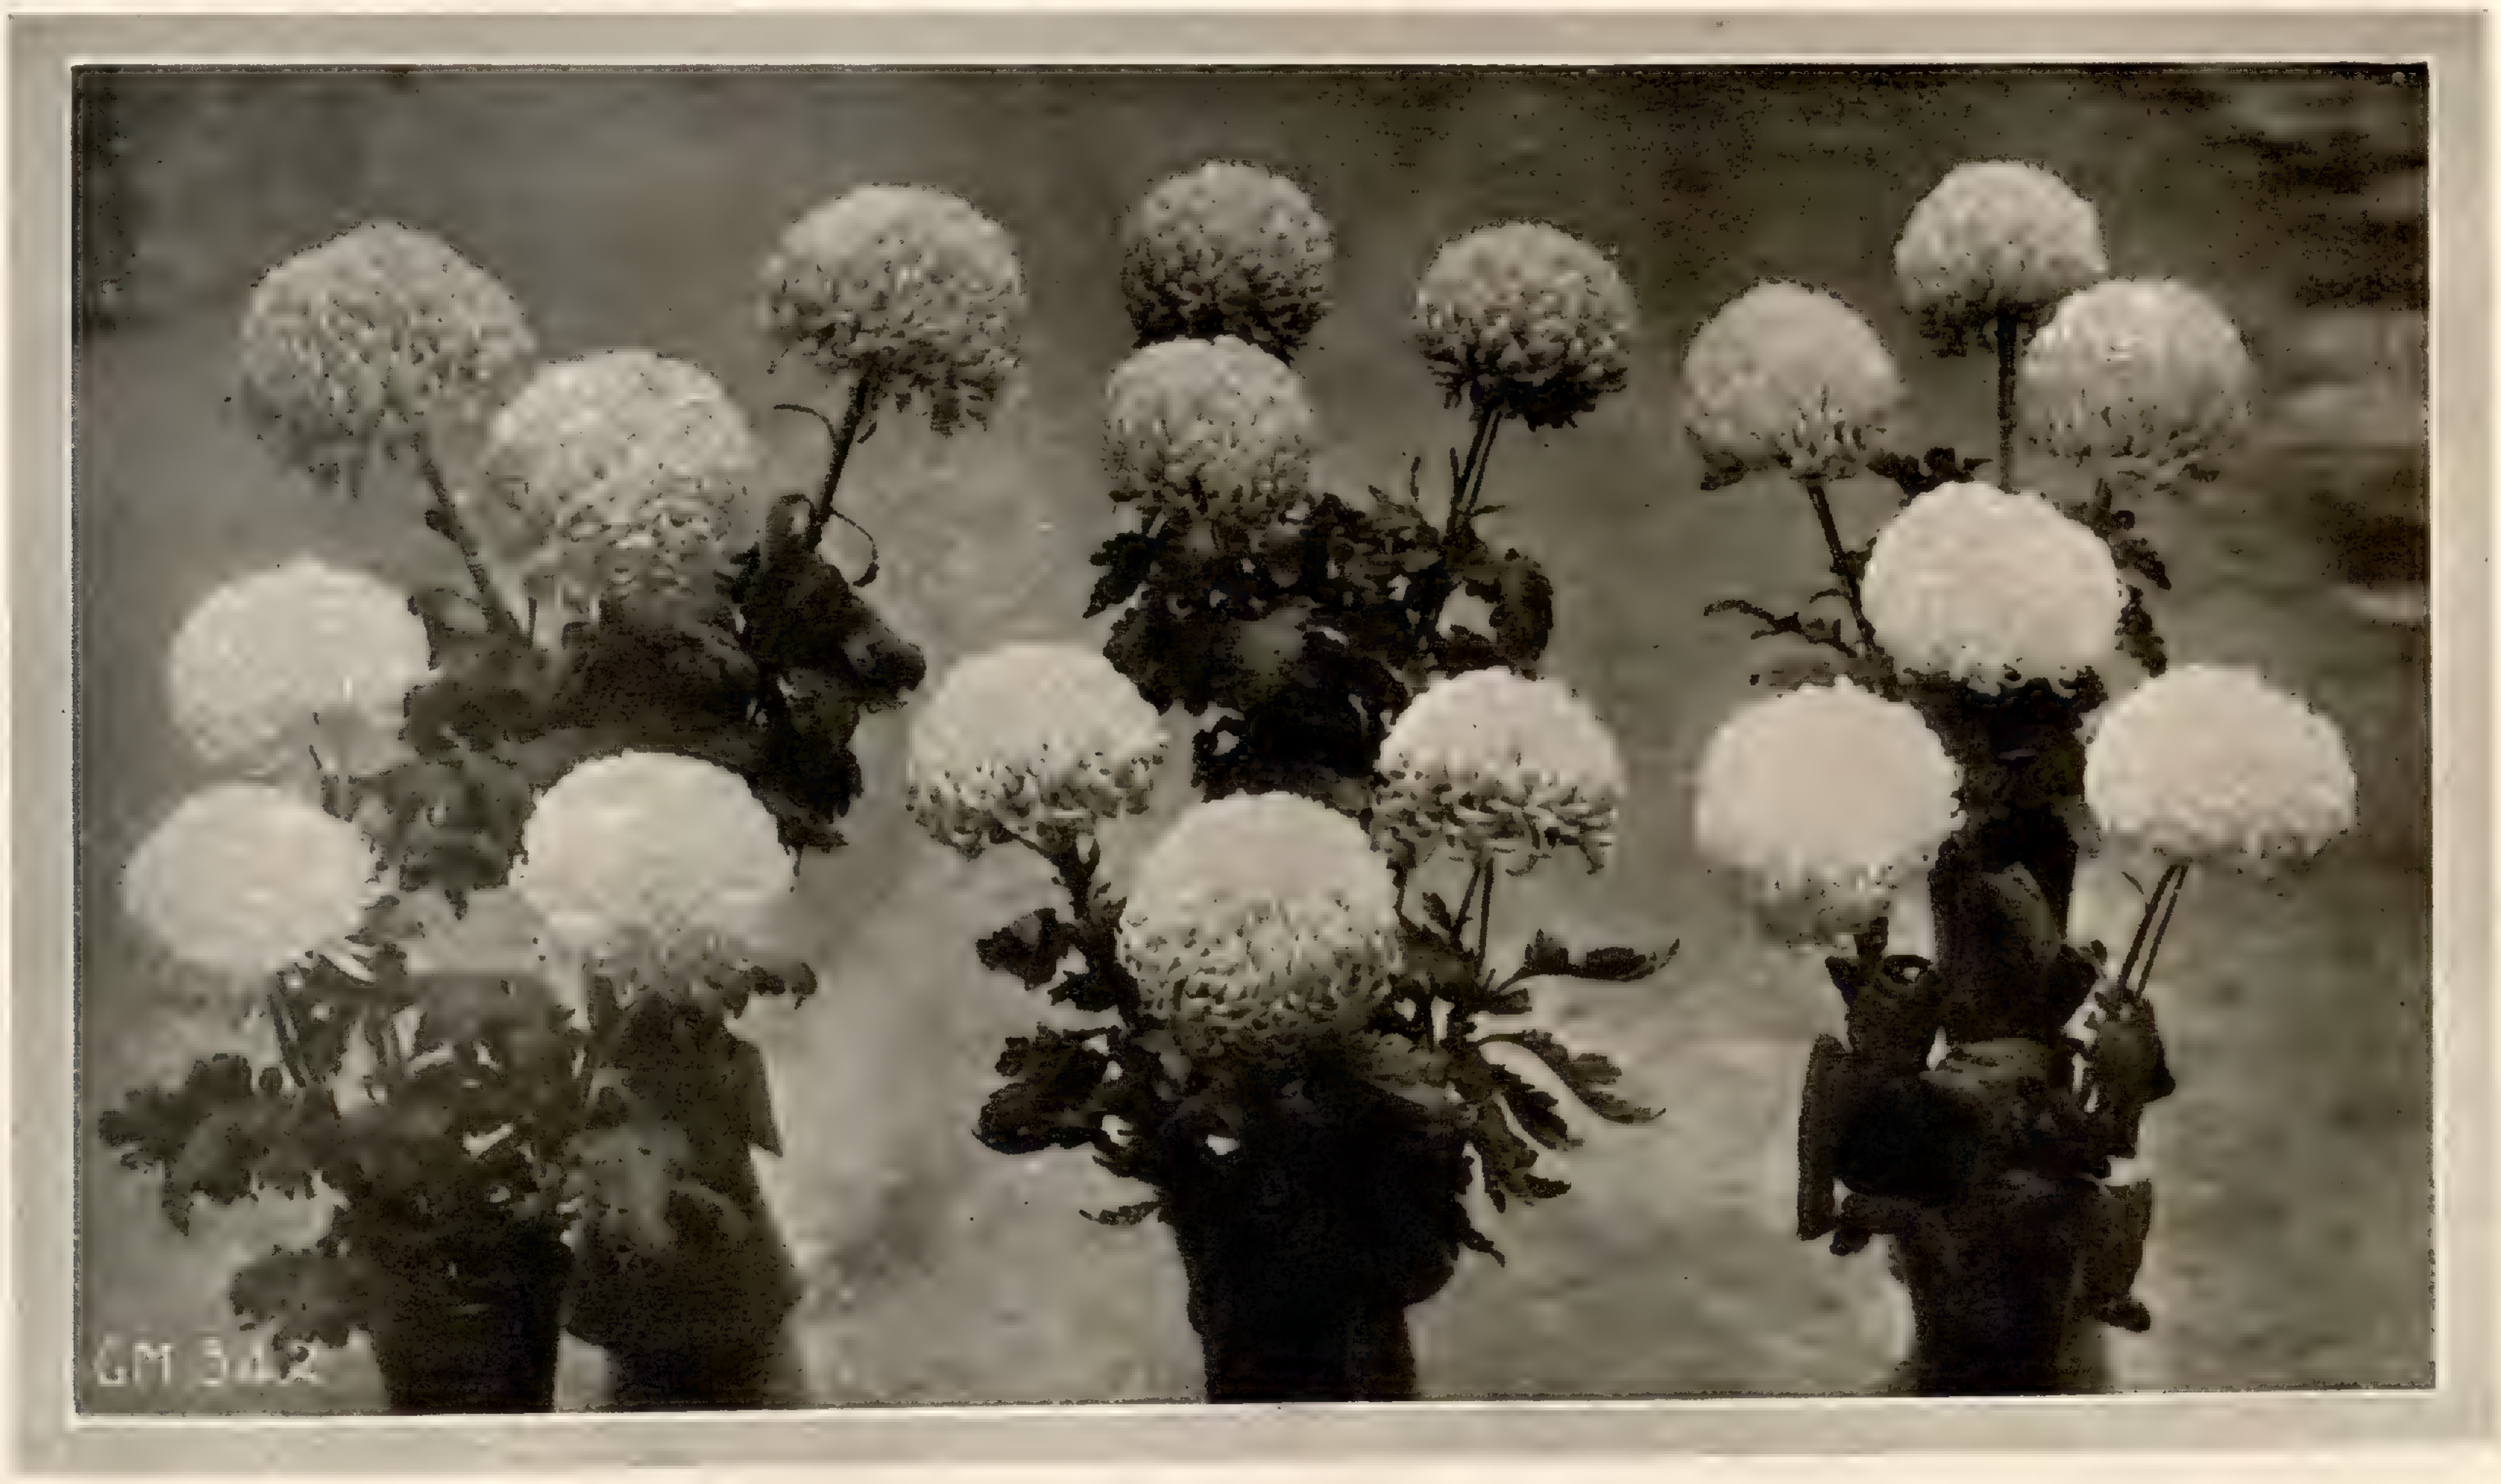
GENERAL.—Sow Shorthorn carrots on slight hotbeds, and make up other beds for asparagus, seakale, etc. Remove endive to safe quarters, but expose it to all favourable weather until required for blanching. Prick out late-sown lettuces into cold frames for spring planting. Watch winter spinach closely, and if shelter is required place fir boughs on the exposed sides. Dust soot over winter carrots, and collect all garden and other rubbish into a heap to rot, turning it occasionally. — Geo. Ellwood, Swanmore Gardens.

# EXHIBITIONS AND MEETINGS.

## Cambridgeshire Horticultural Society.

NOVEMBER 7.

This society, which is one of the oldest of the provincial organisations for the promotion of horticulture, held its annual autumn show on the date given above, and this was so great a success as to fully maintain the high reputation which it has so long enjoyed. As usual, the exhibition was held in the Corn Exchange, and, as for so many years past, this spacious building was filled to its utmost capacity with such products of the garden as are available at this season of the year. The society does not, as in some cases, rely upon any one class of subjects, but endeavours, by the provision of a comprehensive schedule, to have an exhibition that is fully representative of the garden in November, and in this endeavour a high degree of success was achieved. Chrysanthemums were so largely and well shown as to constitute a great and highly attractive feature. Of fruit there was an immense display, many hundreds of dishes being staged, and vegetables were splendidly shown. The arrangements were admirably carried out under the directions of Mr. Rupert Fuller, the honorary secretary, and the committee.



Ethel Thorpe.
Mrs. F. Judson.

Daisy Southam.
Mrs. G. Denyer.

Marjorie Shield.
Duchess of Fife.

FIRST PRIZE SIX VASES OF INCURVED CHRYSANTHEMUMS
Shown by Mr. G. Barker at the Cambridge Exhibition.

### CUT BLOOMS.

Several open classes were provided for chrysanthemum blooms with valuable prizes in addition to those in which the competition was limited to members, and the contributions to them were of so high a degree of excellence as to prove highly attractive to visitors. In the class for twenty-four blooms of Japanese varieties, distinct, Mr. G. Barker, gardener to Miss Gibson, obtained premier honours with large, fresh, and finely finished blooms of Frances Jolliffe, Mrs. T. A. Miller, Fred Green, Mrs. L. Thorn, Rose Pockett, Mrs. A. Herbert, Dorothy Gouldsmith, Marjorie Chandler, Marie Lomes, W. Turner, F. Chandler, G. Mileham, Lady Talbot, Bessie Godfrey, Victorian, Thorpe's Beauty, A. M. Thorpe, W. Mease, Lady E. Letchworth, Mrs. Gilbert Drabble, Duchess of Sutherland, and J. H. Silsbury. The competition was very keen in the members' class for eighteen blooms of Japanese varieties, and in this also Mr. Barker was first, staging splendidly-finished blooms, the varieties chiefly the same as those in his first-prize twenty-four. Mr. E. Dyson, gardener to W. P. Neal, Esq., Cherry Hinton Hall, was a very close second with blooms remarkable alike for their large size, bright colour, and high finish; and Mr. W. Hill, gardener to Sir J. J. Briscoe, Bourn Hall, Cambridge, who was third, staged an excellent set of blooms. Mr. W. Hill was successful in taking the premier awards for six and three blooms of Japanese varieties.

Incurved varieties were so admirably shown both in point of numbers and quality as to be considerably above the average. Mr. G. Barker was successful in taking the premier award for eighteen varieties with blooms of relative large size and admirable in colour and finish. The varieties were Mrs. F. Judson, Romance, Mrs. J. Wynn, Buttercup, W. J. Higgs, Mrs. G. Denyer, Reliance, Daisy Southam, and Mrs. C. Crooks. Mr. T. Todd, gardener to W. A. Briscoe, who was second, had splendidly-grown flowers, which, with a little more dressing might have obtained for him a higher place. Mr. G. Barker also won in the class for twelve incurved, and was closely followed by Mr. E. Dyson and Mr. T. Todd for the second and third places.

The classes for exhibition blooms in vases formed a good feature, for the blooms were throughout in a high state of development and well staged. The class for six varieties, incurved, three blooms of each, shown in vases, was of special interest as evidence that when in exhibition form the flowers of incurved varieties present a very attractive appearance, when arranged in vases, and might with advantage be more freely used for the decoration of indoor apartments. Indifferently-developed incurved blooms, on the other hand, are quite unsuitable for decorations, as they present a rough appearance that is far from pleasant. Mr. Barker scored with an exceptionally fine set, which we have much pleasure in illustrating herewith. The varieties were Ethel Thorpe, Daisy Southam, Marjorie Shield, Mrs. F. Judson, Mrs. G. Denyer, and Duchess of Fife. Mr. T. Todd was a good second. Very fine were the blooms shown in the corresponding class for Japanese varieties, and the prizetakers were Mr. G. Barker, Mr. Todd, and the Rev. C. F. Townley.

The contributions to the classes for decorative and single varieties grown without disbudding, and shown in vases, were so numerous and good as to constitute a delightful feature. Unfortunately, not one of the exhibitors named his flowers, and as a consequence the display possessed but little educational value. Hitherto the flowers in these classes have been carefully named, and we trust the committee will see to it next year that the exhibitors revert to the old practice of naming their flowers. Mr. A. Lelliott occupied the post of honour in the class for six vases of decorative varieties with flowers of high quality and tastefully arranged. Messrs. R. M. Jones and Son and Mr. Edwards were second and third. As for some years past Mr. W. Dobbs exhibited single varieties in splendid style, and the tastefully-arranged six vases with which he obtained premier honours were very beautiful. Mr. W. Hill and Mr. Edwards were first and second. Mr. Dobbs won also in the class for three vases of singles, and Mr. Kirkpatrick, gardener to R. L. Hudson, Esq., was a good second.

### PLANTS.

The groups arranged for effect were of a high order of merit, and the contributions to the classes for chrysanthemum plants were somewhat above the average. The premier award for a group of chrysanthemums, arranged for effect, was made in favour of the Hon. Mrs. Thornton, whose group was remarkable both for the splendid development of the flowers and tasteful arrangement, Mr. E. Dyson was second. Mr. G. Willers, Cambridge, was the most successful of the exhibitors in the classes for specimen plants of chrysanthemums, his successes including first for six and three Japanese, for one reflexed and one single variety. Salvias made a brilliant display of colour, and the most successful of the exhibitors of these were the Rev. F. C. Townley and Mr. Todd, the latter scoring also in the class for begonias with finely-flowered examples of Gloire de Lorraine.

### FRUIT.

The display of fruit was one of the largest we have seen at Cambridge, and the quality was high throughout. Apples and pears were especially well represented, there being several hundred dishes, in which were to be seen at their best all the finest varieties in general cultivation. Very keen was the contest for honours in the class for twelve dishes of apples, to consist of equal numbers of culinary and dessert varieties. Here Mr. J. H. Ridgwell was a splendid first, the fruit being rather large, richly coloured, and admirably finished. We noticed among the cooking apples Peasgood's Nonsuch, Lord Derby, Newton Wonder, and Tower of Glamis and especially noteworthy among the dessert varieties were the fruits of Cox's Orange Pippin. Mr. A. Lelliott was a capital second with a collection in which Lane's Prince Albert was represented at its best. Mr. T. Todd won for six dishes of apples comprising equal numbers of culinary and dessert varieties, Allington Pippin, Charles Rose, and Lane's Prince Albert being especially noteworthy. Mr. Todd was first also for three dishes of dessert apples, staging Blenheim Pippin, Cox's Orange Pippin, and Ribston Pippin at their best, the colour being exceptionally brilliant. In the corresponding class for three dishes of cooking apples Mr. J. H. Ridgwell occupied the first place with excellent examples of Alfriston, Bismarck, and Newton Wonder. Mr. A. Lelliott had the best dish of Lane's Prince Albert. Mr. R. Stephenson staged the best dish of Peasgood's Nonsuch, of Bramley's Seedling, and of King of the Pippins. The best dish of Cox's Orange Pippin was shown by Messrs. R. M. Jones and Son.

The prizes for baskets of apples to contain 20lb. of fruit gave rise, as in previous years, to a very interesting competition. For baskets of cooking apples Mr. W. Cole and Mr. J. H. Ridgwell were first and second with Newton Wonder in splendid condition; and Mr. R. Stephenson and Mr. J. H. Ridgwell occupied similar positions in the class for baskets of dessert apples, both staging Cox's Orange Pippin remarkable for brilliancy of colouring.

The principal class for pears was that for six dishes, and Mr. Todd won with exceptionally fine fruit of Beurré Bachelier, Duchesse d'Angoulême, Doyenne du Comice, Beurré Diel, Charles Ernest, and Le Lectier. Mr. W. Dobbs was a capital second. Mr. E. Dyson secured the premier award for three dishes of pears, with handsome fruits of Beurré Bachelier, Madame Treyve, and Doyenne du Comice. Mr. P. Hollis was a good second. Stewing pears were well shown by Mr. W. P. Hollis, Mr. E. Dyson, and Dr. Dalton. There was a spirited competition in the grape class, and the most successful of the several competitors were the Hon. Mrs. Thornton and Mr. W. Hill for Muscat of Alexandria, and Mr. E. Dyson and Mr. Kirkpatrick for Alicante.

### VEGETABLES.

There was a very strong competition in the society's class for ten kinds, and the Hon. Mrs. Thornton was first with a collection of great excellence, especially noteworthy being the leeks, carrots, and parsnips. Mr. A. Lelliott followed closely for second place, with a collection in which the Brussels sprouts were of high quality, and Mr. P. Hawkes was third. In the class for six kinds, in which Messrs. Sutton and Sons provided the prizes, the Hon. Mrs. Thornton occupied the premier position; and in Messrs. E. Webb and Sons' class Mr. Kirkpatrick was first.

### NON-COMPETITIVE EXHIBITS.

Owing to the space available being so fully occupied by the products in competition for the prizes, non-competitive exhibits are usually few in number at the society's autumn shows. On this occasion Mr. Kirkpatrick exhibited an attractive group of orchids, in which the finely-flowered examples of Cattleya labiata and Vanda cærulea were the most noteworthy. Mr. Ward, of Bishops Stortford, exhibited decorative chrysanthemums in variety, and Mr. Dunn, of Cambridge, staged several boxes of hybrid tea roses, the blooms fresh and otherwise of good quality.

---

## Cardiff Chrysanthemum Society.

### NOVEMBER 6 and 7.

A capital show was held by this society in the Skating Rink, Cardiff, on the above dates, and this roomy structure afforded ample space, both for the exhibits and the visitors. Although there was a slight falling off in the usual number of entries, this was fully compensated for by the excellence of the exhibits, chrysanthemum blooms being especially good, and the miscellaneous contributions by the trade were in every way of a high order of merit. In the presence of a good attendance, and supported by the Lady Mayoress of Cardiff, Lady Ninian Stewart opened the show.

### VASE CLASSES FOR CUT BLOOMS.

The contributions of eight vases of Japanese varieties, three blooms in each, for which the society's challenge cup went with the first prize made a splendid class. Chief honours were deservedly secured by Mr. Farmer, gardener to the Marquess of Bute, Cardiff Castle, who had large, solid, highly-coloured examples of G. C. Kelly (one bloom receiving the National Chrysanthemum Society's certificate as the best bloom in the show); William Turner, fine; Bessie Godfrey, Lady Talbot, F. Mew, White Australia, etc. Mr. H. A. Allen, Penarth, who had a fine set of leading varieties, was second, and Mr. Joys, Courtyrala Gardens, was third. For six vases, Mr. S. J. T. Grinter took the lead with a fine set of blooms, and thus won the Vivian Challenge Cup; among them were F. S. Vallis, Master James, W. Gee, F. Jolliffe, and Lady Talbot. Mr. H. A. Allen was second, and Lord Aberdare third. The prizes for five blooms of any white variety brought four excellent exhibits, each consisting of Mrs. A. T. Miller. Mr. L. E. Treherne led, and was followed by Mr. Grinter and Mr. Edwards for second and third places. In a similar class for other than a white variety, the prizes were taken in the order named by Mr. Treherne, Mr. Edwards, and Mr. H. A. Allen. The class for one vase of single varieties brought some beautiful exhibits. The winning vase, containing mixed colours that blended charmingly, came from Mr. G. Screen, Penarth. Colonel Gaskell was second with a beautiful vase of Mrs. W. Buckingham, and Mr. G. Blower third.

### CUT BLOOMS.—COLLECTIONS.

In the class for twenty-four blooms of Japanese varieties, in not less than twelve varieties, the "Courtes" Challenge Cup formed part of the premier award, and was well won by Mr. H. A. Allen, with fine examples of Lady Talbot, G. C. Kelly, F. Joliffe, Bessie Godfrey, Mad. P. Radelli, etc. Mr. J. E. Davis, gardener to Godfrey L. Clark, Esq., Tahfgare, who was second, also staged well. Two splendid sets were staged in the class for twenty-four blooms, twelve each of Japanese and incurved. The Bell Harrison Challenge Cup was offered with the first prize, and Mr. Farmer, who was placed first, had splendid blooms of W. A. Etherington, Maud Jefferies, F. S. Vallis, President Viger, and White Australia among Japanese varieties, and Buttercup, Mrs. F. Judson, G. F. Evans, Frank Trestain, S. Thorp, and Mrs. G. Denyer among the incurved. Mr. Evans, gardener to Sir E. G. Philipps, Picton Castle, who was the other exhibitor, was strong with incurved varieties. The class for twelve blooms, distinct, Japanese, was especially good, and here again Mr. Farmer occupied the premier position with a splendidly finished lot of fine blooms. Mr. Allen was a good second, and Mr. Joys a capital third. A similar class for twelve blooms, in not less than six varieties, brought Mr. H. Skamp, Penarth, to the front, with Mr. S. J. T. Grinter and Mr. J. Lynn Thomas following in the order named. The class for twelve blooms, not less than four varieties, for which "The Empire" Challenge Cup was offered, again gave Mr. Allen the lead, with, as his best blooms, F. S. Vallis, Master James, F. Jolliffe, Bessie Godfrey, Mrs. A. T. Miller, etc. Mr. H. Edwards was a good second, and Mr. H. Skamp was third.

Incurved varieties were not provided for in so liberal a manner as at one time; nevertheless, they were well represented. For twelve blooms, distinct, splendid sets were staged, the blooms being large, solid, and perfectly formed. Mr. Farmer again secured leading honours, staging J. Agate, Bocasse, G. F. Evans, and Buttercup in especially good form, and Mr. Evans, who was second, also had a fine exhibit

### PLANTS.

The group of plants of single and large-flowering chrysanthemums, arranged with ornamental foliage plants in a space 60 sq. ft., was not well filled, but Messrs. William Treseder, Lim., nurserymen, Cardiff, who received the premier award, had an exceedingly beautiful arrangement, composed of splendidly flowered Japanese and single varieties, with a margin of crotons, palms, and ferns. Mr. A. Brown, gardener to the executors of the late James Howell, Esq., Grove House, was awarded the first prize for a group of chrysanthemums arranged in a space of 50 sq. ft. This was well arranged, and the blooms were fresh, moderately large, and the colours pleasingly blended and edged with ferns and grasses, which made a good finish; for this the National Chrysanthemum Society's certificate was awarded in addition to the first prize. In the class for single-flowered chrysanthemums, arranged in a space of 40 sq. ft., Mr. S. J. T. Grinter was awarded the first prize. This was a really fine group, arranged in the best style, the varieties being choice, well-grown, tastefully arranged, and edged with ferns. A silver cup was given in this class. Another class of this kind was for a group of chrysanthemums, in 32 sq. ft., for those not employing a gardener. Mr. N. Hatherdale, who arranged a creditable collection, was the only exhibitor. A group of miscellaneous plants, arranged in a space of 40 sq. ft., brought two competitors, who arranged these subjects with pleasing effect, Mr. McIntyre, gardener to Lady Hill, Rookwood, Llandaff, taking chief honours.

### MISCELLANEOUS PLANTS.

For six orchids, Mr. G. N. German was the leading prize-winner, and staged nice examples of Oncidium varicosum Rogersi, Calanthe Veitchi, Cypripedium Rothschildianum, and Cattleya labiata. For six Begonia Gloire de Lorraine, Mr. Davis, gardener to G. L. Clark, Esq., was first. For Roman hyacinths Mr. German was first, and for twelve plants for table decoration Mr. McIntyre, gardener to Lady Hill, obtained premier honours.

### FRUIT.

There were but few fruit classes provided, and with comparatively few exceptions the produce was not of a high order of merit. For six bunches of grapes, not less than two varieties, for which the Bruckwich Cup was offered as a first prize, Mr. Dobbs, gardener to Sir John Gunn, St. Mellons, was placed first amongst three exhibitors for fair examples of Mrs. Pearson, Muscat of Alexandria, Alicante, and Gros Colmar; Mr. G. H.

Brown, gardener to L. E. Treherne, Esq., Coedringlan, was second. Mr. G. H. Brown was first for two bunches of black grapes, with Mrs. Pince; second, Mr. A. Brown, with Alicante. For two bunches of white grapes, Mr. Dobbs led with Muscat of Alexandria; Mr. G. H. Brown coming second. Mr. Dobbs scored for six dishes of culinary apples with good samples of The Queen, Hambling's Seedling, Mère de Ménage, Newton Wonder, Peasgood's Nonsuch, and Lord Derby. Mr. McIntyre, gardener to Lady Hill, led for six dishes of dessert apples, and Mr. German had the best six dishes of dessert pears, showing Beurré Diel, Doyenne du Comice, Durondeau, Pitmaston Duchess, Beurré Hardy, and Le Lectier.

### VEGETABLES.

In the three classes devoted to vegetables first-rate produce was staged, which did great credit to the exhibitors. Mr. Dobbs had the best six dishes, and Mr. A. E. Collier, gardener to A. Parson, Esq.; Mr. Shewring, Llandaff; Mr. Chould, gardener to Lord Aberdare; and Mr. Huzzy, Whitchurch, were other prominent prize-winners.

### NON-COMPETITIVE.

The following awards were made: To Messrs. William Treseder, Cardiff, a gold medal for floral designs, roses, conifers; to Messrs. Clibran and Sons, Altrincham, a gold medal for chrysanthemums; to Messrs. S. Treseder and Sons, Cardiff, a silver-gilt medal for floral designs; to Mr. P. Thomas, Cardiff, a silver medal for floral designs; to Messrs. Cypher and Son, Cheltenham, silver medal for orchids; to Mr. Drake, Cardiff, certificate of merit for chrysanthemums; to Messrs. C. Williams and Son, Cardiff, certificate of merit for chrysanthemums; to Mr. Pettigrew, gardener to Earl of Plymouth, St. Fagan's Castle, certificate of merit for a group of begonias.

## Royal Horticultural Society.

### SCIENTIFIC COMMITTEE. NOVEMBER 5.

PRESENT.—Mr. E. A. Bowles, M.A., F.L.S., Sir H. Veitch, Prof. W. Bateson; Messrs. A. Rolfe, J. O'Brien, G. Gordon, R. H. Pearson, W. Hales, A. Worsley, and F. J. Chittenden (hon. secretary).

RICHARDIA ELLIOTIANA FRUITING.—Mr. A. Worsley showed a fruiting spadix of Richardia Elliotiana.

HORSE-CHESTNUT WITH TWIN PETIOLES.—Mr. Bowles showed petioles of horse-chestnut in pairs, springing from a connate base, from his garden at Waltham Cross. Only two such were found and the leaf-blades borne by them were quite normal.

APPLES WITH MORE THAN NORMAL SEEDS.—Mr. Chittenden drew attention to the production in some varieties of apple of more than the normal number of seeds. The usual number of ovules produced by the apple is two in each cell, and this is regarded as one of the chief characters separating Pyrus from Cydonia in which there are usually more than two. He had found in Frogmore Prolific a large number of fruits containing more than two seeds in a cell, and the same in Duchess's Favourite. Professor W. Somerville had first drawn his attention to the phenomenon some years ago in American apples, but he had not hitherto seen it in British apples. The seeds were borne in two series of two, one on each carpel margin.

VARIATIONS IN WILD FLOWERS.—Mr. T. H. Dipnall sent the following list of variations which he had noticed in the form and coloration of British wild flowers: (Double flowers) Ranunculus acris, Papaver Rhæas (one flower and another with all flowers semi-double), Cardamine pratensis, Saponaria officinalis, Silene noctiflora, Primula vulgaris and hose in hose, Sagittaria sagittifolia, Knautia arvensis (like a large lavender thrift). Colour Variations: (White) Viola odorata (common and red also), V. canina, Lychnis flos-cuculi, L. diurna, Geranium molle, G. lucidum, Ononis arvensis, Vicia sepium, Campanula rotundifolia, C. Trachelium, Myosotis sylvatica, Ajuga reptans, Lamium purpureum, Primula vulgaris, Orchis mascula, O. maculata, O. morio, Gymnadenia conopsea, Ophrys apifera, Agraphis nutans, Fritillaria meleagris, Adoxa moschatellina, Cnicus palustris, Centaurea nigra, Symphytum officinale. (Pale yellow) Ranunculus acris, Scrophularia nodosa, Sarothamnus (genista) scoparius. (Dull purple) Papaver Rhæas. (Pink) Cratægus oxyacanthus, Calystegia sepium, Primula vulgaris, Lychnis vespertina, Erica cinerea (very pale), Veronica chamædrys, Centaurea nigra (very pale), Orchis morio, Agraphis nutans. (Blue) Anagallis arvensis. (Pale blue) Agraphis nutans, Campanula Trachelium. (Salmon-pink) Papaver Rhæas.

CATASETUM MACROCARPUM, FEMALE FLOWER.—Mr. G. Rae Fraser, Letchmore Heath, Herts, sent an inflorescence of Catasetum macrocarpum bearing five female flowers, from the same plant as the one exhibited on October 8, 1910. He remarked that the plant has made three futile attempts to flower since them, and at the fourth has produced the present spike. Mr. R. A. Rolfe reports that it agrees with the plant figured as Monacanthus viridis, by Lindley, in the "Botanical Register" (t. 1752) from a plant which flowered with Lord Fitzwilliam, at Wentworth, and which is now known as the female of Catasetum macrocarpum, Rich. It is not, however, the original Monacanthus viridis, Lindl., which is the female of another species.

## Royal Horticultural Society of Aberdeen.

The members of this society held their annual meeting in the Music Hall Buildings, Aberdeen. There was a capital attendance, and Colonel Gill, of Dalhebity, chairman of directors, presided. The annual report was submitted, in which it was stated that, from a horticultural point of view, considering the rather unsatisfactory season, the annual show of the society held in the Duthie Public Park, Aberdeen, in August last, was, both in number and quality of exhibits, most creditable to all concerned; while the financial results were also satisfactory. The income for the year amounted to £488 11s. 6d., and the expenditure was £438 1s. 3d., leaving a surplus of £50 10s. 3d., which, with the credit balance of £27 7s. 10d. at the beginning of the season, left a balance of £77 18s. 1d. to be carried forward to next year's account.

In moving the adoption of the report, the Chairman said they could congratulate themselves on the very satisfactory state of their finances which showed a good profit. Ex-Baillie Todd, seconded. They had he said, a great deal to congratulate themselves upon. It had been suggested that they should start a reserve fund, and it was only wise that they should take the precaution of having something to fall back on. The report was unanimously adopted, and, on the motion of Mr. Todd, seconded by Mr. Robson, seedsman, it was agreed to start a reserve fund with the sum of £30.

The Chairman moved the re-election of the hon. president, hon. vice-presidents, and hon. directors, which was agreed to. Mr. Robson moved that Colonel Gill be re-appointed chairman of the directors. They had no schools of horticulture in the district, he said, as they had of forestry, supported by State aid, but as their association represented the industry in that district it behoved them to keep it well up-to-date. Colonel Gill was a very liberal patron and generous friend to horticulture. The motion was most cordially agreed to, and Colonel Gill returned thanks. Mr. Councillor Simpson was appointed vice-chairman, and Messrs. W. Reid and W. Wyllie were re-elected auditors. Mr. J. B. Rennett was heartily re-elected secretary and treasurer.

The following gentlemen, mostly professionals, were appointed directors for the ensuing year: Messrs. A. Douglas, W. Lockhart, J. Duncan, W. Adam, J. McDonald, W. Anderson, W. Clark, A. Duncan, A. M. Cocker, A. Brebner, J. Ritchie, J. Marr, A. Giles, J. George, W. Walker, John Yule, jun., Alex. Burns, W. Slora, J. Coutts, and W. Cumming.

A very harmonious meeting closed with the usual expressions of thanks to those chiefly concerned.

## Brighton.

The Brighton Horticultural Society's chrysanthemum show was held in the Dome and Corn Exchange on November 5 and 6. The entries showed an increase of 119 on those of 1911, while in the matter of quality the display was particularly good. Mr. Gaston and Mr. Balchin, secretary and treasurer respectively, have been busy securing new members, and have added 170 during the year. The society is not, however, so well supported as it should be, and a loss on the summer show was inevitable.

The leading cut-flower class was for three dozen Japanese blooms in not more than twenty-four varieties, and here Mr. M. Sargeant, gardener to G. Lloyd Wigg, Esq., Merstham, repeated his success of 1910, and won the president's silver cup with excellent flowers of popular exhibition varieties. He was followed in order of mention by Mr. J. Harris, gardener to Colonel J. P. Henty, Arundel; Mr. C. Hack, gardener to Mrs. L. Joad, Patching, Worthing; and Mr. J. E. Dickson, gardener to the Rev. F. S. Slater, Newick Park. For five vases of Japanese varieties, five blooms in each, representing not fewer than eighteen varieties, Mr. J. Jewell, gardener to H. Ramsbotham, Esq., Crowborough Warren, won the chief award with a goodly set; Messrs. J. Stredwick and Son, St. Leonard's, coming second, and Mr. Hugh Macfayden, gardener to L. Breitmeyer, Esq., Cuckfield Park, third.

Mr. C. Fox, Tunbridge Wells, an amateur who always shows well at Brighton, was once more first prize winner in the class for a dozen Japanese blooms, and, as this is his third successive win, he now holds for good the Amateurs' Challenge Trophy. Mr. J. Harris; Mr. A. E. Clarke, gardener to Dr. Rouse, Worthing; and Mr. G. H. Best, Worthing, were other leading prize-winners for cut flowers.

Groups of chrysanthemums were not so numerous as in former years. For a circular display of chrysanthemums and foliage plants, Mr. G. E. Chandler, gardener to S. C. Witting, Esq., Hollingbury Copse, Brighton, led the way, and secured a silver medal and first prize for a pleasing exhibit. For a group of chrysanthemums only, arranged in circular fashion, Mr. J. Addis, gardener to D. Tulk-Hart, Dyke Road, Brighton, was awarded the first prize, and was the only exhibitor. The silver cup for a dozen bush plants of pompon varieties was secured by Mr. G. H. Bennett, gardener to P. H. Bayer, Esq., Withdean. Mr. A. Sayers, gardener to S. Copestake, Esq., Hove; and Mr. S. Watkins, gardener to C. A. Wood, Esq., Preston, Brighton, followed, and their exhibits produced a fine effect in the big dome. Mr. Bennett also scored for half a dozen bush plants, and for half a dozen plants of single varieties, and in the latter class showed particularly well. Mr. T. Eastwood, gardener to Dr. Bryant, Tongdean, also showed well in the classes for bush chrysanthemums, and he had the best dozen primulas. Mr. J. E. Hickson showed the finest set of nine winter-flowering begonias, and Mr. W. Hill, gardener to G. W. Ryder, Esq., Keymer, had matters all his own way in the class for a table of orchids and foliage plants.

Fruits and vegetables were finely represented. In the former section Miss Smith, Withdean, won first prize, both for black and white grapes, Mr. A. Kemp, gardener to C. R. Scrase Dickens, Esq., Coolhurst, Horsham, coming second for white varieties, and Mr. W. Hill second in the black class. Mr. Hickson, Mr. C. Fox, and Mr. J. C. Reeves, gardener to Captain Blake, Rusper, did well in the classes for pears, while Mr. C. Earl, gardener to O. E. d'Avigdor Goldsmid, Esq., Tonbridge, and Mr. G. Stoner, gardener to A. A. Baines, Esq., The Old

Rectory, Westmeston, were leading prize-winners for apples.

Mr. W. Humphreys, gardener to F. W. Franks, Esq., Loam Pits, Tonbridge; Mr. W. Manton, gardener to Mrs. Mashiter, Hurst; and Mr. C. Earl all gained leading prizes in various vegetable classes, and showed excellent produce.

Non-competitive displays of considerable merit were staged by Messrs. W. Balchin and Sons, Brighton (Gold Medal); Messrs. J. Cheal and Sons, Crawley (Gold Medal); J. A. Nix, Esq., Tilgate, Crawley (Gold Medal, for fruits); Messrs. Toogood and Sons, Southampton (Gold Medal); Messrs. W. Wells and Co., Merstham, were awarded a silver-gilt medal, and silver medals fell to the Barnham Nurseries, Barnham; Messrs. Chantrey and Sons, Brighton; Messrs. J. E. Davis and Sons, Brighton; Mr. E. Jones, Patcham; Messrs. W. Miles and Co., Hove; Messrs. Peters and Co., North Street, Brighton; Mr. J. Price, gardener to Alderman J. Colman, J.P. (president), Hove; and Mr. F. Woollard, Lewes Road, Brighton.

## Windsor.

NOVEMBER 8.

The twenty-first annual show was held in the Royal Albert Institute, and was quite up to the average of former displays. This society is noted for its encouragement of the single-flowered chrysanthemum, and it is quite safe to say that nowhere can finer groups of plants of this section be seen than here. The decorative value of large Japanese blooms, in a mass, in vases, with suitable foliage, is another feature, and so are the displays of carnations. Fruit and vegetables are always remarkably fine here. The management, too, is of the best, but it cannot be said that the society is as well supported by the general public as it deserves.

In a class for a group of decorative chrysanthemums, 8ft. by 4ft., in a semi-circle, plants not to be disbudded, and an edging of moss or ferns allowed, the leading award was a challenge cup with a money prize added. Three competed, and as all staged single-flowered varieties, a fine effect was produced. Mr. G. West, gardener to F. Ricardo, Esq., was first with grandly-flowered plants of such effective varieties as Sylvia Slade, Ceddie Mason, Bronze Pagram, and Mensa, arranged in a not too formal bank, 10 feet high, with a neat edging of ferns. Mr. W. Cole, gardener to Mrs. E. B. Foster, Clewer Manor, was second with superior blooms, but poorly arranged; Mr. J. Orton, gardener to Colonel Cox, third.

The leading cut bloom class was for eight varieties, three blooms of each, in vases. The leading award was the King's Challenge Cup, with a cash prize, and naturally this coveted trophy induced a goodly entry. Five competed. Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, Maidenhead, was the winner with handsome blooms of F. S. Vallis, Alice Lemon, G. C. Kelly, Glaucous, Lady Talbot, Colonel H. E. Converse, T. Mew, and R. Vallis, all beautifully fresh. Mr. H. Hearn, gardener to Mrs. Gerald Goodlake, second with rather smaller specimens well staged; Mr. W. Willcocks, gardener to Sir R. Harvey, Slough, third. A class was provided for eighteen Japanese blooms, arranged for effect with any foliage, in a space 5ft. by 3ft. Mr. H. Hearn was first with superior blooms, none too well displayed; Mr. W. Holder, gardener to Mrs. Adair, second with a much more pleasing arrangement of smaller flowers.

Incurved varieties were well displayed in the class for twelve, distinct, by Mr. Page, who secured the leading award quite easily with full, shapely specimens of Beauty of Bucks (creamy-white with closely incurving florets), Clara Wells, Frank Trestian, W. Pascoe, Romance, F. Palmer, and Nellie Southam. Mr. R. Evans, gardener to Mrs. Slattery, second with smaller but neat examples. Mr. Page was equally successful for six incurved, any one variety, with fully finished specimens of Clara Wells.

Single-flowered varieties were remarkably well shown. For six varieties, five sprays of each, undisbudded, in vases, there were six entries, the best coming from Mr. G. West. Each spray carried from six to eight fully-developed blooms, which for decoration were very handsome. The leading varieties were Mensa, Merstham Gem, Mrs. R. C. Pulling, Ceddie Mason, Mrs. John Peed, and Crown Jewel Improved. Mr. W. Cole was a good second and Mr. Orton third.

An interesting class is that for twelve Japanese blooms, arranged with any natural foliage in one vase, a class which displays the value of the large blooms for decoration. Mr. W. Holder was first with handsome flowers of Frances Jolliffe effectively displayed with asparagus and crimson oak sprays; Mr. H. Hearn second with mixed flowers.

Several distinct classes were provided, and Mr. W. Lane, gardener to Sir E. Durning Lawrence led for twelve Japanese blooms in a keen competition. For three white and three yellow Japanese blooms in vases Mr. G. Baskett, gardener to P. Nelke, Esq., was first with medium-sized specimens of Mrs. Marsham and Willie Rawlings.

Miscellaneous plants arranged in groups on one side of the hall made a bright display. Mr. G. West, mainly with orchids, easily secured the leading place; Mr. J. Orton second with well-flowered orchids and palms, but none too well arranged.

Very handsome were the six specimens of Begonia Gloire de Lorraine from Mr. C. L. Branson, gardener to G. Hanbury, Esq., who was the only competitor, and who received the leading award. Carnations in pots were numerous, and for six Mr. G. West, with well-grown, freely-flowered specimens of May Day secured the leading position among four entrants.

Cut carnations were numerous. For three vases, distinct, Mr. G. West won with good blooms of Carola, Rose Doré, and Enchantress. Six competed. For one vase of twelve blooms the competition was keen, and Mr. T. H. Plowright, Windsor, won with meritorious blooms of Mikado, Winsor, Rose Doré, May Day, and White Lawson. The special prizes offered by Mr. Dutton, Iver, Bucks, for six vases induced a brisk competition, and Mr. G. West was first with really fine examples of Carola, R. F. Felton, Pink and White, Enchantress, Rose Doré, and May Day; Mr. W. Holder second.

Mr. W. Allan, gardener to Lord Hillingdon, Uxbridge, led for six dishes of pears with fine fruit; he also scored for white grapes with Muscat of Alexandria. For six dishes of apples Mr. C. Frost, gardener to L. H. Hanbury, Esq., won.

Mr. Charles Turner, Slough, had a remarkably fine collection of sixty dishes of apples and pears, not for competition. The new apple Arthur Turner was conspicuous, as well as Cox's Orange Pippin, Wealthy, Charles Ross, Bismarck, Allington, King of Pippins, Bramley's Seedling, and King Edward (gold medal).

## Manchester.

NOVEMBER 12, 13, and 14.

After a short period the Manchester Royal Botanical and Horticultural Society has resumed its autumn show, which on this occasion was held in the Town Hall, and proved most excellent, both as regards competitive and non-competitive contributions, proving that fine displays may still be produced in the North of the choicest products. Mr. P. Weathers and his council deserve the heartiest congratulations and thanks of the lovers of flowers in the County of Lancaster for the magnificent show the latter have had an opportunity of enjoying.

### PLANTS.

Chrysanthemum plants were not numerous, but those exhibited were all well grown and finely flowered. For nine large-flowered specimens Mr. J. Sedall, gardener to L. Breaslaurer, Esq., secured the leading award, and held a similar position in the class for six Japanese, the specimens in both instances evincing cultural skill of the highest order.

### CUT BLOOMS.

In the class for a display of cut flowers representative of all sections, and arranged for effect, open to nurserymen, Mr. W. J. Garner was awarded the Gold Medal offered as the first prize. The display occupied the whole of the front of the platform, and the cut blooms, which were arranged in vases, stands, etc., had a background consisting of bamboos, palms, and crotons. The effect was rich and tasteful, and the display was much admired. The prizes offered for forty-eight blooms, twenty-four Japanese and twenty-four incurved, distinct, varieties, brought two competitors, one of whom came from the South, and the coveted award was made in favour of Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead, who had a very fine stand. The most notable blooms were, of the Japanese, His Majesty, W. Mease, Marie Lomes, Mrs. Turner, Willie Rawlings, Pres. Viger, Glaucous, Superb, H. G. Coverse, Fred Chandler, and Purity; and of the incurved, H. Hearn, Amber Beauty, Mrs. F. Judson, Bocane, G. F. Evans, Romance, Mrs. B. Hankey, W. Pascoe, Fred Palmer, and Mrs. G. Denyon. Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., Warrington, was second with many fine blooms.

In the class for twenty-four blooms of incurved varieties, Mr. G. Hunt was first with a splendid stand, and he was first also for twelve varieties of incurved with blooms of high quality. Mr. J. Stoney, gardener to Lieut.-Colonel J. B. Gaskell, Woolton, was second; and Mr. H. Curtis, Widnes, third.

For thirty-six Japanese, Mr. C. Jones, Abergele, was first with a collection which contained many flowers of more than average merit. In competition for the prizes for eighteen Japanese, Mr. W. E. Wright, gardener to Lord Sheffield, was the winner of the premier award, with very heavy blooms; Mr. G. Hunt and Mr. J. Stoney were second and third respectively. For twelve varieties the prize-takers were Mr. W. E. Wright, Mr. G. Corbutt, gardener to Cornelius Lamb, Esq., and Mr. H. Curtis. For thirty-six blooms of miscellaneous varieties Mr. J. Stoney obtained premier honours with splendid blooms of Japanese, incurved and reflexed; Miss Lightbown was second. Mr. C. Gove was the first prize winner in the class for twelve Japanese, and also occupied the first place for twelve incurved varieties; the second places being occupied by Mr. J. W. Pritchard in the class for Japanese, and Mr. G. C. Demetriade in that for incurved.

In the classes for dinner table decorations there was an excellent competition, and the successful exhibitors were Messrs. J. Nixon, of Alderley Edge, W. J. Garner and H. B. Vernon. The best basket of chrysanthemums for effect was shown by Mr. J. Nixon, gardener to O. Robinson, Esq.; Mr. W. J. Garner and Mr. H. B. Vernon being second and third. For three bouquets, Mr. W. H. Garner won with lovely arrangements; Messrs. J. Nixon and A. Porter also showed well. In competition for the prizes for one bouquet Mr. O. Robinson obtained premier honours with a charming arrangement.

### MISCELLANEOUS PLANTS.

Roman hyacinths were well shown, and Mr. S. D. Petrocochino won with good plants bearing fine spikes. Chinese primulas were especially well shown by Mr. W. Bramwell, gardener to His Honour Judge Bradbury; and for six cyclamen he won with splendid specimens.

In the class for winter-flowering begonias Mrs. Gill occupied the first place with charming plants. Plants for the dinner-table were well shown by Mr. H. Mallion, gardener to G. F. M. Susman, Esq.

In competition for the best display of orchids, amateurs, W. R. Lea, Esq., secured the premier award—a gold medal—with a beautiful display; Colonel Rutherford was awarded the silver-gilt medal offered as the second prize; and Mrs. A. K. Wood and Mr. A. Warburton equal thirds.

### NON-COMPETITIVE.

This section was one of great merit, and the various contributions added greatly to the interest and value of the show. The following awards were made:

Gold Medals.—To Messrs. J. Cypher and Sons, for a fine bank of orchids, including a grand display of cypripediums, in which C. insigne Harefield Hall and C. insigne Sanderæ were prominent; to Messrs. Charlesworth and Co., for a beautiful display of orchids, in which odontoglossums and cattleyas in great variety and rare excellence were the most noteworthy; to Mr. R. W. Lee, for a beautiful display, in which the cattleyas and cypripediums were of exceptional merit; to Messrs. Dickson, Brown, and Tait, for a collection of fruit, chiefly apples, of excellent quality; and to Messrs. Clibrans, for an attractive display of begonias.

Silver-gilt Medal.—To Colonel Rutherford, for a pleasing contribution of orchids, in which were many fine varieties of cattleyas and cypripediums.

Silver Medal.—To Miss Wood, for a group of orchids, in which Vanda cærulea and cattleyas were of much merit; to Mr. Warburton, for well-grown orchids.

The arrangements were carried out by Mr. P. Weathers with his accustomed ability.

## Horticultural Club.

On Tuesday, the 5th instant, at the Hotel Windsor, this club held its monthly dinner under the chairmanship of Sir Harry J. Veitch, a good number of members and guests being present. Subsequently a most interesting lecture was given by Mr. F. Kingdon Ward, B.A., F.R.C.S., entitled "A Naturalist in Western China and Tibet," and illustrated by a large number of very beautiful lantern slides from photographs taken by the lecturer.

Mr. Ward, who shortly returns to China on another botanical expedition, accompanied the exhibition of the slides by explanatory remarks concerning the nature of the mountainous region which he traversed, and the wonderfully varied character of the plant life which all but pervaded it, the exceptions being considerable areas of arid waste which alternated curiously with adjacent regions where heavy rains fell for six months in the year

The lecture was peculiarly interesting in the light it threw upon the reasons of this variation. A range of mountains, 18,000 to 20,000ft. in height would, for instance, act as a rain screen by intercepting the rain-bearing winds from another range but a few miles distant, the result being that on the windward side the rainfall would be enormous, but on the leeward all but nil. This in its turn naturally greatly affected the character of the vegetation, as did also the winds engendered by different conditions and accentuated by the geographical contour of the land, tree growth being suppressed or encouraged, so that, while one side of a valley was only clothed with scrub or dwarf rhododendrons, the other side might be densely wooded. The difference in shelter thus induced also altered the plants of smaller growth, which, however, in the shape of Alpine flora, particularly of the Saxifrage, Androsace, and Meconopsis or Poppy tribe, constituted a general and particularly rich field for research, and a source, it was hoped, of many new additions to our hardy flower borders. Some slides, showing specimens of such growing in situ, evoked particular interest. Views of the great river Yangtse Kiang and some of the affluents showed some magnificent gorges through which they had eroded their way, between cliffs of several thousand feet elevation. Happily, despite rumours of dissension between the various sections of the inhabitants of the widely-extended region traversed, and even of English invasion, Mr. Ward found hospitality of a rough kind to prevail throughout his travels, and met with no serious adventures.

In the subsequent discussion, however, in which Sir Harry J. Veitch and Messrs. Barr, Druery, and others participated, some very gruesome accounts of sights seen and perils encountered by other explorers in the same regions were quite sufficient to demonstrate that the plant hunter practically took his life in his hand, and had need to possess plenty of pluck and diplomacy in addition to the all-essential botanical knowledge required in such pursuits.

A very hearty vote of thanks to Mr. Ward and wishes for a "bon voyage," and success at the end of his pending journey, concluded a most interesting function.

## Reading Gardeners' Association.

### FORTNIGHTLY MEETING.

The usual fortnightly meeting was held in the Abbey Hall, and the President (Mr. F. B. Parfitt) occupied the chair. The lecturer announced for the evening was a delegate from the kindred society at Bristol, who at the last moment was unfortunately prevented from journeying to Reading. His place was, however, admirably filled by a brother Bristolian, Mr. I. House, who is always welcomed by the Reading Association. The subject selected was "Hardy Perennials," and the lecturer prefaced his address by a humorous reference to propagation, stating it was his intention to say nothing on the point, nor to reply to any question, as he was always in doubt as to how much information he was expected to give, and how little, for his own sake, he ought to divulge, which was unsatisfactory to both himself and his audience.

In the first part of his paper Mr. House defined the term "hardy perennial herbaceous plants," and expressed regret that compilers of show schedules were not clear in their stipulations. Bulbous plants should not, in his opinion, be admissible in a class for hardy herbaceous plants, neither any of doubtful hardiness, nor others treated as greenhouse plants, for the purposes of competitive exhibition. He instanced plants which are not easily propagated, among others commending Ostrowskia magnifica, and giving his experience with it. Another list comprised those which are not generally successful, as Romneya Coulteri, supplementing it with cultural details. Mr. House also gave the names of a number of the newer and finer forms of better-known plants, such as phloxes, pyrethrums, montbretias, etc. In another section of his paper he gave the names of plants which are undesirable occupants of the herbaceous border on account of their predatory habits. He advised his audience as to the kinds of plants which are best left undisturbed for several years, like the forms of Aster amellus, Dictamnus Fraxinella, pæonies, etc., and enumerated others which are better for annual or biennial replanting. Mr. House also pointed out the injury which might follow the premature removal of stems, particularly where of large size, as in delphiniums. The lecturer's wide knowledge and enthusiasm for his subject led to very numerous queries being put to him.

On the motion of the President, an exceedingly hearty vote of thanks was accorded Mr. House.

### FLOWER SHOW.

The Reading Gardeners' Association held its annual exhibition on Thursday week in aid of the gardening charities. No prizes are awarded, everyone exhibits of his best on this occasion, and a grand display is produced.

By the courtesy of the secretary of the Association, we have received the following list of exhibitors and exhibits: Sir Rufus Isaacs, Fox Hill, Reading (gardener, E. Blackwell), group of chrysanthemums and fruit; F. B. Parfitt, Esq., Elmcroft, Caversham, president of the Society, twelve dishes of fruit; L. G. Sutton, Esq., Hillside, Reading, vice-president (gardener, F. Townsend), group of seedling chrysanthemums and circular group of primulas; Messrs. Sutton and Sons, group of chrysanthemums; University College, Reading (per Mr. F. G. Drew), group of chrysanthemums and collection of fruit; Mrs. Noble, Park Place, Henley (gardener, T. J. Powell), collection of fruit; Mrs. Cracroft Wilson, Bill Hill, Wokingham (gardener, R. A. Hatton), collection of fruit; J. Walter, Esq., Bear Wood (gardener, J. T. Tubb), collection of fruit); S. B. Joel, Esq., Maiden Erlegh (gardener, F. Johnson), group of plants and collection of fruit; T. R. Harman, Esq., Sindlesham House (gardener, T. Neve), twenty-five dishes of fruit; Mrs. Bland Garland (gardener, H. Wilson), twelve dishes of fruit; M. H. Foquet Sutton, Esq., Erlegh Park (gardener, H. C. Loader), group of seedling chrysanthemums and collection of vegetables; S. Griffith, Esq., Gordon Lodge (gardener, G. Carter), group of Gloire de Lorraine begonias; T. Alsopp, Esq., Downham Lodge (gardener, G. Hinton), collection of vegetables; H. Collins, Esq., Leopold House, Reading (gardener, A. F. Bailey), twelve dishes of fruit; G. Bryant, Esq., six dishes of fruit; E. Parker, Esq., twenty dishes of fruit; Mr. G. Stanton, Upper Culham, dried grasses, leaves, etc.; Leighton Park School (gardener, W. G. Tovey), zonal pelargoniums, vegetables, and fruit; Eric Palmer, Esq., Shinfield Grange (gardener, G. Smith), collection of vegetables and fruit; Mr. A. Webb, fifteen dishes of fruit; P. Keevil, Esq., (gardener, D. Turner), collection of vegetables; Mrs. Finch, Hurst Grove (gardener, G. West), collection of vegetables; J. Okey Taylor, Esq. (gardener, T. Brown), nine dishes of fruit; Mrs. Collins, Stoneham House (gardener, H. Goodger), collection of vegetables and apples; Mrs. Austen, Whitley Lodge (gardener, W. Bennett), eighteen dishes of fruit; W. Howard Palmer, Esq., Heathlands, Wokingham (gardener, W. C. Moles), collection of dwarf-growing chrysanthemums; Mrs. Bird (gardener, A. Abraham), collection of vegetables; L. R. Erskine, Esq., Binfield Manor (gardener, C. Earle), collection of vegetables; Captain Miller, Blandford Lodge (gardener, H. Reeves), display of pelargoniums and collection of fruit; Dr. C. M. Powell, Caversham (gardener, G. Boxall), ten dishes of fruit; Mr. E. J. Dore, Reading, potatoes and lettuce; Mr. W. Smith Cann, Shaftesbury, Dorset, two vases of violets.

## Eccles.

### NOVEMBER 8 and 9.

The twenty-sixth annual show of this Society was held in the Town Hall under somewhat dismal conditions, as the light was bad, and there was continuous rain. The entries, as usual, were excellent, filling to the utmost the limited space at command.

->Spraying<-
And Limewashing Machines

In every garden and on every estate one of these 'Four Oaks' machines are indispensable.

Will spray the Fruit Trees, Limewash the Stables, Kennels, Outbuildings, &c., in a fraction of the time taken by brushes.

Complete Catalogues of Spraying and Limewashing Machines & Syringes free on application to Sole Manfactrs. : The

'Four Oaks' Limewashing Machine, "Royal Pattern" £3 18s. 6d.

FOUR OAKS SPRAYING MACHINE CO.,
No. 3G, Sutton Coldfield, Birmingham.

The schedule comprised four sections—open, gardeners, amateurs, and novices, and under press of space the first can only be dealt with.

### CHRYSANTHEMUMS IN POTS.

In the class for a semi-circular group, nine feet by six feet, six exhibits were staged. Mr. J. W. Smith, gardener to James Brown, Esq., Heaton Mersey, occupied the position of honour with a well-arranged lot of bright, fresh flowers. Mr. W. Palethorpe, gardener to Miss G. Agnew, was second with a pleasing combination; and Mr. E. Pollitt, gardener to J. Symlie, Esq., was third.

For three pots of Japanese varieties Mr. Smith was again to the fore, with well-flowered plants and medium-sized blooms; this exhibitor evinced his capabilities as a grower by leading in the classes for three pots of incurved varieties; three pots of single-flowered; and six pots of Japanese, grown in six-inch pots, securing five firsts in six classes. For three disbudded chrysanthemums, Mr. W. Holmes, gardener to the Countess Scott Forbes, secured the leading award. For six table plants Mr. A. E. Fox, gardener to T. C. Ansdell, Esq., won with a charming lot in a strong competition. For six pots of Roman hyacinths, Mr. Fox was again to the fore with good spikes, considering the season. Begonia Gloire de Lorraine was best shown by Mr. Fox, who scored with large plants moderately flowered.

### CUT BLOOMS.

Of twenty-four blooms, twelve incurved and twelve Japanese, there were four lots. Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., Warrington, succeeded in securing the leading position, as last year, with a fine lot of well-finished blooms, the best being Lady Talbot, Eclipse, President Viger (which secured the award of merit for the best bloom in the open section), William Turner, Hon. Mrs. Lopes, Martin James, Frances Jolliffe, Mrs. J. Hygate, Pantia Ralli, Buttercup, Mrs. B. Hankey, Mrs. R. H. Hall, Romance, Mrs. G. Denyer, etc. Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Woolton, Liverpool, was an excellent second, his Hon. Mrs. Lopes and Buttercup being extra fine. Mr. J. Copper, gardener to H. Beck, Esq., Huyton, Liverpool, secured the remaining award. Mr. Goves, in the cut-flower section, surpassed the success of Mr. Smith in the plant section by winning firsts in all the open classes as follows: For twenty-four Japanese, in not less than twelve varieties; twelve incurved, distinct; twelve Japanese, distinct; and twelve blooms, six Japanese and six incurved; and he staged excellent flowers in each class.

The decorative exhibits at this exhibition are always well done. For three bouquets Mr. A. Porter led with charming arrangements of choice flowers; Mr. A. Adshead followed with good exhibits that lacked choiceness of bloom. For the single bouquet Mr. Porter again scored, and for the most tastefully-arranged epergne Mr. H. Mallion, gardener to E. F. M. Susman, Esq., led. For the most tastefully-arranged basket of cut chrysanthemums Mr. A. Adshead was to the front, and for six sprays Mr. A. Porter took the lead, while for three buttonholes Mr. M. Hodgson, gardener to E. Timberlake, Esq., won with lovely blooms of odontoglossums.

In the gardeners' section, confined to a radius of eight miles, Mr. J. W. Smith secured the challenge vase and first award for eighteen large-flowered blooms in six varieties, arranged in vases. The remaining prizes were well contested, the first-prize men being Messrs. J. W. Smith, W. Byrom, and W. Holmes.

### NON-COMPETITIVE.

A few non-competitive exhibits were staged. The Earl and Countess of Ellesmere contributed specimen palms; Messrs. Dickson, Brown, and Tait sent lily of the valley and Begonia Gloire de Lorraine; Messrs. Dickson and Robinson had a pleasing array of Michaelmas daisies and chrysanthemums; and Messrs. Frank Dicks and Co. set up palms, heaths, and potatoes.

## Haywards Heath.

On the 6th and 7th inst. the Haywards Heath Horticultural Society held its annual exhibition of chrysanthemums, and a finer show of these flowers has not been arranged by this society. Chrysanthemums, of course, were in chief evidence, but there were also carnations, begonias, violets, cyclamens, etc., and all combined to make a most effective display.

For a group of chrysanthemums Mr. W. Evans, gardener to Mrs. Stewart Mackenzie, of Seaforth, Lyndhurst, Warninglid, won the handsome silver challenge trophy presented by the President, Colonel Stephenson R. Clarke, C.B. This is the third year in succession that this gardener has carried off the cup, and so he was awarded the society's gold medal. His was a magnificent exhibit, the varieties shown including F. S. Vallis, Lady Talbot, Mrs. A. T. Miller, Bessie Godfrey, Merstham Blush, Geo. Hemming, Master Davies, and Master James. Mr. W. Evans obtained a double distinction, for he also won a new cup for carnations—given by Mrs. Stewart Mackenzie, of Seaforth—with a light and graceful exhibit. This was a new feature, and everyone agreed that it was an extremely pretty one. The prize stand included Enchantress, White Wonder, Gloriosa, Lady Alington, Scarlet Glow, and May Day. Second place in this class (open to the County of Sussex) was gained by Mr. H. Lazell, gardener to H. M. Knight, Esq., Beech Hurst, Haywards Heath. Mr. W. Evans won first prize for six Japanese chrysanthemums.

Among the trade exhibits, Mr. J. Box, of Lindfield, had a fine set of single chrysanthemums, including the new varieties, Ceddie Mason, Crimson Mary Richardson, Charles Hale, Chestnut Pagram, Emily Smith, Joan Edwards, J. H. G. Williams, Margaret Gray, Mrs. Tresham Gilbey, R. B. Burge, Snowflake, and Maggie Mailwell. This display, backed with palms, was a splendid piece of staging, and won a gold medal.

In the fruit section quality and quantity were both well maintained, and competition was good, especially in the classes for dishes of twelve apples, for prizes offered by the Rev. T. G. Wyatt. Those who were successful in gaining first places were Mr. J. E. Shirley (culinary) and Mr. G. Sweetman (dessert). A Silver-gilt Medal was awarded to Mr. H. Manton, gardener to W. A. Sturdy, Esq., Paxhill Park, Lindfield, for an excellent exhibit of fruit and vegetables, well put up; while Mr. W. H. Robbins, gardener to Mrs. Rodgers, Great Walstead, Lindfield, gained a Silver Medal for a fine lot of fruit. Mr. J. Sinnock, gardener at the Brighton County Borough Asylum, was awarded a Certificate of Merit for his fruit.

Begonia Gloire de Lorraine was very finely shown, and hardly any fault could be found with the lot put up by Mr. H. Lazell, who secured first prize. Also very good were the displays by Mr. W. Elvy, gardener to R. Foster, Esq., Summerhill, Lindfield, and Mr. W. Evans.

A rare plant on view was Delphinium macrocentron, in bloom. The seed of this was brought from British East Africa by Colonel S. R. Clarke. The plant was inspected with great interest by the large number of visitors.

As usual, the vegetable section of the show was productive of a good display of the fruits of the earth. Competition was especially keen in the classes for gentlemen's gardeners. In the class for a collection, Mr. J. E. Shirley, gardener to the Rev. T. G. Wyatt, St. Wilfrid's Parsonage, Haywards Heath, put up a fine lot, and was awarded first prize; second, third, and fourth prizes respectively were won by Mr. H. Manton, Mr. G. Grubb, gardener to L. B. Schlesinger, Esq., Bedales, and Mr. J. Perrett, gardener to J. Goddard, Esq., Handcross.

Also of great interest was a wild fruit competition for local school children, and many were the comments passed by admiring parents and friends of the winners.

## ANSWERS TO CORRESPONDENTS.

CYANIDING FRUIT HOUSES FOR THE DESTRUCTION OF MEALY BUG.—C. S., Chislehurst: Will you kindly state, through your "Answers" column, how to use cyanide of potassium for fumigating vineries and peach houses which are infested with mealy bug? Kindly give the amounts of cyanide, etc., necessary, and the methods of procedure.—We have dealt with this matter at some length on previous occasions, though not quite recently. There is no doubt that fumigation by means of cyanide of potassium is an excellent means of ridding houses of insect pests, but we must point out that some danger attaches to this method; therefore only the most careful people should use it, after making careful preparations. The vines and peaches must be quite dormant, and the houses at a temperature of 50 to 55 deg. when cyaniding is done. The materials and proportions for use are: Cyanide of potassium 1 part, sulphuric acid 1½ parts, and water 3¾ parts. One ounce of cyanide of potassium is given as the correct amount per 400 cubic feet of space in the houses to be fumigated. The houses must be made as airtight as possible before fumigating. The sulphuric acid should be poured very carefully and slowly into the water, the latter being placed in an earthenware vessel such as a wide jam jar. The cyanide of potassium, wrapped in thin blotting paper, should then be dropped into the diluted sulphuric acid, but the vessel into which the cyanide is dropped should be so near the exit door that it can be reached by the outstretched arm of the operator, who should immediately shut the door and stop up the chinks with gummed paper ready to hand. A better method is for the operator to introduce the cyanide to the diluted sulphuric acid, through the side light, the cyanide being placed at the end of a long rod, or so arranged that it can be lowered by means of a

NEWS FROM HEADQUARTERS.
SPECIAL OFFER
OF
DAFFODILS AND NARCISSUS.

In gardens, from the largest to the smallest, one can almost always find odd corners that would be enlivened up with a few Daffodils. With this in view, we offer the following Collection:

1 King Alfred (Yellow Trumpet)
3 Madame de Graaff (White Trumpet)
3 Golden Bell (Yellow Trumpet)
3 White Lady (Leedsi)
6 C. J. Backhouse (Incomparabilis)
6 Flora Wilson (Barri)
6 Madame Plemp (Bicolour Trumpet)
6 Vanilla (Yellow Trumpet)
12 Poetaz C's White (Poetaz)
12 Poetaz C's Canary (Poetaz)
50 Emperor (Yellow Trumpet)
50 Barri Conspicuus (Barri)
50 Cynosure (Incomparabilis)
50 Sir Watkin (Incomparabilis)
50 Duchesse de Brandant (Leedsi)
50 Pheasant Eye (Poeticus)
50 Ornatus (Poeticus)
50 Van Sion (Double Trumpet)
50 Double Incomparable

Delivered packing and carriage paid on receipt of cheque or postal order for 21/-.

We are also in the position to offer at reduced prices Daffodils and Narcissus in large quantities for naturalisation. Particulars will be sent on receipt of a postcard.

STATION: HARLOW, G.E.R.

pulley into the acid solution. Immediately the cyanide touches the solution the window must be shut, so that the fumes generated cannot reach the operator. The best plan is to place the diluted sulphuric acid in bottles fitted with a cork in which two slits are cut, one to admit air and the other to allow an even stream to flow upon the cyanide, and so provide for a slow and even generation of gas. In this case the cyanide should be placed at intervals along the path of the house, in enamel or earthenware bowls, and the bottles of sulphuric acid be so placed, in a little cage, that they can be readily tilted over. Everything being in readiness, the cord or cords attached to the tilting cages should be passed through the key-hole of the door; the operator must then go outside the house, shut the door, stop up the chinks, and then pull the cords so that the bottles are tilted and the sulphuric acid solution comes into contact with the cyanide. Keep everyone away from the house for at least an hour, but then, if ventilators can be opened from outside by means of a cord or stick, open them, but this must be done in such a way that the operator does not inhale the escaping fumes. Half an hour later fling the doors open, but the house should not be entered for another hour. Cyaniding should be done in the evening and in still weather. A leaflet on the subject is issued by the Board of Agriculture, and can be obtained free on application; the address is 4, Whitehall Place, London, S.W. It is necessary to point out that the cyanide fumes are deadly poison, and that carelessness in fumigating with it may mean death to the operator.

UNHEALTHY BEGONIAS.—A. M.: I am sending you a few leaves of Begonia Gloire de Lorraine, and should be glad if you can explain why they present such an unhealthy appearance. For some considerable time the plants grew well, and then they seemed to stop, and presently came to look very unhealthy. The begonias are growing in a temperature of from 55 to 60 degs.—The begonias have been growing in a confined moist atmosphere, and the leaves present very much the same appearance as do vine leaves when grown in a badly-ventilated vinery. The amount of moisture used in the house would, doubtless, not have been excessive had ventilation and heating been carried out satisfactorily. A great many of the failures that occur among the soft-wooded stove and greenhouse plants are due to an attempt to maintain the temperature of the house by keeping all the ventilators closed. Fresh air is very necessary, and the use of a little extra heat during damp, dull weather is a matter of great importance, as it will permit ventilation without materially reducing the temperature. Amateurs very frequently make the mistake of imagining that ventilation is only of service for the reduction of temperature.

RULES FOR AN AMATEURS' HORTICULTURAL SOCIETY.—M. D., Whetstone: I should be much obliged if, in a coming issue, you would give me some rules for starting a high-class amateur horticultural society, or tell me where I could obtain such rules.—Instead of publishing a list of rules for such a society, we suggest you write to the secretary of the National Amateur Gardeners' Association, Mr. F. A. Poulton, Rosemount, New Barnet, Herts, for a copy of the Association's rules. You might also write to Mr. H. R. Darlington, Park House, Potter's Bar, for a copy of the rules of the Potter's Bar Amateur Rose Society. In each case a stamped, addressed envelope, large enough to hold a schedule, will bring an early answer to your request.

CARNATIONS WITH BURST CALYX.—J. W. B., Mayfield: I have a house of perpetual carnations just coming into bloom, but a good many of the flowers came with a split calyx. Could you give me the reason of this trouble? The plants look very healthy.—The splitting or bursting of the calyx of a carnation bloom is often an inherent failing that no amount of careful cultivation will overcome; but excessive feeding is likely to aggravate the trouble. Small rubber rings placed round the calyx just as the blooms open will mitigate the evil, but if care is taken to select varieties which scarcely ever show a split calyx, then a great deal of trouble and disappointment may be avoided.

DR. M. C. COOKE.—A. H., Pinner: You will have seen our correction respecting Dr. M. C. Cooke. The announcement of his death appeared in the "Kew Bulletin," but Dr. Cooke is, we are glad to learn, very much alive.

### NAMES OF PLANTS.

W. W. S., Selby.—1, Begonia microphylla; 2, Rivina humilis; 3, Hibbertia dentata; 4, Cattleya labiata.

M. E. C., Derby.—1, Ruellia Portelliæ; 2, Thyrsacanthus rutilans; 3, Aglaonema costata; 4, Calanthe Veitchi.

B. P. N., Nottingham.—1, Epiphyllum truncatum; 2, not recognised, send when in flower; 3, Geonoma gracilis; 4, probably Raphiolepis ovata.

A. W., Bath.—1, Nepenthes Burkei; 2, Oncidium varicosum Rogersi; 3, Berberis aquifolia; 4, Cryptomeria elegans; 5, Dalechampia Roezliana.

H. G., Bray.—Crotons are difficult to name from a single leaf; so far as we can make them out yours are: 1, Reidi; 2, Golden Ring; 4, Interruptum aureum; 6, Lord Derby.

J. L., Wimbledon.—The fern is Scolopendrium vulgare crista-galli, and the grass is Elymus arenaria. The specimens of bamboo are not sufficient for identification, but we believe No. 2 is Phyllostachys nigra.

### NAMES OF FRUITS.

F. F., Portsea.—Beurré Sterckmans.

A. B., Uckfield.—1, Not recognised; 2, Souv. de Congres; 3, Golden Noble.

T. D. M., Maidenhead.—1, Dumelow's Seedling; 2, Sturmer Pippin; 3, Wealthy.

W. B., Eynsham.—1, Quite out of condition; 2, Swan's Egg; 3, Comte de Lamy.

E. C., Heytesbury.—1, Loddington; 2, Fearn's Pippin; 3, Ribston Pippin; 4, Beurré Diel.

G. L. S., Dorking.—1. Reinette de Canada; 2, Newton Wonder; 3, Lane's Prince Albert; 4, probably a very small Mère de Ménage.

## GARDENING ENGAGEMENTS.

Mr. Alex. Holm, for the past ten years nursery manager to Messrs. D. and W. Croll, Dalhousie Nurseries, Broughty Ferry, has been appointed general shop and nursery manager to Messrs. Thomas Kershaw and Sons, Lim., Keighley, Yorkshire. Mr. Holm takes up his new duties on November 28.

Mr. Alexander Innes, for nearly twenty years head gardener to W. D. Graham Menzies, Esq., of Hallyburton, has been appointed nursery manager to Messrs. D. and W. Croll at their Dalhousie Nurseries, Broughty Ferry. Mr. Innes takes up his new duties early in December, and, in common with his many friends, we would congratulate him on the appointment.

Mr. Donald McInnes, foreman at Glamis Castle Gardens, has been appointed head gardener to W. D. Graham Menzies, Esq., of Hallyburton, Coupar Angus, in succession to Mr. Alex. Innes.

## FORTHCOMING ENGAGEMENTS

MONDAY, November 18.—National Chrysanthemum Society's Executive Committee, Carr's Restaurant, Strand, 7 p.m.

TUESDAY, November 19.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Some of the Gardens of Bournemouth," by Dr. Hamilton; Scientific Committee at 4 o'clock.

Norwich Chrysanthemum Show; three days.

WEDNESDAY, November 20.—National Chrysanthemum Society's Late Exhibition, at Essex Hall, Strand; Conference in the evening, when Dr. Russell will lecture on "Soil Sterilisation."

Hull Chrysanthemum Show; three days.

North of England Horticultural Society, at Hull.

Newcastle Chrysanthemum Show; two days.

THURSDAY, November 21.—Linnean Society.

FRIDAY, November 22.—Hawick Chrysanthemum Show; two days.

Aberdeen Chrysanthemum Show; two days.

Dunfermline Chrysanthemum Show, two days.

## OBITUARY.

◆

### MR. ALEXANDER DYER.

There passed away, at Manchester, the other day a gentleman who was a well-known seedsman and gardener at Kittybrewster, N.B. This was Mr. Alexander Dyer, who carried on for a long period a successful business at Kittybrewster in the premises now occupied by Mr. James Robertson, to whom he disposed of his interest some time ago. Mr. Dyer was greatly respected in the North of Scotland, and there is much regret felt at his death. Mrs. Dyer and two members of the family survive him.

## CATALOGUES RECEIVED.

AMOS PERRY, ENFIELD.—A particularly useful catalogue of rock garden and border plants, and in these directions it is a masterpiece of comprehensiveness.

GEO. COOLING AND SONS, BATH.—Roses occupy the larger part of this autumn list, but fruit trees, ornamental trees and shrubs, climbing plants, etc., also have a place in it.

MANSELL AND HATCHER, RAWDON, YORKS.—Under the title of "Orchids for Amateurs" this firm has issued an illustrated priced list of popular and useful orchids that do not offer any special difficulties of cultivation to amateurs.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Skins.

It may safely be asserted that every living organism is enveloped in a skin of some kind, since it is impossible to conceive of the fluid contents of the cells which compose them being entirely unconfined, and the very fact of the existence of the cell, itself a walled-in receptacle, as the first essential of organic vitality, precludes such an idea. Even the most primitive, perhaps, of all organisms, the amœba, a mere jelly-like mass, possesses a skin of some sort, which, though permeable at all points, and thus able to take in solid food and excrete its indigestible remains at any part of its surface, is tough enough to retain its living content of protoplasm, and the all-essential nucleus. From this indefinite skin, however, of the primary simple cellular organisms, there has been engendered, in the process of evolution, a practically infinite diversity of very tangible and definite ones, which clothe both the animal and plant world with defensive armour, in the shape of skins and barks, which, in their turn, are often protected by external excrescent coverings of hair, scales, thorns, etc., again of great diversity. In the plant world we find this covering to fall into two great divisions, called, botanically, the exogenous and endogenous, of which the first may be exemplified by those trees which build up an annual ring of wood protected by an independent ring of bark, which forms an outer cylinder of skin enclosing the trunk, branches, and twigs; and the second by the great grass family, which forms no annual rings, and has the surface protected only by a tough, hard, woody deposit coherent with the internal material of the stems, there being no separable bark, and no concentric zone. In the endogens there are also other kinds of protective skins than barks proper; thus in the palms and yuccas, and tree ferns, etc., trunks are formed by the persistence of the extreme bases of their foliage, which survive in the form of scales, and so contribute to form a trunk, which they thus protect. In the exogenous tribes, to which most of our trees and shrubs belong, the nature of the bark varies greatly. Thus in the Plane trees it is smooth, rigid, and unyielding, the result being that as the trunk increases in diameter by the growth of the annual ring of wood within it, the bark is forced off in large flakes, showing, however, in that case, that a fresh layer has been engendered beneath it, and that, in point of fact, with such barks also an annual ring must be engendered outside that of the wood proper. Most trees, however, bear bark of a different character, which is permanent, and such barks are found to be pervaded with cracks and fissures, and by splitting and subsequent filling up they permit the internal wood ring to grow, while imperceptibly expanding in sympathy, and thus increasing correspondingly the diameter of the trunk, branches, and twigs. It is in this way that we arrive at the thick corrugated bark of the oak, which is carried to the extreme in the dense rough coating of the Cork Oak. This splitting of the bark, and subsequent filling up, finds its parallel in the thick armour of the tortoise, the armadillo, and other thick-skinned or shelled animals, whose shells increase in size, not by periodical shedding and renewal, but by accretion of growth round the edges of the plates which compose them, and it has been found that even the scales of fishes may reveal their age by similar annual or seasonal growth. The skins of plant foliage are formed on different lines, since they have but a temporary existence. They are usually very thin, and are permeated by innumerable small breathing pores, or stomata, to permit ingress and egress of the carbonic acid gas required by the cells for the nourishment of the plant, and the oxygen gas which it throws off when the carbon has been thence extracted. In connection with this class of skin many adjuncts have been evolved, mostly of a protective character, such as hairs, bristles, thorns, and glands, all of which serve their purpose in preventing undue transpiration, or the attacks of insect and other foes. In another direction there are the skins of fruits, which take many forms, from the film-like delicate skins of the strawberry tribe to the cast-iron ones of the nuts, culminating in the cocoanut and Brazil nut. In the fruits, indeed, we have skins of two distinct categories, viz., those of the pulps, which, as adjuncts to the seed, we see in the apples, pears, oranges, pomegranates, and others, and those of the seeds themselves. In these fruits we have only to dissect them until we arrive at the seed proper to note an immense difference. The seed is, so to speak, Nature's special care, and thus, while we find the pulps but thinly clad, the pips and stones are strongly armoured, and in the nut tribe, as already cited, they are often thrice-armoured where the exigencies of their environment, and the character of their foes have necessitated such a provision.

MR. F. JORDAN.

**Mr. F. Jordan,** head gardener to Lady Nunburnholme, Warter Priory, Pocklington, York, has had a distinguished career, and his name is well known among the ranks of exhibitors, especially in connection with fruit culture. But Mr. Jordan is not merely a successful exhibitor, he is one of the most capable of gardeners to be found in the United Kingdom, and that is saying a good deal. He commenced his gardening career at Grimston Garth, East Yorks, under the late Mr. Webster, with whom he remained three years. Then followed eighteen months in the nurseries of Messrs. W. Backhouse and Son, York, and a subsequent eighteen months at Huttons Ambo Hall, Malton. Seeking wider experience, he entered the gardens at Osberton Hall, Worksop, where, under the late

Mr. Woods, he learned all that clever fruit and vegetable grower could teach him, and to the influence of Mr. Woods Mr. Jordan attributes not a little of the success he has gained. Three years were spent at Osberton Hall Gardens, followed by nine and a-half years at Welbeck Abbey, where Mr. Jordan acted as foreman in the various departments with such success that in 1897 he was appointed head gardener to J. Corbett, Esq., Impney Hall, Droitwich. While at Droitwich Mr. Jordan exhibited both indoor and hardy fruits frequently at prominent exhibitions, and with great success. Mr. Jordan stayed at Impney Hall until the death of Mr. Corbett, and in 1906 he took charge of the gardens at Warter Priory. Lady Nunburnholme is a most enthusiastic gardener and garden lover, and she has made extensive new gardens and remodelled the old ones, and the work has been carried out under Mr. Jordan's capable superintendence. Those able to judge consider that if health and strength are continued to Mr. Jordan and his generous employer, the gardens at Warter Priory will presently become the most famous in a county containing many fine examples of horticultural skill.

**Cardiff Chrysanthemum Show,** of which a report appeared in a recent issue, resulted, we regret to learn, in a heavy loss. The deficit on the society's work during 1911 was rather heavy, and, with a view to make this season's show more attractive to the public, afternoon and evening concerts of a high-class character were included in the programme, but the attendance was poor on both days, and the experiment proved a failure.

**Cercidiphyllum japonicum.**—Sir Herbert Maxwell, Bart., sends us the following interesting note relating to this attractive tree: "Having raised some thousands of this tree from seed a few years ago, I was at a loss how to make use of the plants. Failing to obtain any information as to its stature I planted it as an ornamental shrub, until I happened to come across a notice of it in Mr. Veitch's 'Traveller's Notes,' in which he records having measured a specimen at Hakodate twenty-one feet in circumference of stem. Thereafter I began planting it as a forest tree. It is almost without a rival for autumnal colour." To fully appreciate the importance of the information given by Sir Herbert Maxwell, it is necessary to remember that his estate of Monreith is situate in Wigtownshire.

**R.H.S. Exhibitions and Meetings,** 1913.—The following exhibitions will be held by the Royal Horticultural Society during 1913: March 4 and 5, Bulb Show. April 15 and 16, Daffodil Show. May 20, 21, 22, Spring Show in the Gardens of the Royal Hospital, Chelsea. May 27 to 30, Rhododendron Show. July 1, 2, and 3, Show at Holland House. September 23, Vegetable Show. October 7, 9, and 10, Exhibition of British-grown Fruit. From the foregoing list of the exhibitions that will be held by the Royal Horticultural Society next year it will be seen that no longer will horticulturists have an opportunity of meeting their friends once a year in the classic gardens of the Inner Temple. It is somewhat difficult to repress a feeling of regret that these meetings have become a thing of the past, but the change was imperative, for the exhibitions have long outgrown the space afforded by the gardens, and the inspection of the exhibits in the congested tents has for some years past been attended with some difficulty, and not a little discomfort. The increased area at Chelsea will enable the Council to provide more spacious tents, ventilated in accordance with modern ideas, and we doubt not that they will take full advantage of their opportunities. With reference to the change, the Council state that it is with considerable reluctance they have found it necessary to change the site of the spring show, but the increased attendance, and consequent overcrowding, in recent years, compelled them to seek for a larger site. They have, therefore, accepted the invitation of the Governors of the Royal Hospital to hold the spring shows in future on the same site as the recent Royal International Horticultural Exhibition. The annual meeting will be held on February 11, when, as was the case this year, there will be no exhibition or other meeting. The dates on which meetings of the various committees will be held are as follows: January 7 and 21; February 4 and 18; March 4 and 18; April 1, 15, 29; May 14 (Wednesday, not Tuesday) and 20; June 3 and 17; July 1, 15, and 29; August 12 and 26; September 9 and 23; October 7 and 21; November 4 and 18; and December 2. By holding the first of the May meetings on Wednesday, May 14, the holding of an exhibition on a day following a Bank Holiday will be avoided next year. A conference on primulas will be held in the Lecture Room at Vincent Square in April next, on a date that has yet to be fixed, under the presidency of Sir John Llewelyn, Bart.

**York Flower Show and Gala.**—This great Northern horticultural event will next year take place on June 18 and the two following days. In sending us the dates of the exhibition, Mr. F. Arey, the secretary, informs us that, with a view to obviating the inconvenience caused to exhibitors by the old system of tents, the Council have purchased from Messrs. Piggott Brothers and Co., Lim., a portion of their patent ventilated tent which was erected by them at Chelsea last year for the Royal International Horticultural Exhibition, and that this will be erected by that firm for the ensuing flower show. The above new system of tents will give an increased area or floor space of at least 20 per cent., whilst the outer walls will be twelve feet in height, and, it is hoped, meet the requirements of exhibitors, and give ample scope for the display of their exhibits, no matter in what position they may be placed. The perfect ventilation of the tent will, it is hoped, prove a great boon to those whose duty compels them to remain therein during the show. The Council trust that the exhibitors will show their appreciation of its enterprise by making special efforts to come to York in June next, and thereby combine in maintaining the high status already attained by the York Show.

**R.H.S. Examinations,** 1913.—The dates of the examinations that will be held by the Royal Horticultural Society next year are as follows: January 6, Examination for gardeners employed in public parks and gardens; April 2, Examination in the principles and practice of Horticulture; April 23, Examination in cottage gardening—open to Elementary and Technical School teachers only.

**North of England Horticultural Society.**—The current issue of the monthly magazine of this society contains a personal appeal from the secretary, which, in the interest of horticulture in the North of England, will, we hope, receive the attention from the Fellows and members it so well merits. The appeal made by the Rev. J. Bernard Hall is to the effect that it is absolutely necessary to make an effort to obtain more Fellows and members, and also donations, sufficient to clear off the initial expenses. The members of Council and committees, and the auditor, deserve, Mr. Hall points out, the society's best thanks for their voluntary and valuable services, but he states, "Unless an effort is made to raise sufficient to cover the initial expenses on or before the annual meeting, on Wednesday, January 15, 1913, by each one of us using our personal influence, the society will have a crisis to face." Mr. Hall also states that he has no fear of the results of a combined movement, on the clear understanding that the society is to be for the seven Northern counties, and that its work is to be primarily educational and scientific, but the detailed office work is now so arduous that he cannot do all he would like to do in the way of personally initiating and developing a forward movement. He further adds, if his services are to be retained he must feel the society is wanted, and know that the necessary cash is forthcoming. At a meeting of the Leeds Committee of this society it was reported that the recent exhibition at Leeds resulted in a balance of £20, which has been handed over to the Leeds Workpeople's Hospital Fund, in accordance with the arrangements under which the show was held.

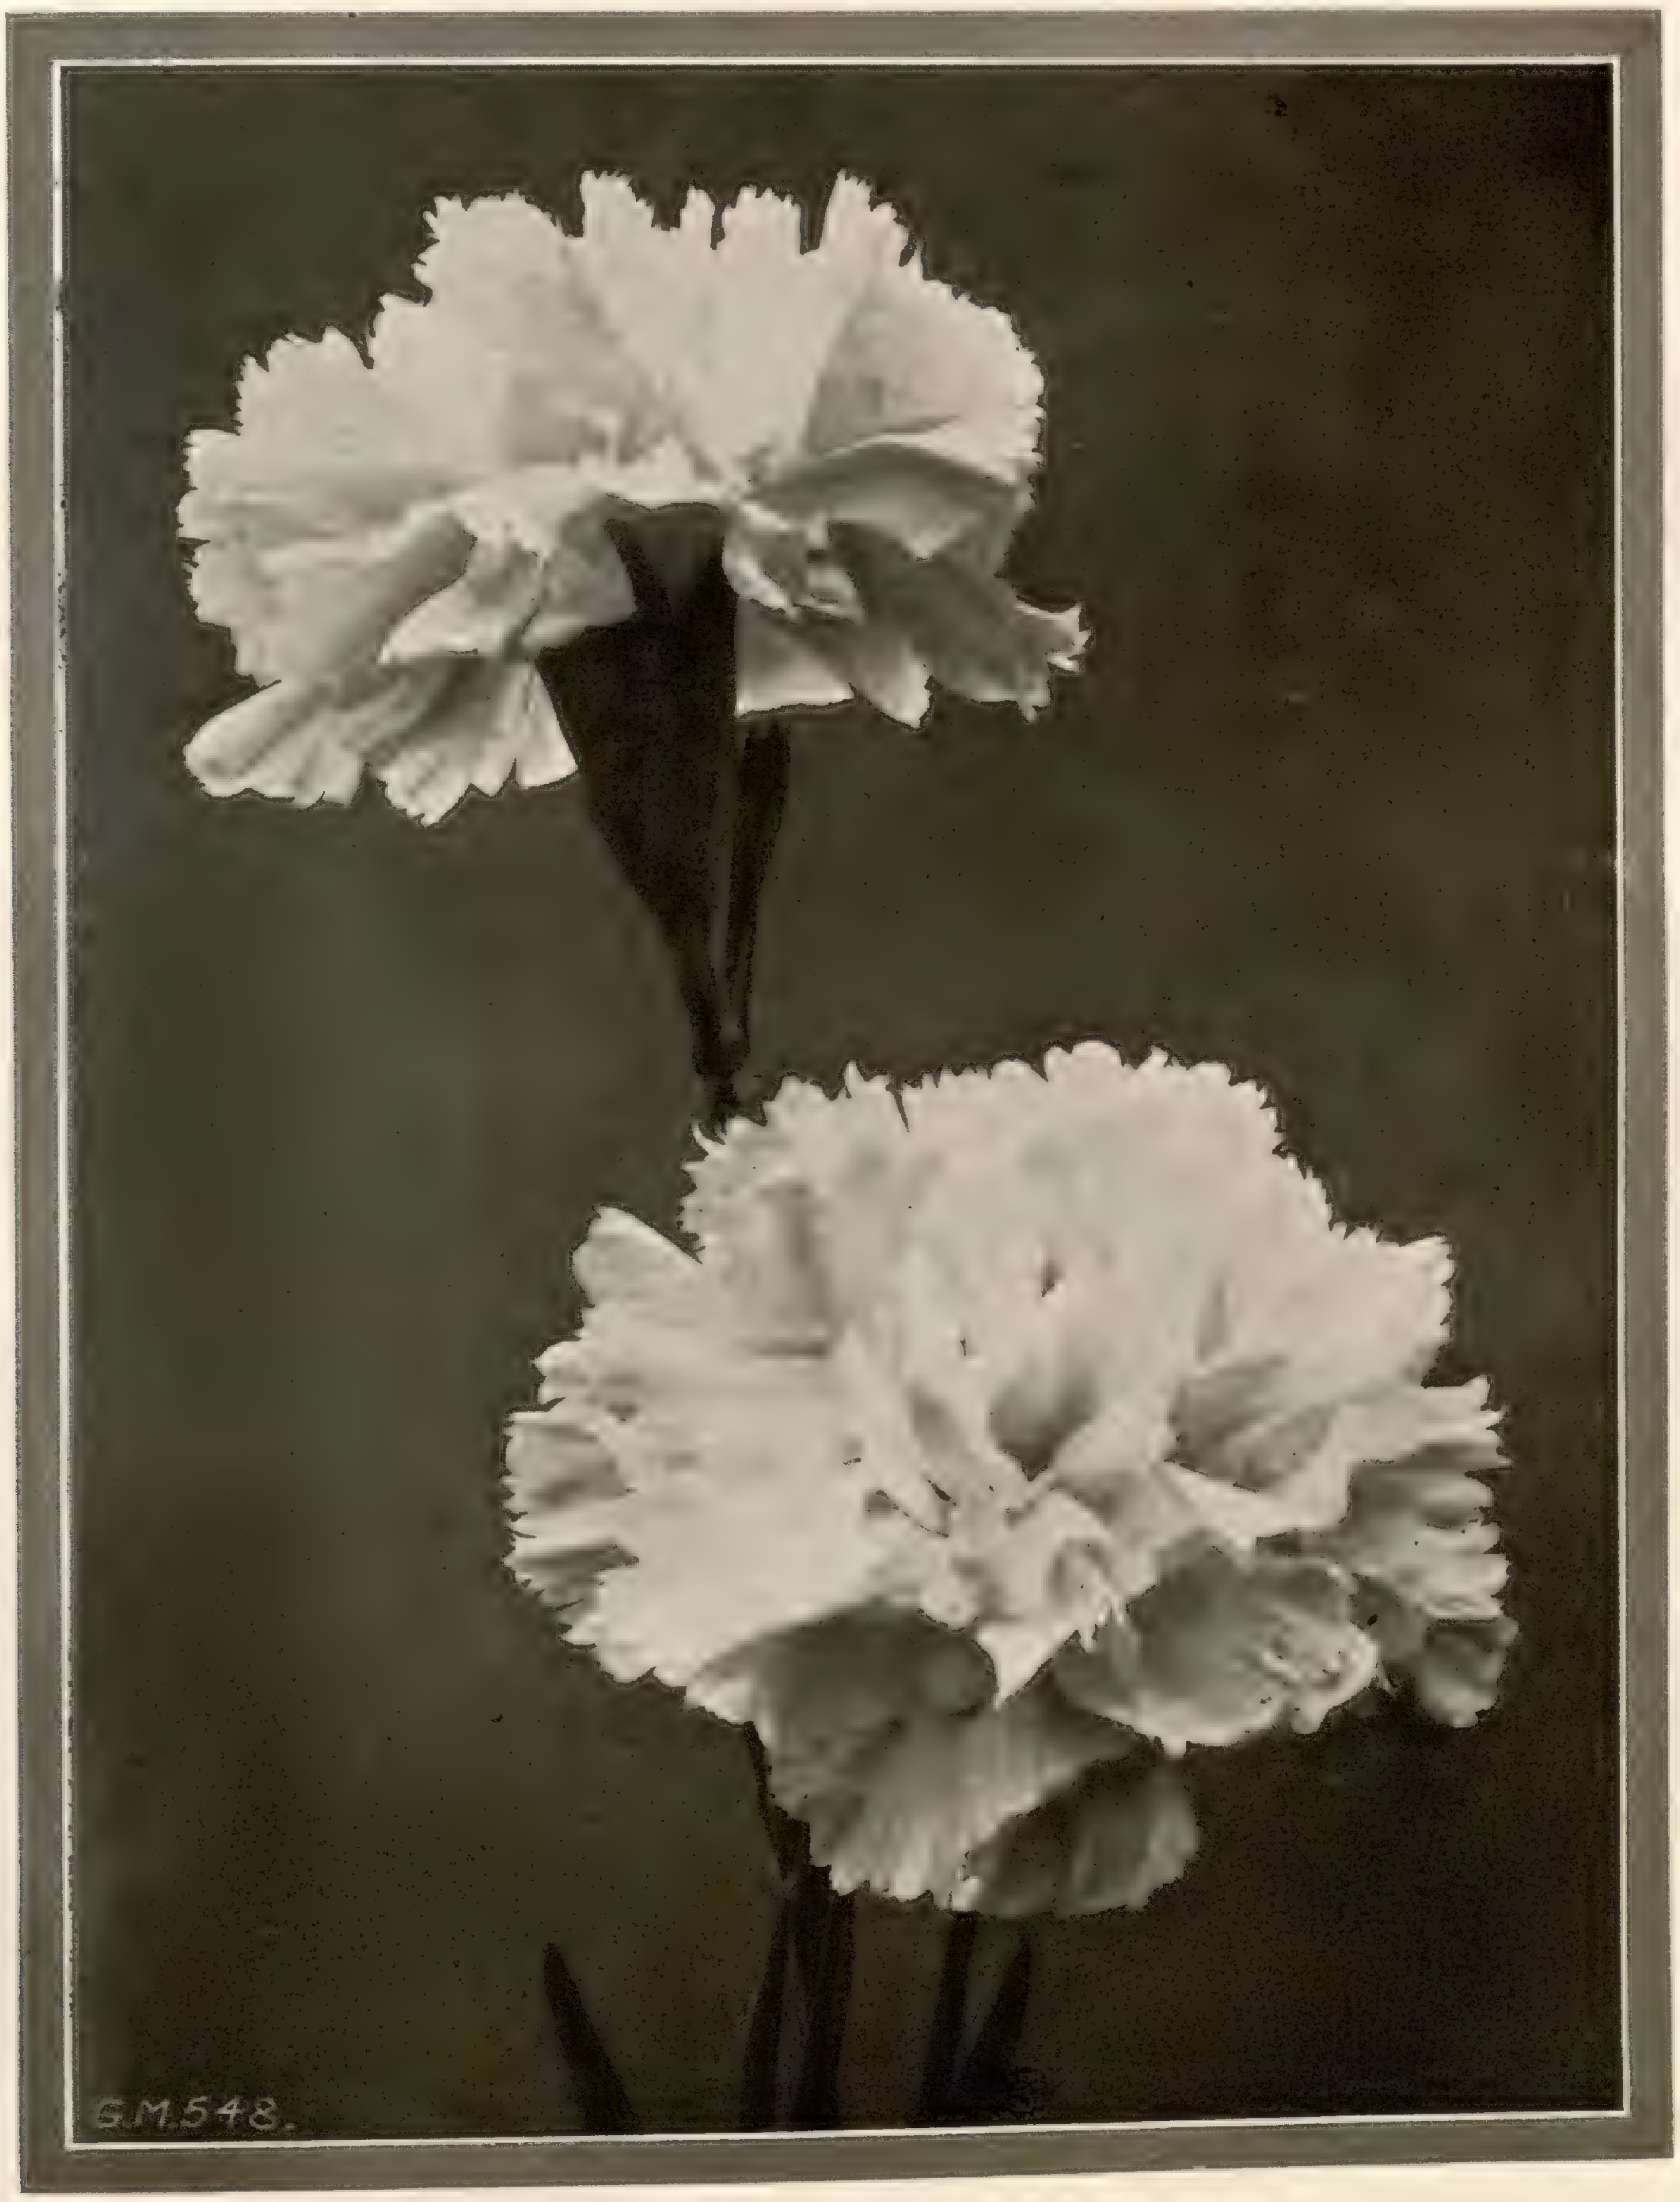
**Mr. James Eddie, F.R.H.S.,** nurseryman and seedsman, High Street, Inverurie, N.B., has been appointed third Bailie of the burgh, in which he has carried on business for many years. Mr. Eddie entered the Inverurie Town Council about four years ago, and last year his abilities were recognised by his being appointed Dean of Guild. His services in that capacity have now led to his attaining the position of Bailie, which will probably be only a step to still greater promotion in the burgh of Inverurie.

**Sale of Orchids at Manchester.**—At the sale by Messrs. Protheroe and Morris, at Manchester, of choice orchids from Mr. S. Gratrix's collection, good prices were obtained. The more noteworthy lots were Cypripedium Moonbeam, with three unflowered growths, 110 guineas; C. Actæus Bianca superbum, two strong growths and two breaks, 30 guineas; C. Alcibiades Illustrious, two unflowered growths and breaks, 30 guineas; C. Troilus Cravenianum, two unflowered growths, 27 guineas; and Odontoglossum Samuel Gratrix, two old bulbs and one new growth, 90 guineas.

**R.H.S. "Journal."**—The second part of the 38th volume of the "Journal" of the Royal Horticultural Society, which has just been published, contains much to interest those who are more or less immediately concerned with horticulture. The principal are: "Drought and Gardening," by Professor Bayley Balfour, M.A., F.R.S.; "The Flowers of Apples as an Aid in Identification," by Mr. E. A. Bunyard; "Tender Plants for Warm Corners," by Mr. R. J. Lynch, M.A., V.M.H.; "Professor J. Henslow as Ecologist," by "Professor J. S. Henslow as Ecologist," by "Present-day Water Lilies," by Mr. J. Hudson, V.M.H. The report on the Delphinium Trial held at Wisley is especially deserving the attention of raisers and cultivators of these stately-growing and beautiful hardy flowers.

**National Chrysanthemum Society.**—A beautiful exhibition was held at Essex Hall on November 20, to which we hope to refer in detail in our next issue. A score or more of new varieties came up for consideration, and the special prize offered for the best new single-flowered seedling was won by Messrs. Cragg, Harrison, and Cragg, Heston, with Portia, a large variety of reddish terra-cotta hue.

# ROYAL HORTICULTURAL SOCIETY.



NEW PERPETUAL CARNATION SNOWSTORM.

A large, pure white, deliciously fragrant variety. A.M., R.H.S., November 19. Mr. W. Lawrenson, Yarm-on-Tees.

The large and interesting exhibition held at Vincent Square, Westminster, on Tuesday, November 19, attracted very many visitors, and for two hours or more it was a very difficult matter to get from one part of the hall to another, because of the crowd. Among notable personalities who visited the hall there were the Right Hon. the Speaker, the Duke of Marlborough, Sir Albert Rollit, and Mr. and Mrs. Winston Churchill.

Chrysanthemums, carnations, and winter-flowering begonias were largely shown, orchids were fairly well represented, and so were trees and shrubs; while vegetables, fruits, and paintings of garden scenes and flowers were quite plentiful.

FLORAL COMMITTEE.

Trees and shrubs were very much in evidence on this occasion, and a large and interesting exhibit was staged across the end of the hall by Messrs. John Waterer and Sons, Lim., Bagshot. These were all evergreen subjects, chiefly conifers and hollies, with an edging of veronica. Golden yews, cupressus, and retinosporas were very charming, but probably the most effective plants were the long-stemmed standards of Retinospora filifera aurea, R. obtusa aurea, Ilex aquifolia argentea pendula, I. a. Watereri, I. a. aurea, Taxus adpressa, T. baccata aurea, and Thuia occidentalis pendula. Some of the hollies were grandly berried, notably a specimen of I. a. balearica with dense clusters of deep red fruits. The small-leaved Ilex crenata and I. c. aurea, and the black berried I. c. latifolia were very distinct; while the big pyramids of golden and silver hollies were grand specimens, and there was a fine example of the elegant Phillyrea Vilmorineana.

Another considerable group of shrubs was aranged on the floor by Mr. G. Reuthe, Keston. Though few of these were in bloom, one could not fail to be attracted by the handsome leafage of the numerous species of Himalayan rhododendrons.

A particularly good bank of winter-flowering begonias, from Messrs. Clibrans, Altrincham, indicated the value of these plants for November flowering. The begonias were capitally grown, and carried large numbers of flowers. Miss Clibran, Clibran's Pink, and Emily Clibran were finely represented, but the new varieties were even more brilliant—these were Splendour (A.M.), deep scarlet; Eclipse (A.M.), salmon-red; Scarlet Beauty (A.M.), bright scarlet; and Lucy Clibran (A.M.), buff, suffused rose; each secured recognition. Winter-flowering begonias were also presented in large numbers by Messrs. J. Veitch and Sons, and in their exhibit the variety The Gem was a blaze of brilliant carmine, while Winter Cheer, Julius, Success, and Ensign were all good and freely flowered. Another large exhibit of begonias was made by Messrs. Wm. Cutbush and Son, Highgate, and the white Lady Waterlow was a conspicuous variety; with these the Highgate firm showed dwarf polyantha roses and perpetual carnations.

Chrysanthemums made a brave show in the hall, and gave a splendid touch of colour. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, contributed a striking exhibit, in which there were bold stands of Japanese varieties, and beautiful bunches of such singles as Mensa, Florrie King, and Sylvia Slade. The new Japanese variety, Miss Roope, was very well shown. A corner group of singles from Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow, included beautiful vases of Elfrida, Elsa, Crimson Queen, Miss W. Wells, Merstham Jewel, Celia, and Mensa.

A bold group of single and decorative chrysanthemums came from Messrs. J. Veitch and Sons, Chelsea, and, as usual, the dwarf plants were capitally grown and beautifully flowered. The brilliant single named Feltham Crimson formed a fine central block in this effective display. Messrs. J. Peed and Sons presented single sorts in great variety, and set them up in light bunches. The single yellow variety, J. C. Pillman, was very finely shown by Messrs. H. Cannell and Sons, Swanley, in a group of chrysanthemums and cut pelargoniums.

Messrs. W. Wells and Co., Merstham, set up big pyramids of huge blooms of Japanese chrysanthemums Wm. Turner, Queen Mary, and Mrs. Drexel, with large groupings of the single varieties, Mensa, the yellow Phyllis Bryant, the crimson Brightness, and the decorative sorts Ada Brooke and December Gold, arranged in between the large blooms. A very bold and effective contribution. The Misses Price and Fife, Grove Park, Lee, displayed single chrysanthemums and some good carnation blooms. Single chrysanthemums were very well shown by Mr. T. Ward, Bishop's Stortford, popular varieties being well displayed. Mr. James Box, Lindfield, exhibited a very handsome group of singles close to one of the annexes. He had large bold stands of beautiful flowers of Ceddie Mason, crimson; Phyllis Bryant, yellow; The King, rose-red; Sylvia Slade, deep rose; Edith Pagram, Leo, and Chas. Hale.

Mr. Chapman, gardener to L. Harrison, Esq., Orchards, East Grinstead, sent a very bright single chrysanthemum named Michael Harrison (A.M.); from the Manor Nurseries, Cardiff, came Audrey (A.M.); Mr. H. J. Jones secured an A.M. for Miss Mary Fox; and Mr. A. Smith, The Convent Gardens, Roehampton, obtained a like award for the white Japanese variety, Mrs. W. T. Smith. Mr. May, gardener to the Countess of Macclesfield, Shirburne Castle, Watlington, showed a bright single chrysanthemum named Countess of Macclesfield.

A splendid lot of blooms of the new perpetual carnation Snowstorm (A.M.), set up by Mr. W. Lawrenson, Yarn-on-Tees, was a centre of attraction. This is a grand pure white, fringed variety of large size, great purity, and excellent substance. The calyx is good, and the flowers are very sweetly scented, like the Old Clove variety. Messrs. S. Low and Co., Enfield, had the new carnations Benora and Rosette on view among vases of popular sorts. The carnations shown by Messrs. Allwood Brothers, Hayward's Heath, contained two good new varieties, i.e., Salmon Enchantress, a salmon sport from an old and popular sort; and Mary Allwood, rich rosy-cerise, with broad outer petals, and making up a handsome bloom; an Award of Merit was granted in each instance. Sunstar, a good yellow variety, was conspicuous in the group of carnations submitted by Mr. C. Engelmann, Saffron Walden.

The handsome Polypodium Mandaianum was again finely shown by Mr. W. A. Manda, St. Albans, and he also showed the variegated Anthericum Mandaianum, which should prove a popular basket plant. Plumbago coccinea, with its slender, graceful spikes of small red flowers, was exhibited in some quantity by Mr. Fitch, gardener to Sir George Faudell-Phillips, Hertford. Cyclamens, poinsettias, and standard capsicums were associated with ferns by Messrs. H. B. May and Sons Edmonton.

Some interesting alpines, chiefly saxifrages, sedums, and other lowly plants, were contributed by Messrs. Whitelegg and Page, Chislehurst; Aubrietia Violet Queen was notably bright and good. Messrs. T. S. Ware, Lim., Feltham, showed a large collection of alpines, and the pan of Androsace coronopifolia, carrying its dainty white flowers, was very pretty. Saxifages in great variety, largely encrusted sorts, were shown in little pans by Messrs. J. Piper and Sons, Bayswater.

## ORCHID COMMITTEE.

A large and handsome group of orchids which attracted general attention was staged by Mr. Hunter, gardener to the Duke of Marlborough, Blenheim Palace. It consisted chiefly of the beautiful blue Vanda cærulea, and there were about two hundred and sixty fine spikes on two hundred and twenty plants, arranged over moss and ferns, with a large number of Cypripedium insigne and C. i. Sanderæ at the base The effect of the group was unfortunately largely spoiled by the use of vivid scarlet draping from the edge of the stage to the floor. There were some fine forms of Vanda cærulea staged, and among these we made special note of V. c. Curtisi, with undulating sepals and reticulating deep blue veins; V. c. Mrs. Spencer Churchill, deep blue; and V. c. Margaretta, with very broad segments.

Some capital cypripediums were shown by Messrs. J. Cypher and Sons, Cheltenham, and there were handsome, substantial flowers of C. Thalia gigantea, C. Leeanum giganteum, C. Milo Westonbirt var., C. Actæus gigantea, C. Mdme. Jules Hye, the bold C. Fulshawense, and the light-hued C. Milky Way. Messrs. Sander and Sons, St. Albans, brought up the handsome deep purple-lipped Lælio-cattleya Haroldiana, the finely-spotted Cypripedium Pyramus Black Prince, and the broad C. Dreadnought; Lælio-cattleya Statteriana was well shown in the group.

Orchids were shown by Messrs. J. Veitch and Sons, Chelsea, and the group consisted largely of cypripediums, with a few odontoglossums and Lælio-cattleya Pedro, L.-c. Priam, and L.-c. Nysa, C. Baron Schroder, C. Actæus Tracey's var., C. Regina, and C. Leeanum Clinkaberryanum were notable among the cypripediums. Very bright were the cypripediums exhibited by Messrs. Swan and Price, Keyfield, St. Albans.

Messrs. Hassall and Co., Southgate, sent a few cypripediums and odontoglossums, and Messrs. Charlesworth and Co., Hayward's Heath, staged Odontioda Bradshawiæ, the fine Cypripedium eboraicum, the quaint little Oncidioda Marjorie, produced from Oncidium Forbesi and Cochlioda Noetzliana; and Oncidium hybridum. Oncidium varicosum Rogersi, Vanda cærulea, Cattleya Armstrongæ, C. Fabia and L.-c. St. Gothard were among the best things in the group from Messrs. S. Low and Co., Enfield.

F. Menteith Ogilvie, Esq., The Shrubbery, Oxford, showed a few choice orchids, and secured an Award of Merit for Lælio-cattleya Scylla, a free-flowering yellow hybrid, and for Cypripedium Elatior, a neat and pretty hybrid from C. Leeanum and C. Baron Schroder. Mr. W. H. Davidson, Orchid Dene, Twyford, gained a First Class Certificate for a fine plant of Lælio-cattleya Bella Orchid Dene var., with large purple blooms. From Westonbirt, Tetbury, Mr. Alexander, orchid grower to Sir George Holford, brought up Cypripedium Latona (A.M.), a broad, shapely flower, white and green.

## FRUIT AND VEGETABLE COMMITTEE.

Vegetables, finely grown and finely staged from Messrs. Jas. Veitch and Sons, Chelsea, formed a very handsome and educational feature of the exhibition. There were a hundred varieties on view, and the background was formed of celery, kales, broccoli, capsicums, the brilliant-hued Chilian beet, and red cabbages. In the foreground a few of the best dishes from a goodly set were Hollow-crown parsnips, Ailsa Craig onions, the new Intermediate beet, white artichokes, celeriac, Snowball and Yellow Perfection turnips, Model carrots, and potatoes.

A very fine collection of fruit, consisting of about seventy dishes of clean, well-coloured apples, twenty-two dishes of pears, eighteen bunches of Black Hamburgh, Muscat of Alexandria, Cooper's Black, and Prince of Wales grapes, with three dishes of medlars, an Emerald Green melon, quinces, and nuts, was staged by Mr. Edwin Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

A collection of cabbages and kales from Messrs. Jas. Carter and Co., Raynes Park, was interesting as showing the great variation in one species of plant. Model cabbage, the Russian kale, Couve Tronchuda, Christmas, Drumhead cabbage, White Prizetaker cabbage, and Drumhead kale were a few parlarly noticeable and useful sorts.

Mr. W. M. Bennett, gardener to C. Goring, Esq., Wiston Park Gardens, Steyning, contributed about thirty dishes of apples; and Mr. C. Prentice, gardener to Mrs. W. Gordon Cumming, Hartpury House, Gloucester, displayed about fifty dishes of apples and pears, grouped with small crotons and palms. Mr. Stanard, The Gardens, Panshanger, Hertford, was awarded a Cultural Commendation for a dish of White Ischia figs.

## CERTIFICATES AND AWARDS.

First-class Certificate.—To Lælio-cattleya Bella Orchid Dene variety, from Mr. W. H. Davidson, Orchid Dene, Twyford.

Award of Merit.—To Carnations Mary Allwood and Salmon Enchantress, from Messrs. Allwood Bros., Haywards Heath; to Carnation Snowstorm, from Mr. W. Lawrenson, Yarm-on-Tees; to winter-flowering begonias Eclipse, Scarlet Beauty, Lucy Clibran, and Splendour, from Messrs. Clibrans, Altrincham; to Chrysanthemum Miss May Fox, from Mr. H. J. Jones, Lewisham; to Chrysanthemum Mrs. W. T. Smith, from Mr. A. Smith, Convent Gardens, Roehampton; to Chrysanthemum Audrey, from Manor House Nurseries, Cardiff; to Chrysanthemum Michael Harrison, from Mr. Chapman, gardener to L. Harrison, Esq., Orchards, East Grinstead; to Cypripedium Latona, from Sir George Holford, Westonbirt, Tetbury; to Lælio-cattleya Scylla and Cypripedium Elatior, from F. Menteith Ogilvie, Esq., Oxford.

## MEDALS.

Gold.—To Messrs. J. Veitch and Sons, Chelsea, for vegetables; to Mr. Hunter, gardener to the Duke of Marlborough, Blenheim, for orchids, and also a Silver Lindley Medal; to Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Elstree, for fruit.

Silver-gilt Flora.—To Messrs. J. Waterer and Sons, Bagshot, for evergreen shrubs; to Messrs. W. Wells and Co., Merstham, for chrysanthemums.

Silver Flora.—To Messrs. Stuart Low and Co., Enfield, for orchids; to Mr. F. Galsworthy, Chertsey, for paintings of flowers; to Mr. H. J. Jones, Lewisham, for chrysanthemums; to Messrs. J. Veitch and Sons, Chelsea, for begonias and chrysanthemums.

Silver Knightian.—To Mr. Prentice, gardener to Mrs. W. Gordon Cumming, Hartpury House, Gloucester, for fruit; to Messrs. E. Westmacott and Co., Leadenhall Street, for South African preserves.

Silver Banksian.—To Mr. J. Box, Lindfield, for chrysanthemums; to Messrs. Clibrans, Altrincham, for begonias; to Messrs. Wm. Cutbush and Son, for carnations, begonias, etc.; to Messrs. H. B. May and Sons, Edmonton, for cyclamens and ferns; to Messrs. Jas. Carter and Co., Raynes Park, for cabbages and kales; to Mrs. Miller, Moyleen, Marlow, for preserves and sweetmeats; to Miss Sewell, South Kensington, for jams.

Bronze Banksian.—To Mr. Bennett, gardener to C. Goring, Esq., Wiston Park, Steyning, for fruit.

# THE WIRE FRUIT CAGE AT NUNEHAM PARK.

In some districts where birds are very plentiful considerable difficulty is experienced in preserving small fruits from their depredations. The use of fish-netting is by no means satisfactory, because one or two flaws in the netting will enable the birds to enter, and there is little satisfaction in catching and killing the feathered thief after it has devoured a considerable portion of the fruit crop. Further, the use of netting is likely to cause no small damage to the trees unless all the small fruits are in regular plots, so that a wooden framework can be erected and covered in with netting. But if this sort of thing has to be done annually it becomes a fairly serious problem, and at once suggests the desirability of a permanent protection, such as the one depicted here, which has done duty for several years at Nuneham Park Gardens, near Oxford.

This fruit enclosure was put up in 1907 by Messrs. Boulton and Paul, of Norwich, and is 187ft. long by 50ft. wide. Mr. C. E. Munday, head gardener to L. Harcourt, Esq., states that the structure is 16ft. 6in. high to the ridge, and 6ft. 6in. to the eaves, and therefore throws off snow easily. It runs east and west, and all the supports are of 1¾in. angle iron work. The netting used is ⅝in. mesh. Inside, espalier trellises are placed 5ft. apart, the wires being secured by screw-bolts to the supports to allow for tightening. About half the espaliers are devoted to loganberries and raspberries, and the other half to gooseberries; and the illustrations show how well the former respond to good cultivation in this wire cage.

Three gates along one side give entrance to the enclosure, and a 4ft. path divides the plantation north and south; while a path along each side allows ample room for wheeling, cleaning, etc. In every way this wire fruit cage has answered expectations, and crops are safe from birds.

# ESTATE FRUIT PLANTATIONS.

The title of this article suggests its object, namely, to draw attention to the cultivation of mixed fruit on the home estate as a crop for the purpose of profit. This may be described as a more or less modern phase of fruit culture, but it is being developed, and is frequently under the charge of the head gardener. For centuries hardy fruits like apples, pears, and plums have been grown in orchards, and when the demand arose for more of these commodities the market gardener commenced by interspersing his vegetable plots with lines of trees, and this led up to devoting land entirely to fruit. The business is somewhat speculative, it has its ups and downs, its good seasons and bad seasons, its years when prices are good and others when they are below the average, but the steady increase in fruit growing as a commercial venture affords proof of its possibilities, and it is not likely that the demand for fruit will grow less, so long as the population increases and big towns encroach further and further into country districts.

The success of commercial fruit culture, however, depends very much on one condition, i.e., the class of fruit that is grown, the method of packing, and the way in which it is put upon the market. In a word, it is the best fruit that pays, and when we hear of gluts and low prices, it is very often a superabundance of second-rate produce in the market that is responsible for this. The object, then, of any man who sets out to grow fruit as a commercial venture should be to aim at the production of the very best, for it is nothing but this that has enabled foreign growers to get such a hold on British markets.

### Sites and Soil.

Nothing could be more mischievous than the doctrine, which I am afraid has been preached by irresponsible persons in the past, that fruit culture is an easy way to fortune, and that any man who has land may plant it with fruit with a reasonable assurance that it will yield him a profit. The fruit grower may assist Nature, but he must not attempt to dictate to her, and, before setting out to form a plantation, there should be reasonable assurance that the soil is adapted to fruit culture. This being so, it is the safest plan to start in a district where fruit is already grown, and there is evidence to show that the local conditions are suitable. There are many circumstances to bear in mind, for not only should the soil be deep and of a suitable character, but it should be well-drained; if not naturally, then artificially. There should be shelter from the prevailing winds, the position should be elevated enough to be reasonably safe from those late spring frosts that are so fatal in some seasons, and the position should be convenient for the purposes of hauling and general cultivation.

The selection of the site for a fruit plantation is not a matter that should be dismissed lightly, for too much care cannot be exercised over this at the outset, and a blunder at the beginning may lead quickly to disappointment and loss of money. When putting down land as a mixed fruit plantation, there is necessarily a big initial outlay, varying according to circumstances, but it is very essential that the land should be well cultivated, and, above all things, clean. To plant fruit on land that is foul with twitch or other obnoxious weeds is a fatal mistake, and if an arable field is planted, there should be no labour stinted in getting it clean. Under some circumstances, ploughing will suffice in preparing for planting, but in others it may be necessary to resort to the more expensive operation of digging or even double digging, particularly where grass land is being broken up for fruit, as it is very desirable that the turf be buried well beneath the surface. In short, the whole success of plantation fruit culture consists in doing things well, and the better the initial start the less will be the cultural expenditure later on.

### Arranging Plantations.

There are many different ways of arranging mixed estate plantations that are suited to different conditions, but the general object is to occupy the ground and get a return as quickly as possible. To this end a certain section of the trees will be of a permanent character, consisting of apples, pears, and plums, and the other portion will be temporary and comprising such fruits as gooseberries, currants, raspberries, and strawberries. I am aware, in writing this, that there are hundreds of acres of land devoted to these latter fruits, and where the object is to grow a quantity of soft fruit, this is obviously the course to pursue, but the estate plantation I have in view is permanently intended for hard fruits, and the berries are only included as an under crop to occupy ground, and give a return until the other trees occupy the space. It is quite a mistake to think that apples, pears, and plums can be grown permanently with small bush and berry fruits, because there comes a day when the latter have to give way to the former; therefore, if the main idea is to grow small fruits in bulk, the land should be given up to them entirely.

As a temporary crop, however, bush fruit will yield a profit for a few years after coming into bearing in a mixed plantation, and help to pay expenses until the permanent trees arrive at a fruit-bearing condition. In arranging the planting scheme then, the sites of permanent trees should be first selected, and the intervening spaces be filled with bushes.

### Types of Trees.

Apples are the fruits which claim first attention, and, valuable though standards are for orchards, the bush trees are the best for fruit plantations, because they come into bearing quickly, and most of the operations in respect of pruning and picking can be done from the ground. I do not much favour the practice of mixing up plums and pears and apples, but prefer breaks of these fruits distinct if they are all grown. Bush apples of moderate vigour do very well at 10ft. apart, but vigorous growers like Bramley's Seedling are not too close at 12ft. apart, and when planting it is well to consider what the tree will be like when fully developed. For the most part bush trees are worked on the Paradise stock for plantation work, but it is unwise for propagators to make hard-and-fast rules in the matter, because such excellent apples as Stirling Castle and Lane's Prince Albert are more permanently profitable if worked on the more vigorous free or crab stock.

The above remarks as to distances apply to pears in the bush or pyramid form, but plums are best as half-standards, and these may be planted at 15ft. apart. After deciding the positions of the permanent trees it will be seen how many bushes of gooseberries or currants can be accommodated at, say, 5ft. apart between the rows of trees and also between the specimens in the rows. Rows of strawberries, 2ft. apart, are often grown for a few years between lines of apples, and so are raspberries, but, owing to the natural habit of the latter fruit, I think they are better in breaks by themselves. Young, well-grown trees that have been cut back once in the nursery are suitable for planting, and hundreds of these specimens are sold every year for plantations, but let it be a rule to plant good trees, which, if dearer at the outset, are cheaper in the end.

Half-standard plums should have clean stems and good heads, gooseberries and red currants should be specimens raised from cuttings, with clean stems well above the ground, but the clean-stemmed bush is not desirable in black currants, where the object is to get as much young wood as possible every year from the base. H.

(To be continued.)

---

## RASPBERRIES.

When properly treated the raspberry is one of the quickest of all our hardy fruits to come into bearing, even the strawberry not being able to give it many points in this respect, while an established plantation keeps up a good yield for many years, and the fruiting season is a fairly prolonged one. There is this peculiarity about the raspberry, though some of its roots run just under the surface, others go down very deeply, and this should be borne in mind when preparing the ground for planting. It should be dug a couple of feet deep, but the lowest spit should not be brought to the surface unless it is of an exceptionally good character. The finest raspberries I ever saw, both in luxuriance of growth and in size and quantity of fruit, were in the trough of a valley in the Black Forest, in South Germany, where the soil was black and spongy with the residue of decaying leaves, and was fed at every considerable rainfall by the washing down of similar materials from the forests of pines on the mountain slopes, which afforded a good deal of shade to the vegetation below. This shows us something of the raspberry's favourite habitat in a state of nature, and we all know it will stand more shade and dampness than almost any fruit, except the gooseberry.

There is little fear of doing the raspberry too well, and unless the soil is in very good heart where it is to be planted, it would be well to mix manure and organic refuse of all sorts with the whole depth of worked soil, and, in any case, bone meal and quarter-inch bones should be mixed with it to form a lasting reserve of phosphate of lime. The beginning of November is the best time to make a plantation, though, if the canes have to come from a distance, it would perhaps be worth while to wait another ten days for the leaves to fall. When moved from one part of the garden to another this may be done with advantage as early as the third week in October, unless it is a dry time, and they will scarcely feel the move. A store of bonfire ashes is a good thing to put over the roots, as they start very quickly in this. Any idea of fruit the first year should be given up, the canes being cut down in March to within a foot of the ground. If they are cut down in the autumn water will collect in the hollow stems, and frost following will cause them to split, with the result that they will die back, perhaps even to the root. A mulch of strawy manure should be put over the soil about the roots in case a hard winter should follow, when they might freeze out.

It is a common thing to see the soil of a raspberry plantation beaten down like a road all the summer and autumn, which is followed by the digging in of a little manure in the winter. This is the worst treatment possible. The raspberry, being such a surface rooter, should not be even hoed to a depth of more than half an inch, and not allowed to dry out. The surface should be kept loose all the spring, and a little nitrate of soda given during flowering-time, and at the end of May or beginning of June, according to the dryness of the season, a mulch of manure should be put all over the bed, and, if it is very dry, given a good soaking immediately afterwards to wash in some of the goodness, the mulch, in any ordinary season, keeping the surface from getting unduly dry until most of the fruit has been gathered. The mulch will make a clean surface to walk on in all weathers without kneading the soil.

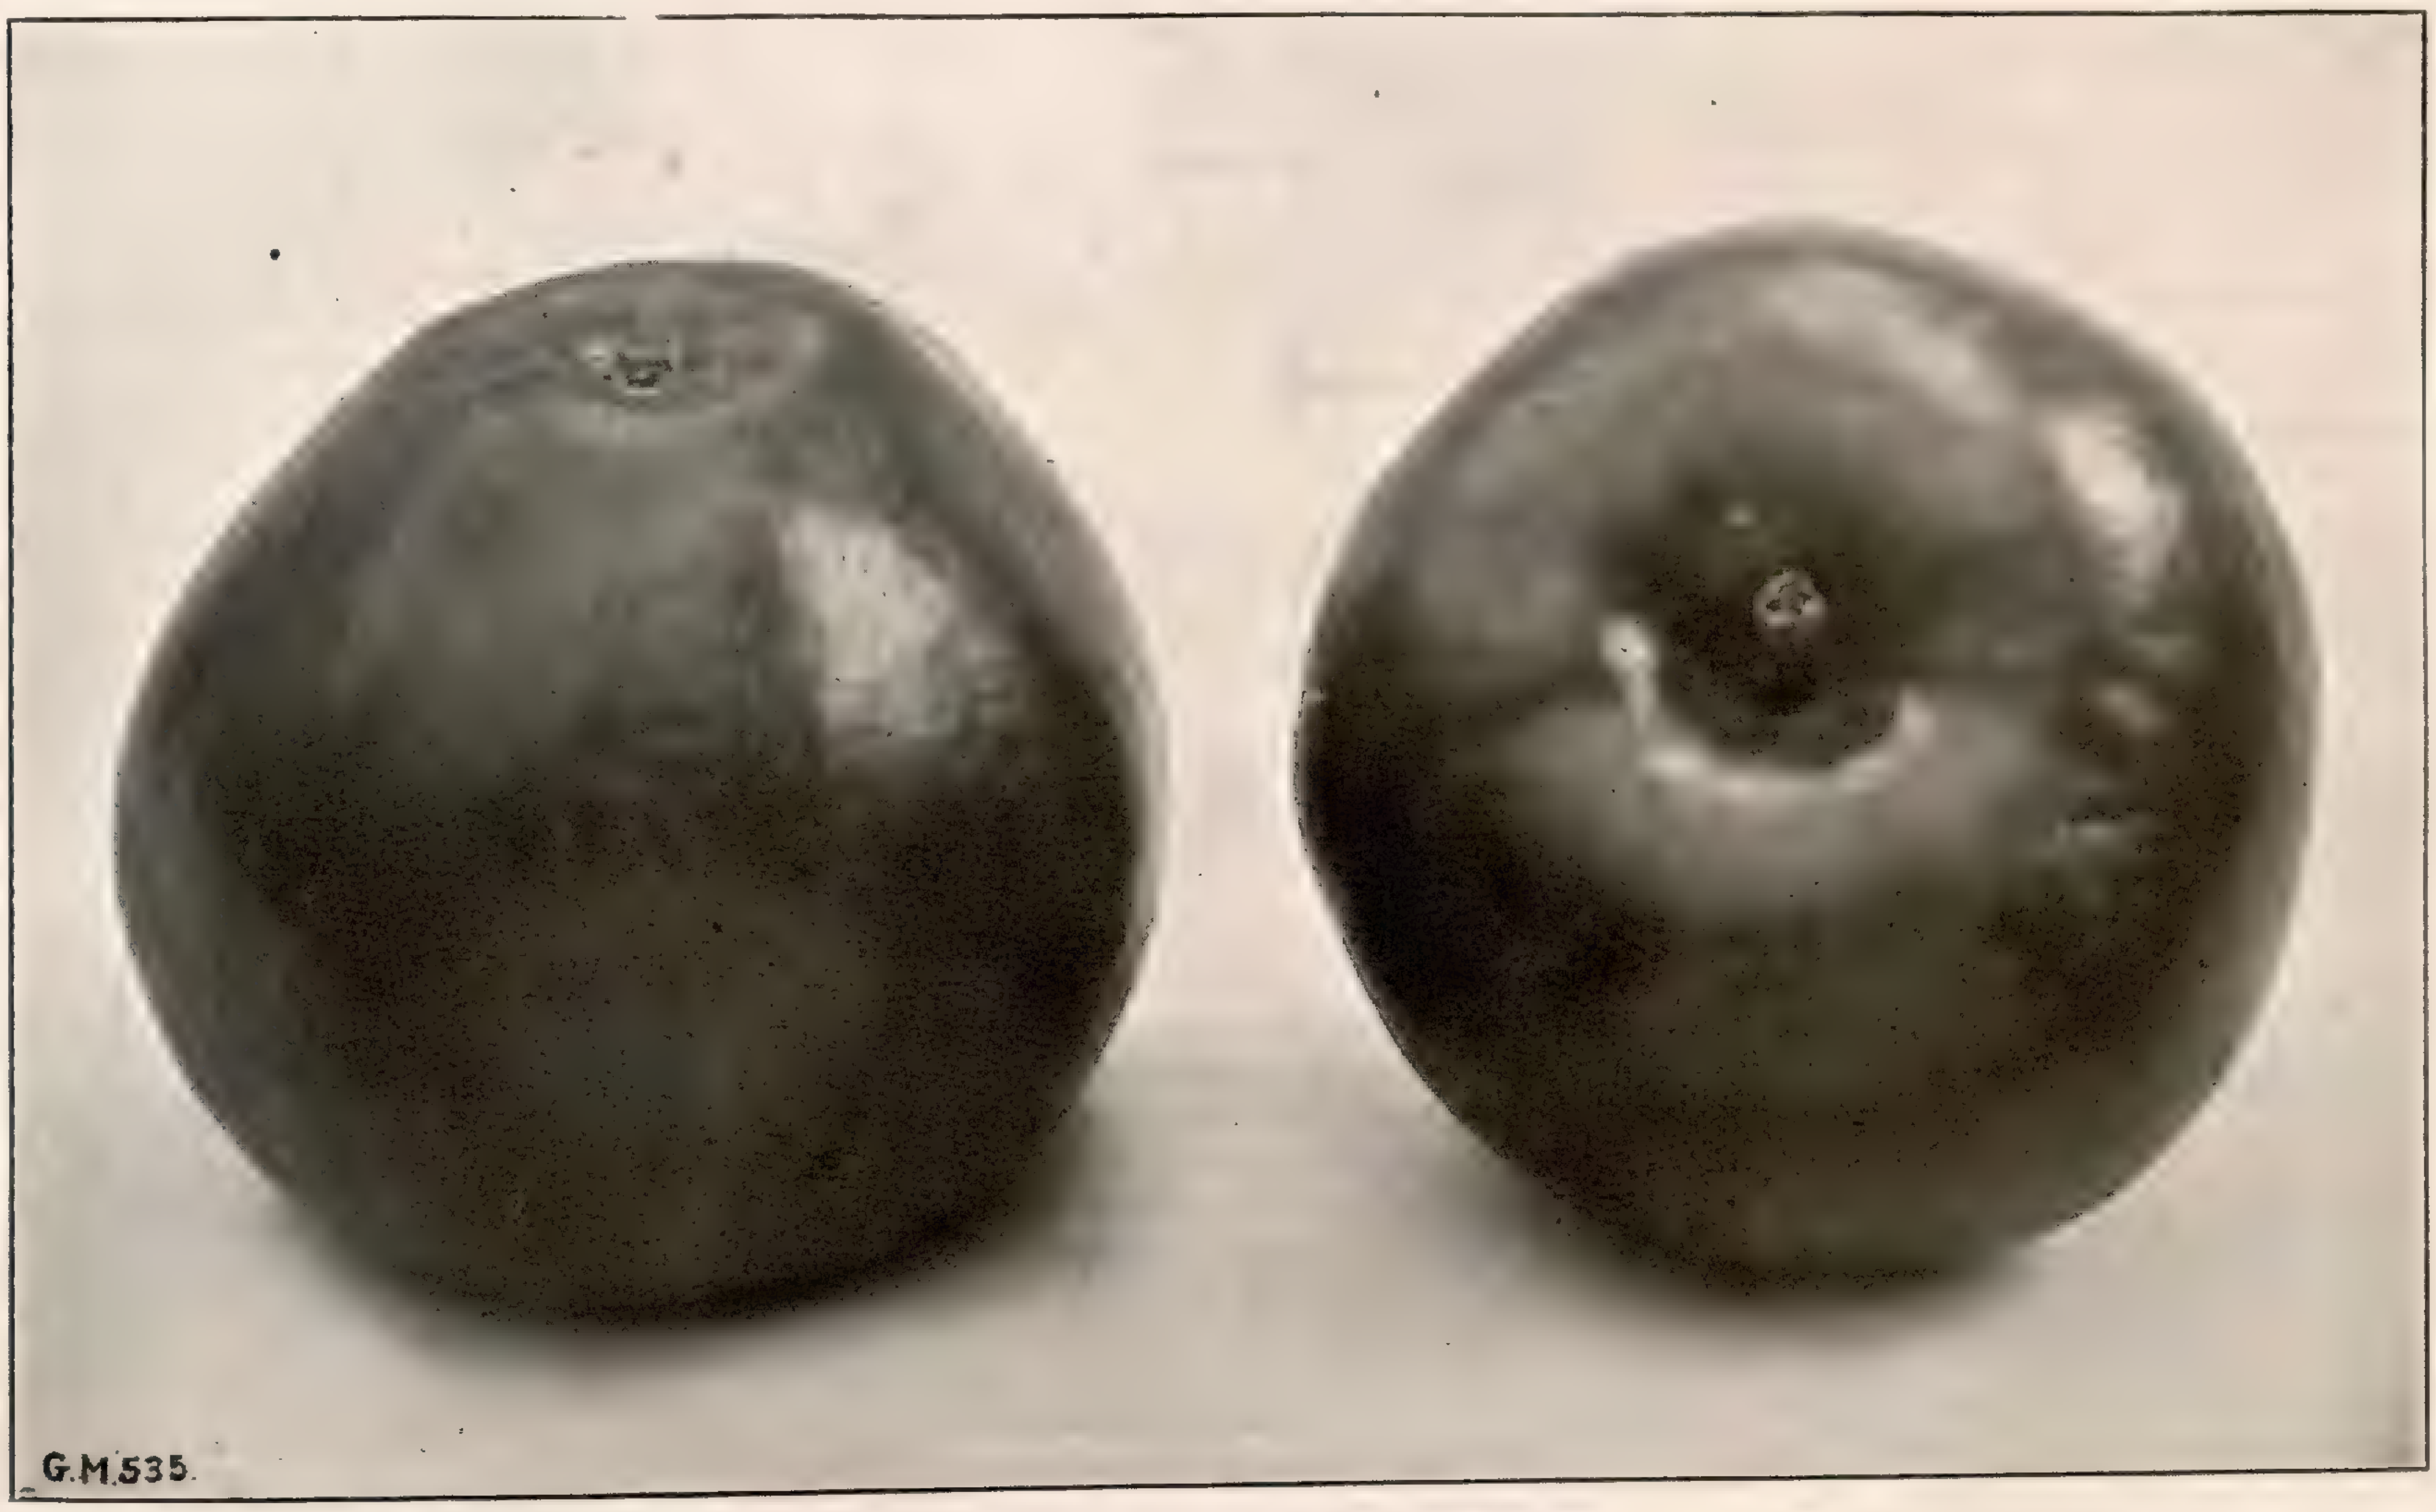
When the fruit has all been gathered, or there is not enough remaining to make it worth while to leave the old fruiting canes any longer, these should be cut out, as well as any superfluous young ones, and the rest tied in for the winter, taking care not to break the leaves off the young canes that are left if it can be avoided. Any shortening of canes which may seem to be necessary should be deferred till the plantation is overhauled in the early spring.

Of the various methods of supporting the canes, the fixing of bamboos horizontally along the rows and tying the canes to them is probably as good as any, and certainly better than tying the canes to stakes in groups. To prevent the canes sliding too much along the bamboos the raffia, or other material, should be first tied firmly to the bamboos and then loosely to the canes. At the time these operations are done the soil should receive a dressing of basic slag at the rate of five or six pounds to forty square yards, and this should be lightly hoed in, the mulch by this time breaking up, for the most part, under the hoe. If, however, the soil is a sandy or gravelly one, and not very rich in humus, it would be better to apply bone meal or steamed bone flour instead at the same rate, supplemented by three pounds of kainit in the winter to the same area. The mulch will probably have kept down the weeds, but two hoeings during September and October will keep under any that may establish themselves, and be very beneficial in other ways, after which the plantation will want no further attention till the early spring, when there will probably be a few dead canes to cut out, others to tie in, and some to shorten, while the surface should be lightly hoed as soon as it will work well, and thereafter kept from caking together till the mulch is applied early in the summer.

A word as to varieties must conclude these notes. As there is no one kind which is the best for all purposes, a compromise has to be made, unless two or three sorts are going to be planted. Superlative is generally considered the best raspberry to plant, as it is a heavy bearer of large fruit, and has an extended season, but it does not do well on all soils, being sometimes a failure on a tenacious clay, while the fruit is rather acid for dessert. Baumforth's Seedling is one of the best, being regarded as an improved Northumberland Fillbasket. The old Red Antwerp is still scarcely to be improved upon as a dessert fruit, being very rich and sweet. For preserving there is none better than Semper fidelis, which is more acid than most, and comes on after others are over, lasting throughout August and well into September. Norwich Wonder and Carter's Prolific are two good growers and heavy croppers. Alger Petts.

## SOME NEWER APPLES.

New apples do not make their appearance in any considerable numbers, and to those who have given any considerable share of their attention to the matter this is not surprising. In the first place, the raising of new apples cannot be very profitable, for the percentage of really first-class seedlings is small, and the trees have to be grown some years before their merits can be satisfactorily determined, and the raising of a sufficient stock of trees for distribution requires several years. Moreover, growers with so many varieties at their command do not readily take to new introductions. Speaking generally, a considerable area should not be planted with novelties until their suitability for the district and purpose for which they are required has been proved by trial; but it would be well were cultivators to plant novelties for that purpose more freely than is usually the case. The cost would not be great, the trees would afford much interest, and the trials would be of value in various ways. The following varieties of recent introduction can be recommended as well deserving the attention of fruit-growers.



G.M.535.

APPLE WILLIAM CRUMP.

A new dessert apple, raised by Mr. W. Crump, of Madresfield Court, which received an Award of Merit from the Royal Horticultural Society when first introduced.

### Arthur Turner (C. Turner).

A new and distinct culinary apple of great promise. The fruit is large, somewhat conical in outline, and distinctly handsome, the skin bright green flushed with red on the sunny side, changing when ripe to bright yellow. The tree is upright in growth ,highly productive, and bears large, richly-coloured flowers. The parentage appears to be somewhat doubtful, but the fruit reminds one of Hollandbury, without its brilliant colouring; the growth is more compact, and the tree is a heavier cropper. The cooking qualities are high, and the fine appearance of the fruit renders it of much value for exhibition. The season extends over October and November.

### Rev. W. Wilks (J. Veitch and Sons).

A culinary apple of undoubted merit, being quite unequalled for early fruiting by any other large-fruited variety with which I am acquainted. It was raised from a cross effected between Peasgood's Nonsuch and Ribston Pippin; the fruit is exceptionally large even on quite young trees, the skin pale yellow, with an occasional red flush on the sunny side, and the flesh is white, juicy, and pleasantly flavoured. It is in season during October.

### Admiration.

A dessert apple somewhat resembling in appearance Ribston Pippin. The fruits are of medium size, with green skin marked with red and yellow streaks, flesh moderately firm, fairly sweet, and with a pleasing aroma. The tree is fairly vigorous in growth and a good bearer, and the fruit is in use during November.

### Crimson Bramley (H. Merryweather and Son).

A distinct form of Bramley's Seedling that is described as differing from that famous apple in having a rich crimson skin. With me there is not much difference in the colour of the fruits of the new and old forms. Should it prove to be an improvement in this respect upon the old type, it cannot fail to be of much value. Of its superiority in cropping there cannot be two opinions, more especially in the young state. The early period at which it commences to bear fruit is a very strong point in its favour.

### Encore (C. Ross).

This is one of the several good apples raised by that veteran fruit-grower Mr. C. Ross. It originated from a cross effected between Warner's King and the Northern Greening. The fruits are large, with yellow skin flushed with red on the sunny side, the flesh crisp and pleasantly acid. In use from September to April.

### James Grieve (Dickson and Co.).

Although not new in the strict sense of the word, this apple has not been in cultivation a sufficient length of time to be generally grown. Therefore it should be useful to remind fruit-growers that it is an early dessert apple that cannot fail to become popular because of its merits, more especially for market. It is free in cropping, and the fruits are of medium size, with a skin attractively coloured crimson and yellow, and with reference to flavour it is quite one of the best of the September and October varieties.

### Lord Stradbrook.

With me this is a most promising late kitchen apple. The fruit is large and handsome; the skin is green with red markings, changing to yellow when ripe. When on the tree the skin is distinctly glaucous. In season during January.

### Norfolk Beauty (W. Allan).

From my earliest acquaintance with this apple I have had a high opinion of its merits as an early culinary variety, and still regard it as one of the best of the season. It is described as having been raised as the result of a cross between Warner's King and Waltham Abbey Seedling, and possesses some of the points of both these varieties. The fruits are large, with light yellow skin, marked with a few traces of russet. For culinary purposes it is not excelled by any apple of its season, which extends over October and November. It is admirably adapted for cultivation in bush form, and as an orchard standard it cannot fail to prove a success, for its manner of growth is exactly suited to that method of culture.

### Red Victoria (W. Miller).

An early culinary apple, in use during August. The fruits are large, with brilliant crimson skin; the flesh white, juicy, and excellent in flavour. Owing to its freedom in cropping, even in a young state, and its bright colour, it should prove a profitable market variety.

### St. Everard (J. Veitch and Sons).

This is said to be the finest flavoured early dessert apple in cultivation. The fruit is of medium size, with crimson skin nearly covered with russet; the flesh yellow, crisp, juicy, and with an aromatic flavour.

### William Crump (W. Crump).

A distinct dessert apple of so high a degree of excellence as to be worthy of the name it bears. The variety was raised from a cross effected between Cox's Orange Pippin and Worcester Pearmain, and the fruits have much the appearance of those of the latter, both in shape and colour. It is of much higher quality than Worcester Pearmain, the flavour being intermediate between that of the two parents. It is later, and has a much longer season than the last-named, the fruit keeping well into the New Year. E. MOLYNEUX.

## BUSH PEAR TREES.

Some fifteen years since, when forming a new garden in one of the home counties north of London, I set apart a space for the cultivation of fifty pear trees in bush form, and in twenty-four varieties. A rather open position, with a southern slope, was selected as the site for the plantation, and, knowing the susceptibility of the pear blossom to the injurious effects of easterly winds, a row of spruce firs was planted outside the boundary on the east side to break the force of these winds, and the screen thus formed has had a most beneficial effect in promoting the productiveness of the trees.

The soil is a moderately strong loam to a depth of about eighteen inches, and this rests upon stronger soil, closely approaching brick earth, but it does not form a very thick layer. My having a soil so favourable to the growth of pears has, of course, been a great advantage, for it has greatly reduced the attention necessary to maintain the trees in the best possible condition, and enabled the trees to bring their fruits to a high degree of perfection. Possibly we have not had to devote one-half the labour that is occasioned by trees growing in poor, gravelly soil or those so tenacious in texture and cold that in unfavourable seasons the trees fail to ripen their wood, and produce an abundance of flower buds.

Knowing the difficulties some of my friends experienced in reducing the vigour of the trees sufficiently to bring them into bearing, owing to the ground having been heavily manured previous to planting no manure was applied in the preparatory stage. I was further encouraged to refrain from the use of manure until after the trees had become established by the advice you have given on more than one occasion on this important point. The ground was prepared by the process of what is known as bastard trenching, and thereby broken up to a depth of two feet without any of the strong soil from the second spit being brought to the surface.

All the trees were on the quince stock, and were, at the time of planting, two and three years old. They had been trained into shape before leaving the nursery, a point of some importance when intended for the gardens of amateurs. They were planted eight feet apart in rows, with nine-feet spaces between them, and these spaces were given with a view to obviating the necessity for the free use of the knife at an early stage for the purpose of preventing them becoming crowded. The precaution was taken to provide stations of sufficient diameter to allow the roots to be spread out horizontally, the soil was carefully filled in about them, and trodden as firmly as possible. Then, to prevent loosening of the soil about the roots, the trees were securely fastened to stout stakes that had been driven into the ground previous to their being planted.

The original selection has been modified somewhat since the plantation was formed, and the following are those which can, according to my experience, be the most strongly recommended as

### The Best Pears for Bush Culture.

Beurré d'Amanlis.—Although not equal in flavour to some other of the early dessert pears it is decidedly good, and should be included in a selection exceeding twelve varieties. The fruit is large and of good appearance, the skin green and usually flushed with red on the side next the sun. The growth is rather spreading,, and the tree with but little manipulation forms a handsome bush, and is a constant and heavy cropper. In season during September.

Beurré Giffard.—A medium-sized pear of excellent quality, ripening in August. The fruits have a bright yellow skin, marked with deep red, and the flesh is white, juicy, and rather sweet. It succeeds best with me on the quince, and planters will do well to have their trees on that stock; unless their soil is light and naturally poor.

Beurré Fouqueray.—An excellent variety, the fruit of good shape and with light green skin, the flesh white, juicy, and richly flavoured. In season during October, and the fruits should be sent to table before they have become over ripe, as they deteriorate in flavour rather quickly after they have attained maturity. The tree makes a capital bush, and is very productive.

Beurré Perran.—A distinct and excellent pear, which was introduced to cultivation nearly twenty years ago, but does not appear to be much grown. It was added to my plantation eleven or twelve years ago, and it has given an excellent return. The fruits are above medium-size, and the skin is brown, and nearly covered with russet when borne by trees in the open, the flesh is greenish-white, juicy, and richly flavoured. In season during February.

Beurré Superfin may be described as one of the finest pears of its season for bush culture. The fruits are large and shapely, with pale green skin when ripe, freely marked with patches of russet; the flesh is white and richly flavoured. In season during October and November.

Charles Ernest.—A useful variety, not unlike in general appearance Souvenir du Congrès. The fruits are large, with a white, juicy, and richly-flavoured flesh. With me it bears most satisfactory crops, and is in season during December and January, when first-class pears are of much value.

Conference.—One of the best of the autumn pears, for the tree is so heavy a cropper as to render it of much value for market, and the flavour is remarkable for its richness. The growth is upright, and the tree, while making a fine bush, can be readily converted into a handsome pyramid. The fruits are large, distinctly pyriform, with green skin nearly covered with cinnamon-coloured russet. This variety is one of the most productive of the pears in my plantation. In use during October and November.

Doyenne du Comice.—This pear is so well known and highly appreciated that there is no occasion to dwell upon its merits. It must, however, be said that it is one of the very finest of the autumn pears, and should be planted more largely than any other pear of its season. Four trees were planted when my plantation was formed, but since then the number has been increased to six, to take the place of some indifferent varieties that were banished, and even now the supply is not more than sufficient to meet the demands of the household. The fruit is large and handsome, and the flesh is melting and richly flavoured. The severe thinning that is recommended by some writers is not advisable, as medium-sized fruits are more suitable for dessert, and the quality is higher than in the case of the large fruits. The growth should be repressed when necessary by root-pruning, and when the trees are heavily cropped a mulching of partly-decayed manure will be of great assistance. In season during November.

Jules Guyot.—This may, perhaps, be best described as an improved Williams' Bon Chretien. The fruit is large and handsome, the skin being rich yellow, and the flesh melting and of good flavour. As in the case of the variety immediately preceding, fruits of medium size are preferable. It is a heavy cropper, and the fruit should be gathered before it is fully ripe. In season during September.

Emile d'Heyst.—A rather large and handsome pear, which has a good constitution, as evidenced by the satisfactory condition of trees that I have seen in Northern gardens. The fruits are shapely, the skin is rich yellow, and the flesh straw colour, melting, and richly flavoured. This variety is one of the most regular croppers in my plantation, and the tree forms an excellent bush. In season during October and November.

Josephine de Malines.—A distinct, hardy, and productive variety. The fruits are of medium size, the skin pale green, marked with russet, the flesh melting, juicy, and richly flavoured. The growth is somewhat erect, and the tree forms a handsome bush, and bears with great regularity. In season from January till March, the length of time over which the fruit may be had in perfection depending in some degree upon the season.

Louise Bonne of Jersey.—Combining a hardy constitution with productiveness and high quality, this old and well-known pear cannot be too strongly recommended for cultivation in bush form. A description of the fruit would be superfluous, and all that need be said is to state that it is handsome and of high quality. The tree makes a fine bush and a handsome pyramid. In season during October.

Marguerite Marillat.—An excellent pear that well deserves more extended culture, although it attains maturity at a time when there are so many other good varieties in season. The tree is upright in growth, and makes a handsome bush, and is highly productive when on the quince stock, and on this stock it should be worked for bush culture. The fruits are large and handsome, the skin is bright yellow, flushed with red when ripe, and the flesh is melting and richly flavoured. The fruits should not be thinned too freely, as those of medium size are preferable. In season early in October.

Olivier de Serres.—Valuable for the late period of the pear season in which it is available for the table. The tree is rather free in bearing, and makes a good bush; the fruits are rather small, with greenish-yellow skin, nearly covered with brown russet, the flesh is juicy and richly flavoured. In season during the first three months of the year. W. H. H.

## DESSERT APPLES FOR THE NORTH COUNTRY.

Notwithstanding the great amount of information upon fruit growing, more particularly upon apple selection and culture, spread throughout the country by means of the horticultural press, horticultural and school instructors, as well as by several other means, the question is often asked: Which are the best varieties to plant? A question, by the way, though very simply advanced, is not always so easily answered, owing to the well-recognised fact that varieties of apples which may succeed in some parts, perhaps over large districts, may not be so satisfactory in others; hence it is somewhat difficult at times to give a reply that is thoroughly reliable.

The following list is of twelve well-tried varieties that may, with a fair degree of certainty, be depended upon to succeed in growth and maintain a supply of first-class fruit from the middle of August until April following, in most parts of the North of England and Scotland where soil and climatic conditions render it possible for apples to mature.

### Beauty of Bath.

A handsome, medium-sized, high-quality fruit, that for an early ripening variety keeps well, say, for a fortnight or rather more, after gathering. The tree is well adapted for cultivation in bush form, is seldom troubled with canker in the branches, and crops very regularly.

### Mr. Gladstone.

An angular, highly-coloured fruit of excellent quality. It is often recommended to be eaten direct from the tree, which infers that the fruit retains its high quality but a short time after being gathered, an inference that is scarcely correct, for if picked before it gets fully ripe it will keep a week or two without the least deterioration. The tree is a spreading and free grower, and bears freely on either the paradise or crab stock. It is inclined, if left to itself, to bear in alternate years, a matter that may easily be overcome by early reduction of the superfluous fruits one year, so that the energies of the tree are not unduly exhausted, with the result that more regularity of cropping ensues.

### Lady Sudeley.

The fruits of this are medium to large, mostly four-sided rather than round in form, and beautifully striped and mottled with red upon a yellow ground. An excellent apple for exhibition throughout September. The tree succeeds on either stock and in bush or standard style of training, and is very healthy in growth.

### Devonshire Quarrenden.

A very old variety, and still one of the best. As an orchard tree it grows and bears with great freedom, though if grafted upon the crab stock several years will elapse from the time of planting ere full crops will be produced, though if upon the paradise stock the waiting period is greatly reduced.

### Worcester Pearmain.

Though not richly flavoured, this is almost indispensable where large supplies of dessert apples are required, as it is a most constant cropper, is in season during the whole of October, and proves very useful at a time when, at most private residences, large parties are the order, and the variety and quantity of other fruits is diminishing daily.

### James Grieve.

Probably this is the most popular early winter apple at the present time, as the fruit is large and handsome in appearance and of excellent quality over a long season. The latter, if a little care is exercised in storing, may be made to extend from October to January. The tree grows and bears freely, quite small plants one or two years after planting being remarkable in this respect.

### Kerry Pippin.

A rather small, beautifully coloured, and highly-flavoured fruit; the tree is a very moderate grower both in dimensions and in the vigour of the branches, consequently it is well fitted for situations rather cramped for space, where it will prove both ornamental and useful.

### King of the Pippins.

One of the most constant fruiting varieties in cultivation, as well as being one of the most handsome. The wax-like appearance of the individual fruits, after being stored for a time, is very fascinating, while their texture and solidity are both favourable to long keeping, or for packing.

APPLE ARTHUR TURNER.

A new culinary apple, introduced by Mr. Charles Turner, of Slough, and given an Award of Merit by the Royal Horticultural Society in October last.

### Allington Pippin.

A comparatively new variety, but one that has of late been largely planted. Under favourable conditions—good soil and climate—the fruits become very large, shapely, and well coloured. The tree makes a pretty bush or pyramid—the branches, in the course of a few years, assuming quite a pendulous form, partly so from the natural habit of growth, but more so probably from the weight of fruit they sustain annually.

### Scarlet Nonpariel.

This is a very old variety, having been recognised for its sterling qualities for about a century. The fruits are small and rather flat in shape, but highly coloured, and of the highest quality. The tree succeeds in any form and is very prolific, and like some of the earlier ripening apples bears principally upon the points of the branches, which are slender; hence pruning should be very moderately carried out.

### Magnum Bonum.

Though not perhaps very extensively cultivated over a wide area of country, I, after many years' experience of its behaviour here, consider this one of the very best late-keeping apples, and the tree a good grower and most constant cropper. The fruits are large, rather flat in form, and become beautifully coloured in the spring months when fit for use.

### Reinette du Canada.

To do this variety justice it should be planted in a spot sheltered by a fence or other trees, where the storms of autumn do not readily reach it, so that the crop may remain upon the branches until the leaves fall, or well into November. Under these conditions the full measure of maturity may be assured, and shrivelling of the fruits quite late in the season, when ripening should take place, be thereby considerably mitigated.

The foregoing twelve varieties are all well adapted for cultivation in the open garden, though, of course, were they trained against a wall the fruits, especially in unfavourable seasons, would be larger and more highly coloured, but such treatment is unnecessary to secure good and full crops of serviceable produce that will answer all household purposes, and, as already stated, will provide a supply as long as dessert apples are possibly obtainable.

(To be continued.)

Galloway House, Garlieston.

# A PLEA FOR PLUMS IN POTS.

A considerable amount of attention has been given to the culture of peaches, nectarines, and cherries in pots during the past decade, but plums in pots have not had the same amount of attention bestowed upon them. Yet the plum fully deserves to be grown in pots equally as much as either of these trio. I have forced them now for some fifteen seasons, so as to have ripe fruits early in May, and the same trees that I commenced with in 1898 are still doing well in nearly every instance.

Some of these trees formed part of the fruit exhibit set up at the Royal International Show in May last. No one could say that these trees had got at all out of bounds as regards either the size of the individual tree or of the pot in which it was grown.

A dish of well-ripened plums during May and June is most useful, and indeed valuable, for the dessert. These afford a variety in fruits when as yet there are not any too great a selection from which to choose. The plum, when forced, is amenable to the same course of treatment as the peach and nectarine under pot culture. If planted out it is just possible that the growth would be too vigorous, therefore I strongly recommend that none but pot plums be forced. By growing them in pots one has thorough control over the roots, and from the point of flavour the pot-grown fruit of the plum cannot be beaten.

PLUM EARLY PROLIFIC.

A well-fruited specimen of this excellent early plum, exhibited by Messrs. T. Rivers and Son, Sawbridgeworth, at the Royal International Horticultural Exhibition.

When not forced, but allowed to come on quite of their own accord, the results are equally satisfactory. Then one will see another advantage, also, viz.: in the control of the trees during wet or drizzling weather. Last autumn, as a case in point, I heard of several complaints of the plum crop being spoiled by the wet time that was experienced. Wasps, again, are great depredators upon the ripe fruit outside, but when under glass these pests give but little trouble. It is also possible to keep up a better succession of ripe fruits, without having at any time a superfluity, as more good kinds can be grown in the same space at command, and at the same time afford a greater variety. The "finish" imparted to pot-grown fruits can rarely be equalled and never surpassed out of doors.

## Forcing.

I will upon this point record my own experience. We start our earliest trees during the first week in December. These will yield ripe fruit from the beginning of May onwards through the month. The earliest to ripen is Early Prolific (syn. Early Rivers); then we have Blue Rock (forced this year for the first time); and then Early Transparent—the "crème de la crème" of all early pot plums. This latter variety will be found to yield ripe fruits for fully a fortnight from the same tree, and if so be a few fruits do not at the end fully mature, they will be useful for fruit compôtes. Jefferson, if started at the same time, will follow the Early Transparent Gage. This will carry the supply well on to the middle of June, and, if a further supply be needed, it should be through a second batch of trees started early in January.

Further away in the country a week or ten days later in starting will give the same results as with us under the murky skies of the London locality. We find no difficulty whatever in securing a crop. As a rule we have to thin severely, for it is a great mistake to attempt to carry too heavy a crop. When this is the case, many fruits will be spoiled and be only fit for cooking purposes. Plenty of blossom is invariably the rule, as no bud-dropping obtains as with some peaches and nectarines when forced early. We usually arrange our plums upon the north side of a span-roofed house that points east and west, and as near to the path as possible for convenience in the constant attention to pinching the shoots, and also for a sharp watch to be kept against insect pests.

We do not disbud, but prefer to pinch freely, and thus aim at producing fruiting spurs in due course for another season.

## Trees not Forced.

Our object with these, in our own particular case, is to retard them as much as possible, as ripe fruit during August is not greatly in request. These trees, in our case, set their fruits in an absolutely cool house where they stand until room can be found later on for them in other houses. Our intention is to secure ripe fruit throughout September, and as far into October as possible. Greater variety can be had when no forcing is attempted. Oullin's Golden Gage is one of the first to ripen under these conditions; Denniston's Superb will follow this, and then Early Transparent Gage will be ripening, and this again will be followed by Kirke's and Jefferson. After that the Golden Transparent will be ripening; this fine plum is, in my opinion, the very finest of all plums, from the point of flavour, of appearance, and of productiveness when under pot culture.

If this, or any other of the Transparent section of the Reine Claude family be planted in the open, there is always a tendency to luxuriant growth of a non-productive character. Transparent Gage (the type) will ripen in pots at about the same season. Then we have Coe's Golden Drop and Reine Claude de Bavay as well as Late Transparent, and, last of all, Ickworth Impératrice.

President, though not a high-class dessert plum, is, under pot culture, much improved, and it is at the same time of splendid appearance. Late Orange is also well worthy of notice by reason of its excellent cooking qualities as well as for its appearance. Primate, as a late cooking plum, is one of the best to grow.

From the standpoint of mere size, as contrasted with quality, I do not recommend any variety. To those who may contemplate starting to grow some plums in pots, my advice is: do not lose any time. Only such trees should now be purchased as have been potted this autumn, for only under exceptional circumstances is it advisable to pot so late as the end of November. James Hudson, V.M.H.

Gunnersbury House Gardens.

## KNIPHOFIAS.

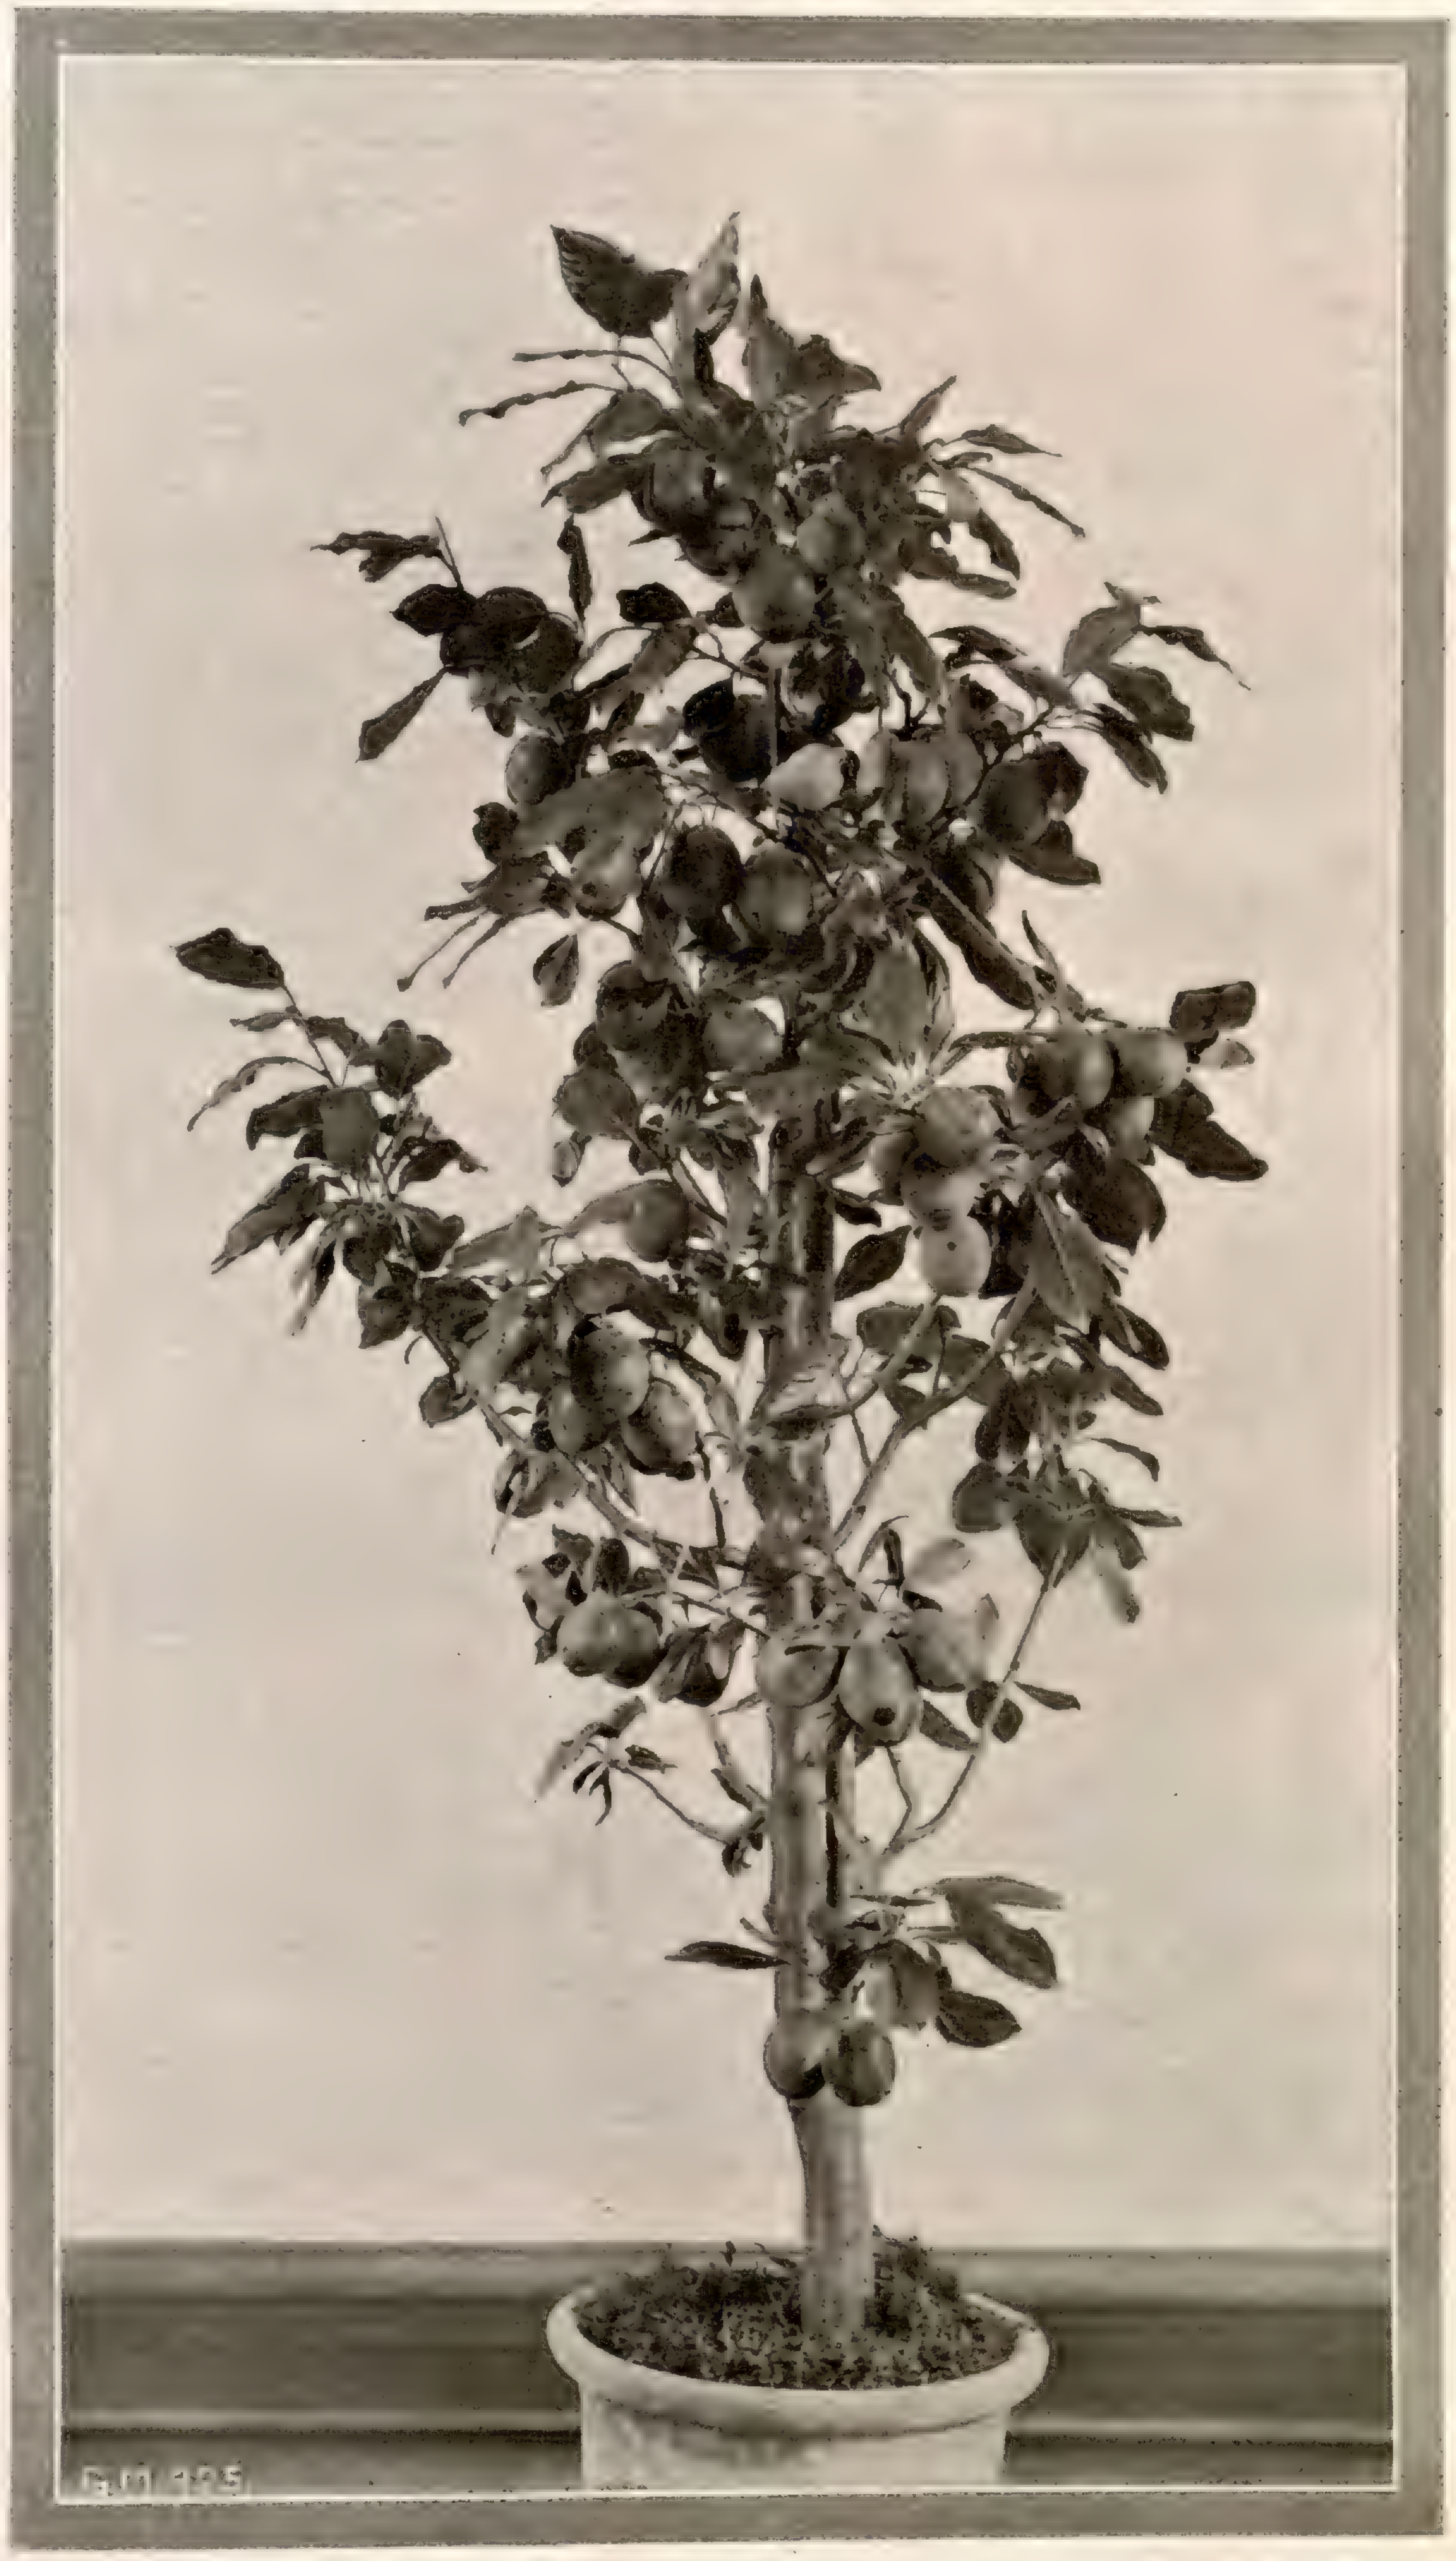
Formerly regarded exclusively as autumn-flowering subjects, Kniphofias (or Tritomas) now enjoy a much more extended season, as the majority of the newer varieties flower in advance of the older kinds, and are also characterised by greater refinement, both in the habit of the plants and the colour of the flowers. Their only weakness is that they are susceptible to the evil influence of excessive damp in winter, to counteract which they should be planted in well-drained soil, not directly under trees, but in a position fully open to sun and air. It is also advisable to place some protective material, such as dry bracken, around the crowns in October, in order to minimise the effect of damp.

The older kinds of kniphofia, when fully established, produced their spikes in such marvellous quantities that they stood out in bold relief, and the effect these stately subjects produced this last autumn was brilliant in the extreme, the orange flame of the flowers having fellowship with the autumn tints that suffuses the leaves of arborescent vegetation.

While Kniphofias show to excellent advantage in borders or beds, as perennial subjects and also adapt themselves for grouping among shrubs, they produce unique effects when inter-grouped with bamboos, phormiums, yuccas, musas, and plants of similar character, and the result is particularly satisfactory if carried out on a broad scale. A simple yet effective arrangement is to group them in wide borders with varieties of Michaelmas daisies (asters). In either arrangement the minimum disturbance is offered to the roots, which always resent interference during the dormant season. Kniphofias should only be planted while the ground is fairly warm. Early in autumn and late in spring are the two best seasons for carrying out this work.

The varieties of Kniphofia are numerous. K. uvaria, the old garden form, gives a variety named nobilis that is one of the grandest sights in the autumn garden when in flower; the spikes are brilliant orange-red, and attain a height of some six feet, with growth that is correspondingly vigorous. K. caulescens is a distinct species, flowering during early autumn, the foliage being very glaucous, and the flowers red and greenish-yellow. K. citrina is a dwarf summer-flowering kind, with small, neat heads of pale lemon colour. K. Lemon Queen is a seedling from the last-named, most refined in habit, with spikes of lemon-yellow flowers. K. corallina grows to a height of $2\frac{1}{2}$ feet, and produces spikes of coral-red flowers in great abundance. K. Macowani only attains a height of 18 inches, and bears bright coral-red flowers in profusion. K. Nelsoni is a dwarf, autumn-flowering kind, with spikes of bright orange flame colour. K. Rufus, grows 30 inches high, and has neat spikes, coloured lemon, orange, and red. K. Solfaterre is a pale-coloured hybrid, the flowers being amber and soft yellow on two-feet stems; it is one of the most distinct of the late summer-flowering kinds. K. Torchlight blooms in summer, having rich orange-scarlet flowers on three-feet stems. K. Star of Baden-Baden is a distinct shade of bronzy-yellow. K. John Benary has flowers of brilliant red and orange-yellow on three-feet stems, in autumn; and K. obelisque has massive spikes of chrome-yellow flowers on four-feet stems in autumn. Thomas Smith.

Coombe Court Gardens.



PLUM PRESIDENT.

A finely-fruited specimen of this valuable late plum, exhibited by Messrs. G. Bunyard and Co., of Maidstone, at one of the Royal Horticultural Society's shows during the present autumn.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

MASDEVALLIAS.—Those that were repotted during September will now be rooting freely, and making fresh leaf growth; but they must still have water given them very sparingly, as an excess of moisture to the roots at any time will result in the loss of many leaves and roots, which means the general decline of the plants. The black markings and spots which often disfigure the leaves of masdevallias are principally caused by excessive moisture at the roots, or an excess of atmospheric moisture during damp, cold weather. Now that it is necessary to use fire-heat to maintain the temperature, care must be taken to prevent aridity in the atmosphere, as a dry, parched atmosphere is most harmful at any season of the year. Much depends upon the situation of the house in which the plants are grown; should it be in a dry, exposed position, more atmospheric moisture can be supplied by damping between the pots, on the floor, etc., than would be requisite if the house were situated in a moist and damp situation.

M. TOVARENSIS, removed to the cool end of the intermediate house, as advised last month, are now in flower, or fast developing their flower-spikes of pure white flowers; these being produced upon the top of the stems, which vary in length from 4 to 6in., and bring the flowers well up above the foliage. Being of a very free-flowering nature and of compact growth, it is a valuable decorative subject. If the plants are in a shaded position in the intermediate house they will remain in flower for some five or six weeks. When grown in fairly large quantities, it is easy to make an effective display at this dull season of the year, especially if a few of the brilliant odontiodas are mixed with them. This masdevallia should always be removed when in flower from the house during vaporising, or the tails of the blooms will quickly turn to a brownish-pink colour and be spoilt. The flower-spikes should be cut away as soon as the flowers fade, although they may produce flowers again, but I think the practice of allowing them to flower more than once is injurious.

CYPRIPEDIUM INSIGNE AND ITS VARIETIES.—In the intermediate house the numerous varieties of this most useful orchid will for some time onward be in full beauty. In the more southern districts the flowers are possibly over before Christmas, but with us in the northern counties they are most valuable for cut flowers at that season. It is astonishing how long the flowers will last in a cut state if cut when they have been open a reasonable time. Perhaps at the present time there is not much inducement to grow the true species, especially where the better varieties, such as C. i. Harefield Hall, C. i. stupendum, C. i. Chantini, C. i. Thompsoni, and numerous others amongst the coloured varieties can be obtained. Besides the coloured varieties, we have now in quantity the beautiful yellow forms, all of which can be obtained at fairly reasonable prices. I refer to that section which includes C. i. Sanderæ, C. i. Sanderianum, C. i. Gloire de Audenghem, and C. i. Gladys. After these plants have finished flowering they may be repotted should this be a necessity. Keep them rather dry until the roots enter the new compost. By attending to this matter early some relief will be afforded in the work of repotting, which presses so heavily in the early days of the New Year.—J. T. BARKER, The West Hill Gardens.

## STOVE PLANTS.

PLUMBAGO ROSEA.—This useful species in undoubtedly one of the most beautiful of winter-flowering plants, and being compact in growth, large numbers may be grown in a comparatively small space. The rosy-scarlet flowers are borne on long spikes and/are of inestimable value for cutting purposes, as they last for a long time in water. For table decoration this plumbago is unique, and when associated with light fern, or asparagus fronds the effect under artificial light is charming. The plants will now be throwing up their inflorescences, and should be regularly fed with liquid farmyard manure, alternated with a safe artificial, until the flowers commence to open, when only clear water should be applied.

EUPHORBIA FULGENS.—This is another indispensable plant that requires every attention at the hands of the cultivator from now onwards. Flowers will be showing, and the plants must be kept not far from the roof-glass, which should be kept clean. I know of no plant more impatient of being over-watered or over-fed. The soil should be allowed to become fairly dry before water is given, and then it should be of about the same temperature as the air of the structure. Some manurial assistance should be continued until the flowers open, but it should be given well diluted, or the delicate roots will be injured. Cow or sheep manure, with soot added and placed in a bag in a tank or tub of rainwater, gives at once a safe and beneficial stimulant to this and other delicate-rooted plants.

GARDENIAS.—The plants we depend upon for providing flowers during winter are grown in 24-sized pots, and they are giving us occasional blooms, which are much appreciated during the dull days. Given a good holding soil with restricted root-room they produce plenty of stout shoots, each yielding a flower. As is well known gardenias are gross feeders, and when well established in their flowering pots frequent applications of liquid manure are essential to success. A fairly high temperature should also be maintained, accompanied by heavy syringings twice or thrice daily. Cut the flowers when about half open, and place in tepid water at once. If allowed to remain on the plant until fully expanded they quickly turn yellow and fade.

HIPPEASTRUMS. — Bulbs that were treated as advised in a previous calendar will by now be well ripened, and the pots may be laid on their sides on a dry shelf in an intermediate house until wanted for forcing. —H. T. MARTIN, Warren Wood Gardens.

## FRUITS UNDER GLASS.

LATE GRAPES.—For the past few weeks the weather in this locality has been very trying for ripe grapes. Generally, November is the most critical month of the year for ripe grapes hanging upon the vines, therefore take great care to maintain the atmosphere of the house at the proper temperature, allow a little heat to be kept in the pipes regularly, and ventilate the house night and day, but in accord with outside climatic conditions. Do not allow the borders to become dry, as this is a practice that should be heartily condemned; drought has not only an injurious effect upon the roots of the vines which are still active, but it also has a bad effect upon the foliage and fruit. It should be borne in mind that the longer the leaves can be maintained, the better and longer the grapes will keep in good condition. When watering is necessary it should be done early on a bright morning, with plenty of air admitted to the house; keep the pipes fairly warm to dispel the moisture before night, and maintain a night temperature of from 45 to 50 degrees at all times. Constant supervision will be necessary, removing at once all berries that show the least sign of decay; while all decayed leaves or partially decayed leaves should be taken away immediately.

PEACHES AND NECTARINES. — Push on the finish without delay the work of pruning, which should only consist of the removal with a sharp knife of all surplus wood not required to form a well-balanced tree. Thoroughly cleanse the trees with soapy water, or some approved insecticide; scrub down the glass and woodwork with strong soapy water, and finally wash the whole structure down with clean water applied forcibly with the garden engine. Whitewash the walls, and tie the trees out into their proper places immediately. This work should be done expeditiously, and the houses put in order without delay, so that no time will be lost when forcing commences. The earliest house should be closed up at the latter end of this month, but no fire heat will be required for a few weeks; the trees should be lightly sprayed over with tepid water on bright days, early in the forenoon. A temperature of 40 to 45 degrees will be sufficient, with artificial heat. Proceed with great care at this season of the year, as the trees respond very slowly to artificial heat, and many failures can be attributed to the fact that sufficient care and forethought is not exercised at the commencement.

THE GRAPE ROOM.—Keep the temperature as near 45 degrees as possible, and if this can be secured without the aid of artificial heat, so much the better. Carefully look over the bunches several times a week, and remove all berries that show the least sign of decay; keep the room fairly dark and the atmosphere as dry as possible.— HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

THE WATER GARDEN.—The decayed foliage of plants growing at the water's side should now be removed. Keep the pools themselves free from dead leaves. When it is intended to plant nymphæas in the spring, it is well to mark the vacant spaces at once, so that there will be no difficulty in placing the plants in the right positions. Aquatics can be divided and replanted during open weather, and the various plants that grow so luxuriantly near the water's edge can be treated in the same way. Among those suitable for this position the following should always be included: Astilbe Davidi, Spiræa aruncus and S. palmata, Lythrum roseum superbum, a most effective subject; Rodgersias in variety, and Saxifraga peltata; Lysimachia clethroides and Funkia Sieboldi, both especially attractive; while Iris Kæmpferi, I. sibirica, Osmunda regalis, Primula japonica, hemerocallis, and senecios in variety are quite indispensable. This selection only includes a few of the more desirable subjects for the purpose. The soil around the plants should be kept free from grass and weeds, and in many cases they will derive benefit from a top-dressing of rich soil or well-decayed manure.

LILY OF THE VALLEY.—Crowns of this lovely flowering subject can be planted now, and in choosing a site for them it is well to have a fairly shaded position, such as under a north wall. The ground should be liberally enriched with manure, and where it is of a heavy, retentive character, add a good supply of leaf-soil. Plant the crowns so that their tips are on a level with the surface, and apply a top-dressing of leaf-soil two inches thick after planting.

CHRISTMAS ROSES.—It is desirable to grow these in beds where they can be easily covered with frames in order to protect the blooms, otherwise they are frequently spoiled by the weather. Isolated plants are easily covered with handlights, and when so treated they produce good blooms by Christmas. Tidy up the beds and remove any decayed foliage around the plants. After the soil has been lightly pricked up with a fork a mulch of decayed manure placed around the plants is a great advantage.

EREMURUS.—These noble plants are frequently a source of much beauty in gardens where they succeed. To grow them successfully they require a deep, rich medium loam, and the site should be sheltered and well drained. They look well in shrubbery borders, or in the semi-wild garden where there is a suitable background to show them off to advantage. They may be planted now, but in preparing the stations for them great care is necessary. If the natural soil is of a tenacious character remove it entirely to a depth of three feet, and use a specially prepared compost that should be light and rich. It is desirable to protect the crowns with coal ashes during the winter.—J. GARDNER, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## Edinburgh Chrysanthemum Show.

The Scottish Horticultural Association held its annual exhibition in the Waverley Market, Edinburgh, on Thursday, Friday, and Saturday, November 14, 15, and 16. The weather was dry and cold, but, thanks to the effectiveness of the combined heating and ventilating apparatus recently installed by Messrs. Mackenzie and Moncur, Lim., the inside of the hall was kept at an equable and delightfully comfortable temperature throughout the show, so that in future exhibitors need fear no harm for their tender plants, nor need visitors fear discomfort from cold and draughts. The attendance of the public was very satisfactory, the drawings being £10 in excess of last year's.

There was a considerable decrease in the number of entries, but, on the other hand, in consequence of the council having decided that every competitor should pay a deposit as a guarantee that he would stage, there was a very marked difference in the proportion of entries staged as compared with former years. In fact, the staging was almost full, whereas formerly from 20 to 30 per cent. was not an unusual proportion of non-staged entries in some sections. In the vegetable classes, for example, the entries staged were scarcely less numerous than last year's, whereas fully one-half of the total deficiency in the entries occurred in this group. The show, however, appeared somewhat thinner owing to a falling off in the entries in the principal chrysanthemum big-bloom classes. In the leading class there were only two entrants, and the number was little more than half the average in the Scottish Challenge Cup class, and, taking them all over, the blooms were not so fine as usual.

THE FINE COLLECTION OF CHRYSANTHEMUMS.
for which Mr. T. Lunt, gardener to Captain A. Stirling, was awarded the City of Edinburgh Cup and £12 at the Scottish Horticultural Society's Exhibition.

### CUT FLOWERS.

In the leading class for cut blooms of Japanese chrysanthemums, viz., the City of Edinburgh Queen Victoria Memorial Class, for fifteen vases in 15 varieties, three blooms in each vase, Mr. Thomas Lunt, gardener to Captain Archibald Stirling of Keir, and Mr. James Fraser, gardener to Mrs. Simson, Bonaly Tower, Colinton, were the only entrants. Mr. Lunt was an easy first, and he was awarded the prize of £12 and the City of Edinburgh Cup, which, having been won by him for the third time, now becomes his property. The cup and the prizes are presented by the Magistrates and Town Council of Edinburgh. Mr. Lunt's varieties, with points awarded to them, were as follows:

| Variety shown. | Max. Pts. | Pts. Awarded. |
|---|---|---|
| Coronation | 12 | 8 |
| Hon. Mrs. Lopes | 12 | 9 |
| White Queen | 12 | 8½ |
| Geo. Hemming | 12 | 8½ |
| Mrs. L. Thorn | 12 | 10 |
| Mary Poulton | 12 | 10 |
| Lady Talbot | 12 | 9 |
| Mrs. A. T. Millar | 12 | 11 |
| Frances Jolliffe | 12 | 9 |
| Maud Williamson | 12 | 10 |
| Melchet Beauty | 12 | 8½ |
| Purity | 12 | 9 |
| F. S. Vallis | 12 | 9 |
| J. H. Silsbury | 12 | 9 |
| Wm. Turner | 12 | 10 |
| | 180 | 138½ |

It will be observed that the points awarded to Mr. Lunt are considerably under last year's (156), when he last won the cup, and this, no doubt, may be put down to the bad season.

In the Scottish Challenge Cup class, for eight vases, Japanese chrysanthemums, in eight varieties, three blooms in each vase, confined to Scottish gardeners and amateurs, there were six lots staged, and the challenge cup (to be held for a year) and first prize of £6 was carried off by Mr. James Small, gardener to John Graeme Thomson, Esq., of Norwood, Alloa. The second prize of £4 was awarded to Mr. R. Mackenzie, gardener to J. E. B. Baillie, Esq., of Dockform, Inverness. The third to Mr. H. MacSkimming, gardener to W. T. MacLellan, Auchenault, Helensburgh; and the fourth (£1) to Mr. D. McLean, gardener to Right Hon. R. C. Munro Ferguson, of Raith, Kirkcaldy. Mr. Small's varieties and the points awarded to them were as follows:

| Variety shown. | Max. Pts. | Pts. Awarded. |
|---|---|---|
| Wm. Turner | 12 | 11 |
| Frances Jolliffe | 12 | 8½ |
| Mrs. A. T. Millar | 12 | 10 |
| F. S. Vallis | 12 | 9 |
| Mrs. L. Thorn | 12 | 8½ |
| White Queen | 12 | 11 |
| Fred Chandler | 12 | 9½ |
| Lady Talbot | 12 | 8½ |
| | 96 | 76 |

Mr. R. Mackenzie had 74½ points, Mr. MacSkimming 72½, and Mr. McLean 71½ points out of 96. Mr. Small also won the silver medal for the best bloom in the show with his Wm. Turner in this class.

In the class for six vases Japanese chrysanthemums, in six varieties, three blooms in each vase, Mr. John Waldie, gardener to W. H. Dobie, Esq., Dollarbeg, Dollar, had 57 out of 72 points, and was awarded the first prize of £4; Mr. MacSkimming being second, Mr. D. McLean third, and Mr. L. McLean, gardener to David Thomson, Esq., Greenfield, Alloa, fourth. For twelve blooms Japanese chrysanthemums, in twelve varieties, shown on boards, Mr. T. Lunt was first, Mr. Small second, and Mr. R. Mackenzie third. Mr. Lunt was also first for two vases Japanese chrysanthemums of one variety, three blooms in each vase, and for four vases in twelve varieties, three blooms in each vase. Mr. G. Little, gardener to the Hon. Mrs. Askew Robertson, Ladykirk, Norham, was second, and Mr. D. McLean, Raith, third in the above two-vase class; Mr. L. McLean second, and Mr. A. S. Watt, Whiting Bay, Arran, third, in the above four-vase class. Mr. P. MacLachlan, gardener to C. E. Green, Esq., Liberton, was first in the class for four vases in four varieties, three blooms to each vase; Mr. R. Whannell, gardener to Colonel More Nisbet, The Drum, Gilmerton, being second; and Mr. T. Chapman, gardener to Jas. N. Graham, Esq., Carfin, Carluke, third; and in the class for two vases in six distinct varieties, three blooms in each vase, Mr. Whannell was first, and Mr. MacLachlan second. Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, was first in the class for three vases of chrysanthemums, in three varieties, not more than twelve sprays in a vase, for quality and decorative effect; Mr. W. Armstrong, gardener to Dr. Scott, Musselburgh, being second. Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Tower, Musselburgh, was first for one vase of chrysanthemums, disbudded, and arranged for effect; Mr. A. McMillan, gardener to the Earl of Home, second; and for six vases singles, in six varieties, not more than twelve sprays in each vase, Mr. Galloway took first place, and Mr. Jas. Bruce, Davidson's Mains, second. Mr. A. Knight, gardener to Sir W. Lawson, Bart., Brayton, excelled in the class for three vases singles, in three varieties, not more than twelve sprays in each vase; Mr. A. McMillan, gardener to the Earl of Home, being second; and for three vases of the same kind, for quality and decorative effect, Mr. Galloway was first, and Mr. W. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, second. Mr. A. S. Watt, Whiting Bay, Arran, carried off the first of the prizes offered by Messrs. W. Wells and Co. for three blooms of Mrs. Gilbert Drabble, Mr. R. Mackenzie being second.

In the class for market growers, in which six vases chrysanthemums, in six varieties, three single and three double, were asked for, Mr. James Bruce, Davidson's Mains, and Messrs. Todd and Co., Musselburgh, who were the only entrants, took first and second place respectively.

Messrs. Wells and Co., Merstham, carried off the silver medal for the best new chrysanthemum not in commerce with a fine bloom of Queen Mary, Mr. G. Little, gardener to the Hon. Mrs. Askew Robertson, Ladykirk, Norham, obtaining the Bronze Medal with the Honourable Mrs. Askew Robinson.

There was good competition for two vases winter-flowering carnations, twelve flowers in each vase, and the first prize fell to Mr. A. Williams, gardener to Lord Stratheden and Campbell, Hartrigge, Jedburgh, and the second to Mr. A. A. Law, gardener to Wm. Baird, Esq., Elie, Fife.

### BOUQUETS.

Miss H. Newlands, Leith, carried off the first prize for one bride's bouquet and two bridesmaids' bouquets; bouquet of chrysanthemums, bouquet of carnations, and floral wreath respectively. Mr. A. Knight was first for one bouquet (chrysanthemums and carnations excluded), basket of flowers (chrysanthemums excluded), hand bouquet (chrysanthemums excluded), and basket of orchid blooms arranged for effect. Mr. J. Beats, gardener to Mrs. Boase, Binrock, Dundee, excelled for basket of chrysanthemums and bouquet of chrysanthemums. Mr. Kidd was first for floral decoration of dinner table (orchids excluded), and Mr. G. Scott, gardener to A. Sinclair Henderson, Esq., Seathwood, Dundee, was second. Mr. Kidd's decoration consisted of francoa and carnations, with groundwork of Ampelopsis Veitchi. In the other classes Mr. A. Horton, gardener to Colonel Claude Kane, St. Wolstans, co. Kildare, was first for a basket of hardy foliage and berries, arranged for effect; Mrs. J. B. Hamilton, Liberton, excelled for sprays of chrysanthemums for ladies' wear, and for the best arranged epergne of chrysanthemums; and Mrs. J. Donaldson, Kirn, was first for the best-arranged vase of chrysanthemums.

### CHRYSANTHEMUM PLANTS.

Chrysanthemum plants made a good show, though there was a smaller number staged than usual. The quality, however, was good, Mr. W. Michie, gardener to Lady Steel, Edinburgh, had first honours in the classes for six distinct varieties (single and pompon excluded); four Japanese (distinct); two varieties, distinct; one large-flowered and one single (marguerites excluded), while Mr. J. Fraser, Bonaly, excelled for six plants in 7in. pots. In the amateur classes the honours were divided between Mr. W. Aithie, Tranent, and Mr. Thos. L. Bell, Edinburgh.

### MISCELLANEOUS PLANTS.

In the plant classes the quality was about the average, and here also there was a smaller number staged than usual. In the palm classes, Mr. A. McMillan, Douglas Castle, was first for six palms in 7in. pots, and also for two specimen palms, while Mr. J. Templeton, gardener to Mrs. Rose, Richmond House, Glasgow, excelled for three specimen palms, and Mr. J. Macgregor, gardener to Sir Wm. Younger, Bart., Auchen Castle, Moffat, for one specimen palm. Mr. J. Wilson, gardener to Sir John Gilmour, Bart., Montrave, Leven, was first for six dracænas; Mr. D. McLean, Raith, for six Primula sinensis and six P. obconica; Mr. G. Anderson, gardener to Rt. Hon. A. J. Balfour, M.P., Whittinghame, for six table plants (excluding ferns); Mr. W. Robertson, gardener to Miss Balfour Melville, Pilrig House, Edinburgh, for six dwarf hardy ferns; Mr. A. Johnstone, Hay Lodge, Edinburgh, for six table ferns; Mr. J. Alexander, gardener to Mrs. Wauchope, Niddrie, for six Salvia splendens; Mr. J. McNeill, gardener to Major Thorburn, Craigerne, Peebles, for six Roman hyacinths; Mr. A. McMillan, Douglas Castle, for three pans lily of valley and six specimen ferns; Mr. A. Williams, Hartrigge, for six cyclamen and four winter-flowering begonias; Mr. A. Knight, for eight decorative foliage plants; Mr. J. Macgregor, Auchen Castle, for four decorative foliage plants.

### FRUIT.

Fruit, considering the season, was fairly good, but amongst the hardy kinds there was a distinct falling-off in quality and quantity. There were only two entrants for the collection of eight dishes, viz., Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Tower, and Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, who were awarded the first and second prizes respectively. Mr. D. Halliday, gardener to W. Mackay, Esq., Ascog, Bute, was awarded first prize for four bunches grapes, distinct, but the prize was withheld on protest on the ground that two whites shown as Mrs. Pearson and Dr. Hogg were both of the former variety. Mr. Kidd was placed second, and Mr. W. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, third. In the two-bunch classes, Mr. Halliday was also first for Alicante and for any other variety. Mr. J. Waldie, gardener to W. H. Dobie, Esq., Dollarbeg, Dollar, was first for one black and one white; Mr. Pirie first for two bunches Muscat of Alexandria; Mr. J. Shiells, gardener to Sir James King, Carstairs House, for two Gros Colmar; Mr. A. Anderson, Whittinghame, for one Appley Towers; and M. J. McNeill for one Lady Hutt.

In the hardy fruit classes, Mr. J. Duff, gardener to Colonel Gordon, Threane House, Castle Douglas, was first for eighteen dishes apples, in not less than twelve varieties, grown in Scotland, for eighteen varieties apples, for six varieties culinary apples, and for six varieties dessert apples. Mr. W. Galloway excelled for six varieties of pears grown in Scotland, and Mr. Geo. McKinley, gardener to the American Ambassador, Wrest Park, for six varieties of pears. For three baskets of dessert apples and three bakets of culinary apples, each in three varieties, and 12lbs. each basket, confined to market gardeners, Mr. R. G. Sinclair, Congalton, Drem, was first in each class. There were two entrants for six bottles of preserved fresh fruit, and the first prize went to Mr. Thos. McPhail, gardener to Mrs. Hamilton Ogilvie, Archiefield, East Lothian.

### VEGETABLES.

For the collection of vegetables, nine distinct kinds, selected from a list in the prize schedule, there were five entrants, and the first prize of £3 3s. was awarded to Mr. R. Stuart, gardener to the Earl of Lauderdale, Thirlestane Castle, Lauder; Mr. W. P. Bell Bothwell Castle, being second, and Mr. W. Harper, gardener to J. R. Stewart Richardson, Esq., Bankfoot, Perth, third. Mr. Stuart's collection consisted of onions (Ailsa Craig), parsnips (Student), tomatoes (Perfection), cucumbers (Delicacy), leeks (Lyon), broccoli (Self-protecting Autumn), beet, potatoes (Gay Gordon), celery (Solid White).

---

## West of England Chrysanthemum Society.

The annual chrysanthemum show of the above society was held in the Guildhall, Plymouth, on November 12, and was a great success. The entries were more numerous than usual, the competition was very keen, and in many cases the merits of the exhibits were so nearly equal that the judges experienced much difficulty in making their awards. The Earl of Morley has lately become the President of the society.

### CUT BLOOMS.

The cut blooms were far finer than those exhibited at Plymouth of late years, and the stands needed very careful judging. In the first class for twenty-four Japanese blooms the first prize was won by Lady Buller, who had very fine examples of Master David, W. Turner, Rose Pockett, F. S. Vallis, Miss L. Baker, and Lady Talbot; Lady Buller also occupied the post of honour in the class for eighteen Japanese, and also in that for six Japanese. In the class for twelve Japanese the premier award was made in favour of Mr. T. B. Bradshaw, his Mrs. David Syme and Hon. Mrs. Lopes being particularly fine. There were two classes for twelve vases of single chrysanthemums, one open, and the other confined to residents within fifteen miles of Plymouth, and the silver-gilt medal for which these two classes competed was won by Mrs. Bainbridge in the local class.

### PLANTS.

In the class for a miscellaneous group of stove and greenhouse plants, Mrs. Bainbridge was first with a very attractive and well-arranged collection of well-grown plants. In the centre was a good specimen of Arundinaria Falconeri, surrounding which were examples of Aralia Veitchi, Cypripedium insigne, Salvia leucantha, Urceolina aurea, Marguerite Boule de Neige, dieffenbachias, Eupatorium micranthum, coleus in variety, eulalias, Calanthe Veitchi, Panax Victoriæ, Aralia gracillima, single-flowered chrysanthemums, dracænas, crotons in variety, and maidenhair ferns. For a group of single chrysanthemums, the first prize was awarded to Dr. Burke, who had a very well set up collection of plants, bearing very fresh and well-coloured flowers. For four specimen Japanese chrysanthemums, the premier award was obtained by Mr. E. J. Hannaford, who also won the first prize for one white Japanese specimen chrysanthemum. For one Japanese specimen, any other colour, Mr. G. Hoskin was a capital first.

The first prizes for salvias, Chinese primulas, Primula stellata, zonal pelargoniums, and six table plants, were won by Mrs. Bainbridge; the first prize for six cyclamen was awarded to Lady Buller; while the first prize for six Begonia Gloire de Lorraine was won by Lieut.-General Sir R. Pole-Carew.

### SALADS, FRUIT, AND VEGETABLES.

In the class for a collection of salads in variety, a most attractive table was shown by Mrs. Bainbridge, who carried off the first prize. It was generally admitted that it was one of the prettiest contributions to the exhibition, the arrangement being excellent, and the colouring very bright. It was indeed quite good enough to win in London. Comprised in the collection were grape tomatoes, red and yellow, large yellow and red tomatoes, five sorts of capsicums, very bright in colour, chervil, chibbles, chives, American cress, Australian cress, Brazilian cress, watercress, mustard, taragon, Chinese cabbage, variegated chicory, red-leaved chicory, whitloof, Batavian endive, moss-curled endive, cos and cabbage lettuce, oak-leaved lettuce, asparagus-leaved lettuce, cucumbers, and long and turnip radishes.

The fruit was especially fine and well-coloured. For a collection of twenty-four dishes, Mr. H. St. Maur was successful in winning the first prize; while in the local class for twenty dishes the first prize was won by Lieut.-General Sir R. Pole-Carew.

Vegetables were good, and the majority of the prizes were won by Mr. Coryndon Matthews.

### NON-COMPETITIVE EXHIBITS.

The nurserymen's exhibits were particularly attractive, and contributed greatly to the success of the show. The Devon Rosery, Torquay, was awarded a gold medal for a splendid collection of fruit, in which considerably over a hundred varieties of apples were exhibited, as well as a large assortment of pears. The apples were large in size, and generally very finely coloured. Among those that attracted the greatest attention were Bismarck, Newton Wonder (very large and fine), Bramley's Seedling, Cox's Orange Pippin (beautifully coloured), Emperor Alexander, Peasgood's Nonsuch, Blenheim Pippin (very bright), Gascoigne's Scarlet, Passe Colmar pear, and three distinct varieties of medlar.

The King's Acre Nurseries, of Hereford, were awarded a gold medal for a remarkably fine collection of fruits. The most notable thing on this stand was the Apple Gloria Mundi, of which there were several specimens of gigantic size. Other fine fruits were King's Acre Bountiful, Lord Derby, Warner's King, and Mère de Ménage.

Messrs. Sutton and Sons, Reading, contributed a wonderful collection of vegetables, for which they received a gold medal. The stand was most tastefully arranged, and the produce was spotlessly clean, well set up, and remarkable for its excellent quality and freedom from coarseness. Every description of vegetable shown was a perfect example, and the tomatoes, cucumbers, potatoes, carrots, parsnips, leeks, Chilian beet, and kohl rabi could not be surpassed. Messrs. Robert Veitch and Son, Exeter, received a silver medal for their stand, which contained a large number of winter-flowering carnations, amongst which were noted Ceres, Lady Dainty, Bonfire, Sunstar, Beacon, Countess of Onslow, Mikado, and Triumph. Other plants included Zygopetalum Mackayi, Sarracenia exoniensis, Grevillea ornithopoda, G. longifolia, Physalis Bunyardi, Cryptomeria elegans, Citrus sinensis in fruit, Ilex cameliæfolia, Cotoneaster pannosa, C. angustifolia, and Symphoricarpus occidentalis, the last-named covered with snow-white berries.

## Liverpool Horticultural Association.

NOVEMBER 13 and 14.

This society held its show in the Corn Exchange on the above dates, and the entries were well up to the average, both in quantity and quality; these, with good staging, produced what was generally admitted to be the society's finest autumn exhibition, for every point of the spacious hall was well furnished with bright and telling exhibits.

### CHRYSANTHEMUMS IN POTS.

These are generally a feature at this show, the trained specimens being capable of holding their own with those at any exhibition. A considerable number were staged, and did credit to the growers, for the blooms were well regulated.

For three large-flowered trained plants, Mr. T. Hitchman, gardener to A. Earle, Esq., Childwall, secured the premier award with finely-flowered specimens; Mr. W. Wilson, gardener to W. Cunningham, Esq., Gateacre, a good second. For a single specimen Mr. T. Hitchman again led, followed by Mr. J. Armistead, gardener to Mrs. T. A. Vlaste. For three single-flowered specimens, Mr. W. Wilson took the coveted position with a charming trio, his Sylvia Slade and Stella being fine exhibitions of the trainer's skill; Mr. Hitchman held the next position. For one pompon, trained, Mr. T. Atkin, gardener to T. W. Wright, Esq., and Mr. J. Armistead were placed first and second respectively. Staked plants had three classes allotted to them, for six plants, three plants, and one plant, the first prize winners being Mr. E. R. Finch, gardener to W. J. Lockett, Esq.; Mr. T. Hitchman, and Mr. R. Cardwell, of Southport.

In the class for a group of singles arranged on 60 sq. ft., the prizes were awarded to Mr. F. Atkin, Mr. P. Caunce, gardener to G. Nicholson, Esq., and Mr. G. Osborne. For four Begonia Gloire de Lorraine, Mr. A. Wharton, gardener to J. Findlay, Esq., proved successful in a strong competition, while for three stove or greenhouse ferns, Mr. G. Eaton led with grand specimens, his Davallia Mooreana bordering on 12ft. in diameter. This latter exhibitor also excelled for one fern, with an immense Davallia fijiensis plumosus. Three orchids found Mr. H. E. Herd, gardener to G. L. Pilkington, Esq., Gateacre, to the fore, and for the single plant, Mr. J. McColl, gardener to J. W. Hughes, Esq., Allerton, won with Brassocattleya Maronæ. Two palms or cycads were best shown by Mr. Atkin, and for three examples in 8in. pots Mr. G. Osborne scored. Good salvias and cyclamen were put up by Messrs. E. R. French and J. Stoney.

### CUT FLOWERS.

Sixteen classes were devoted to this section, with highly satisfactory results, many good entries being staged that received no awards.

For thirty-six blooms, eighteen Japanese and eighteen incurved, in not less than twelve varieties of each section, the Tate silver challenge vase goes with the first prize. There were three competitors, the premier award going to last year's winner, Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., Warrington, for a good all-round lot, the best blooms being Romance, Mrs. R. F. Hall, Mrs. G. Denyer, G. F. Evans, William Turner (which gained the N.C.S. certificate for the best bloom in this section), Frances Jolliffe, F. S. Vallis, Hon. Mrs. Lopes, and Lady Talbot. Second prize fell to Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., who had some excellent blooms, his Buttercup being selected for the N.C.S. certificate as the best incurved bloom in the show; Mr. H. Osborne, gardener to R. R. Heap, Esq., West Derby, was placed third.

The best eighteen incurved, in not less than twelve varieties, came from Mr. J. George, gardener to Thomas Henshaw, Esq., Roby, who won with a good stand. Mr. C. Osborne, gardener to A. Cook, Esq., Aigburth, followed, and in the class for twelve varieties Mr. J. Clark, gardener to Mrs. Clarke, Allerton Hall, took the lead, while for six blooms Mr. E. R. Finch scored.

The class for eighteen Japanese, in not less than twelve varieties, found Mr. C. Goves again to the fore, followed by Mr. G. Eaton, gardener to W. Tod, Esq., Allerton. In the class for twelve blooms, Mr. D. McKelvie won, and for six Mr. E. R. Finch was first. For six vases of Japanese blooms, three in each vase, Mr. G. Haigh had the leading lot, with Mr. D. McKelvie second. The class for six vases of single flowers, nine blooms in each vase, brought forth a grand competition, marvellous flowers being well staged. Mr. Loo Thomson, Formby, proved the victor, and hearty were the congratulations accorded this enthusiastic amateur; he had splendid specimens of Edith Pagram, Snowflake, Crimson King, etc. Messrs. G. Haigh and G. Eaton were the remaining prize-winners. For three vases, Mr. Thomson again proved the victor.

For the best basket of cut blooms Mr. E. Wharton took the lead, and for the decorated table, Mr. J. Williams, gardener to C. J. Procter, Esq., beat Miss Newsham with roses and carnations against chrysanthemums.

### FRUIT.

For six dishes of fruits, Mr. J. Taylor, gardener to F. Bibby, Esq., Shrewsbury, was well to the fore, having heavy bunches of Alicante and Muscat of Alexandria grapes, a fine melon, and excellent apples and pears; Mr. T. Ellsworthy was second. In the class for four bunches of grapes Mr. J. Wright, gardener to Edmund Lord, Esq., Rawtenstall, won well with fine Alicante and Muscat of Alexandria; Mr. Thos. Barclay, gardener to Mrs. S. Cook, St. Helen's, second. For two bunches of Alicante, Mr. W. Piper, gardener to W. H. Fernie, Esq., Thornton Hough, proved the winner, and for any other black Mr. E. R. Finch scored with good bunches of Gros Colmar. For two bunches of Muscats Mr. W. Wilson won with well-coloured bunches, and held his position for any other white with well-preserved bunches of Golden Queen. Apples and pears were in excellent quality, many being splendidly coloured.

### NON-COMPETITIVE.

The entries in this division were well up to the mark, and proved valuable features of the show.

Gold medals were awarded to Messrs. Mansell and Hatcher for a fine bank of orchids; to Messrs. R. P. Ker and Sons for a fine display of cyclamen, with palms, crotons, etc.; to Mr. J. W. Fletcher, gardener to R. L. de Doux, Esq., for a set of cypripediums; to Messrs. Fishlock Bros., for an extensive floral display; to Messrs. Stuart Low and Co. for a bank of carnations and orchids.

Silver medals went to Mr. W. Rowlands, for Begonia Gloire de Lorraine; to the Liverpool Orchid Company, for orchids; to Mr. C. A. Young, for carnations; to Mr. Norman Davis, for cut chrysanthemums; and to Mr. H. Middlehurst, for potatoes.

## Reigate.

The Reigate Society's twenty-fourth chrysanthemum show was held on November 13 at the Public Hall, Reigate, and it was a great success. The entries were unusually numerous, and the committee had no little difficulty in finding space for the large number of exhibits. It is unfortunate that the Society cannot find a more suitable place for the show, because if all the exhibits could have been arranged in one hall they would have provided a most imposing, interesting, and beautiful display. As it was, the hall proper did not accommodate half the show, and four other rooms were requisitioned. In these the light was poor and there was little room for visitors. The room devoted to the cottagers' exhibits was quite crowded with very fine blooms of Japanese and single varieties, which deserved more space and a better position. In this section Mr. Andrews won three cups, including one for the most points gained.

→ **Spraying** ←

The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested "**FOUR OAKS**" which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-**. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 G, SUTTON COLDFIELD.**

GREAT PERPETUAL - FLOWERING Carnation Show, Royal Horticultural Hall, Vincent Square, S.W., Tuesday, December 3rd, Non-competitive Exhibits only. Open 1 to 5 p.m.

WEDNESDAY, December 4, GRAND COMPETITION and GENERAL EXHIBITS, open 12 noon to 5 p.m., Admission 1s. Also a Conference on Carnations in the Lecture Hall, at 3.30 p.m. Mr. W. E. Wallace, Champion Carnation Grower, will open the discussion. For Schedules, etc., apply, E. F. HAWES, Ulysses, Fortune Green, N.W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

However, the Reigate gardeners are very enthusiastic, and the committee do uncommonly well considering the disadvantages of the show site.

### CUT BLOOMS IN VASES.

The handsome challenge cup presented by Miss Wooley is for the best twenty-five Japanese blooms, in vases, five blooms in a vase, and not fewer than eighteen varieties. Mr. W. Sargent, gardener to G. Lloyd Wigg, Esq., Rockshaw, Merstham won the coveted award with clean, fresh flowers of W. Mease, President Viger, F. Payne, Bessie Godfrey, Marie Loomes, Mrs. R. A. Witty, Master James, Superbe, Frances Jolliffe, Purity, etc.; Mr. J. Beeson, gardener to J. N. Mappin, Esq., Headley Park, Epsom, was a good second, and Mr. W. Morgan, gardener to W. Ellis, Esq., The Woodlands, Reigate, third. Mr. Sargent was also the prize-winner in the open class for fifteen Japanese blooms in five vases.

A local class was for two vases each of Japanese, decorative, and single varieties, and there was a capital competition. The challenge vase was won by Mr. W. Prouting, gardener to H. Somers Somerset, Esq., Reigate Priory; Mr. F. Cordell, gardener to A. F. Blades, Rookfields, Reigate, second; and Mr. J. Delley, gardener to J. T. Mitchell, Esq., Bath Hill, third.

Mr. F. Phillips was placed first for six incurved blooms of one variety, in a vase, with particularly solid flowers of Souv. de Wm. Clibran; Mr. W. Hunt second, and Mr. W. M. Blackmore third, each showing Clara Wells in good form. For one vase of incurved blooms, six varieties, Mr. W. Hunt was to the front. The Wells silver-gilt medal for the best dozen Japanese blooms, in two vases, was won by Mr. F. Phillips, whose best flowers were of W. A. Etherington and Mrs. F. W. Vallis; Mr. Prouting second.

The best five Japanese blooms, white, in a vase, were of Wm. Turner from Mr. Sargent; Mr. Hunt coming second; both exhibited Wm. Turner in splendid condition. For five yellow Japanese blooms, one variety, Mr. Sargent beat Mr. Phillips, each showing Mrs. F. S. Vallis. In the "any other colour" class, Mr. Sargent was again first, with Marie Loomes, and Mr. Hunt second with W. Mease.

Single varieties were splendidly shown in several classes. Mr. W. Hunt scored for six vases, six sprays in each vase, with lovely blooms of Charles Kingsley, Merstham Gem, Mrs. W. Higgs, Mensa, J. B. Lowe, and Metta. Mr. W. M. Blackmore came second, and Mr. W. Prouting third. In another division singles were also very well shown, and the premier award for six vases fell to Mr. P. Sherlock, gardener to J. B. Crossfield, Esq., Undercroft, Reigate, for very fine flowers of Countess Egremont, Ceddie Mason, Snowflake, Metta, Mrs. F. Gilby, and an unnamed rose-pink variety; Mr. C. Washington second, and Mr. Cordell third. The four entries in this class made a handsome display.

Mr. Scutt was successful for one vase of six Japanese blooms in the small growers' section with fine examples of F. S. Vallis, G. Penford, Frances Jolliffe, W. Turner, R. C. Loomes, and Mrs. G. C. Kelly. Mr. J. Dilley, gardener to J. T. Mitchell, Esq., Baths Hill, second, and Mr. W. Hunt, gardener to G. Jackson, Esq., Cherchefelle, Reigate, third. Five entries.

For three vases of five blooms each, Japanese varieties, the Redhill Tradesmen's Cup was worthily won by Mr. J. Dilley with a fine set that included W. Turner, Reginald Vallis, H. E. Converse, Master David, and W. Mease in good form; Mr. W. Hunt second and Mr. F. Cordell third.

### GROUPS AND MISCELLANEOUS PLANTS.

The premier award for a group of single chrysanthemums was won by Mr. J. A. Steadman, gardener to Dr. E. C. Prince, The Shrubbery, with a very beautiful exhibit of semi-circular form, rising about 9ft. high at the back. It inclined a little to formality, but the flowers were delightful, and the colour blending of popular varieties was first rate. Mr. Thomas Kemp, gardener to C. V. Nicholl, Esq., Oakwood, Redstone Hill, was a capital second and Mr. J. Giles, gardener to Miss Talbot, Eastnor Cottage, third; four entries.

The only table group of Japanese blooms and foliage plants was the one set up in the corner by Mr. W. A. Dobson, and he was awarded first prize for a good effort.

Mr. Scutt scored for six Primula obconica, leading among six competitors with very richly-coloured forms; Mr. W. R. Blackwood, gardener to J. C. Auerbach, Esq., Hethersett, second, and Mr. W. Coldman, Highfield Gardens, third. Mr. Prouting scored for half a dozen begonias of the B. Gloire de Lorraine type, with freely-flowered, well-trained specimens of moderate size; Mr. W. A. Dobson, gardener to A. J. Waley, Esq., Stone House, second, and Mr. F. Phillips, gardener to Colonel Sir R. W. Inglis, Craigendorne, third.

Mr. W. Scutt, gardener to H. C. Shelton, Esq., Lowwood, Reigate, scored for six zonal pelargoniums with beautifully-flowered specimens in small 32's, his example of J. McLaren being particularly beautiful and smothered with pink and salmon flowers; Mr. Blackwood, gardener to J. Auerbach, Esq., Hethersett, second. Mr. W. M. Blackwood led for three bush plants of chrysanthemums with good bushes of Felton Favourite, W. Duckham, and Mrs. Greening.

In the classes for decorative exhibits Mrs. A. C. Brown, Brokes Lodge, Reigate, won the Adams Cup and first prize with a pretty exhibit of yellow and bronze flowers that was, however, a little too formally arranged round the base of the centrepiece. Miss Shelton second and Miss West, Firth Lodge, Reigate, third. Miss West and Miss Brown were first and second respectively for a vase of decorative chrysanthemums, and Mrs. Brown and Miss West scored for vases of single varieties.

Mr. Blackwood scored for black grapes, and was closely followed by Mr. J. Walder, gardener to Paul Von Fleischl, Esq., Shagbrook, Reigate; and both showed good clusters of Alicante.

There were a few non-competitive exhibits. Mr. C. Dales sent wreaths and other floral devices; Messrs. J. Cheal and Sons, Crawley, sent a collection of apples and pears; and Messrs. H. and A. Trower, Redhill, showed vegetables, ferns, and flowers.

## Bournemouth Gardeners' Association.

### ANNUAL CONCERT.

On October 15, a very successful concert was held in aid of the Royal Gardeners' Orphan Fund. The President, J. H. Ralph Smythe, Esq., being unavoidably absent, the chair was occupied by Mr. G. H. New, of Bournemouth, who made an earnest appeal for funds in aid of the work on behalf of orphan children of gardeners. He said there were three children in the Bournemouth district now receiving benefit from these funds.

A collection is taken, but no charge for admission to the concert made. On this occasion the sum collected amounted to three pounds nine shillings and ninepence. The artistes give their services free of charge, so that the whole amount collected is forwarded to the proper quarter. The concert was a very good one, the items being greatly appreciated by a large audience.

## Hull Chrysanthemum Show.

### NOVEMBER 20 and 21.

One of the most interesting of the floricultural events of the present year has been the revival of the Hull Chrysanthemum Society, which, for a period of twenty-one years exercised a great and highly beneficial influence upon the cultivation of chrysanthemums and their presentation to public notice. This influence was felt over the whole of the United Kingdom, for the fame of the society was such that exhibitors came from long distances to compete for the liberal prizes that were offered, and many were the visitors from widely separated districts to see what was being done at Hull, and in not a few instances to obtain object-lessons in the art of presenting chrysanthemums to public notice in the most attractive manner. Nowhere had the art of arranging groups attained to so high a degree of development as was to be seen at the exhibitions of the society, and, writing with a full knowledge of what has been accomplished by the leading societies in the United Kingdom, we have no hesitation in saying that nowhere have there been competitive groups of plants arranged for effect that were quite equal to those which formed so glorious a feature of the annual displays that for a long series of years filled the spacious halls of the Artillery Barracks to their utmost capacity.

While the influence exercised by the society was felt far beyond the boundaries of the East Riding of Yorkshire, in which Hull is situate, the influence for good was the greatest in the intermediate neighbourhood of the town, a statement that can be justified in a very few words. At the first exhibition of the society, which was held in the Assembly Rooms on November 20 and 21, 1884, the whole of the exhibits in competition for the prizes were contributed by growers from a distance, while at the last exhibition previous to the suspension of the society's activities in 1903, practically the whole of the competitive exhibits were from local growers, and the show was one of the finest the society had held. This great change is all the more remarkable when it is remembered that the cultivation of chrysanthemums received comparatively little attention in and around Hull until the society was formed, and it was largely owing to this fact that Mr. R. Falconer Jameson, the late Mr. Bohn, and some other gentlemen interested in these flowers were induced to form the society.

It is interesting to recall the fact that Mr. R. F. Jameson, the chairman of the executive committee of the revived society, was the first honorary secretary of the original body, a position he occupied some four or five years with singular ability and immense advantage to the society. He, indeed, filled the position of honorary secretary until he was elected chairman of committee, and succeeded by the late Mr. E. Harland, who a few months later was joined by Mr. James Dixon, and for sixteen years these gentlemen were the honorary co-secretaries, and rendered services of which it would be difficult to speak too highly. At the annual meeting held in 1903, Mr. Harland retired, and Mr. Dixon was joined by Lieut.-Colonel R. E. Johnson, who is now taking an active part in the work of the society as a member of committee, and on May 11 of the same year Messrs. Harland and Dixon were each presented with an illuminated address and a piece of plate in recognition of their services. Mr. James Dixon now fills the position of hon. secretary, and on the executive are a number of gentlemen who were long associated with the original society.

The cause of the suspension of activities in 1903 may be briefly explained. The committee aimed, on the initiation of the society, at a high ideal, and on its attainment they determined to carry on the work so long as the support was such as to enable them to maintain it, and no longer. At the first exhibition the success was so great that a profit of over £77 was realised, and the success continued until 1896, when there was a slackening in public interest, and this continued until 1902, when there was some revival and the annual subscriptions came in more freely. There seems to have been a relapse in the following year, and, as the result, the work of the society was suspended. In taking this course the executive acted wisely, for it was much better to have a few years' rest than to lower the standard for the purpose of maintaining a balance between the income and expenditure, as is done in so many cases.

During the past few years the question of reviving the chrysanthemum show has been raised in Hull on several occasions, but not until this year were steps taken to give practical effect to the wishes of those who were anxious that the shows should again be held. The exhibition on Wednesday and Thursday was held in the New City Hall, and the schedule of prizes was more comprehensive than on any previous occasion, with a view, it may be assumed, to render the display more varied and useful. The classes for cut blooms of chrysanthemums were arranged in four sections, and in the first of these the competition was open, and the classes were of the greatest importance. In two of them valuable silver cups were provided, in addition to liberal prizes in cash. The second section was open only to cultivators resident in the East Riding of Yorkshire and in Lincolnshire within twenty miles of Hull; and in the third section the competition was limited to amateurs, and in the fourth to allotment-holders. Then followed the sections for groups, plants in pots, table decorations, and fruits and vegetables.

Great as are the resources of the New City Hall, they were taxed to the utmost, for the competition was exceptionally keen in the whole of the classes. The great hall was devoted to groups arranged for effect, the cut blooms of chrysanthemums, the miscellaneous plants and the non-competitive collections of vegetables. In other halls and rooms were the floral arrangements and decorated dessert tables, the fruit, all the competitive collections of vegetables, and various non-competitive exhibits other than those of vegetables.

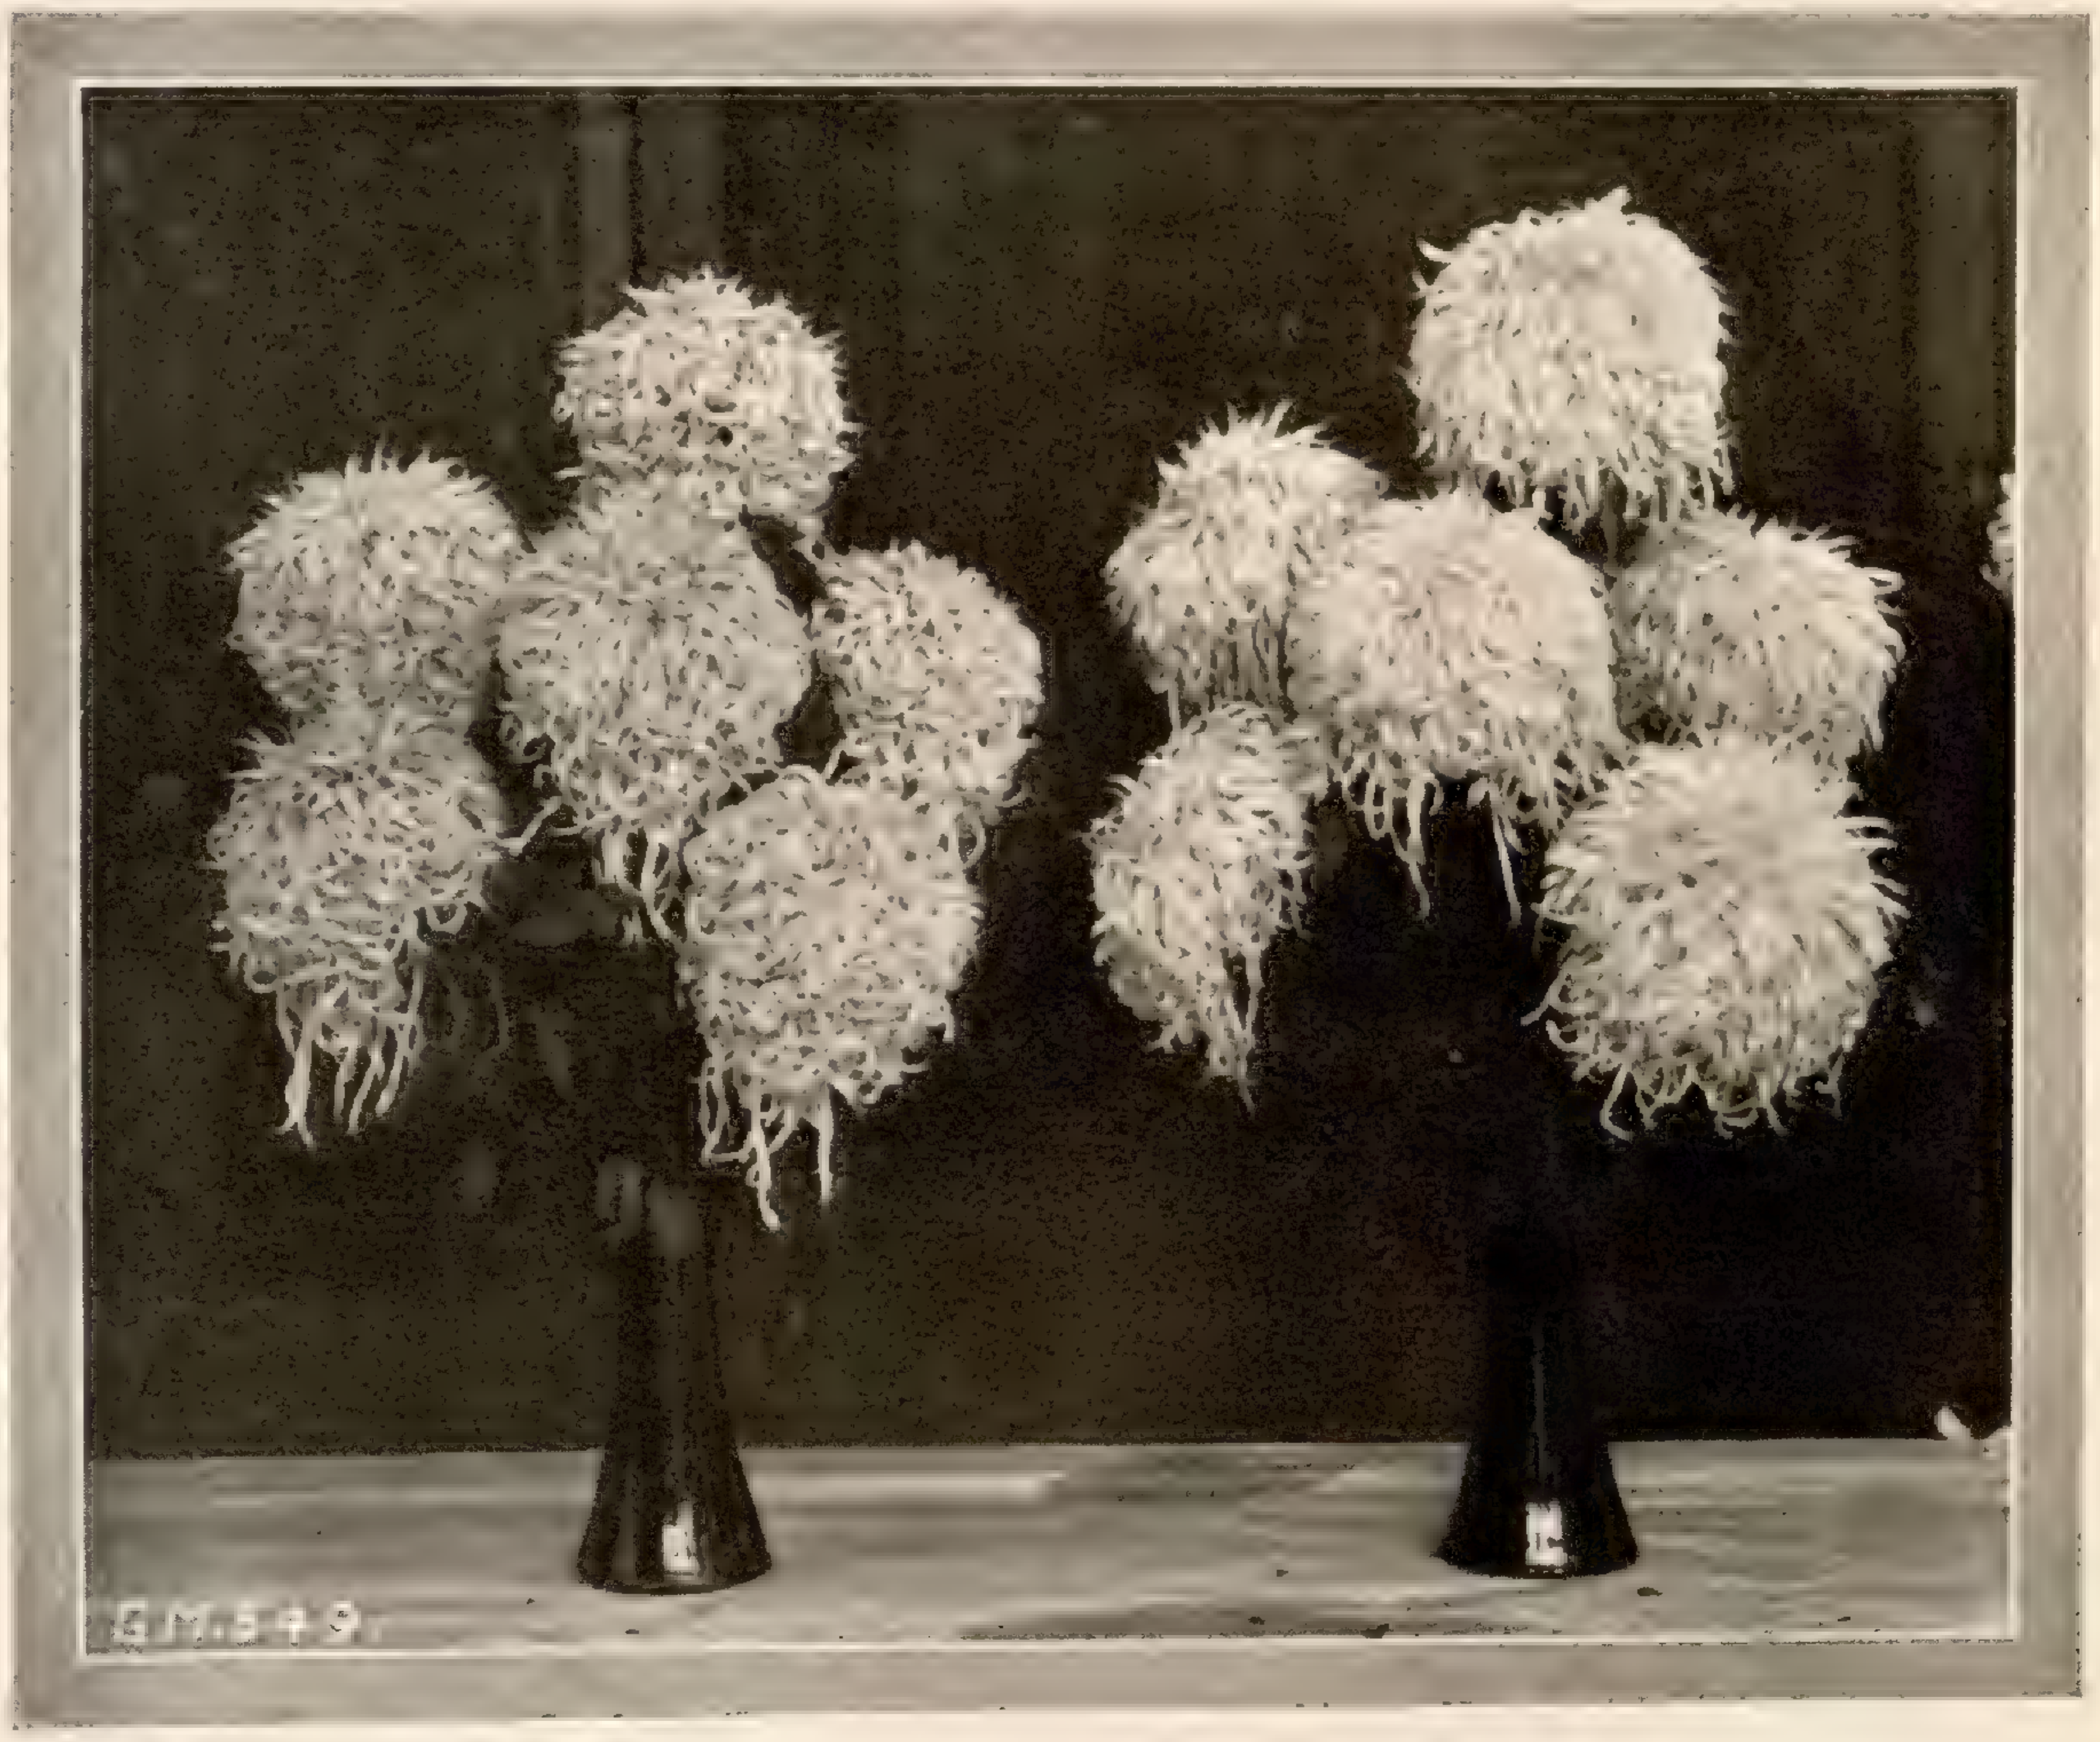
All the characteristics of the Hull chrysanthemum shows were revived; the arrangements were so admirably carried out as to be beyond praise. All the plants and flowers were staged in time for the judges to commence their duties at ten o'clock, and everything was in spick and span condition at 12.30 when the visitors were admitted, and the exhibition was opened by the Mayor of Hull, who was accompanied by the Sheriff and several members of the Corporation. A mere mention of this will show that Mr. J. Dixon and other members of the executive performed their duties in a manner deserving of the highest commendation. The judges were Mr. E. Molyneux, V.M.H., and Mr. J. W. Moorman, who had officiated for many consecutive years previous to the suspension of the exhibitions, and Mr. George Gordon, V.M.H., who had officiated from the foundation of the society in 1884.

## COMPETITION IN THE CLASSES FOR CUT BLOOMS.

The classes for cut blooms were numerous, and as the entries were many and the flowers remarkable for their high quality they formed an important and highly-attractive feature. The competition in the open class for twenty-four blooms of Japanese varieties was very strong, and the premier award, which included a valuable silver cup, was made in favour of Mr. F. J. Fleming, gardener to H. G. Hewitt, Esq., Weelsby Old Hall, Grimsby, who had a collection remark-for the splendid development and uniformity of the blooms. Especially noteworthy were those of Lady Talbot, Mrs. G. E. Kelly, W. Mease, Hon. Mrs. Lopes, Pres. Viger, Madame G. Rivol, Mrs. G. Drabble, Frances Jolliffe, and F. Green. Mr. G. W. Musk, gardener to Captain J. F. Laycock, Wiseton, Bawtry, Notts, followed closely for second place, with medium-sized blooms, high in finish, and bright in colour. Mr. A. Chandler, gardener to Arthur Jones, Esq., Coton House, Rugby, was third with blooms of high quality.

Incurved flowers were less numerically strong than the Japanese varieties, but the greater proportion of those staged were of exceptional quality. More epecially was this the case in the open class for eighteen, in which Mr. G. Wilson, gardener to Mrs. Hall-Watt, Bishop's Burton Hall, Beverley, was a splendid first. Among other blooms of great excellence were those of Madame Ferlat, Pantia Ralli, Mrs. F. Judson, Mrs. G. Denyer, Mrs. J. Seward, Romance, Buttercup, F. Palmer, and G. F. Evans. Mr. A. Chandler was a capital second.

The competition for the prizes for two vases each of yellow and white varieties, seven blooms in each vase, was very keen, and the several contributions produced a glorious and interesting display. Mr. A. Chandler was successful in winning the first prize in the class for two yellow varieties, with magnificent flowers of F. S. Vallis and Lady Talbot. Mr. G. W. Musk was a close second with two fine vases of blooms, those of F. S. Vallis representing that variety at its best. In the corresponding class for two vases of white varieties, Mr. G. Wilson scored with superb blooms of Purity and Mrs. A. T. Miller; Mr. Chandler was a capital second.



Lady Talbot. F. S. Vallis.

FIRST PRIZE TWO VASES OF YELLOW JAPANESE CHRYSANTHEMUMS.

Exhibited by Mr. A. Chandler at the Hull Chrysanthemum Show.

The competition was brisk, and the blooms of high quality in the class for six blooms of any one Japanese variety. The prizes were awarded to Mr. A. Chandler, Mr. A. Shearsmith, gardener to F. Costello, Esq., West Hill Lodge, Hessle; and Mr. G. Wilson, in the order of their names.

The contributions to the many classes for singles and decorative varieties were so numerous and meritorious as to form a bright and interesting feature. For twelve vases of singles, nine sprays, naturally grown, in each, Mr. M. Stather, Arlington Nursery, Cottingham, was first with finely-developed examples of well-known varieties. Mr. W. Allison, gardener to E. Kenneth Wilson, Esq., Little Tranby, Beverley, was a close second, with a collection of much excellence, and Mr. G. W. Musk was third with finely-veloped flowers. Equally well filled was the class for six vases of singles, five blooms of each, disbudded, and here the first prize was awarded to Mr. A. Drewery, gardener to H. Hildyard, Esq., Cherry Garth, Cottingham, for blooms of exceptional excellence, the varieties including Robert Thorpe, Bronze Pagram, Sylvia Slade, H. J. Williams, and Edith Pagram. Mr. M. Stather and Mr. G. Wilson were second and third respectively, both staging well.

The class for six vases of decorative varieties was a good one, and Mr. M. Stather and Mr. W. Smith, Holy Trinity Cottage, Hull, who were first and second respectively, are deserving of high praise for the excellence of their exhibits.

## LOCAL CLASSES FOR CUT BLOOMS.

The competition in the classes open only to residents in the East Riding of Yorkshire and such parts of Lincolnshire as are within twenty miles of Hull, was of the keenest. Mr. G. Burrows, gardener to Miss Bennett, Westlands, Grimsby, was successful in obtaining premier honours in the class for eighteen Japanese, with magnificent blooms of the leading varieties, the colouring being especially good. Mr. J. W. Backhouse, The Bar, Beverley, was a close second with blooms evincing cultural skill of a high order; and Mr. Hedley Smith, 43, Old Clee Road, Cleethorpes, who was third, also staged remarkably well. Very numerous were the entries in the class for twelve Japanese, and the blooms were of a high degree of excellence throughout. Mr. G. B. Burrows won with large and brightly-coloured blooms; and Mr. T. Hardcastle, gardener to A. G. Ayre, Esq., Tower Hill, Hessle, and Mr. A. Shearsmith were second and third with blooms of great excellence.

In competition for the prizes for incurved Mr. G. Jarvis, gardener to Mrs. Whitaker, Cliff House, Hessle, was a capital first; and Mr. J. W. Backhouse and Mr. T. Hardcastle followed closely for second and third places.

Both decorative and single chrysanthemums were admirably shown in the classes set apart for local growers, and Mr. Stather was a splendid first for six vases of decorative varieties, five blooms of each, disbudded with Felton's Favourite, and similar varieties.

For six vases of singles, naturally grown, Mr. A. Drewery was first with a very bright set, the blooms being especially remarkable for high finish. Mr. M. Stather and Mr. W. Allison were second and third.

The amateurs' classes were well filled. In the classes for Japanese the most successful exhibitors were Mr. H. H. Barlow, Glencoe, Hessle; Mr. T. Lazenby, Northolm Villa, Hessle; and Mr. J. E. Gibbins, Hessle. The principal prizes for incurved were awarded to Mr. J. E. Gibbins, Mr. H. H. Barlow, and Mr. J. R. Ellis, Hull. Chief among the prizetakers in the classes for single and decorative varieties were Mr. C. J. Mudd, Cottingham, and Mr. W. Smith.

### GROUPS.

There were four competitors in the great class for groups of chrysanthmums, and fine foliage plants arranged for effect, and, disposed in prominent positions on the ground floor of the great hall, they contributed liberally to the general effect. Mr. R. B. Witty, superintendent of the Public Parks and Gardens of Hull, arranged a magnificent group, in which both large and small-flowered chrysanthemums were used with rare taste and judgment. Very finely-coloured were the crotons used as a marginal fringe, and noteworthy for its high development was the large Kentia used as a centrepiece. The group was placed first in order of merit in its class, and Mr. Witty was awarded a large silver medal by the delegates of the North of England Horticultural Society. Next in order of merit was the group for which Mr. Jarvis, gardener to Mrs. Whitaker, Cliffe House, Hessle, was awarded the first prize, consisting of a silver cup and a sum of money. This was formed almost exclusively of Japanese varieties, the blooms throughout being of high quality, and the arrangement remarkable for the taste evinced. Mr. T. M. Petch, St. John's Street, Bridlington, was second with an excellent group, the development of the blooms being especially noteworthy. Mr. J. P. Cummings, Holderness Road, Hull, was third with a pleasing group, in which Japanese and single varieties were tastefully associated.

The arrangements in the class for decorated mirrors were so numerous and characterised by taste of so high an order as to constitute a very pleasing feature. Mr. G. Wilson, gardener to Mrs. Hall-Watt, Bishop Burton Hall, Beverley, was first of six competitors, with a remarkably bright and tasteful arrangement. At the base were crotons, poinsettias, variegated abutilons, dracænas, and other fine foliage plants. On either side were Japanese and single chrysanthemums and bamboos, the latter being carried over the top, where variegated abutilons were associated with them with good effect. Mr. T. M. Petch was an admirable second, albeit the top decoration was decidedly weak. Single and Japanese chrysanthemums were very tastefully used in the embellishment of the base and sides, and on one side a slender Kentia was deftly placed. Mr. T. Willey, gardener to H. Holland, Esq., The Sycamores, Cottingham, was a close third, with a very tasteful arrangement in which white chrysanthemums and feathery centaureas predominated.

Begonias of the Gloire de Lorraine type were splendidly shown, and the several collections of six produced a beautiful display of colour. Mr. T. Hardcastle, gardener to A. T. Ayres, Esq., Tower Hill, Hessle, was a splendid first, with finely-flowered pyramidal specimens, and Mr. Scales, gardener to A. Spring, Esq., Waylands, Hessle, second. Brilliantly-coloured salvias, lily of the valley, and attractive cyclamen were admirably shown.

### FLORAL DECORATIONS.

The large room devoted to table decorations and other floral arrangements presented a delightful appearance, and was a great source of attraction. There were four decorated dinner-tables, all possessing much merit, and the awards were made to Mrs. E. Robson, Tower Grange, Hull; Mrs. E. G. Bilton, Princes Avenue, Hull; and Miss E. S. Hardy, Middleton-on-the-Wolds, in the order of their names. Epergnes, baskets, bouquets, and ladies' sprays were all shown in a manner that reflected much credit upon the exhibitors.

### NON-COMPETITIVE EXHIBITS.

These were fairly numerous and of a high order of merit, with the result that they greatly enhanced the attractions and interest of the show. The North of England Horticultural Society sent a deputation to award medals to the more important of the exhibits not in competition for the prizes. The members of the deputation were Mr. J. S. Brunton, Mr. Hicks, Mr. Ker, Mr. J. P. Leadbetter, and Mr. Dolby, and the following awards were made:

Gold Medal.—To Messrs. Clibrans, Altrincham, for a large collection of vegetables.

Large Silver-gilt Medal.—To Messrs. Toogood and Son, Southampton, for a collection of vegetables.

Large Silver Medal.—To Mr. H. B. Witty, for his beautiful group of chrysanthemums and fine-foliage plants, arranged for effect; and to Messrs. E. P. Dixon and Son, Hull, for floral designs, flowers, and fruit.

Silver Medal.—To Messrs. Mansell and Hatcher, Leeds, for a fine group of orchids; and to Messrs. W. Wells and Co., Merstham, for a tastefully-arranged group of cut chrysanthemums, consisting chiefly of the newer varieties.

First Class Certificate.—To Messrs. W. Wells and Co., for Japanese chrysanthemum Queen Mary.

---

## Kilmarnock Chrysanthemum Show.

The eighteenth annual show of the Kilmarnock Chrysanthemum Society was held in the Agricultural Hall, Kilmarnock, on November 15, and was one of good quality. The class for a table decoration, on a circular table, of plants, flowers, and foliage, arranged for effect, was again one of the outstanding features, and here Mr. James M'Gran, Goodham Gardens, led with a tasteful table of plants and flowers of very fine quality. Mr. A. Dewar, Dankeith Gardens was second, and Mr. James Muir, Crosbie Tower, Troon, third. In the gardeners' classes for pot plants some good chrysanthemums, primulas, begonias, and plants for table decoration were shown. Mr. R. J. Clark, Cambusdoon, Ayr, was first for three pots of chrysanthemums, and also for two pots of singles—a class growing in favour here. Mrs. Kennedy was first for two pots of Japanese, and Mr. A. J. Ferguson for two of pompons.

In the classes for plants grown on a single stem, Mr. Jas. Cochran took the first for Japanese, and also for singles. Mr. A. Methven, Galston, came first for Primula obconica, well done here; and Mr. R. J. Clark took a similar position for other primulas. Mr. Methven was first for six plants for table decoration; for three plants in flower or foliage; and for four pots of pelargoniums. Mr. W. Mair, Blair Gardens, led for begonias; Mr. Clark for salvias and palms.

Cut blooms were very good, though a little poorer in general quality than in some former seasons. In the leading class for twelve Japanese Mr. Jas. Muir, Crosbie Tower, Troon, came first, followed by Mr. P. Anderson, Ballochmyle, who was first in the class for six, for two vases white Japanese, and for six and three vases exhibition chrysanthemums. Mr. J. Muir was first for two vases of yellow Japanese and for six sprays chrysanthemums.

---

⁂ We regret that owing to the extreme pressure upon our space we are unavoidably compelled to hold over the reports of Winchester, Hitchin, Woolton, Bolton, Blackpool, and National Chrysanthemum Society until our next issue.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

NITRATE OF SODA.—M. G., Shefford: I shall be obliged if you can tell me the chief source of nitrate of soda, and what is the annual output?—For the moment we have not the complete figures to hand, but we may state that nitrate of soda comes chiefly from South America, and principally from Chile. In 1911 the production in Chile amounted to 2,480,000 tons, an increase of 54,000 tons over 1910. The consumption of nitrate during 1911 was 108,000 tons more than in 1910, the United Kingdom and the United States using 10 per cent. more than in the previous year, while Holland increased its consumption of this fertiliser by 7 per cent., France by 4 per cent., Belgium by 7 per cent., and Italy by 12 per cent. It is estimated that the production of nitrate in Chile in 1912 will reach 2,535,000 tons, and it is stated by experts that the grounds now being worked contain enough nitrate to maintain the present rate of supply for thirty years.

DISEASE - IMMUNE POTATOES.—C. R. T., Wisbech: Seeing how bad potato disease has been in many districts this year, I am led to ask you what are the possibilities and probabilities of a variety immune from disease?—This is a large question. Some varieties of potatoes resist disease far better than others, and that leads us to hope that an immune variety may be raised. The difficulty seems to lie in the combination of immunity with a productiveness that will be of commercial value. Dr. Salaman has been

NEWS FROM HEADQUARTERS.
SPECIAL OFFER
OF
DAFFODILS AND NARCISSUS.

In gardens, from the largest to the smallest, one can almost always find odd corners that would be enlivened up with a few Daffodils. With this in view, we offer the following Collection:

1 King Alfred (Yellow Trumpet)
3 Madame de Graaff (White Trumpet)
3 Golden Bell (Yellow Trumpet)
3 White Lady (Leedsi)
6 C. J. Backhouse (Incomparabilis)
6 Flora Wilson (Barri)
6 Madame Plemp (Bicolour Trumpet)
6 Vanilla (Yellow Trumpet)
12 Poetaz C's White (Poetaz)
12 Poetaz C's Canary (Poetaz)
50 Emperor (Yellow Trumpet)
50 Barri Conspicuus (Barri)
50 Cynosure (Incomparabilis)
50 Sir Watkin (Incomparabilis)
50 Duchesse de Brandant (Leedsi)
50 Pheasant Eye (Poeticus)
50 Ornatus (Poeticus)
50 Van Sion (Double Trumpet)
50 Double Incomparable

Delivered packing and carriage paid on receipt of cheque or postal order for 21/-.

We are also in the position to offer at reduced prices Daffodils and Narcissus in large quantities for naturalisation. Particulars will be sent on receipt of a postcard.

Name..............................................................

Address..............................................................

experimenting with potatoes for several years, and he has shown, in the "Journal" of the Royal Horticultural Society, that, in 1909 and 1910, when disease was exceptionally prevalent, one-fourth of the seedlings of S. etuberosum were unaffected by disease, while the remainder perished. From these immune individuals numerous crosses have been made and large families formed. It is hoped that in the second-generation families the recessive quality of immunity may segregate out. Therefore, Dr. Salaman considers that a really immune potato, to which other desirable qualities may readily be added, is not an improbable feature of the future.

HORTICULTURAL EXHIBITION IN ST. PETERSBURG IN 1913.—A. A. G., Hull: Can you give me any information concerning the horticultural exhibition to be held in St. Petersburg next year?—An international horticultural exhibition will be opened at St. Petersburg at the end of April, 1913. It is being organised by the Russian Imperial Horticultural Society. The exhibition will comprise an agricultural section in addition to various floricultural and horticultural sections. Intending foreign exhibitors must give notice of their intention to exhibit to the Comité Exécutif de la Société Impériale d'Horticulture de Russie, St. Pétersbourg, Quai de la Cour, 32, before January 1, 1913. A copy of the regulations, programme, and awards may be seen at the office of the Board of Agriculture, 4, Whitehall Place, London, S.W.

BLACKENED CATTLEYA AND VANDA LEAVES.—E., Darlington: Could you tell me the cause of blackening in the leaves of cattleyas and vandas, examples of which I send you?—There is little doubt but that the evil is due to excessive moisture in the potting compost, coupled with a stagnant atmosphere. As a general rule, trouble among cattleyas is due to insufficient ventilation and excess of moisture about the roots. Give less water, stand the plants in a light position, ventilate freely, having due regard to the weather, and use a little extra fire-heat to maintain the temperature. You will find much help in our Orchid Notes under Work for the Week.

DO ROSE CUTTINGS COME TRUE?—Ignoramus, Enfield: If a cutting is taken from a rose bush and rooted, will it produce the same sort of rose as its parent, or will it have to be budded first?—A rose cutting will, when rooted and grown, produce precisely the same sort of roses as the plant from which it was taken. As a rule roses are propagated by budding, and the stocks used are seedling briar, cutting briar and Manetti; but sometimes "own-root" roses are offered for sale, and these are obtained from cuttings. Thus, if you root a cutting of Mdme. Abel Chatenay or Mrs. John Laing you will get flowers of those varieties in due course, without budding. Budding is the quicker method of increase.

FAILURE OF IVY-LEAVED PELARGONIUMS.—H. T., Oxford: I am sending a specimen of ivy-leaved pelargonium Souv. de Charles Turner, for examination, and should be glad to have your opinion of it. We had the house panted inside, as well as the staging, in the summer of 1911, and subsequently the pelargoniums lost every leaf. We cut the plants back and removed them to another house, and they then grew away well. This summer I had all the plants removed from the house painted last year, and had the paint washed, and the ventilators and doors left open for two months. In this house we have some good single chrysanthemums and Primula Kewensis, flowering well, but the pelargoniums are going just the same as before, the leaves shrivelling up and falling. We keep a fire going during damp and cold weather, and leave a little air on at night. Two gardener friends consider that the trouble is due to the odour from the paint. Kindly give your opinion to one who has taken the "G. M." for many years, and found it most useful.—The trouble cannot be due entirely to the paint, or some other subjects would have been affected. The leaves show no signs of disease, but their appearance suggests lack of light and excess of atmospheric moisture. It may be that from various local causes the stock has become debilitated. Have you grown any other pelargoniums in the same house, and, if so, with what success? Further, at what period of the year do the leaves commence to fall?

### NAMES OF PLANTS.

J. A. S., Bridgend.—Nægelia zebrina.

L. L., Buckingham.—1, Vallisneria spiralis; 2, a leaf of Gingko biloba.

S. H. A., Devonport.—1, Oncidium ornithorynchum; 2, O. pubes; 3, O. bicallosum.

B. F., Oswestry.—1, Struthiopteris germanica; 2, Polypodium propinquum; 3, Vaccineum Vitis Idæa.

E. J. W., Preston.—1, Luculia gratissima; 2, Cypripedium insigne Sanderæ; 3, Maxillaria variabilis; 4, Aglaonema costata; 5, Dracæna Baptisti.

G. B., Bournemouth: 1, a fine form of Begonia Gloire de Lorraine, probably the variety Mrs. Leopold de Rothschild; 2, Laportea moroides, the Poison Tree of Queensland—thanks for your prominent notification of its stinging powers; we know the plant quite well, and experienced its capabilities, under cultivation, a score of years ago, but if we had not known what to expect in the box we might have had an unpleasant shock.

### NAMES OF FRUITS.

G. M., Felixstowe.—Kerry Pippin.

N. R., Petersfield.—1, Bergamotte d'Esperen; 2, Alicante.

H. S. Y., Tewkesbury.—1, Margil; 2, Washington; 3, King of the Pippins.

P. W., Reading.—1, Court Pendu Plat; 2, Claygate Pearmain; 3, King of the Pippins.

F. E., Coggeshall.—1, Ribston Pippin; 2, Beurré Clairgeau; 3, Winter Nelis; 4, Catillac; 5, Tyler's Kernel.

W. S. T., Craven Arms.—1, Dumelow's Seedling; 2, not recognised; 3, Dutch Mignonne; 4, Emile d'Heyst.

W. N. R., Bickley.—1, Roundway Magnum Bonum; 2, Fearn's Pippin; 3, Warner's King; 4, Gascoigne's Scarlet.

C. T. D., Coventry.—1, Chelmsford Wonder; 2, Golden Noble; 3, Beurré Superfin; 4, Doyenne du Comice; 5, out of character, possibly Court Pendu Plat; 6, Uvedale's St. Germain.

## OBITUARY.

◆

### MR. JOHN KINNAIRD.

There has just passed away, at the comparatively early age of 58 years, Mr. John Kinnaird, Burnieboozle, Aberdeen, an outstanding personality in the market gardening industry of the city of Aberdeen. The Kinnairds have for several generations been connected with the market gardening industry of Aberdeen, but no member of the family has left a better record of work well done than Mr. John Kinnaird. Burnieboozle, which contains over a hundred acres, is recognised as a model market garden, and the excellent and practical manner in which the grounds are laid out and tended earned for Mr. Kinnaird the warm admiration of every one of his professional brethren. He was eminently successful as a grower of vegetables and fruit, and, as our columns in past years can testify, he invariably took a very prominent place in the prize list at the annual shows of the Royal Horticultural Society of Aberdeen. He is survived by a widow and a son and daughter. The son, Mr. John Kinnaird, jun., has for long been associated with his father in the business, and so the continuity of the Kinnairds as Aberdeen market gardeners will be preserved.

### MR. JOHN ELLIOTT BURTON.

There passed away at Twickenham, on November 11, Mr. John Elliott Burton, in his eightieth year. Mr. Burton was a native of Flitwick, Beds, and had his early training in the Duke of Bedford's garden at Woburn Abbey; from there he received an appointment as head gardener to Lord John Russell at Rodboro' Manor, Gloucestershire, and later to Sir Edward Dean Paul, Bart., of Cambridge House, Twickenham. The interment took place at Twickenham Cemetery on November 16, preceded by service at St. Stephen's Church.

### SIR THOS. SKEWES-COX.

After a very brief illness, Sir Thos. Skewes-Cox died at Manor House, Petersham, Richmond, a few days ago. Sir Thomas was a solicitor, but in the Richmond district he was well known for his interest in horticulture and the support he gave to the Richmond Horticultural Society.

## FORTHCOMING ENGAGEMENTS.

WEDNESDAY, November 27.—National Chrysanthemum Society's Annual Dinner and Prize Distribution at the Holborn Restaurant, at 6.45 p.m. Sir Albert Rollit will preside.

TUESDAY, December 3.—Royal Horticultural Society; Committee meet at 12 o'clock; Lecture at 3 p.m. on "Vegetation of the Islands of Lake Maggiore," by Mdme. Tzikos St. Leger; Scientific Committee at 4 o'clock.

Scottish Horticultural Association.

WEDNESDAY, December 4.—Perpetual-flowering Carnation Society's Winter Exhibition at the Royal Exhibition Hall.

THURSDAY, December 5.—Linnean Society.

SATURDAY, December 7.—French Horticultural Society of London.

"For brilliant colouring, substance, uniformity of height, time of flowering, and lasting properties, your Inimitable Tulips are the best I have ever seen."

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

IT IS WORTH WHILE TO PLANT A PERENNIAL GARDEN.

It will be a saving in pocket and a Perennial Delight, as one season succeeds the other.

It is a garden of which you can make a *hobby*, which can hardly be said of the bedding system. Plant it with Kelway Artistic Colour Borders. Now is the time to plan them. Kelway's will save you all the trouble connected with them if you will send particulars as to area, position, soil, etc., to

KELWAY and SON, The Royal Horticulturists, LANGPORT.

From ———, Berwick House, near Shrewsbury.
"The plants in both boxes arrived safely to-day. They are an excellent selection. I cannot speak too highly of the careful way in which they were labelled and packed."

KELWAY'S PÆONIES.

NOW IS THE TIME TO PLANT Pæonies—the best time in the whole year. No garden is complete without the new Pæonies. Kelways recommend the following collection (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden.

COLLECTION OF PÆONIES.—Agenoria, Amalthea, Czarina, Duc de Wellington, Formosa, Lottie Collins, Nycletius, Princess Maude, Splendida, Tessa, The Lancaster, Zephyrus.

36s. the dozen; good plants, true to name. Immediate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

From ———, Russia.
"Have now received the box of bushes and flowers, and have planted them out. The Pæonies and bulbs came splendidly; Loganberry perfectly fresh."

KELWAY AND SON, The Royal Horticulturists, LANGPORT, SOMERSET.

BOX EDGING, one yard sufficient to plant two yards, 8d. per yard; 55s. per 100 yards. Limes, 10 to 12ft., 18s. dozen. Smaller and larger sizes equally cheap. Prices on application to R. W. PROCTOR and SONS, Growers of Hardy Derbyshire Roses, Chesterfield. (Established 1825.)

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

XL ALL NICOTINE INSECTICIDE WASH for Syringing, Dipping, and Dressing Fruit Trees and Plants. Mealy Bug, Scale, etc., cannot exist where this is used.

XL ALL INSECTICIDE WASH B (sine Nicotine), best non-poisonous Wash on the Market. No licence required to sell this. Other preparations of great renown are RICHARDS' XL ALL WINTER WASH for dormant Fruit Trees and Bushes; XL ALL GARDEN FERTILISER; XL ALL LAWN SAND, etc.

Don't forget to ask your Nurseryman or Seedsman for my small pink list.

G. H. RICHARDS, Manufacturer,
234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### The Chrysanthemum Season.

The exhibition season of the chrysanthemum has now practically run its course, and those who have visited any considerable number of the exhibitions that may be regarded as representative in character, are now in a position to express with some degree of authority their views on the season in relation to years which have immediately preceded it. We have visited many of the competitive gatherings, both in the north and south, and after a careful comparison of them we are strongly inclined to the opinion that the shows may, as a whole, be described as a good average. Some of our friends, whose opinions are entitled to respect, regard the exhibitions that have been held during the past season as below, while others consider them as above, the average of the past few years. Much, of course, depends upon the character of the exhibitions that have been visited by those who readily give expression to their opinions on the superiority or otherwise of the various shows. There is, of course, a consensus of opinion that the societies which devote their attention exclusively to the chrysanthemum do not possess the same degree of strength as that which enabled them to render splendid service in the cause of the flower from fifteen to twenty-five years ago. Societies, on the other hand, that do not set so severe a limit on their usefulness, have suffered less from the change in public taste, and have been able to hold gatherings that have been highly attractive, varied in interest, and financially successful. Of the greatest interest to large numbers of the fanciers of chrysanthemums were the two exhibitions held by the National Chrysanthemum Society at the Crystal Palace. The early October show was of special interest for the aid it rendered in bringing into prominence the most beautiful of the varieties that are available for beautifying the garden and decorating the conservatory and indoor apartments during the months of September and October. On the glorious display that was produced at the end of October by the joint efforts of amateur and trade cultivators much praise might be lavished, but it must suffice to record the fact that it was, in many respects, worthy of the best traditions of the society. There were no classes for the fine and shapely incurved varieties, because the date was so early as to render it practically impossible for these noble flowers to be shown at their best. Provisions were made for them at the Essex Hall show on the 20th inst., and a few of the growers were careful to take advantage of their opportunities for presenting examples of their skill in the growth of the incurved varieties. It is unfortunate this section, on which past generations of chrysanthemum growers lavished much love and skill, should have fallen on evil days, but the fact must be faced and looked at squarely. We regret the decadence of the incurved chrysanthemum, but we should certainly not advise growers to cultivate varieties that are not in accordance with the taste of their employers or themselves. There is also a slight decline in the growth of large flowers of the exhibition Japanese varieties, and there is some diversity of opinion as to the cause or causes by which this change has been brought about. Some growers consider the introduction of the vase classes as the sole cause. The change in the method of staging may have helped to reduce the numbers of large Japanese blooms, but it has not been the only cause. In proof of this, we have only to point out that when we suggested in these pages, some ten or eleven years since, that a few classes should be provided for Japanese varieties in vases, for the purpose of rendering the shows less monotonous, there had been a considerable decrease in their numbers. There was then an appreciable slackening of interest in big blooms on the part of the owners of gardens, and not a few had, after the novelty of prize-winning had worn off, an objection to so much attention being devoted to the production of exhibition blooms. In many instances, this objection was based on their consideration for their gardeners, knowing that the production of blooms of such quality as would bring honours in a keen contest at an exhibition of the first class imposes a heavy strain upon the cultivators. If the incurved varieties are no longer regarded with much favour by either cultivators or the public, and the large blooms of Japanese varieties are less popular than they were a decade or more ago, there is no occasion for those who appreciate the flower in its many attributes of beauty to regard the future of the chrysanthemum with any degree of apprehension. We venture to suggest that at no period in the history of the chrysanthemum in this country has it enjoyed a higher degree of popularity than at the present time. Twenty years ago its culture was, to a very large extent, confined to the glass structures, chiefly in the gardens of the wealthy, and now immense numbers are grown in open beds and borders in the gardens of all classes. The change in the trend of public taste, in its relation to chrysanthemums, has encouraged the raisers to devote special attention to the single, semi-double, and decorative varieties, and the success they have achieved has been such as to place at the disposal of cultivators a wealth of flowers remarkable for elegance and attractive colouring. At practically all the exhibitions the singles are largely shown in baskets, vases, and other receptacles, and some groups of wondrous beauty are arranged with these varieties, notably at Reigate and Windsor. The decorative chrysanthemums, which are really Japanese varieties with medium flowers, are not less valuable in their way, and it would be well were something done beyond what has been already accomplished in defining the class. It has afforded us considerable pleasure during the season to see how little those societies that invited miscellaneous flowers and

MR. A. G. GENTLE.

plants, fruits, and vegetables to their exhibitions suffered from the change of public public taste, as compared with those which confined their shows to chrysanthemums. Many years have elapsed since we first called attention to the necessity of interesting all classes of cultivators in the work of societies which hold autumn exhibitions, and it is to us immensely gratifying that our advice should have been so generally acted upon.

---

**Mr. A. G. Gentle,** gardener to Mrs. Denison, Little Gaddesden, Berkhamstead, has been a most successful exhibitor for a number of years, and has shown vegetables of particular excellence at many of the leading exhibitions. High quality rather than size is Mr. Gentle's ideal. His first important success was in 1900, when he won the Sydenham Challenge Bowl for vegetables at the Royal Aquarium. He also won it the following year, and again in 1902, when it became his property. He holds five silver-gilt and three silver medals from the Royal Horticultural Society for vegetables exhibited during January and February. At the Royal International Horticultural Exhibition he won a silver-gilt and other awards for potatoes, the tubers being almost as fresh in May as new ones. At Birmingham, Liverpool, Norwich, Sandy, Hitchin, Luton, St. Albans, Crystal Palace, Chiswick, Bedford, Dunstable, Leamington, Bletchley, Watford, Hemel Hempstead, and Berkhamstead Mr. Gentle has secured premier awards for vegetables in keen competition. But he does not confine his attention to vegetables. He has been successful with sweet peas and with pentstemons, and gained an Award of Merit this year for Pentstemon Gaddesden Gem. Mrs. Denison has a collection of rare New Zealand and Australian plants, and this Mr. Gentle has managed capitally during his sixteen years' stay at Little Gaddesden. The beautiful Acacia cultriformis flowers grandly in the conservatory at this interesting garden, and flowering growths from it were illustrated in our issue of May 21, 1904. The Royal Horticultural Society subsequently granted a First-class Certificate for this fine species. Clethra arborea does well at Little Gaddesden, and one specimen is about 7ft. high and 5ft. through, and flowers profusely. Mrs. Denison is devoted to her garden, and takes a very keen and personal interest in all Mr. Gentle's successes.

**National Chrysanthemum Society's Exhibitions,** 1913. — The shows to be held by the National Chrysanthemum Society at the Crystal Palace in 1913 have now been definitely fixed for October 1 and 2 and November 5, 6, and 7, and the agreement has already been signed between the society and the authorities of the Crystal Palace. It is hoped that other chrysanthemum societies throughout the kingdom will kindly make a note of these dates with a view, as far as possible, to prevent clashing.

**Horticultural Inspectorships.**—The Board of Agriculture invites applications for two vacant inspectorships in their Horticultural Branch. The salary attached to the posts is £300, rising by annual increments to £400. Candidates must be between twenty-five and thirty-five years of age. The successful candidates will be appointed on probation, and they will be required to satisfy the Civil Service Commissioners within two years of their appointment as to their knowledge of the following subjects: (1) Elementary botany, (2) applied zoology with special reference to the diseases of plants, (3) the cultivation of farm and garden crops, (4) the Acts and Orders of the Board dealing with destructive insects and pests and kindred subjects. Applications must be addressed to the Secretary, Board of Agriculture, 3, St. James's Square, London, S.W., on or before December 1, 1912.

**"Botanical Magazine."**—Coloured plates are given of the following plants in the current issue of this publication: Eriopsis Helenæ, a distinct species, with yellow flowers suffused with red at the margin of the sepals and petals; it is a native of Peru, and flowered for the first time at St. Albans in 1897. Mesembryanthemum Pearsoni, a distinct and striking species, which was collected in 1910 by Mr. Pillans on the eastern slope of a ridge about twelve miles south of Nieuwerust during the expedition to the Orange River led, on behalf of the Percy Sladen Trustees, by Professor Pearson. It has short, thick, fleshy leaves, and from the centre rises a rose-red flower. Cornus controversa, one of the most elegant of small deciduous trees in cultivation. It has slender, erect stems, with horizontal branches, and rather large heads of white flowers. Iris caroliniana, an attractive species, which was first discovered by Mr. W. A. Manda, near Wilmington, in North Carolina, and flowered for the first time in cultivation in the Harvard Botanic Garden. It is rather closely allied to I. versicolor, and has soft purple flowers. Corokia virgata, an interesting shrub, a native of New Zealand, attaining a height ranging from six to twelve feet, and bearing small yellow flowers.

**Proposed Addition to Valentine's Park, Ilford.**—An effort is being made to increase the beauty of Valentine's Park, Ilford, by the addition of about twenty-two acres of land, including a mansion, fruit garden, and rose garden. The Ilford Urban Council is contributing £11,500 towards the purchase money, and £1,720 has been received by the Park Extension Committee, but a further £800 must be obtained by the close of the present month if the effort is to be successful. The acquisition of this piece of land is eminently desirable, as it is a beautiful spot, and would add materially to the attractiveness of Valentine's Park.

**Honour for Dr. Francis Darwin.**—The King has approved of the award made by the Council of the Royal Society of the Darwin Medal to Dr. Francis Darwin, F.R.S., for his work in conjunction with Charles Darwin, and for his researches in vegetable physiology.

**Horticultural Club.**—The house dinner of the Horticultural Club for the coming month will be held on Tuesday next (December 3), when Mr. Arthur W. Sutton will give a lecture entitled "My Desert Camping Tour to Mount Sinai." The lecture will be illustrated by 100 limelight views from original photographs taken by Mr. Sutton. As usual, the dinner will be at the Hotel Windsor, and commence at 6 p.m.

**Carnation Show and Conference.**—The Perpetual-flowering Carnation Society anticipates a fine exhibition of carnations at the Royal Horticultural Hall, on December 3 and 4. The non-competitive displays will be staged on December 3, in conjunction with the usual R.H.S. meeting, but the competitive exhibits will not be staged until December 4, and on that day the society is prepared to set up flowers sent in by amateur members who reside over fifty miles from London, and are unable to attend. The society's annual dinner will be held at the Holborn Restaurant at 6.30 p.m. on Tuesday, December 3, to be followed by the annual meeting, at 8 o'clock. A conference will be held at the Royal Horticultural Hall on Wednesday, December 4, at 3.30 p.m., when Mr. J. S. Brunton will preside, and a lecture on "The Culture of Perpetual-flowering Carnations" will be delivered by Mr. J. Gardner, The Gardens, Batsford Park, Moreton-in-the-Marsh, Gloucestershire. The discussion on this important subject will be opened by Mr. W. E. Wallace, the veteran grower, of Dunstable.

**Variation in Nephrolepis.**—Mr. William Marshall, V.M.H., recently sent an interesting plant of Nephrolepis exaltata todeaoides to the Royal Horticultural Society's Scientific Committee. It appears that after being once potted, it had been allowed to grow as it liked. It had given rise to fronds exactly similar to those of the type of N. exaltata and also to numerous other forms, including todeaoides, some with more, some with less, frequently divided pinnules than that plant. The case of this fern is a very curious one, paralleled, however, by certain other garden plants. The type was introduced from the Tropics about 1793, and gained the reputation of being the most useful of its genus and of wide cultivation. A few varieties were recognised during the nineteenth century, but it was not until after the beginning of the twentieth century that many made their appearance, and since then they have come thick and fast. The first of these apparently came from America, but others have appeared in England since. The striking exhibit of Messrs. H. B. May and Sons in the Science and Education Section at the Royal International Exhibition showed the origin and course of variation in the plants of this genus in a remarkable manner.

**Inoculation of Leguminous Plants.**—During the past two years experiments have been carried out by Dr. Voelcker in a field on plots of lucerne, white clover, and red clover, with a new inoculating material coming from America. This preparation, while much resembling previous ones that have been tried, differs somewhat from them in regard to the method of preserving the culture. In one case the leguminous seed was sown untreated; in the other the seed, previous to being sown, was inoculated with the material in question. One cutting was obtained in 1912 of each crop, the general result for the first year being to show in each case a slightly improved crop where inoculation had taken place. The increase, however, was not sufficiently large to allow of definite conclusions being drawn at this early stage.

**Early Potato Crop in Ireland.**—The report on the cultivation of early potatoes in Ireland, in the current issue of the "Journal" of the Irish Department of Agriculture, gives an interesting account of the development of this new feature in Irish agriculture. The report shows that the results obtained more than justify the action of the Department in inducing farmers in certain districts to enter into the remunerative work of raising early potatoes for market. According to the report, the net return in some instances has exceeded £70 per statute acre; in others more than £60; while upwards of £40 is quite common, the average in one large district being £43 8s. 4d. The crops were planted, the tubers having been already sprouted, in February, and dug in May or June, after which cabbage, broccoli, or turnips were planted, the second crop being valued at £10 to £12 per acre. The districts suitable for this form of intensive culture, of course, are circumscribed, but it is evident that, as regards the natural facilities for the production of early potatoes, Ireland compares favourably with Great Britain. Different types of potatoes have to be grown for the English and Glasgow markets, a kidney-shaped tuber, like the Ninety-fold, being preferred in England, and a round potato in Scotland.

**Town Planning at Croydon.**—A broad stretch of fine open country lies between Waddon Hill and Russell Hill, in the Borough of Croydon, and a scheme of town planning somewhat on garden city lines is to be prepared for dealing with this area of about six hundred acres.

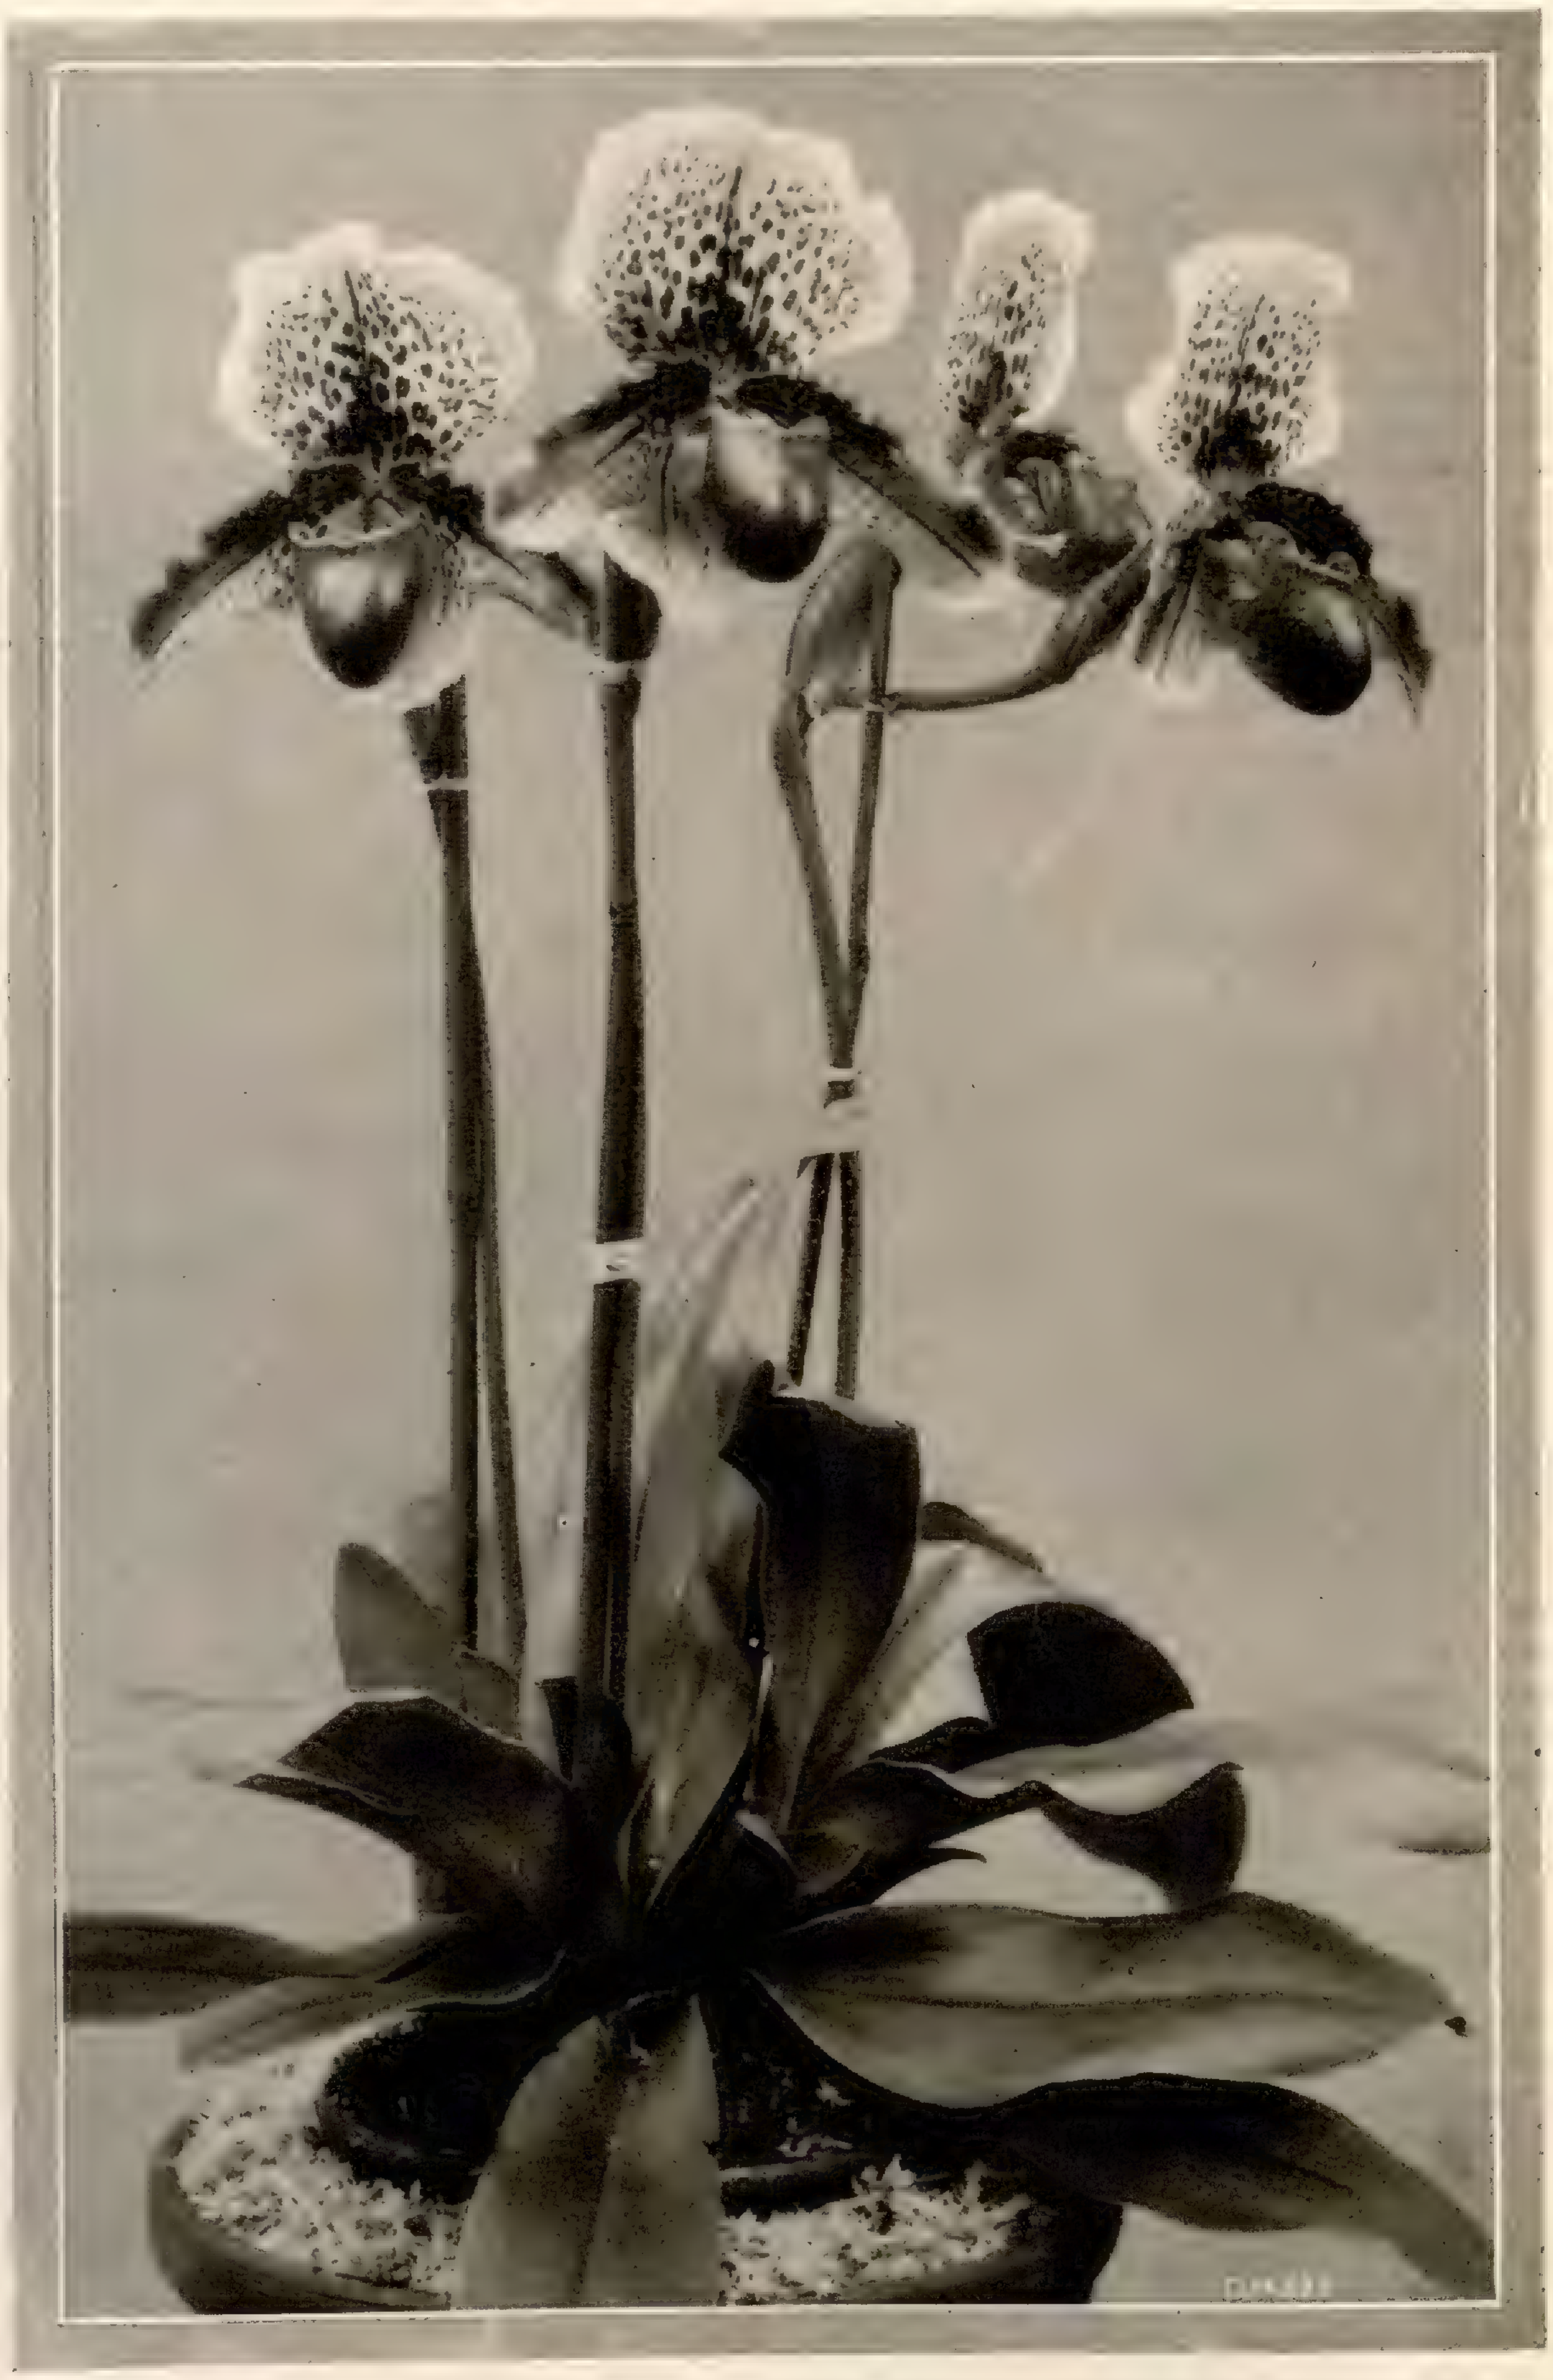
**Albino Form of Geranium Robertianum.**—In reply to an enquiry from the R.H.S. Scientific Committee, Mr. Eric M. Luckin, 58, High Street, Feltham, has written: "With reference to the enquiry as to wild albino forms of Geranium Robertianum, some four years ago I discovered a plant growing in a meadow bearing albino flowers, stems green. The two years following I revisited the spot and found the plant, but this year I failed to locate it, and fear it has been destroyed. The meadow is near Haywards Heath, Sussex."

**Larch Sawfly.**—In view of the injury that has been done by the larch sawfly in plantations in various parts of the country, it cannot be too widely known that an important bulletin on this pest has been published by the Canadian Department of Agriculture, Ottawa. It was written by Dr. C. Gordon Hewitt, and contains the results of investigations made by the author in England and in Canada. Dr. Hewitt holds the opinion that the pest can be controlled in the British Isles by its natural enemies, and the chapter on combating the sawfly by cultivating its parasitic enemies is worthy of consideraton. A description is given of experiments in subduing the pest in this way, and, although for climatic reasons the proceeding has not been effective in North America, it was fairly successful in Cumberland and in Wales. Among remedial measures described are spraying with solutions of arsenite of copper in the proportion of 1lb. to 130 gallons of water, Paris green in the proportion of ¼lb. to 40 gallons of water, or lead arsenate in the proportion of 2lb. to 40 gallons of water; destruction of cocoons; hand picking and crushing; jarring of trees, and tar branding.

**Potato Culture in England and Wales.**—From a preliminary statement issued by the Board of Agriculture we gather that the acreage under potatoes in England in 1912 was 436,948, and in Wales 25,955. The estimated production for the year is 2,113,409 tons in England, and 130,237 tons in Wales, or a total of 2,243,646 tons. The yield works out at about 4.85 tons per acre, and is the lowest since the returns were first made in 1884. The lowest previous tonnage per acre was 4.97, in 1900.

**Glacial Flora of the Grand Duchy of Baden.**—For some years past Dr. P. Stark has been engaged in the investigation of the glacial flora of the Grand Duchy of Baden, and the report on the results shows that the work accomplished was remarkable for its thoroughness. The report deals with both the flowering plants and mosses; and not only are such remains as stems and leaves described, but such matters as pollen spores and fragments of the epidermis. Containing much information on Alpine, Arctic, and moorland vegetation during glacial and post-glacial times, the report is of much interest from the ecological standpoint. The author evinces much caution with reference to inferring great changes of climate from the succession of plant remains in the glacial and interglacial peat deposits, and directs attention to the importance of taking into account ecological conditions other than variations in temperature.

**Eradication of Moss from Grass Land.**—During the past ten years a series of experiments have been conducted by the Cornwall County Council for the purpose of determining the method by which moss in pastures can be the most effectually eradicated. The four plots set apart for the purposes of the trial were manured as follows, the quantities of the fertilisers used being calculated at per acre: Plot 1.—6 cwt. superphosphate and 6 cwt. fine bone meal, applied separately. Plot 2.—6 cwt. superphosphate and 6 cwt. fine bone meal, applied at the same time as the manures on Plot 1, but mixed three months before. Plot 3.—6 cwt. basic superphosphate. Plot 4.—6 cwt. superphosphate. On Plots 1 and 4 the moss turned brown in from a week to ten days after the application of the manures, while on Plot 2 no appreciable effect could be observed until late in the autumn of the second year. In the case of Plot 2 the acid of the superphosphate had been neutralised by the bone meal. Close observation has shown on several occasions that on Plot 1 the acidity so affects the carpet of moss, which has often stood from 2 to 3in. high on the poor pasture upon which the experiments have been conducted, that the manure soon reaches the soil below, and takes effect. On Plot 2, on the other hand, the manure, which may be seen lying upon the carpet of moss months after it has been applied, is powerless to either injure the moss or to reach the soil below. The results of the trial should be of much interest to those who have mossy lawns under their care.



CYPRIPEDIUM ELATIOR.

A very effective hybrid, with yellowish-green sepals, petals and lip, and a white, purple-marked dorsal sepal. F.C.C., R.H.S., November 19. F. Menteith Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford. (See p. 916.)

## THE LOGAN BERRY.

Although the logan berry has failed to fully justify the highly optimistic views to which expression was given by some cultivators on its introduction to British gardens it has proved of much value as an aid in increasing the supplies of soft fruits during the summer season. It has not, for example, supplanted the raspberry as some writers thought it would do, but its failure to accomplish that which would have been most undesirable, can hardly be regarded as a defect. It is, in the present state of our knowledge, difficult to understand why it should have been thought by anyone acquainted with the various kinds of soft fruits that the logan berry would prove so far superior to the raspberry that it would, in course of time, take its place. The two fruits belong to the same Natural Order, and possess a family likeness, but in other respects they are so distinct as to hardly come into competition with each other. This fact is now recognised by those who are well acquainted with the two fruits, and they are planted in such proportions as may be deemed advisable after fully considering the demands that are made by the household on the fruit supplies.

The logan berry is, in its way, a most valuable fruit, for, while it does not possess the richness of flavour characteristic of the raspberry, it has a flavour of its own that is much appreciated by many. It can hardly be regarded as a high-class dessert fruit, but for use in a cooked state, for conversion into jam, and for bottling, it cannot be too strongly recommended. The fruit possesses sufficient briskness to prevent it becoming insipid when bottled in syrup or made into jam, even when the sugar is used rather too freely.

As well known at the present time, the growth is so robust as to resemble, in some respects, that of the strong-growing blackberries, and therefore requires considerable space for its full development. The growths range, under normal conditions, from twelve to fifteen feet in length, and under exceptionally favourable conditions I have had them attain a length of twenty feet. With so wide a spread of branches it follows that the plants require considerable space and tall supports, and both must be given them to ensure a full measure of success. Boundary fences, ranging in height from six to eight feet, may be utilised in supporting them with the most satisfactory results. If they are to be grown in the open quarters a trellis about eight feet high should be provided, and if they are to be grown in parallel rows a ten-feet space should be allowed between them. In the formation of the trellises larch poles, five or six inches in diameter and ten feet in length, are used, and these are sunk in the ground to a depth of two feet to ensure their being so firmly fixed as to enable them to withstand the effects of strong winds. To connect the uprights together three or four strands of strong wire are stretched between the poles at equal distances apart, and secured to the uprights by means of staples of moderate strength.

To afford the plants room for their full development, arrange them about ten feet apart in the rows, but if it is desired to fill the space as quickly as possible put them six feet apart, and when they are becoming crowded take out every other plant. Autumn is the best time for planting, and in carrying out this operation open out a hole large enough for the roots to be spread out horizontally, fill in the soil about them with some care and tread firmly. Suckers are not very freely produced, but there will be no difficulty in obtaining ample supplies from the nurseries. It is advisable, as in the case of raspberries, to cut the canes down to within six inches or so from the ground level to obtain in the first year strong growths from the base.

The subsequent management will consist chiefly in cutting close to ground the growths that have fruited soon after the crop has been gathered. This is essential to allow space for the young growths to attain their full size and become well ripened. It sometimes happens that these are so numerous as to suggest injury from overcrowding. When this is the case, reduce their number to about two-thirds by the removal of those which present a weakly appearance. When the old growths have been removed, and the young ones have been thinned, train them to the wires, and in spring take from twelve to eighteen inches off the top, the proper rule being to cut them back to the firm wood. To logan berries growing on light soils a mulch of partly-decayed manure will be of considerable assistance. R. W.

## A BEAUTIFUL SPRING BED.

As spring bedding, or rather the display it produces, is of comparatively temporary character, seldom lasting in full beauty more than a month, or six weeks at the most, it is one of its essentials that the plants to be used for the purpose should not be difficult to raise. Few people who call themselves gardeners leave their flower beds vacant during the winter and spring, but spring bedding is still regarded by some as extra work which should be reduced to a minimum.

The bed to be described consists in part, or mainly if so desired, of the Leopard's Bane, known as Doronicum plantagineum excelsum, which has attained such widespread popularity during the last dozen years or so. Apart from the brilliant effect it produces in April and May, its large green leaves give an appearance of modified luxuriance during the winter which is very welcome. It is easy to propagate, the best time being as early in March as the soil is in good condition, when a nursery bed should be prepared, and some spare clumps taken up and pulled to pieces, every little piece with any root attached forming a nice plant by October, and needing no further trouble or attention after being planted unless the season is abnormally dry. A further advantage is that this plant will grow equally well in shade or sun, so that the best positions need not be given up to it, either for rearing the plants or flowering them.

This Leopard's Bane forms the framework of the bed and a setting for the bulbs to be planted in it. The kind of bulbs to be used depends upon the size of the clumps of Leopard's Bane, and the distance apart at which they are planted. For the sake of colour contrast tulips are better than narcissus, but in any case the bulbs should be planted in groups or clumps rather than singly. A good tulip to use for the purpose is the popular Keizerskroon, the golden-yellow and crimson forming both a blend and a contrast with the paler yellow of the Leopard's Bane. If later tulips are used they should be tall kinds, such as the Darwins, or some of the May-flowering section. Hyacinths are rather too formal for a free-growing bed of this kind, and rather too short as well, but there is no fear of any shade of tulip or hyacinth clashing with the clear yellow of the doronicum.

ALGER PETTS.

## RAIN AND IVI TREES.

In the paper read by Sir Everard Im Thurn, K.C.M.G., at a recent meeting of the Royal Horticultural Society on "Plant Life in a Tropical Island," the following reference was made to the Rain and Ivi trees in Fiji.

For my present purpose it is unnecessary to dwell long on the beauty, real though this is, of Suva. The gardens and open spaces, even over-filled with luxuriant but too unrestrained tropical vegetation, are more or less bright throughout the year with the too ubiquitous hibiscus, ixora, dracæna, oleander, croton, coleus, and bamboo. There are, however, two features in the vegetation outside the garden limits proper which are so prominent as to demand a few words of comment; these are the "Rain-trees" and the "Ivi-trees"—the latter the so-called "Tahiti chestnuts."

The rain-tree is the Inga Saman or Pithecolobium Saman of botanists. It is a native of tropical America, but because of its beauty and the splendid shade which it throws, it has been carried by white men to almost all tropical places, and has been largely planted as a town and road-side tree.

But in Fiji the rain-trees, like most other trees, do not grow as luxuriantly as in other tropical places, because of the occasional hurricanes. A row of these trees, planted quite long enough ago to have become perfect specimens elswhere, stands on the sea side of the road for more than half a mile from the Suva landing wharf up to the entrance to the Government House land; and twice during the six years I knew them hurricanes have bowled them over like a set of ninepins; and twice, at my intercession, they have been successfully set up again. But though under this treatment by nature and art they have not come to perfection, yet for a few mornings each spring I have been refreshed by the pale bright green of the soft young leaves, and the little tassels of pink flowers which at that season burst from the swelling leaf-buds of the rain-trees.

By the way, as I still often see in the corners of newspapers wonderful stories of the alleged reservoir-like qualities which are supposed to give the popular name to this tree, I may as well here explain the foundation of these yarns. It is noticeable that in very dry weather more moisture reaches the ground covered by the spreading branches of this tree than elsewhere. What happens is that the leaflets seem to have some power of accumulating the dew which falls at night even in the driest weather. At nightfall they fold together and hang downward (as in the better-known case of the "sensitive plant"), gradually discharging the accumulated moisture from each leaf-point, sometimes so abundantly that, to anyone standing in the early morning under one of these trees, the effect is as of a shower of rain.

The other tree which will certainly attract the stranger in Suva is the ivi, or native chestnut (Inocarpus edulis Forst). A group of gnarled and evidently old ivi trees occupies the greater part of the swampy paddock which lies between the sea and the hill on which Government House stands. The large roots writhe like great snakes over the ground; and from these roots rise the great buttressed trunks which carry the few twisted giant trunk branches. These magnificent old trees are splendidly beautiful in themselves, and should interest the plant-loving traveller in that each of their branches is in itself a wonderful garden of interlacing orchids, ferns, hoyas, and other plants in almost incredible variety. The Fijians formerly made much use of the fruit and timber of the tree, and planted it about their houses. The particular clump of which I have been speaking marks the site where the native town of Suva stood till, in 1882, the Fijian inhabitants were bought out and induced to remove to the other side of the bay, in order to make room for the modern town of Suva, the capital of the Colony.

## NEW PLANTS, ETC.

### CHRYSANTHEMUMS.

Mrs. G. W. C. Drexel.—A very large, spreading Japanese variety of good exhibition form. The long florets curl loosely and incurve a little at the points. Light silvery-pink about describes the shade of colour. F.C.C., N.C.S., November 11. Messrs. W. Wells and Co., Merstham.

Miss Mary Otter.—A medium-sized single variety of good form and substance. Rich golden-yellow. Commendation, N.C.S., November 11. Messrs. W. Wells and Co., Merstham.

Mrs. J. G. Day.—A fair-sized Japanese variety, with broad florets that curl somewhat at the tips, and make up a pleasing flower. The colour is very effective—rich golden-amber. F.C.C., N.C.S., November 11. Mr. H. J. Jones, Ryecroft, Lewisham.

Thorpe's Amaranth. — A medium-sized Japanese variety of decorative value. The colour is rosy-amaranth, with silvery-rose reverse. F.C.C., N.C.S., November 11. Mr. H. W. Thorpe, Worthing.

Ivor Grant.—A very beautiful, medium-sized single variety of excellent form and substance. The colour is bright rose-pink with a white zone round the dark yellow centre F.C.C., N.C.S., November 11. Mr. G. Mileham, Emlyn Gardens, Leatherhead.

Mdme. Depree.—A large incurved variety, solid, closely incurving, and with bluntly-pointed florets. The colour is cream-white, with a very pale blush tint on the outer florets. F.C.C., N.C.S., November 11. Mr. H. W. Thorpe, Worthing.

Juno.—A giant single variety with wonderful flowers, seven or eight inches across, and of a deep reddish-rose colour; there is a narrow white zone round the eye, and some of the florets are tipped with white. F.C.C., N.C.S., November 11. Mr. H. W. Thorpe, Worthing.

Prince of Wales.—A large and handsome Japanese variety that should prove useful alike for exhibition and general use. The florets are fairly broad, and of moderate length, and a few of them show the bronzy undersides. The general colour is rich crimson. F.C.C., N.C.S., November 21. Mr. Norman Davis, Framfield.

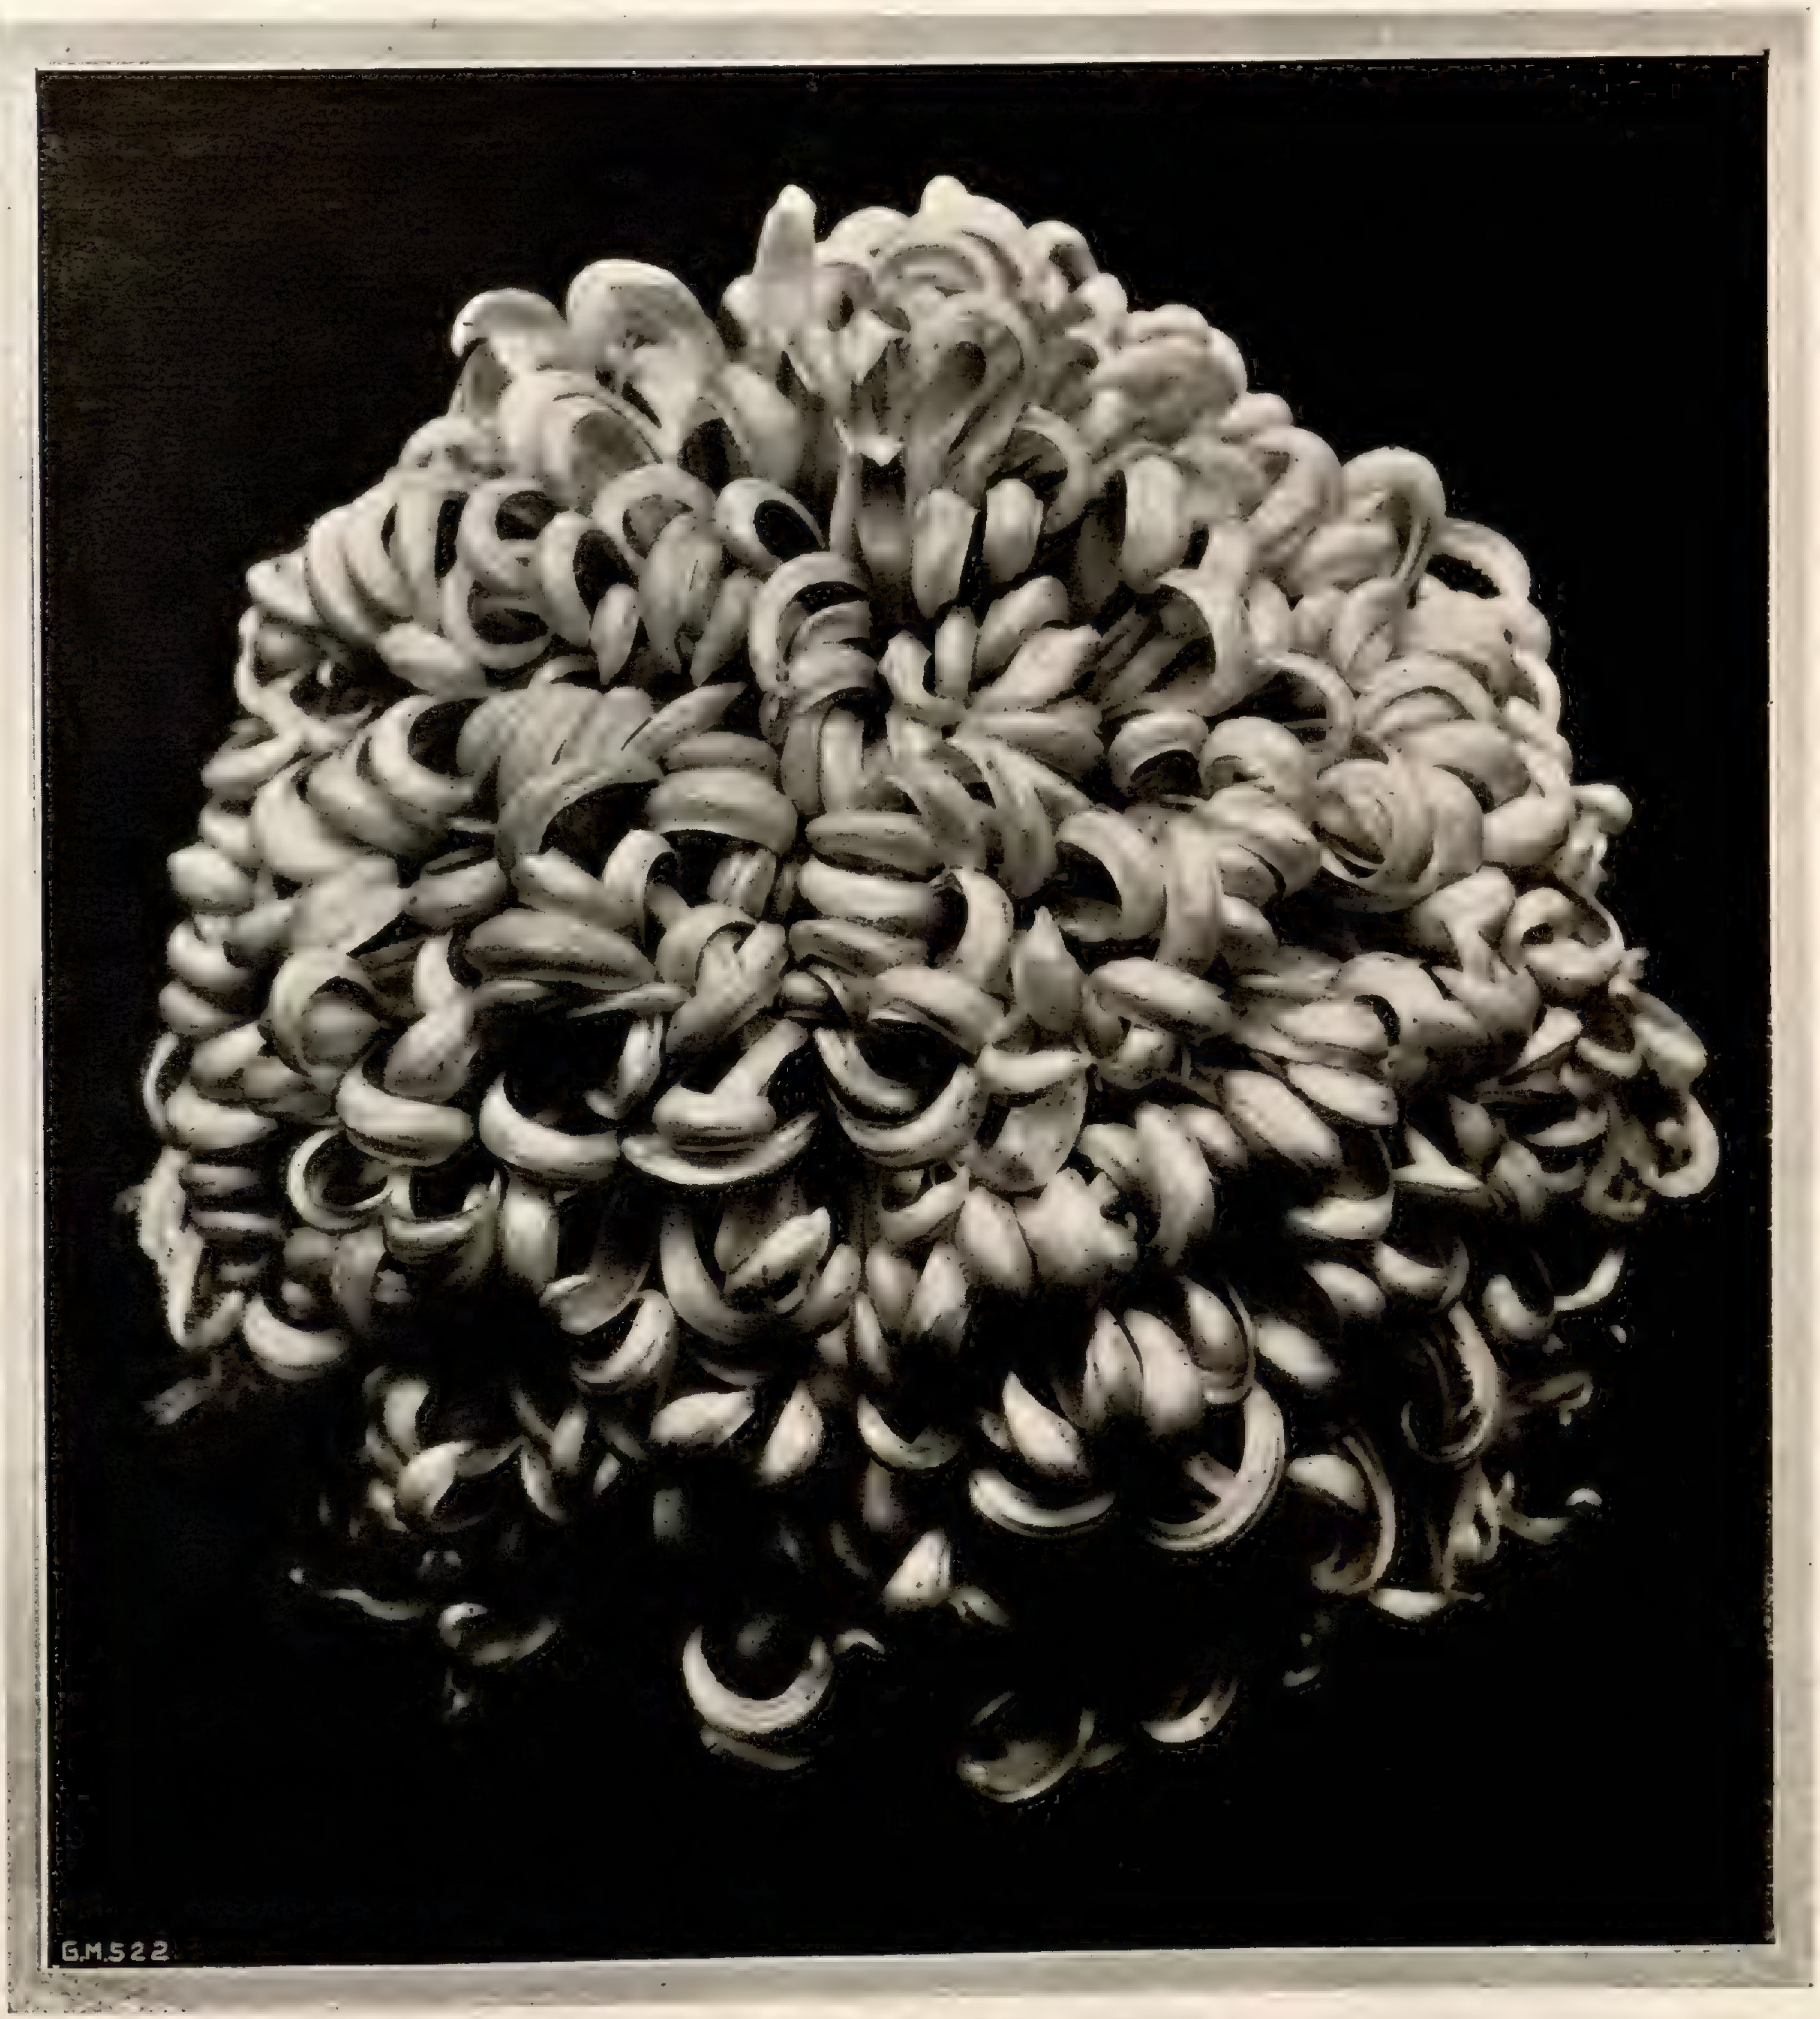
Bronze Beauty. — A delightful single variety, large-flowered, of excellent form and substance; the florets broad and blunt-tipped. The colour is a beautiful shade of orange-bronze. F.C.C., N.C.S., November 11. Mr. Philip Ladds, Swanley Junction.

Ethel Mortimer.—Another splendid large-flowered single, with three or four rows of florets. Fine form and substance. The colour is clear golden-yellow. F.C.C., N.C.S., November 11. Mr. Philip Ladds, Swanley Junction.

Cynthia. — A particularly handsome medium-sized Japanese variety of good decorative form. The colour is vivid crimson-amaranth or wine-red. Commendation, N.C.S., November 11. Mr. Walter Jinks, Thames Ditton.

Rowena.—A charming single variety of large size and good form. There are two rows of deep chestnut-crimson florets, and a narrow yellow zone round the dark yellow eye. F.C.C., N.C.S., November 11. Messrs. Cragg, Harrison, and Cragg, Heston, Hounslow.

Royalty.—A very showy medium-sized single variety of great beauty. The colour is bright



CHRYSANTHEMUM MRS. DREXEL.

A new Japanese variety, of large size and light silvery-pink colour. F.C.C., N.C.S., November 11. Messrs. W. Wells and Co., Merstham.

crimson, almost crimson-scarlet, and a shade that is wonderfully effective under bright light. F.C.C., N.C.S., November 21. Mr. Norman Davis.

Joey Saunders.—A very showy large-flowered single variety, with three rows of firm, shapely florets of a beautiful golden-buff shade. F.C.C., N.C.S., November 21. Mr. L. Lawrence, Shoreham, Sevenoaks.

Mrs. Roger Gregory.—A medium-sized single variety, with broad pink florets and a white zone round the yellow disk. Commendation, N.C.S., November 21. Mr. Lawrence, Shoreham, Sevenoaks.

Mrs. W. T. Smith.—A refined large-flowered Japanese variety, pure white, with broad, loosely incurving florets. A.M., R.H.S., November 21. Mr. A. Smith, The Convent Gardens, Roehampton.

Miss May Fox.—A large-flowered Japanese variety, soft pale yellow, with greenish-yellow centre. The florets are long and drooping. A.M., R.H.S., November 19. Mr. H. J. Jones, Ryecroft, Lewisham.

Michael Harrison.—A very handsome large-flowered single variety. It is reddish-bronze with a zone of yellow round the disk. A.M., R.H.S., November 19. L. F. Harrison, Esq. (gardener, Mr. A. Chapman), Orchards, East Grinstead.

### LÆLIO-CATTLEYA BELLA ORCHID DENE VAR.

An especially large-flowered and handsome form of the hybrid between Lælia purpurata and Cattleya labiata. The sepals and petals are light purplish lilac, and the lip is deep crimson-purple, with a white base. F.C.C., R.H.S., November 19. Mr. E. H. Davidson, Orchid Dene, Twyford.

### CYPRIPEDIUM ELATIOR.

A very showy, attractive, and yet refined flower, and a particularly good form of the hybrid between C. Leeanum and C. Baron Schroder. The petals are yellowish-green, shaded with purple, and the rounded dorsal sepal is white, freely marked with deep wine-purple. F.C.C., R.H.S., November 19. F. Menteith Ogilvie, Esq. (gardener, Mr. Balmforth), The Shrubbery, Oxford.

### WINTER-FLOWERING BEGONIAS.

The following varieties have been obtained by crossing B. socotrana and tuberous-rooted varieties.

Eclipse.—A semi-double variety, with a profusion of salmon-red flowers. Among the semi-double flowers are numerous single, fertile ones. A.M., R.H.S., November 19. Messrs. Clibrans, Altrincham.

Splendour.—This is a very useful variety, free-flowering, and of excellent habit, and bears an abundance of semi-double flowers of deep scarlet hue. A.M., R.H.S., November 19. Messrs. Clibrans, Altrincham.

Lucy Clibran.—A very distinct variety, strong-growing, and with large foliage and flowers. The latter are often three inches across, and the colour is buff, suffused with rose, the younger flowers showing a light orange tinting. A.M., R.H.S., November 19. Messrs. Clibrans, Altrincham.

Scarlet Beauty.—This has medium-sized, semi-double flowers of a bright scarlet shade, and these are freely produced; the plant is most effective. A.M., R.H.S., November 19. Messrs. Clibrans, Altrincham.

### CARNATIONS.

Snowstorm.—A beautiful white perpetual variety, large, fringed, and very fragrant. (See illustration on p. 893.) A.M., R.H.S., November 19. Mr. W. Lawrenson, Yarm-on-Tees.

Mary Allwood.—A fine, clove-scented perpetual variety, the flowers large, stems good, calyx entire, and the petals broad and smooth. The colour is salmon-red or rich rosy cerise. A.M., R.H.S., November 19. Messrs. Allwood Brothers, Wivelsfield, Hayward's Heath.

Salmon Enchantress.—A salmon-coloured sport from the well-known perpetual-flowered Enchantress, and of equal merit. A.M., R.H.S., November 19. Messrs. Allwood Brothers, Hayward's Heath.

## FRUIT AT MESSRS. W. SEABROOK AND SONS' NURSERIES.

We can imagine nothing more gratifying to a man imbued with an intense love of horticulture than that he should, from small beginnings, and by the exercise of his own energies, perseverance, and skill, build up a sound and extensive nursery business, and attain to a high and honoured position among the leading authorities in the particular branch which he has made his speciality. A striking example of such a man is Mr. W. Seabrook, of The Nurseries, Chelmsford, who for nearly half a century has devoted himself to a close study of all that concerns fruit culture in the British Isles, and is to-day proprietor of extensive, well-stocked fruit nurseries at Springfield, and Boreham, Chelmsford, as a result of personal care and labour for the past thirty years.

The headquarters of the firm are situated in a delightful spot at Springfield, about a mile from the town of Chelmsford. It stands on sloping ground surrounded by verdant meadows, except on one side where runs the main line of the Great Eastern Railway. It is on this nursery that Mr. Seabrook has carried out his many experiments, not a few of which have resulted in the discovery of improved methods of culture and treatment of our more important fruits. Quite early in the days of the paradise stock our friend appreciated its possibilities, and in a thorough and systematic manner he set to work to prove its value as a stock upon which to work apples for commercial purposes. It was not long before the discovery was made that all paradise stocks were not of equal merit, and with characteristic judgment, a selection of the best and most useful of them was made, and the stocks themselves were propagated from individual roots that proved to be productive of the best results. The wisdom and economic advantage of this course is evident to-day in the fine quality and productiveness of the trees grown by the firm. Almost any variety of apple may be seen in the form of well-grown trees, with abundant fibrous roots, which run wonderfully near the surface of the ground, inducing early and prolific cropping. The fact that the point of union between graft and stock is almost invisible, even in quite young trees, is strong evidence that the stocks used are capable of bringing the trees into free bearing at a very early age.

The month of October was at an end when we paid our visit of inspection, but even so late as this we saw bush trees about five feet in height carrying heavy crops of fruit. That handsome apple Bismarck was most conspicuous by reason of the quantity of large ruddy fruits that hung on trees protected by nets from the attentions of birds. This apple is held in high esteem by Mr. Seabrook, and large quantities of it are worked annually. Cox's Orange Pippin does extremely well at Chelmsford, and is consequently very largely grown. Here again we were told that the success is mainly due to careful selection of a type of stock that has proved exactly suited to the variety. Some idea of the extent to which fruit trees are produced by the firm was obtained from the fact that an order had just been accepted for ten thousand maiden Cox's Orange Pippin, and later in the day we saw the splendid "break" from which this big batch of trees would be drawn. This was at the Boreham Nursery, about four miles out from Chelmsford, where the firm has just added over forty acres for necessary extensions, both to the fruit tree and rose departments.

To quote a few figures, it may be said that there are a hundred thousand maiden trees on paradise and crab stocks; thirty to forty thousand two-year-olds and about as many three and four-year-olds. There is a fine batch of five or six thousand horizontal-trained trees, with, on an average, three or four tiers, and thousands of standards and half-standards. We made no note of the exact number of varieties grown, but can safely say that it would be a difficult matter to name a really first-class apple not included in the splendid collection.

There are, as everyone knows, a few sorts of both dessert and kitchen apples that every grower needs, and it was no surprise to us to find big batches of Lord Grosvenor, Lord Derby, Bramley's Seedling, and Warner's King, all of which are apples of high reputation as excellent croppers and cookers. King of Pippins, Worcester Pearmain, Allington Pippin, and Ribston Pippin may be named as the most popular of the dessert varieties after the prime favourite, Cox's Orange, which, without a doubt, is the best apple to grow where it will thrive as it does at these nurseries.

It is not only the maidens and quite young trees that do well here, but the large quantities of older trees in permanent quarters are equally fine, there being no sign of disease or the ravages of pests, but abundant evidence that the trees are in prime condition for the production of paying crops. The firm, by the way, make the production of fruit for market and for private customers equally important branches of the business as the propagation of young trees for sale, and those who have seen the highly creditable exhibits of home-grown fruit staged at the R.H.S. and other shows will be by no means surprised to read that the fruit rooms were found well filled with fruit of high quality. Mr. Seabrook has great faith in fruit growing for profit in this country, and entertains not the slightest fear of either colonial or foreign competition. He stipulates, of course, that the fruit farmer must have a thorough knowledge of his business, must have suitable land, and exercise judgment in selecting varieties suitable to his land and situation. He must spray and grease-band in season, prune wisely, and nourish liberally; and, having obtained his crop, he must grade and pack sensibly, and keep a keen eye open for the best market.

One matter that gave a clue to the whole secret of the success of this firm was forthcoming when we were shown a quarter of Lady Sudeley, an early apple of splendid market qualities. Mr. Seabrook soon found that this apple, on the richer soil in one part of his plantations, produced wood and foliage at the expense of fruit, whereas on poorer, shallow land at the top of the nursery the trees fruited freely. This was sufficient to show that the right course to adopt with this apple is to grow on poor land, but to feed liberally while the fruit is developing; and, thanks to the fibrous-rooting stocks used, the trees on the rich soil were lifted and successfully transplanted even at ages ranging from twelve to fifteen years.

We were much interested in a grand stock of black currants, which are as healthy a lot as ever we have seen. It is an early variety which has not yet been named; but the great thing is that it has not been affected with the terrible big-bud scourge, and customers have informed Mr. Seabrook that, even when planted beside affected bushes, the Seabrook stock has remained perfectly clean. Pears, too, are well and largely grown. Beurré Clairgeau is a special favourite here, and is spoken of as the most profitable variety to grow.

In a range of light, airy houses, some fine peach trees were seen, and, in reply to our remarks upon their splendid condition, Mr. Seabrook ventured the statement that the secret lies in the fact that the trees are not neglected after the crop is gathered, but are carefully nourished and kept thoroughly clean during that period when they are storing up vitality in readiness for next season's work.

Mr. Seabrook is assisted in the business by his two sons, who, having obtained business training elsewhere, joined their father, and now conduct the office work, attend exhibitions, and, in a whole-hearted manner, work together with one common ambition, i.e., to carry the name and fame of Seabrook and Sons still further.

## THE LING.

The common form of Ling—Calluna (or Erica) vulgaris—is more or less familiar to everyone, from the fact that it is the popular heather of our hills and moors, and during August and September it transforms them into glowing sheets of ruddy purple, presenting a colour picture of rare and refreshing beauty. The conditions under which it succeeds are generally indifferent in character, and as it withstands great exposure there is every reason for planting it extensively in gardens or grounds of a semi-wild nature.

The type has given rise to numerous varieties, and it is to these that planters should specially direct their attention, as they include some of our most beautiful hardy Ericaceous plants. Like the type, they succeed best in a sandy loam, although in this respect they are not fastidious, provided lime is not present, as in a soluble state this substance is highly injurious to the roots. The Ling is an evergreen, hard-wooded shrub, and requires the soil made very firm at planting. It is also beneficial to the plants to clip them over after flowering, as this induces a denser habit, and with those that are naturally dwarf, the result is a close, compact carpet of verdure.

Where the garden proper extends into the grounds, many positions will occur for including varieties of Ling. They are admirable as foreground subjects to azaleas, rhododendrons, kalmias, and allied plants, and with liliums like L. Hansoni, L. testaceum, L. umbellatum, L. tigrinum, and L. croceum inter-grouped among them, a woodland picture of great beauty will generally result. Probably the most popular varieties of Ling are Hammondi and Searlei; both have white flowers, and they form strong bushes up to two and three feet high. The latter is the most attractive, as the foliage has a definite mossy character that appeals to one, irrespective of the flowers. The variety flora plena is a most captivating subject, with silvery-purple flowers in the form of miniature rosettes; it is more spreading in habit than the foregoing, and bears clipping with impunity. Alporti forms a large bush with dark-coloured foliage and bright crimson flowers. Pilosa, pumila, and rigida are dwarf white-flowered forms; and hypnoides and pygmæa are purple coloured, also dwarf. Argentea and aurea are silvery and golden-leaved respectively, the former more compact in growth than aurea.

A most successful instance of the judicious use of the varieties of Ling, on an extended scale, is to be seen in the grounds of Pyrford Court, near Woking, the property of the Hon. Rupert Guinness. Each variety is massed in quantity and due regard given to the habit and colour of each, both as disclosed by the flowers and the foliage; and from the latter alone a most interesting colour scheme results, to which the pine trees and rustic stone paths form a most picturesque setting. Thomas Smith.

Coombe Court Gardens,
Kingston Hill.

**A Heavy Crop of Potatoes.**—I have weighed and sorted an enormous crop of Factor potatoes. I used Scotch seed, a liberal dressing of Webbs' Special Potato Manure, and sprayed the haulm twice with Woburn mixture. They came out at 22 tons 10 cwt. to the acre, of which 18 tons are ware and the rest seed and chats. In this part of the country potatoes are not good.—J. S. S. Godwin, James House, Hadlow, Kent.

## PLANTING FRUIT TREES.

### Choice of Site.

Among the many impressions made upon the observer who has travelled amongst the orchards and fruit plantations of this country, the one which often strikes him most is the immense importance attaching to a right or wrong choice of a site for the orchard or plantation.

Fruit is so often planted in a haphazard manner, just anywhere, without proper thought and care being bestowed upon the question as to whether the field is suitable in any way.

The last few years has seen such a revolution in questions of transport, a revolution which is only just beginning, and has not yet reached the full extent of its possibilities, that one of the chief factors which formerly governed the choice of a site for fruit growing is fast losing its significance, i.e., the relative position of the proposed site to the market or markets it hopes to serve. At one time it was essential that it should be situate either within easy road distance of the market, which certainly limited it to twenty miles' radius, or close to a railway station with a good service of trains.

With the great strides which have been made in motor traction, the distance which fruit can be profitably carried by road has been certainly doubled, if not trebled, while in many cases it has rendered the grower absolutely independent of the railways for the carriage of his produce. Thus, one of the big factors in deciding on a site for fruit growing has been, to a great extent, eliminated. It is possible to give, therefore, greater attention to, and to be more discriminating in, the choice of the site, as judged from other standpoints.

The two great factors which remain are soil and site. Is the soil suitable, from the point of view of texture, and from its natural chemical constitution, and how does the land "lie" with respect to the surrounding country, and also with regard to its "tilt," if any?

First as regards "soil." The very best soil, from an all-round point of view, for fruit growing, that is, best to suit all kinds, is a good "holding" loam of a depth ranging from two to three feet, and has been well drained. Such a soil will grow healthy trees of all kinds of fruit, which will be of good size, the only point on which it may fail is in the colour of the skin, which may not be so good as some grown on more shallow and hotter lands.

The lighter loams, almost amounting to sands, which are often of good depth, are not quite so good as that just mentioned, and they are certainly poorer, and require more given to them in the way of manuring, but still must be considered favourable for fruit growing. Another type of soil frequently met with, which grows good and highly-coloured fruit, is a loam, often light, overlying a deposit of gravel. Very frequently the surface soil is of very little depth, and in such cases considerable quantities of manure rich in humus is needed, but if the requirements of the soil in this direction are attended to excellent fruit can be grown, while the colour will be unequalled by fruit produced on any other type of soil.

In contradistinction to the above there is a type of soil on which fruit should not be planted, in the opinion of the writer, that is a thin loam, often heavy, sometimes light and gravelly, overlying a stiff clay subsoil.

Trees in this soil grow fairly well for the first few years, while the roots are in the top soil, but when they reach the cold subsoil all sorts of trouble set in, and often, as in the case of apples, the trees are doomed.

A thoroughly clayey soil may suit some sorts of fruit, plums and black currants, and, to some extent, gooseberries, fairly well, but as it is so difficult to work, and costly in comparison with better soils, it cannot be said to be favourable for fruit culture.

With regard to the chemical constituents of the soil it is frequently, if not always, possible to supply any deficiency there may be found to exist in the soil on which it is intended to plant fruit, but it is advisable, in the case of badly worked, exhausted land, to bring the soil into a better state of cultivation some year or two before planting by the application of the necessary organic manure to supply humus, and also by the supply of chalk to renew any shortage there may be in the lime content of the soil.

The other point concerning the situation and aspect of the land is almost as important as that of the nature of the soil itself.

In the first place, low-lying land at the bottom of a valley, or in a hole anywhere, should not be chosen, as the frost in the spring always gathers in such places, and the damage is always more serious than on higher ground.

On the other hand, it is seldom wise to choose the top of a hill that is at all bleak and exposed to severe winds, as the fruit is likely to be dashed to the ground before it is mature enough to pick, and the trees themselves will often be damaged by being thrashed about by gales. The best position is midway between these two extremes, and, if it is possible, the land should have a slope towards the sun, that is to the south or west.

Such land is always slightly warmer than a dead flat, and appreciably so than lands which tilt either to the north or east.

It may be extremely difficult, in fact, impossible, to find a plot of land which fulfils to the full all these requirements, but if the intending planter has in mind that which is most desirable in every way, he can thoroughly weigh all the advantages and drawbacks any proposed plot may have, and then, after mature consideration, decide for himself the wisest course to pursue.

Pilgrim's Hatch. F. Hammond.

## COTONEASTERS.

The rockfoils, or cotoneasters, are an important group of shrubs, insomuch that the genus includes some of the most showy fruiting shrubs to be found in the garden, that some of the species are really good evergreens, and that nearly all the kinds thrive without any special cultural attention. Considerable variation in habit is noticed among the species, for while certain ones grow into very large bushes, or almost small trees, others rarely rise more than a foot or two above the ground, whilst at least one kind is of trailing habit. Their uses are many, for they are equally at home in shrubberies and specimen beds; some form handsome isolated specimens, others are useful for covering walls, while the strong-growing sorts may be planted about the outskirts of plantations. They have also the advantage of being suitable for both coastal and inland gardens, and of not being fastidious regarding soil, although that of a loamy character is most suitable.

Propagation is effected in a variety of ways. Seeds are the best means of increase for some kinds; in other instances cuttings prove more satisfactory; branches may be layered, and now and then plants are grafted. Little can be said against either of the three former methods, although there is really no necessity for layering, but cultivators should be warned against grafted plants. When propagation is carried on by grafting, the common whitethorn is usually selected for the stock. This produces suckery shoots rather freely even when quite a small section of stem is left between roots and scion, and it is a very difficult matter to keep them cut away after the cotoneaster has attained a fair size.

The rockfoils do not require much pruning, except when they are outgrowing their positions. In such cases it is an easy matter to draw out the longer branches during winter. When grown against walls it is a good plan to cut long shoots back or the weight of the front growth will probably tear the main branches from the wall. Insect pests do not trouble the cotoneaster much, although aphis and scale may now and then put in an appearance. The former may be destroyed by syringing with a solution of soft soap and quassia chips and water, and the latter by syringing several times during April and May with paraffin emulsion.

The genus is composed of about fifty species, some of which have been known for half a century or more, while others have but recently been introduced. They are widely distributed, some occurring in Europe, others in Asia, and the remainder in America. The headquarters of the family appears to be the Himalayas, but many are found in China. Those from the Himalayas and China are the most useful for decorative purposes. The American kinds do not appear to be in cultivation, but from herbarium specimens they seem to be less showy than the best of the generally known kinds, although they are very distinct.

In the following notes attention is directed to the most suitable sorts for garden use.

C. applanata.—This is a new species from Western China, which was introduced to British gardens early in the present century by Messrs. Veitch, who received seeds from their collector, Mr. Wilson. It is a tall-growing shrub, of rather loose habit, with small, broadly-oval leaves, which are silvery by reason of a dense pubescence on the under-surface, and dark green above. The flowers appear in small clusters from the leaf axils during May, and they are succeeded by bright red fruits, which commence to colour about the end of August. It promises to be quite one of the most ornamental species, and is likely to be widely grown in the near future.

C. bacillaris is a large-growing kind from the Himalayas. Mature bushes may be anything between twelve and twenty fee high, with a wide spread. The deciduous leaves are ovate in shape, and the white flowers are borne in flattened heads from axillary buds in May. They are followed by dull reddish-purple fruits, which are ripe in September. It is a good kind to use about the outskirts of a plantation, or at the back of a shrubbery, where a good block plant is required, but it is not one of the most showy species.

C. bullata.—So far as can be seen of this species it is likely to be one of the most useful of all, for it is very showy and easily grown, and although it was unknown ten or twelve years ago, it has already made many friends. Its large deciduous leaves are up to four and a-half inches in length and two inches in width. They are densely hairy on the under-surface, and the young wood is pubescent. The flowers are borne in large axillary panicles, and are followed by glossy-red fruits, which are at their best in September. It is an excellent shrubbery plant, and will also prove suitable for an isolated specimen.

C. buxifolia.—A Himalayan species which has been grown for nearly a century in British gardens. Belonging to the evergreen section it is recognised by its small oval, box-like leaves, which are dark green above and grey beneath by reason of a dense woolly pubescence. The conspicuous white flowers appear in May, and the bright red fruits mature towards the end of August, and hang for a considerable time in good condition. Growing from six to ten feet high, it is of vigorous constitution, and spreads rapidly, therefore a wide space of ground should be allowed.

C. Franchetti.—A comparatively new introduction from China, which was described with figures in the "Revue Horticole" ten years ago, and it was grown in French gardens prior to its introduction to the British Isles. Of vigorous habit, it attains a height of six or eight feet in less than ten years, and spreads to a considerable width. The ovate or ovate-lanceolate leaves are from one to one and a-half inches long, green above, grey and pubescent beneath. The flowers appear in small clusters from the leaf axils. They are white, flushed with rose, but not very showy. The fruits ripen in September, at which time the colour is scarlet. It has already proved itself to be a useful and decorative shrub.

C. frigida.—The most ornamental, and probably the best known, of the older and stronger-growing kinds. A native of the Himalayas, it grows into a very large bush, or, sometimes, a small tree. Numerous specimens twenty feet and upwards in height, with a head diameter of as much as forty feet, are to be found. The oval deciduous leaves are three to five inches long, and pale green in colour. As in other cases, the white flowers are borne from the leaf axils. They are showy, produced in large clusters, and are succeeded by bright red fruits. Individual heads of fruits sometimes exceed six inches in diameter. There is a variety with yellow berries, but it is not often grown.

C. horizontalis.—This was comparatively unknown in gardens twenty-five years ago, but is now quite plentiful. Its specific name was given on account of its peculiar manner of growth. Planted in the open it attains a height of one and a-half to two feet, but spreads over a considerable area of ground, its curiously flattened branches having a distinct and ornamental appearance. The small dark green leaves turn to gold and scarlet before they fall. No decorative value is attached to the flowers, for they are not in any way showy; the fruits are, however, bright red. When planted against a wall, as in the case of the fine specimen, herewith illustrated, at Gunnersbury House, it attains a height of quite twelve feet, the flat side branches standing clear of the wall for a couple of feet or so. It is a native of the Himalayas.

C. humifusa.—A new species from China, is distinct and curious by reason of its prostrate habit and long slender branches. Growing very fast, it soon covers a wide space of ground, and has proved itself to be a good plant for the rock garden. The ovate leaves are rather more than an inch long, and the fruits are bright red.

C. Lindleyi.—Another strong-growing species from the Himalayas. It has much in common with C. bacillaris, from which it can be separated by its shorter and rounder leaves. It is not necessary to include both kinds in ordinary collections.

C. microphylla.—An evergreen species from the Himalayas, much grown on account of its small leaves, compact habit, and generally useful character. Although often planted as a bush in the open ground, and growing from one to two feet high, it is frequently employed for covering walls, and for that purpose much can be said in its favour. Although of low stature when planted in the open, it grows fifteen feet or more in height against a wall. The white flowers are well shown against the dark leafage, and in autumn a good crop of red fruits may be seen. The variety glacialis is even more compact than the type.

C. moupinensis.—Found in the same region as C. bullata. The two species are very similar, except in the colour of the fruits, which in moupinensis is black.

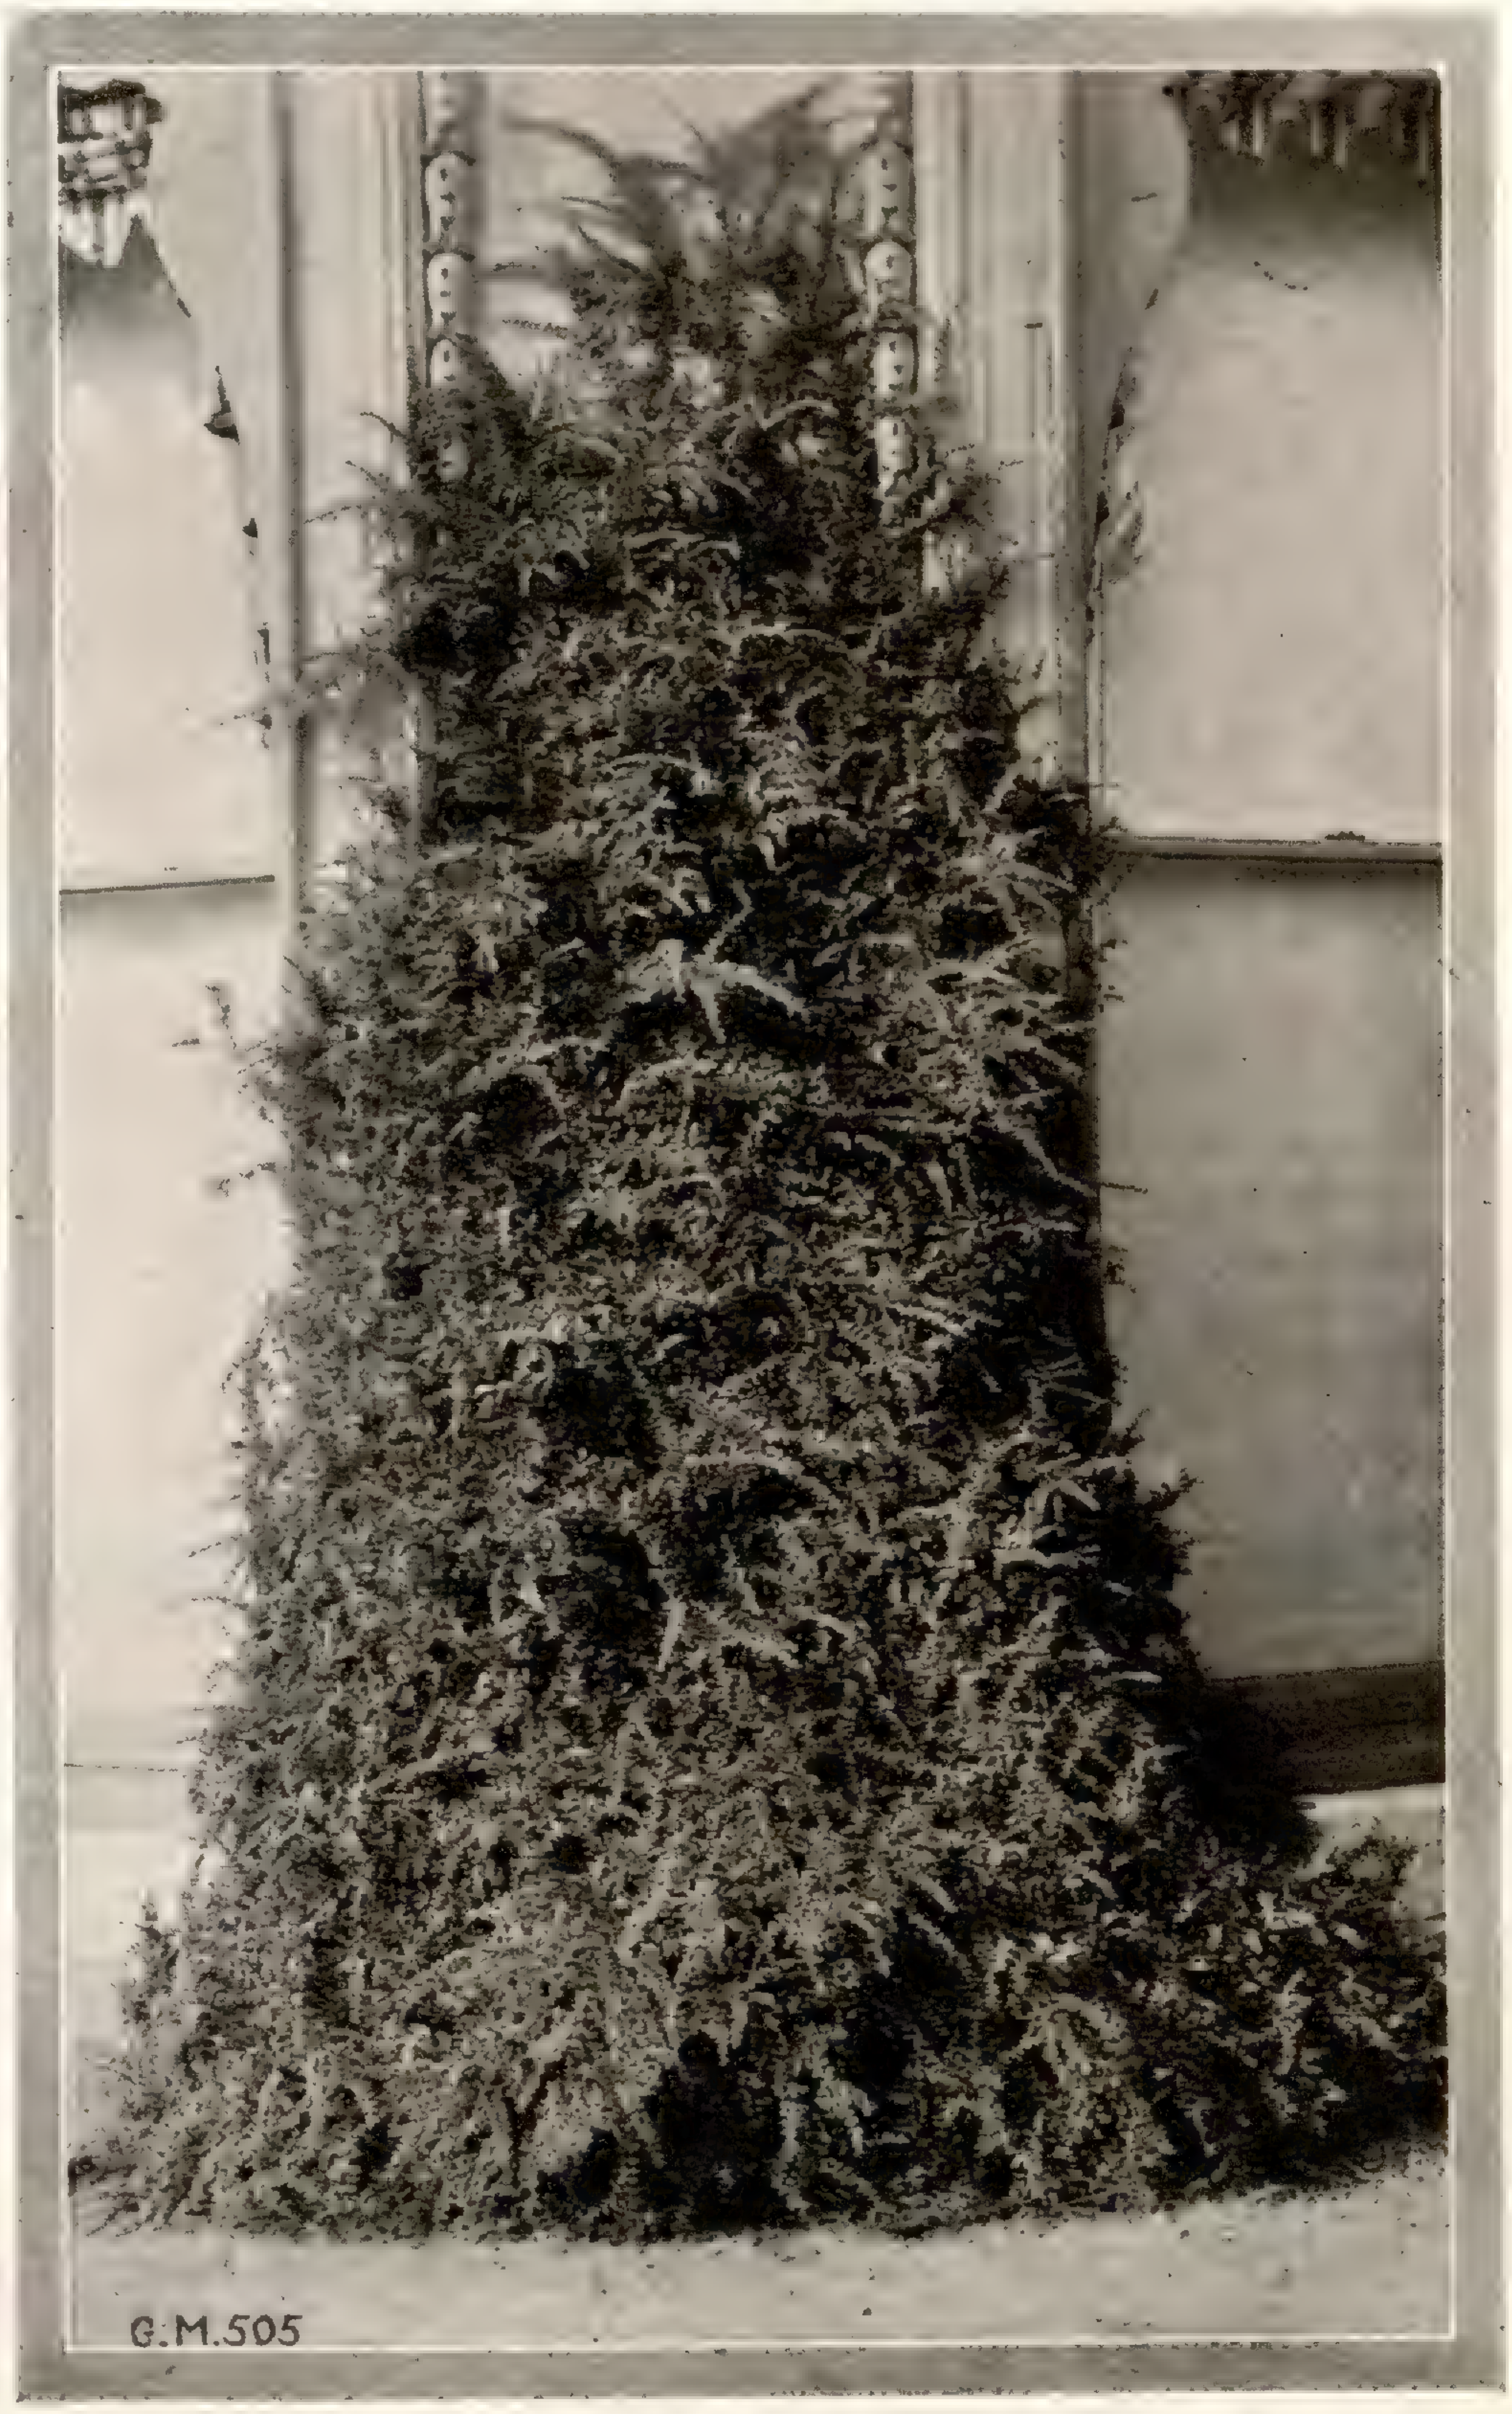
C. multiflora.—A deciduous species from China. Assuming the habit of a small tree, it may be seen with a short trunk, bearing a large head of branches, with numerous long, thin, wiry branchlets, from which showy white flowers are borne freely in May. Although easily one of the most conspicuous species when in flower, its red fruits are not produced freely enough to make much of a display.

C. pannosa.—Introduced to France from Yunnan during the closing years of the last century. Attaining a height of eight or ten feet, it forms a wide-spreading bush, with long slender branchlets, bearing small ovate leaves, which, together with the young shoots, are covered with a greyish pubescence, especially on the under-surface. The red fruits are borne in profusion, but lose much of their brightness by reason of a coating of short woolly hairs.

C. rotundifolia.—A very attractive species from the Himalayas. Growing three to four feet high, it bears small dark green semi-evergreen leaves, and large quantities of rich red berries, which are not troubled by birds to the same extent as are those of many other species. It thrives excellently as a bed or group in the open.

C. rugosa Henryi.—Another new species from China. Of loose habit, it appears as if it will attain a considerable height. The oblong leaves are four inches in length and an inch wide, and bunches of small red fruits are borne in profusion from axillary buds. It promises to become one of the most ornamental kinds.

C. Simonsi.—This is one of the best-known of all the cotoneasters. A Himalayan shrub, it is met with in gardens between six and fifteen feet in height. Its branches usually assume a rather stiff and upright habit, and they are clothed with semi-evergreen leaves. The flowers are not very showy, but the orange and scarlet fruits create a pleasing effect in autumn.



A WALL SPECIMEN OF COTONEASTER HORIZONTALIS.

When planted in the border or on the rockery, this handsome species grows more or less horizontally; but when growing against a wall, as in the case of the specimens at Gunnersbury House, it assumes an erect habit, and attains a considerable height. The specimen illustrated is about eight feet high.

C. thymifolia.—This resembles C. microphylla in many respects, although its evergreen leaves are somewhat narrower. Its white flowers and red fruits are equally showy. W. Dallimore.

Kew.

---

**Cotyledon fulgens.**—This cotyledon, or echeveria as it is generally termed, will, in the greenhouse, produce its bright-coloured blossoms during the winter months. It is also a first-rate window plant.—K.

## EPIPHYLLUMS.

The showy-flowered Epiphyllum truncatum and its several varieties seem at the present day to be under a cloud, though for the embellishment of the warm greenhouse or intermediate structure towards the end of the year they are most valuable. They are mostly grafted as standards on to the Pereskia, and in this way their semi-pendulous habit of growth enables the flowers to be seen at their best. Beside this they are first-rate subjects for growing in suspended baskets, for which purpose they are better on their own roots than when grafted. They may be readily propagated by means of cuttings; indeed, good-sized branches will root without difficulty. Strange as it may appear, epiphyllums were at one time grown in considerable numbers in order to supply Covent Garden market with cut flowers, but that was in the days of formal bouquets when practically all flowers were wired. Then these epiphyllum flowers often formed a fringe around the outside of the bouquet, their peculiar oblique shape standing them in good stead for this purpose. W. T.

## MEDINILLA MAGNIFICA.

This interesting and beautiful shrub is not often met with, but it well deserves a place in every collection of stove plants. The flowers are produced in the form of gracefully drooping panicles, and are of a soft pink colour, while the foliage is very handsome, a single leaf often measuring ten inches in length and eight inches in breadth.

Cuttings taken off as soon as the young growth is produced, and inserted in small pots in a mixture of equal parts loam and peat, with a liberal supply of silver sand, and placed in a close case on gentle bottom heat, root freely, and will be ready to pot within a month or six weeks. When these young plants have made their first pair of leaves they should have the point of growth removed to encourage branching. They will soon form good plants, and should receive a liberal increase of root room each time they are repotted, for they are very free-rooting subjects. Medinilla magnifica thrives best in a night temperature of 70 degrees, rising to 80 degrees in the day, but will succeed in a lower temperature, even down to a minimum temperature of 60 degrees.

Very little shade is needed even in bright weather, as plants flower most freely when the wood is thoroughly ripened by the sun. Frequent syringings will be of great assistance, while watering occasionally with liquid manure or a solution of Clay's Fertilizer or peruvian guano, will be a great incentive to luxuriant growth. During the autumn months water should be gradually withheld, and during the winter only just sufficient should be given to prevent the leaves from shrivelling; this period of rest will cause the wood to thoroughly ripen, and thus ensure abundance of flower.

Branches should be shortened freely after flowering, for this will encourage compact, sturdy growth, and, at the same time, will keep the plants within reasonable dimensions; very little staking is required, a stake to the central growth and one for each of the main side growths being all that is necessary. Ralph E. Arnold.

Roselands, Cheltenham.

## AN EFFECTIVE BED OF VIOLAS.

The value of violas for the production of rich colour effects in the garden during the spring and summer months has had reference made to it in these pages on more than one occasion, and there can be no question as to our advocacy of their merits having contributed in no small degree to the popularity they now enjoy. There is a considerable variation in the suitability of the numerous varieties in cultivation for what is technically known as bedding purposes, but if the varieties that are compact in growth and free and continuous in flowering are selected, the results will not fail to be in the highest degree satisfactory. Planted in the course of the autumn season they become well established before the opening of the spring.

The early period at which the violas come into bloom is a strong point in their favour, for it enables them to join with bulbous and other hardy plants in beautifying the flower garden at a time when rich colouring is much appreciated. Moreover, they form a green carpet during the winter and early in the spring when all who have gardens would like to see the bare earth more or less hidden from view. Unlike other hardy plants that flower in spring the violas do not cease to yield of their floral wealth with the opening days of summer. They enjoy to the full a rather cool rooting medium, yet they will bloom freely throughout the summer, and, indeed, until the autumn is well advanced, provided their roots have the run of a deeply stirred and moderately rich root run. If they are associated with daffodils or tulips it is an easy matter to lift the bulbs when they have become ripened without appreciable injury to the violas. Then, if the soil is rather too light in texture to maintain them in a vigorous state in the autumn, asters of medium height or other suitable plants can be planted thinly among them after the bulbs have been lifted, for the purpose of maintaining the effectiveness of the beds until the autumn. In many gardens supplementary plants will be wholly unnecessary.

The remarkably fine bed herewith illustrated occupied a prominent position in Springburn Park, Glasgow, in 1911, and the photograph of which the illustration is a reproduction was taken early in September. The effects of the long drought and great heat that were experienced over the United Kingdom last year may not have been so hurtful to vegetation at Glasgow as in the South of England, but it was considerable. Yet the violas in this bed and elsewhere grew vigorously and bloomed profusely throughout the summer; and in September gave no signs of exhaustion. The bed was sixty feet in length, and some five or six feet in width. The centre was the rich purple J. B. Riding, and the flowers were so plentiful as to practically form a solid block of colour. On either side was a band of the lavender-coloured Come to Stay, and, as a marginal band, the white Countess of Hopetoun was used with good effect. Altogether, the bed was the most effective of the beds of violas that have yet come under our notice, and we congratulate Mr. J. Whitton, the superintendent of the Glasgow parks, and also the head gardener at Springburn, on the work achieved.

AN EFFECTIVE BED OF VIOLAS IN SPRINGBURN PARK, GLASGOW.

# NOTES ON CHERRIES IN POTS.

The cultivation of the cherry in pots is not by any means a new departure, the method having been fully demonstrated by the Messrs. Rivers and Son, of Sawbridgeworth, many years ago. Probably no other cultivators have such fine collections of specimen cherries in pots as this firm, and no conception can be formed of these splendid examples of cultural skill unless a visit be paid to Sawbridgeworth in the fruiting season. These fine trees, be it noted, do not leave the nurseries, for they are too big for all but the largest of vans. A visit to this home of pot cherries will amply repay anyone interested in superior cultivation.

## The Advantages of Pot Cultivation.

I was not, I must admit, a keen enthusiast for this method of culture until Mr. Leopold de Rothschild wished me to try my hand in this direction. That was in 1894, and since then we have annually forced a considerable number of trees. At first I started cautiously, but it was soon found there was much in the system to recommend it. Now we annually force our trees so as to obtain ripe fruit by the end of April. Our largest trees have been forced since the year mentioned above, a fact that is sufficient to prove the soundness of the system. It is very rare indeed that a well-established tree succumbs to canker, or any other form of disease. The growth of the cherry, when it is planted out, is notoriously vigorous, if precautions are not adopted to check this vigour. In pots, however, the growth is kept in check by the root limitation, and the result is spur-bearing, fruitful wood. Insects, too, are more easily kept in check under glass than upon the open wall or on standards.

Of course, it goes without saying that the season of the sweet cherry is thus considerably extended. It is possible, with two divisions, to have ripe fruit by the middle of April. We should do so at Gunnersbury, but the dreaded London fog during the flowering season is the deterrent. During the two months between the middle of April and the middle of June the crop under glass is available, and after that ripe fruit may be obtained from the open wall or from trees in pots, where the house has been kept absolutely cool. Cherries under glass, whether in pots or planted out, are under better control than upon the open wall, for no cracking then takes place, e.g., as during a damp drizzling day in early July, when the fruit is fully ripe. Nor have the birds the slightest chance of making a meal. By growing the late dessert kinds it is possible to have ripe fruit for close upon four months from under glass. Surely this fact is sufficient to recommend this system of cultivation!

## Forcing.

It is no doubt in the forcing of the cherry that some difficulty is experienced, even at the present day. I have heard it recommended to follow on the same lines as for peaches and nectarines, but this is too warm a treatment by almost, if not quite, five degrees. The cherry is very impatient of a closed house. Ventilation should be always allowed, even if a little frost be indicated outside. As long as I could maintain a minimum temperature of 40 degrees up to the time of the setting of the fruit, I would not close all the ventilators. Artificial warmth should be sparingly used, and the pipes should not at any time feel uncomfortably warm when the hand is placed upon them. The cherry will succeed best if forced with a free circulation of air.

No fruit tree responds so readily as the cherry, and the buds begin to swell very quickly indeed. If the treatment be too generous the wood buds may make a start too soon. In order to obtain ripe fruit about the end of April we partially close the cherry house about the middle of January, and syringe the trees twice or thrice daily. For the first two or three weeks no warmth in the pipes is allowed so long as the temperature does not fall lower than 36 degrees. We always move a hive of bees into the cherry house when a fairly good number of flowers have expanded. We find no other means so effectual in the pollination of the flowers. The first two years that I forced Early Rivers cherry this plan was not adopted, and the average set was not satisfactory. Ever since I have relied upon the bees we have not

CHERRY GUIGNE D'ANNONAY.

A black cherry, richly flavoured, and ripening early in the season; well suited for pot culture, as indicated by the specimen illustrated, which was exhibited by Messrs. T. Rivers and Son in May last.

had a failure, but, on the other hand, have had to thin the fruit freely on every tree. When the fruit is set, and seen to be swelling away freely, a light shading is put upon the roof. For this I use, and recommend it also, what is usually known as No. 3 shading. This is sufficient to break or diffuse the bright rays of the sun. The reason for shading is that, if the fruit swells away too rapidly at first, it is liable to drop after having turned yellow. A light shade will prevent this unpleasant experience.

When the fruit is fairly swelling it is just possible that a small caterpillar may do damage to the tender fruit by fastening them and the leaves together. A fumigation of the usual strength will prevent this. Hand picking is also desirable for the same ends. Of course, the shading is never used when the sun is not shining brightly. The range in which our cherries are forced runs east and west, thus the southern blind is most in use, the opposite one only being in request later on, when the afternoon sun is somewhat warm. One great advantage with cherries produced by trees grown in pots is that they remain in good condition for quite a fortnight, and, in some cases, for three weeks after they are ripe. But little pruning is necessary for cherries in pots, and it is better if done early with the finger and thumb, and then only to regulate the growth.

PART OF A BED OF GUSTAVE REGIS ROSE AT KEW.
This is a further illustration of the decorative value of pegged-down roses.

### Trees Not Forced.

These should be allowed to come on quite naturally, and with an abundance of air at all times; in other respects the treatment is practically on the same lines. With these it is possible to dispense with the bees, that is, of having the hive in the house; the bees, however, will find their way in, if there are any about. The use of the camel's-hair brush may be advisable if there are no bees. The syringe may be needed more frequently upon the nonforced trees during bright and sunny weather. For these trees I advise the use of a light blind; it is possible to dispense with it, but I prefer the safer course. When the fruit is fully ripe the blind serves a two-fold purpose.

### Varieties for Forcing.

Of black cherries (which appear to be the most popular colour) we force three or four varieties. The earliest to ripen is Guigne d'Annonay; this is about ten days in advance of Early Rivers, and is most useful from the point of earliness alone. It is a somewhat small cherry, but it has a relatively small stone, so the difference is not so manifest. It colours well, and is of excellent flavour, too. Early Rivers is the next to ripen. This is "par excellence" the best cherry of its colour for forcing. It crops freely, its fruits are of the largest size, and of the richest flavour, firm in flesh, and yet very juicy. Its constitution is also excellent. Bigarreau de Schreken is a fine, handsome cherry, possibly as large as any, and a good cropper; like all the Bigarreaus, it is firm, with the hammered appearance seen upon the Mill Hill Hamburgh grape. Knight's Early Black is only useful as a substitute for Guigne d'Annonay. Of white cherries the two best are Frogmore Early Bigarreau and the American cherry—Governor Wood. The former is very handsome indeed when fully coloured and ripened; it is very firm in flesh, and of large size; also a good cropper. Governor Wood is somewhat smaller, and, in point of flavour, is one of the sweetest. It is rather liable to bruise, and thereby become discoloured. Elton, a well-known and excellent cherry, may, perhaps, be classed with the whites, but it is, when well coloured, more of a red cherry. It is firm, and crops well. It is most essential to have at least one of the May Duke section—the old May Duke itself being as good as any. The object of this is for the sake of the pollen to aid in the pollination of the sweet cherries. The fruit of the May Duke is always useful for compotes, and for jellies as well.

James Hudson, V.M.H.

---

**Yellow-berried Holly.**—Though the berries of this are often borne less freely than some of the scarlet-fruited kinds, it is from its distinct appearance and general all-round beauty well worthy of more attention than is usually bestowed upon it. Though red berries are numerous, those of a clear, decided yellow are scarce.—W.

## PEGGING DOWN ROSES.

In the Gardeners' Magazine of October 5 Mr. Osborne drew attention to the desirability of pegging down the growths of very vigorous roses used for bedding purposes. He also gave a list of roses found especially suitable for this method of cultivation, and of which there were good examples at Kew. Frau Karl Druschki was illustrated on that occasion, and we now give an illustration of a bed of Gustave Regis, a fragrant nankeen-yellow variety that flowers almost as freely in September as in June. This illustration shows a bed of the rose pegged down at Kew, and still further emphasises the value of the method advocated for garden decoration.

---

## PÆONY-FLOWERED DAHLIAS.

I see on page 852 that somebody else beside "C. T. D." is looking out for trouble, and sure enough he will find it on this subject. Now, if Mr. C. E. Pearson is noted for anything, it is certainly his pertinacity and thoroughness; when he forms his likes and dislikes I doubt if the prophet Mahomet himself would change him or alter his opinion. Poor Pæony Dahlias, if only a tithe of the epithets Mr. C. E. Pearson has levelled at their ragged heads could have taken effect they would have been off the face of the earth long ago. It is particularly unfortunate for your correspondent that he has failed to bring this about, for if my memory serves me rightly, when they first appeared in this country, he promised them very short commons, and it seems to me that as his unfortunate prophecy has never been fulfilled, he has never turned his back on his arch enemy. The sight of pæony-flowered dahlias is equivalent to the proverbial red rag to a bull, and, like the latter animal, he never fails to "go" for them. Thus it happens that we see him endeavouring to assist "C. T. D." primarily, but with an eye to the main chance, for I do not think he could let an opportunity pass, even if he were to try to do so, so inherent in his dislike for these flowers. I am afraid his comparison between the number of people who appreciate beautiful pictures as against statuary is just a little too far fetched for most of us in the horticultural world. The latter may be the higher art, but it is a fortunate thing for most of us that we are not educated to that particular degree. What glorious colours we should lose, the shades of marble and bronze do not appeal to the majority of people, neither does form in a flower, thank goodness! If it did, what would become of the majority of our garden and bedding roses, our perpetual carnations, Alpine auriculas, pansies, violas, etc.? But these examples are sufficient to set Mr. Pearson thinking. If he would only get the expressions, such as "coloured rags," "abortions," etc., out of his mind and look at the newer forms of this type, I feel sure he would see some little beauty in them, which under present conditions he finds impossible.

J. B. R.

---

**Phalænopsis.**—There are few orchids more difficult to manage during winter, especially when grown with other plants. When a house can be devoted to them many difficulties pass away. The succulent and sensitive nature of the leaves, and the absence of pseudo-bulbs for storing up nourishment, makes phalænopsis susceptible to injury, which renders keen watchfulness on the part of the grower necessary. P. Schilleriana, P. Aphrodite, P. amabilis, and others that are sending up their flower spikes, should be kept fairly moist at the roots. When giving water care should be taken that none of it remains in the centre of the plants. A most humid atmosphere must be maintained at all times with sufficient air to allow any excess of moisture to pass away.—J. T. Barker.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

WARM HOUSE ORCHIDS.—In the East Indian house, the majority of ærides, saccolabiums, angræcums, vandas, and renantheras have practically finished their growth, and although they are never absolutely dormant, they require at this season to be treated in many respects as resting plants. They have no pseudo-bulbs, and should not be kept so dry at the roots as the deciduous kinds; neither should they have water applied to them in such quantities as when in full growth. During winter it is only advisable to give sufficient water to keep the moss in which the plants are growing alive, and the plants plump and healthy. Ærides crispum, A. Lindleyanum, and A. Warneri should not be subjected to the heat of the East Indian house, but will be found to thrive better in a temperature a few degrees lower. The winter-flowering Angræcum sesquipedale and the hybrid A. Veitchi, now showing for flower, should receive more root moisture than those plants at rest, but the sphagnum moss must not be kept in a saturated condition; it should be allowed to become white, or fairly dry, between each operation.

RENANTHERA LOWI should not be exposed to sunshine at any time, therefore should be placed in as shady position as possible, and be shaded whenever the sun shines strongly.

VANDAS.—Vanda cærulea and the supposed natural hybrids from it, such as V. amœna, V. Charlesworthi, and V. Mooreana, although enjoying heat when in full growth, should not be grown in the East Indian house, but in a house in which a fairly high temperature is maintained, with abundance of air at all times. These may be placed in their winter quarters, and induced to rest; a temperature ranging from 55 to 60 degrees will answer their requirements. Fresh air should be given them at all seasons; indeed, a stagnant, stuffy atmosphere is detrimental to the majority of orchids at any season.

ONCIDIUM CAVENDISHIANUM, now showing flower spikes, should be well supplied with water at the roots, while its allied species, O. Lanceanum, being at rest, should only have sufficient to keep it from shrivelling. The pretty O. chierophorum, now pushing up its spikes, should be removed to the warm house, where the flowers will develop much better than if left in the cooler division, but when the flowers are fully open the plants may be returned to their growing quarters, as the flowers will then last for some considerable time in good condition if not injured by damp. After the flowers fade afford water sparingly till growth recommences, when any necessary repotting may be done.—J. T. BARKER, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—Most of the large-flowered exhibition varieties are now over, or have been cut for decorations. Notes should have been taken at the shows of varieties of outstanding merit which appear to be an advance on older kinds, and these should be added to keep the collection up to date. It is not a wise policy to have a large number of varieties, many of them quite inferior and out of date, but rather the aim should be to grow only the best in each colour section. Flowers which have been shown well at important exhibitions this autumn are Frances Jolliffe, yellow, suffused rose; Mrs. L. Thorne, pale yellow; Thomas Lunt, crimson; His Majesty, deep crimson; Miss A. E. Roope, deep yellow; Lady Talbot, yellow; Gladys Herbert, pale pink; whilst the huge white Queen Mary quite outclassed all other whites in the Japanese section. Incurved varieties are still grown by a few, and have their admirers; the varieties of special merit are Buttercup, Romance, Duchess of Fife, Mrs. F. Judson, W. J. Higgs, and Lady Isabel. The single varieties still increase in number as well as quality, and these now interest me most, owing to their extreme usefulness, since we have to provide huge quantities for house and table decoration. The best of these are White Pagram, Bronze Pagram, Edith Pagram, Shasta, Miss Mabel Booth, and Mary Richardson, while the sweetly-scented, deep pink Ladysmith is still flowering splendidly here outside in the open border.

CUTTINGS.—As the plants are cut down they should be overlooked, and sufficient kept for producing cuttings; the surplus may be at once thrown away. Any cuttings which are ready may be inserted in clean 3in. pots. The soil should consist of two parts loam, one part leaf-soil, and one part coarse silver sand, all passed through a half-inch sieve. Place five cuttings in a pot, and put them in a cold frame to root. Very little water will be needed for some time, but the frame should be kept rather close, and the cuttings sprayed occasionally. Varieties which are slow in throwing up cuttings should be placed in a late vinery or heated pits where they get a little warmth; place them as close as possible to the glass to encourage a sturdy growth, and syringe them over each morning.

WINTER-FLOWERING CARNATIONS.—These are now giving a good account of themselves by producing first-rate blooms. Owing to the open autumn and absence of heavy fogs, the colours are brighter than usual, and the plants are growing freely. The pots are also quite full of roots, and liquid manure water should be given about twice a week. Soot water and fowl manure, given alternately, will be found excellent.

POTTING SOILS.—The time has again arrived for laying in a stock of loam sufficient to carry through the potting operations for another year. This is a very important matter, and one which may mean success or failure. It will be found that the top spit from an old pasture, which has been closely grazed by sheep, is the best for this purpose, not too heavy, but with plenty of fibre in it. The turves should be carted and stacked in layers, placing a layer of turf and a layer of well-rotten manure, and to every three such layers should be added a bushel of burnt earth or wood ashes, while some soot is always beneficial at the rate of half a bushel to the ton of soil.—LEWIS SMITH, Cadland Gardens.

## HARDY FRUITS.

BUSH FRUITS.—The pruning of various kinds of small bush fruits may now be undertaken. For gooseberries, the spurring method in vogue at one time is not so much practised, but more young wood is left to produce a heavier and finer crop of berries the following season. When this style of pruning is followed, some of the branches must be cut clean out from near the base to make room for the young growths, but sufficient space should be allowed for the ready gathering of the fruits. The different varieties of gooseberries vary much in habit of growth; some have a more or less pendulous form, others are of stiff, erect growth, and the pruning must be adapted to the various habits. Remove partially, or wholly, from the former those shoots which, if allowed to remain would, when weighted with fruits and foliage, touch the ground, thereby spoiling the fruits for use. When pruning on the spur system, the side growths should be cut hard back and the growths at the ends of the branches shortened more or less according to the size of the bush; it is advisable to leave a well-placed young shoot here and there to take the place of old or exhausted branches, merely shortening them according to their strength.

RED AND WHITE CURRANTS should be pruned on the spur system. Newly-planted bushes should be cut back to ensure a sufficiency of young growths to form the basis of a shapely bush.

BLACK CURRANTS require a different mode of pruning. The young growths on fully-grown bushes should not be shortened, with the exception of weak growths, which should have the tips removed; the oldest branches should be cut clean away, so as to give the bush a shapely appearance, and leave the other branches sufficiently wide apart to allow free access of light and air when in leaf. Growths arising from the roots should be preserved, as these will in due course take the place of those removed. A strong, free growth should be encouraged by surface manuring, as this will insure good-sized berries, and act as an antidote to the bud mite, which has become a scourge to the black currant in many parts of the country. So far, no certain cure or antidote seems to have been discovered; to a certain extent the pest may be kept under by spraying with quassia and soft soap, or by dusting the bushes with dry lime and sulphur. After a personal trial of these remedies I consider it the best plan to grub up and burn the affected bushes, and replant with a clean stock on ground not previously occupied by black currants.

GOOSEBERRY AND CURRANT BUSHES should be dressed with some mixture to prevent the birds taking the buds. One of the best preventives I have used is a solution of Bentley's quassia extract, used at the rate of half a pint to three gallons of rain-water, with a little freshly-slaked lime and some soot added. The dressing may have to be repeated during the winter.—W. MESSENGER, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

PEAS.—If room is available under glass for a small batch of peas, it should be taken advantage of, for nothing will be more appreciated next spring, weeks before any outside crop is fit to gather. Both pits and cool houses are suitable for their culture. Ways are various in which the seedlings can be raised and grown; perhaps the best and most accommodating plan is to sow the seeds direct into ten-inch pots, particularly if they are to fruit in the said pots. Otherwise, if they are to be planted out in the borders of the houses early in the year, it is better to sow four seeds in 60-sized pots. In the larger pots mentioned, use a few pieces of crock, and a small quantity of coarse, dried manure above to prevent clogging. For compost mix three parts decaying turf, one part of leaf-soil and mushroom-bed manure with a small quantity of burnt garden refuse; place this mixture firmly in the pots to within four inches of the rim, and press eight seeds into the soil in each pot, covering them with the finer particles. Eventually thin out to the five strongest plants, and fill the top space with occasional top-dressings as time goes on. Place the pots in a quite cool and well-aired house, and never hasten growth. Later on stake, tie, and syringe as required. Reading Giant and Edwin Beckett are first-rate marrowfat varieties for this purpose.

BROAD BEANS.—These may be treated in the same way as peas, but especial care is necessary at the flowering period, as only a fresh and buoyant atmosphere will ensure a good "set." Pinch out the tops previous to the flowering stage.

MUSHROOMS.—The earlier beds should now be in good bearing, and care must be taken not to overheat the house, or only partial crops will result. Maintain a uniform temperature of 50 degrees, and the beds will bear for a longer period, and the quality of the mushrooms will be superior than if subjected to greater heat. Well protect beds in cold sheds by placing extra coverings on them.

SALSIFY AND SCORZONERA should now be carefully lifted and placed in fine soil under a wall or hedge facing north; if severe frosts are expected, place litter over the store, but remove during mild weather.

CHICORY.—Bring a sufficient quantity forward by placing plants a few inches apart in any dark, warm place. Seakale, too, will now be found to force quite easily.—GEORGE ELLWOOD, Swanmore Gardens.

# EXHIBITIONS AND MEETINGS.

◆

## National Chrysanthemum Society.

The final exhibition of this society was held in the Essex Hall, Strand, on November 20, when the exhibition must have surpassed the ideas of the committee, for the hall was packed to such an extent that locomotion was practically impossible; while, at the same time, the exhibitors appeared to be cramped for room. The market element was very prominent, and their classes were enthusiastically criticised.

The Holmes Memorial Challenge Cup for incurved varieties had been reserved for this show, as the committee thought the large exhibition in October too early for this particular section. Strange to say, however, there were only three entrants for the class, which is always difficult at all times; but as the champion, Mr. G. Hunt, gardener to Pantia Ralli, Esq., Ashtead Park, Epsom, turned up, the decision appeared to be a foregone conclusion, and he simply romped home with the trophy; his flowers were good throughout, the whole making a clean, fresh exhibit. The most noteworthy flowers were G. F. Evans, Mrs. H. J. Jones, W. Pascoe, Amber Beauty, Marjorie Shield, May Phillips, Embleme Poitevin, Mrs. G. Denyer, Madame Ferlat, Colonel Kekewich, Mdlle. L. Faure, Souv. de W. Clibran, Clara Wells, Miss N. Threlfell, Doris Raynor, H. Hearn, Miss M. Lyne, The Egyptian, and Edwin Thorp. The second prize was awarded to Miss Langworthy (gardener, Mr. T. J. Broom), Gays House, Holyport, who staged fine examples of Clara Wells, G. F. Evans, Miss B. Hankey, Pearl Palace, Chas. Pacque, Frank Tristian, J. Wynne, C. H. Curtis, and Mrs. G. Denyer. The third prize falling to Mr. W. W. Mann, Ravenswood, Bexley (gardener, Mr. J. Simon), who certainly provided a capital third.

For a display of market chrysanthemums to fill a floor space of six feet by three feet, Mr. Norman Davis, Framfield, carried off the first prize with flying colours; the flowers were exceedingly bright and fresh. The varieties were December Gold, Western King, Christmas Gift, Maud Jefferies, R. F. Felton, Black Prince, Marquis of Linlithgow, Phœbe, Wells' Late Pink, Mrs. H. Luxford, and Godfrey's Perfection. The second prize was awarded to Mr. J. Tulley, Enfield Highway, who adopted a smaller type of flower. The best varieties here were Western King, Violet Lady, Beaumont, Niveus, Dr. Enguhard, Mrs. Wilcox, Cullingfordi and its yellow sport, and Embleme Poitevin. Messrs. Cragg, Harrison, and Cragg also exhibited in this class, staging some very fine examples of Ethel Thorp, Mrs. Powell, Freda Bedford, Exmouth Crimson, Lord Brook, Phœbe, December Gold, Mrs. Buckbee, and Matthew Hodgson; but the firm evidently failed to catch the judge's eye; why seemed to be a mystery to the majority of market growers present.

The class for three vases of singles only secured three entries, the first prize being awarded Messrs. Cragg, Harrison, and Cragg, Merivale Nurseries, Heston, who staged fine vases of Portia, Merstham Jewel, and Sandown Radiance.

There were nine entrants for a vase of single varieties, though only one prize was offered. This fell to the lot of Mr. P. Ladds, Swanley, who staged a grand vase of Bronze Beauty and Ethel Mortimer, both new varieties, the yellow and bronze combination being exquisite.

The competition for two vases of spidery, thread-petalled, pompon, or anemone pompon varieties secured two entrants, the first prize being won by Miss S. G. Abethell, Devonshire Lodge, Muswell Hill (gardener, Mr. E. P. Cooper), who arranged two very fine vases, utilising the following varieties: Miss G. Waterer, Julie Lagravère, Wm. Westlake, Arachnoideum, Mrs. Carter, and White Baby; while Mr. T. J. Broom was awarded second prize, having well-built vases of Mrs. Filkins, Mrs. W. Butters, W. Westlake, Toussaint Marrisant, and Agalina. For a vase of singles there were six fine entries of disbudded blooms, the first prize falling to Mr. Loo Thomson, Ailsa Craig, Formby, Liverpool.

Mr. J. Emberson, Walthamstow, was the only competitor for a basket of chrysanthemums, and was deservedly awarded the first prize. The scheme was yellow, gold, and crimson, the following varieties being employed: Romance, Market Red, Chas. Kingsley, Mrs. Filkins, Merstham Jewel, and Leo.

The non-competitive groups were undoubtedly a feature of the show. Mr. N. Davis, Framfield, Sussex, staged a grand exhibit in tall pyramids, with vases in front. The chief varieties were Mdme. P. Radaelli, Lady Talbot, Edith Jameson, Mdme. G. Rivol, Mrs. Gilbert Drabble, in splendid form, Mrs. G. C. Kelly, Prince of Wales, His Majesty, Mrs. T. B. Edwards, and Gorgeous, while the incurveds, pompons, and singles were well represented. Messrs. W. Wells and Co., Merstham, occupied the platform with a fine exhibit. The best features were huge bamboo stands of Mrs. Gilbert Drabble and Queen Mary. Frances Jolliffe, D. B. Crane, and Lady Talbot were also well represented, while the singles were not only well represented, but were staged with taste.

Mr. P. Ladds, Swanley, made a great effort, his background being formed with huge vases of Japanese varieties, which were of exhibition size, the finest examples being Mdme. P. Radaelli, Miss A. Brooker, Mdme. G. Rivol, December Gold, and W. Turner; while the smaller decorative varieties were Mrs. Cooper, Framfield Pink, a glorious colour, and Freda Bedford. The singles employed were bright and well-developed. Messrs. Cragg, Harrison, and Cragg staged a splendid group of chrysanthemums, typical of the highest form of market culture. The most striking varieties were F. Cooper, a bronze sport from Mrs. F. McNiece, D. Ingamells, Exmouth Crimson, Ethel Thorp, December Gold, Romance, Mrs. Buckbee, Foxhunter, and Mrs. J. Hygate. The singles were a great feature, notably Miss Hilda Wells, Portia, Mrs. W. Garner, and Pink Beauty.

## Conference on Soil Sterilisation.

There was a large attendance at Essex Hall during the evening to hear a lecture on "Soil Sterilisation" by Dr. E. J. Russell, of Rothamsted. Mr. Thos. Bevan presided.

Dr. Russell pointed out that "Soil Sterilisation" did not mean sterilisation as opposed to fertility, but was a term used to indicate a process of killing off most of the injurious bacteria in the soil, and also some of the weaker of the useful bacteria. The result of this partial sterilisation was to give a fair field to the hardiest of the useful soil bacteria, and thus increase the fertility of the soil. Various methods of sterilisation were noted, and steam at a temperature of 210 degrees, at high pressure, forced into old and "sick" soils, was considered the best. Heating in a kiln or over a furnace was considered a good method, but there was a possibility of overheating, and so defeating the end in view. Other tolnol, and petrol. Of these formaldehyde pyridene, calcium sulphide, carbolic, cresol, tolnol, and petrol. Of these formaldehyde appeared to be the next best method to steam heating, and Dr. Russell hoped that in the near future this, or a similar chemical, would provide a cheap and ready means of partially sterilising worn-out and unproductive soils. He suggested formaldehyde should be used at the rate of one part per thousand parts of soil, or about 2lb. per ton; but subsequently, he said, he believed 4oz. to the square yard would be sufficient.

Dealing with chrysanthemums, Dr. Russell pointed out that cuttings took longer to root in sterilised than in ordinary soil; there was some delay in root action, but subsequently the plants grew stronger than those in ordinary soil, and flowered earlier. He showed that soil which had produced tomatoes and cucumbers often contained a very large amount of manurial matter, even when thrown out as useless for further crops, but he showed that such soils, when partially sterilised, produced fine crops without any addition beyond the ordinary feeding as the plants progressed, and such soils had been used three or four times over, after fresh partial-sterilisation, without any apparent decrease in their fertility. By means of lantern slides the wonderful production of masses of fibrous roots in sterilised soil, as compared with ordinary soil, was made very apparent.

In answer to a question, Dr. Russell said that commercial formaldehyde could be obtained for about 6d. per lb. He also stated that, where soils remained long frozen, partial-sterilisation resulted to the great advantage of subsequent crops; and, in reply to Mr. Curtis, he said that the "drying-out" of soils had a similarly good effect on subcequent crops. Mr. T. Stevenson referred to some experiments made with chrysanthemums, and opined that he had overheated his soil. His plants rooted slowly, and growth was slow for some time, and then it was fast and strong, but never of the right kind to produce the best results. He also said he had used one gallon of formaldehyde in 200 gallons of water, and applied it to a plot six yards by twenty yards, to prevent "streak" in sweet peas, with the result that his plants were 25 per cent. better than previously, and they kept up their vigour all along.

Mr. Percy Cragg suggested that cuttings were not a success in treated soil, because of the large quantity of food material available, a sort of indigestion being set up. For several years they had used treated soil at Hounslow for ferns, and found that the ferns were ready for market two or three weeks earlier than in ordinary untreated soil. Not only did partial sterilsation render more plant food available, but it very largely eliminated disease and other pests. Mr. Hawes referred to a large plant erected in a cucumber nursery, where five tons of soil per day could be treated, and he suggested that, as this was a commercial matter, there was little doubt as to the efficacy of the treatment.

Mr. Fairlie, of Acton, told how he placed water in the bottom of a galvanised iron dust bin, and over this a sieve of soil; the whole was then placed over a fire until the soil was so hot that it could scarcely be handled. In soil so treated he had potted a thousand carnations, and the results at present seemed eminently satisfactory. He asked whether sterilised soil was of equal or greater value than first-rate fibrous loam. Dr. Russell suggested that where sweet loam of the very best kind could be readily obtained, there was scarcely any need for sterilisation, but he advised experiments and comparisons. Mr. W. Wells said that at Merstham they sterilised eighty cubic yards of soil; it was steam-heated for half an hour, and the cost was 5s. per yard. But time and money were saved, because the soil proved extremely useful, and all pests and weed seeds had been killed; he could not have bought new soil of equal value at 5s. per load. Mr. T. Weston and Mr. Norman Davis also took part in the discussion.

On the motion of Mr. Percy Cragg and Mr. D. B. Crane, a very hearty vote of thanks was accorded Dr. Russell, who said that his experiments with chrysanthemums would be continued. A vote of thanks to the chairman concluded the proceedings.

GREAT PERPETUAL - FLOWERING Carnation Show, Royal Horticultural Hall, Vincent Square, S.W., Tuesday, December 3rd, Non-competitive Exhibits only. Open 1 to 5 p.m.

WEDNESDAY, December 4, GRAND COMPETITION and GENERAL EXHIBITS, open 12 noon to 5 p.m., Admission 1s. Also a Conference on Carnations in the Lecture Hall, at 3.30 p.m. Mr. W. E. Wallace, Champion Carnation Grower, will open the discussion. For Schedules, etc., apply, E. F. HAWES, Ulysses, Fortune Green, N.W.

HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY.
The 22nd Annual Show is fixed for 19th and 20th November, 1913.
JAMES DIXON, Hon. Secretary.
County Buildings, Hull.

NEXT YEAR BIRMINGHAM CHRYSANTHEMUM SHOW will be held at BINGLEY HALL, 11th, 12th, and 13th November, 1913.
ALFRED NOAKES, Secretary.
148, Bristol Street, Birmingham.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

## Woolton.

NOVEMBER 6.

The fourteenth exhbition of this society was held in the Church Hall, and, owing to removals and the early date selected, the entries showed a slight decrease on that of last year. The committee have been fortunate in securing three silver challenge vases during the year, making a fine total of cups to be competed for, which adds largely to the attractions of the show.

Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Highfield, Woolton, secured two cups, one for twenty-four Japanese cut blooms with a fine, heavy, fresh stand; the other for six vases of decorative flowers, four stems in each vase, with three blooms on each stem; this was an effective exhibit, arranged with a background of cork furnished with small plants and ornamental foliage. Mr. H. Howard, gardener to A. S. Mather, Esq., Beechwood, Woolton, had a walk over for the challenge cup for nine vases, distinct, single varieties, nine flowers in each vase. The blooms were good, but hardly up to the grand form usually found at this show. Mr. R. Hitchman, gardener to Mrs. Schintz, secured the challenge vase for six distinct kinds of vegetables with a very fine lot. Mr. Thomas Foster was the winner of the cup in the farmers' section, and Mr. John Radley in the cottagers' section.

Mr. Haigh was also successful in winning for four vases of incurved blooms, and for ten Japanese blooms in one vase with any foliage. This exhibitor secured the honour of staging the best incurved bloom in the show, this being a very fine Buttercup, and the best Japanese was a grand Hon. Mrs. Lopes. Mr. Stoney led for eighteen incurved blooms with an excellent stand, and Mr. J. Clark, gardener to Mrs. Clarke, Allerton Hall, occupied a similar position for eighteen Japanese. Mr. G. Lowe had the best dozen incurved blooms, and Mr. R. Hitchman the best twelve Japanese.

The bouquets and sprays and button-holes from under-gardeners were of high merit, the chief awards going to Mr. W. H. Richardson, Camp Hill; and Mr. J. Barker, of Highfield.

Some excellent grapes were staged, the best Muscat of Alexandria coming from Mr. J. Stoney, and the best black grapes (Alicantes) from Mr. W. Wilson, gardener to W. Cunningham, Esq., Gorsey Cop, Chilwall.

Chrysanthemums in pots were hardly at their best. Mr. R. Hitchman was first for three large-flowering, one Japanese and one anemone variety. Mr. W. Wilson scored for the best incurved and for a single variety, and Mr. Haigh had the best reflexed specimen.

Mr. J. McColl, gardener to J. W. Hughes, Esq., Allerton, had the leading orchids; Mr. G. Hodnett, gardener to A. G. Dent, Esq., The Riffel, Woolton, the best fern; while Mr. J. Stoney scored for a pair of Begonia Gloire de Lorraine, and Mr. G. Haigh showed the leading palm.

## Winchester.

NOVEMBER 13 and 14.

The annual autumn display was held in the Guildhall, and, if not quite so large as in some past years, the quality of the exhibits was quite up to the average, and few societies can present so complete a display of horticultural produce at this season of the year. The Winchester Society does not confine attention to chrysanthemums, but encourages miscellaneous plants, fruit, vegetables, and floral designs.

### PLANTS.

For the best group of chrysanthemums arranged in a space eight feet by seven feet, Mr. W. Kight, gardener to Lady Blaine, Barton Mark, Winchester, led with handsome blooms on well-arranged dwarf plants; Mr. F. W. Stone, gardener to the Rev. A. G. Bather, Sunnyside, Compton Road, Winchester, second, with smaller flowers. For nine plants, in not less than six varieties, with not less than five blooms on each plant, there were four entries, and Mr. G. Cousens, gardener to J. A. Fort, Esq., The College, Winchester, won the premier place with F. S. Vallis, W. Mease, and Lady Talbot; Mr. C. White, gardener to Captain C. Mitchell, R.N., West Highlands, second. For the same number of white and yellow varieties, Mr. Cousens was again successful with similar plants, and especially good were Nellie Pockett and F. S. Vallis; Mr. H. Gigg, gardener to Mrs. Moorson, Holyrood, Winchester, second. In a class for six plants, each to carry not less than eight blooms, Mr. F. W. Stone won with finely-flowered examples of Rose Pockett and Splendour; Mr. A. J. Marsh, gardener to W. Hodgson, Esq., Morton House, Winchester, second, and especially fine in his exhibit were Freda Bedford and David Ingamells. Single-flowered varieties were not numerous nor remarkable. The best of six plants came from Mr. W. J. Knight.

For a group of miscellaneous plants, arranged for effect, three entered, and Mr. J. Hayes, gardener to Captain R. J. Arbuthnot, St. Philips, Winchester, was first with a none too effective combination of colours; he had a groundwork of maidenhair ferns, Begonia Gloire de Lorraine in a mass, and a background of Salvia splendens; Mr. E. Hart, gardener to H. Trimmer, Esq., Hockley House, Twyford, second.

### CUT BLOOMS.

It was in this section of the show that the entries were less numerous than usual. The leading class was for twenty-four Japanese, in not less than eighteen varieties, and but three entered. Mr. C. Moore, gardener to E. J. Thal, Esq., Frensham Place, Farnham, was first with fully-developed, fresh specimens of Lady Talbot, Mrs. G. Drabble, W. Turner, Duchess of Sutherland. Hon. Mrs. Lopes, F. S. Vallis, Frances Jolliffe, Alice Lemon, and Splendour; Mr. A. J. Marsh second with slightly smaller blooms of Mrs. W. Iggulden, Mrs. H. Stevens, G. Rodwell, etc. For twelve blooms of six varieties, arranged in vases, Mr. C. Moore had the best of three sets, staging W. Turner, Frances Jolliffe, J. H. Silsbury, Mrs. G. Drabble, and F. S. Vallis as his best; Mr. T. Hall, gardener to Ellen, Lady Swaythling, South Stoneham House, Southampton, second, with desirable blooms of Rose Pockett, Mrs. J. C. Neil, and Lady Talbot.

Incurved varieties were sparsely shown. For twenty-four, in not less than eighteen varieties, two competed; Mr. Marsh led with large blooms, and Mr. Moore was second. The last-named won for twelve blooms with Clara Wells, Mrs. G. Denyer, Fred Palmer, and Frank Trestian; Mr. E. Hart second.

A class was provided for a vase of any section, arranged for effect, with any foliage; there were six competitors. Mr. R. Learmonth, gardener to J. Liddell, Esq., Sherfield Manor, Basingstoke, was first with F. S. Vallis, happily blended with oak and other foliage; Mr. G. Cousens second with H. Broomhead. Single-flowered varieties, not disbudded, made a pleasing display. Mr. E. Henderson, gardener to the Right Hon. Earl of Northbrook, Stratton Park, Micheldever, was first for six vases with Mensa, Leo, Old Gold, Mrs. Chamberlain, and Sylvia Slade; Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, second. Decorative varieties, not disbudded, were good, and Mr. A. E. Taylor, 3, Hillside Terrace, Bar End, Winchester, won for six bunches with a really fine exhibit of Phœbus, Mrs. Buckbee, and Source d'Or; Mr. Ellwood second with Market Red and Mrs. Knox.

Carnations were good, and Mr. W. Last, gardener to Donald Nicols, Esq., Burntwood, Winchester, scored for six blooms with Carola, Enchantress, and a seedling; Mr. Learmonth second.

### LADIES' CLASSES.

The most tastefully arranged stand of single chrysanthemums, foliage, and grasses, suitable for table decoration, was contributed by Miss A. Cordery, 13, St. Thomas Street, Winchester. Three entered for a table of chrysanthemums, and Mrs. Bealing, The Nurseries, Bassett, Southampton, was easily first with bronze and yellow flowers effectively displayed along with oak and prunus foliage; Miss A. Cordery second.

### FRUIT AND VEGETABLES.

Fruit was numerous and good. Mr. T. Hall had the best black and white grapes—Lady Downes and Muscat of Alexandria, both of desirable quality. Dessert apples were best shown by Mr. Ellwood; and Mr. T. Hall led for kitchen varieties. Mr. Learmonth had the best four dishes of pears.

Vegetables were a fine display, and Mr. Ellwood annexed the premier award in both Messrs. Sutton and Sons' class for six varieties, and Messrs. Toogood and Sons' class, with excellent examples of leeks, celery, cauliflowers, tomatoes, onions, and potatoes.

### NON-COMPETITIVE EXHIBITS.

These were not numerous. Messrs. E. Hellier and Son, Winchester, arranged fruits, carnations, and Gloire de Lorraine begonias; Messrs. Jeffery and Son, Winchester, had cut shrubs and carnations; Mrs. Myers, Swanmore House, arranged a table of apples and autumn foliage; Messrs. B. Ladhams and Co., Shirley, Southampton, had rock plants in variety; and Messrs. Toogood and Sons, Southampton, staged vegetables.

## Bournemouth Gardeners' Association.

There was a very attractive exhibition of chrysanthemums and orchids at the meeting held by the members on November 19, when Mr. J. B. Stevenson gave his interesting paper on "Pruning Fruit Trees."

In the class for three vases of single chrysanthemums, distinct, six sprays in a vase, Mr. C. Nippard was placed first with a lovely lot of clean, fresh flowers; Mr. Pearce was second, and Mr. G. H. Heath third. In the class for three exhibition blooms in a vase, any varieties, Mr. Nippard again won, Messrs. C. Pearce and E. G. Cox being second and third respectively.

Some excellent ferns and begonias, Gloire de Lorraine, were staged in the class for the "points" prizes at the end of the season, by Messrs. Heath, Pearce, and Pavey. A Certificate of Merit was awarded to Mr. Hobbs for two fine specimens of Cypripedium insigne; and Mr. Smith, gardener to the Dowager Lady de Tabley, received a vote of thanks for a finely-flowered plant of Odontoglossum Rossi.

There was a good attendance of members, and Mr. G. Bunyard, of Maidstone, also attended, and was given a most cordial reception. He took part in the discussion which followed the reading of the paper on "Pruning" by Mr. Stevenson. The latter quoted the opinions of several high authorities on fruit culture, respecting the pruning of trees, and then gave his own, and the reasons why. He referred to a discussion which took place many years ago between a fruit grower and himself on pruning versus non-pruning. The advocate of non-pruning, said Mr. Stevenson, had since been converted, as his trees had not proved satisfactory unpruned.

The lecturer said pruning depended a great deal on the conditions under which the tree was planted. In the northern counties he thought that young trees should not be pruned the first year from planting. In the south he would lightly prune the trees in March, as they made growth so much sooner than in the north. He had carefully examined young trees and had found new roots an inch long a month after they had been planted and lightly surface-mulched. When trees had been brought to a free fruiting stage, the lecturer said that cropping would prevent very strong growth, and pruning would not be necessary on a large scale. To prevent extension when the tree had reached the limits of available space, the cultivator should prune leading shoots back to a fruit bud. He also referred to summer pruning and root-pruning.

There was a free discussion, and, on invitation, Mr. Bunyard gave his own opinions. He did not favour pruning the first year, and he also referred to the pruning of large standards, saying that the principle was to so prune and have the main branches so disposed apart that a man's shoulders and arms could be freely moved about in any part of the tree. After other members had spoken, and replies had been given to questions by Mr. Stevenson and Mr. Bunyard, cordial votes of thanks were passed to the lecturer and the chairman, Mr. G. Garner.

## Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—November 19.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Dr. A. B. Rendle, Prof. W. Bateson, Messrs. E. M. Holmes, A. Worsley, G. Wilson, R. H. Curtis, A. W. Sutton, W. E. Ledger, W. Hales, W. Fawcett, and F. J. Chittenden (hon. secretary).

THE GLASTONBURY THORN.—Mr. W. E. Ledger showed flowers of the well-known Glastonbury thorn from his garden at Wimbledon. This variety (Cratægus oxyacantha var. præcox) apparently flowers on short shoots, which have no definite resting period as in the normal form of the species, where spurs producing flowers in alternate years are the rule, with a definite winter rest. The Committee could call to mind no analogous cases among apples or pears, and would be glad to learn of any such that may be known.

DROSOPHYLLUM LUSITANICUM. — Mrs. Bergheim, of Belsize Park, sent plants of this interesting carnivorous plant. The genus is allied to Drosera, but the foliage is erect in habit, and the glandular tentacles are on the lower (exposed) surface of the leaves instead of the upper, as in Drosera.

MISTLETOE ON PEAR.—Sir Harry Veitch, V.M.H., sent two branches of pear, in which mistletoe had been sown, to illustrate the difficulty experienced in getting the parasite to establish itself on that tree. In both cases the seed had germinated, but the branches had died, and they were typical of all the infections tried.

ONCIDIODA × "MARJORIE."—Messrs. Charlesworth sent a plant resulting from a cross between Cochlioda Noezliana and Oncidium Forbesi. Several crosses between members of these genera have now flowered, and Messrs. Charlesworth were awarded a Certificate of Appreciation in 1910 in recognition of their work in demonstrating the possibility of uniting these genera, which, although sufficiently distinct morphologically are evidently closely allied physiologically.

IVY LEAVES DISEASED.—Mr. E. A. Bowles showed foliage of ivy from Waltham Cross having numerous pale brown spots with a purplish margin. No fungus could be discovered upon them nor sign of other cause.

## Newcastle.

The eighth annual show of the Newcastle-on-Tyne and District Chrysanthemum Society was held in the Town Hall and Corn Exchange on November 20 and 21. The exhibits, considering the unfavourable season, were remarkably good. There was a slight falling off in the quality of the large-flowered Japanese varieties in the open classes, but the district and local classes, and the single-vase classes, brought out the best competition in the history of the society. Bush plants were a striking feature, and it is interesting to note how keen the local amateurs become in this class. The vegetable classes brought out good competition, especially the leek classes, where the pitmen were well represented. The grapes, apples, and pears exhibited were the best that have ever been shown in connection with this society.

In the open class for twelve vases of Japenese chrysanthemums, not fewer than twelve varieties, three blooms in a vase, Mr. R. Addison, gardener to the Countess of Ravensworth, Cresswell Hall, Morpeth, was first, with an even and bright-coloured set, the most prominent varieties being Miss Elsie Fulton, George Hemming, F. S. Vallis, Reginald Vallis, A. T. Miller, Lady Talbot, and Eclipse; Mr. Jas. Kerr, gardener to Dr. J. B. Simpson, Bradley Hall, Wylam, was second, and his Hon. Mrs. Lopes, F. S. Vallis, and A. T. Miller were very fine; Mr. G. W. Musk, gardener to Captain Laycock, D.S.O., Wiseton, Bawtrey, Notts, third, with heavy flowers, rather wanting in brightness, but including three fine flowers of F. S. Vallis, which were afterwards awarded the medal for the finest vase in the show. For six vases of Japanese chrysanthemums, not fewer than six varieties, three blooms in a vase, Mr. R. Addison came first, Elsie Fulton, A. T. Miller, F. S. Vallis, and Lady Talbot being particularly fine; Mr. Askew, gardener to the Right Hon. W. Runciman, M.P., second; Mr. G. W. Musk third. For four vases, Japanese, Mr. A. W. Appleton, gardener to C. Lacy-Thompson, Esq., Farlam Hall, Cumberland, led, and Mr. G. W. Musk was second.

For three blooms (white), Mr. R. Addison led with White Queen; Mr. Appleton second with Mrs. A. T. Miller; and Mr. T. Reay, gardener to James Readhead, Esq., Weston Hall, South Shields, third. For three blooms (yellow), Mr. G. W. Musk scored with F. S. Vallis, very fine; Mr. J. Thomas, gardener to the Right Hon. Viscount Allendale, Byrwall Hall, Stocksfield, second. For three blooms, Japanese, any other colour, Mr. G. W. Musk was first, and Mr. Addison second. For four vases of incurved chrysanthemums, Mr. Askew led with H. W. Thorp, Buttercup, Marjory Shield, etc.; Mr. G. W. Musk second, and Mr. J. Thomas third. For a pair of vases, Mr. Askew was first, Mr. Musk second, and Mr. T. Reay third. For six vases of single varieties, dissimilar, Mr. G. W. Musk, Mr. Thomas, and Mr. T. Reay won the awards.

In the classes confined to the counties of Northumberland and Durham, Mr. Kerr was an easy first for four vases of Japanese varieties, and, having previously won the silver cup for two years, it has now become his own property. The varieties exhibited were Hon. Mrs. Lopes, Purity, F. S. Vallis, and Frances Jolliffe. Mr. J. Thomas second, and Mr. T. Elsdon, gardener to F. R. Shield, Esq., Leezes Hall, Burnopfield, third. For four vases grown within three miles of the Central Station, Mr. J. Hall, gardener to Mrs. Hunter, Wickham, was first; Mr. T. Bill, gardener to A. E. Bainbridge, Esq., second.

The bush plants provided the greatest attraction in the show. The fifteen guinea cup was won by Mr. Reay with beautifully grown plants of Cheltoni, Nellie Pockett, Viviand Morel, and Chas. Davis; Mr. W. Thomson, an amateur of South Shields, was a close second; and Mr. James Cooper, 13, Weston Park, South Shields, was third. For four bush plants (singles), Mr. Reay was again first, and Mr. T. Bell second.

For a group of chrysanthemums and other flowers and foliage plants, Mr. T. Bell led with a neatly arranged group; Mr. J. Hetherington, gardener to C. T. Kendell, Esq., Preston House, North Shields, second.

For a collection of vegetables, ten kinds, Mr. T. Carr, Blue Bell Cottages, Shields Row, led, with Mr. R. Shield, Swalwell, second, and Mr. T. Booth, Swalwell, third.

In the cup class for three leeks, Mr. W. Robly, Station Cottages, Fourstones, was first, the combined measurements of his three specimens being 157.4 cubic inches; Mr. J. Mowbray second, with 151.3 cubic inches; and Mr. Walter Telford, West Wylam, third, with 138.5 cubic inches. The competition was very keen. For two heads of celery Mr. W. Telford was an easy first.

In the fruit classes, for two bunches of white grapes, Mr. W. Smith, gardener to the Earl of Durham, Lambton Castle, led; and for two bunches of black grapes, Mr. J. Hetherington scored. For six dishes of cooking apples, Mr. Jas. Henderson, gardener to the Right Hon. Sir Edward Grey, Bart., Fullodon Hall, scored; and for six dishes of dessert apples, Mr. W. Lambert led the way.

There were numerous non-competitive groups, and notable among these was a group staged by Mr. Perry, gardener to Lord Ridley, Blagdon Hall, consisting of brilliantly coloured winter-flowering begonias, liliums, various orchids, and other flowering and foliage plants. The North of England Horticultural Society's medal was awarded to this exhibit. A similar award and a gold medal was awarded to Messrs. S. Finny and Co., Granger Street, Newcastle, for one of the finest exhibits of floral designs ever seen in the city. Gold medals were also awarded to Messrs. Sutton and Sons for a large exhibit of potatoes; and to Messrs. W. Lawrenson and Sons, 111, Pilgram Street, Newcastle, for a fine group of miscellaneous flowering and foliage plants. Silver medals were awarded to Messrs. Dicksons, Chester, for chrysanthemums; to Mr. W. A. Armstrong, for a large group of plants suitable for decorative purposes; to Messrs. Michie and Co., Alnwick, for a collection of apples; and to the Earl of Devon, Powderham Castle, Devon (gardener, Mr. Powell), for a collection of finely-coloured apples.

## Hitchin.

The Hitchin Society has pursued the even tenour of its way for many years. It invariably holds a good exhibition, though in extent and site this has varied a little in the course of time. On Thursday, November 14, the society held a capital show in the Town Hall. The table decorations were placed down the centre of the hall, while baskets, bowls, and vases of blooms, and the vases of single chrysanthemums, were accommodated in the Council Chamber upstairs. There is scarcely room to do the exhibits justice, but full advantage is taken of the available space, plant classes and vegetables being grouped on the deep platform or stage.

No boards are used at Hitchin, but all the cut flowers are displayed in vases. Fine quality was found throughout, and Mr. Jefferies' flowers were as fine as could possibly be. Fruits and vegetables were staged freely and well.

The silver challenge cup for six vases of Japanese chrysanthemums, three blooms of one variety in each vase, was won by Mr. A. Jefferies, gardener to J. Balfour, Esq., Moor Hall, Harlow, with superb, solid flowers of Fred Green, Wm. Turner, F. S. Vallis, Mrs. Gilbert Drabble, John Peed, and Lady Talbot; Mr. E. Kimms, gardener to W. B. Hawkins, Esq., Stagenhoe Park, Welwyn, second, with good blooms of Frances Jolliffe, Lady Talbot, and Hon. Mrs. Lopes; Mr. R. H. Crockford, gardener to M. R. Pryor, Esq., Weston Park, Stevenage, third; seven entries. Mr. Jefferies also secured premier award for twelve Japanese blooms, distinct, set up in four vases, and here he had Marie Loomes, Lady Talbot, H. Converse, and John Peed in fine form; Mr. T. J.

Hartless, gardener to T. Fenwick Harrison, Esq., King's Warden Bury, Hitchin, second with medium sized, fresh blooms; and Mr. E. Kimms third.

Five magnificent blooms of Wm. Turner won for Mr. Jefferies the chief award in the class for five white Japanese flowers, and probably no finer examples of this fine variety have ever been seen; one secured the prize as premier bloom in the show; Mr. R. H. Crockford second, and Mr. T. Pateman, gardener to C. A. Cain, Esq., The Node, Welwyn, third. For five coloured blooms Mr. Jefferies was again to the front, scoring with massive examples of F. S. Vallis; Mr. H. Brotherston, gardener to the Earl of Lytton, Knebworth House, Herts, second with F. S. Vallis. For half a dozen Japanese blooms, distinct, Mr. E. Seale, gardener to Lady J. van Houghnet, Bareleigh, Aston, Stevenage, was the premier prize winner, followed by Mr. F. Figg, gardener to Colonel F. W. Leaver, The Poplars, Codicote, Welwyn. Mr. Brotherston won the cup for four vases of chrysanthemums, and he showed very fresh examples of F. S. Vallis, Mrs. F. W. Vallis, J. C. Neville, and Mrs. R. Luxford; second prize fell to Mr. Seale. The best vase of incurved blooms came from Mr. E. Kimms, who showed five very solid blooms of C. H. Curtis; Mr. G. Calvert, gardener to J. R. Drake, Esq., Balchwood, St. Albans, second.

Mr. E. Orsman, gardener to S. Lucas, Esq., Hitchin, had the best group of chrysanthemums, and Mr. W. P. G. Clark, York Road, Hitchin, secretary of the society, was second, but each showed very formal groups. Mr. Titmus, gardener to W. Tindall Lucas, Esq., Foxholes, Hitchin, was awarded a first prize for a group of chrysanthemums and foliage plants, and his arrangement was much admired. Mr. Pateman was a good first for three Begonia Gloire de Lorraine, with Mr. T. J. Hartless second. Mr. E. Kimms led for six cyclamen, among four good exhibits; Mr. Hartless was second, and Mr. Brotherston third. Mr. Hartless led for table plants with especially neat examples, and he was second to Mr. E. Kimms for one orchid, the latter showing Cattleya Mrs. Whiteley with twenty flowers.

Mr. Robinson, gardener to F. Ransom, Esq., The Chilterns, Hitchin; and Mr. Titmus were first and second respectively for three specimen chrysanthemum plants, and each showed large bushes, freely flowered.

The best vase of outdoor flowers consisted of lupins, pentstemons, etc., from Mr. Brotherston, while Mr. A. Wilson, gardener to Miss P. Ransom, Benslow, came second with scabious and pentstemons, and Mr. Pateman was third. Mrs. C. Hill, Coleacre, Letchworth, led for a basket of chrysanthemums with a handsome arrangement of Mary Richardson and yellow singles, associated with berberis foliage; Miss A. R. Lucas, Tile House, second; and Mrs. W. G. P. Clark third. The best-arranged vase of single chrysanthemum was a splendid effort by Mr. W. Robinson, who had grand flowers, and a fine colour blending; Mr. E. Orsman was a good second, and Mr. Hartless third, among seven competitors.

The best-arranged vase of decorative chrysanthemums came from Mr. W. Robinson, who combined yellow, crimson, and white varieties; Mr. Hartless second, and Mr. A. Wilson third. Miss D. Armstrong scored for buttonholes. Mr. Hartless and Mr. Jefferies were placed first and second for a vase of perpetual carnations, and there seemed little to choose between them. Mr. Brotherston staged the best vase of outdoor roses in a good competition, and Miss A. R. Lucas scored for a vase or bowl of flowers with a good design in single chrysanthemums.

Mrs. Humbly, St. Staughton, St. Neots, scored for a table decoration with a pleasing arrangement of Mary Richardson chrysanthemums and selaginella sprays; Mrs. Crockford, Park Gardens, Weston, second, with light pink single flowers, and Miss Armstrong, Fish Pond Road, third.

Mr. Pateman scored for a collection of fruits arranged on a space 5ft. by 3ft., and he showed fine bunches of Lady Hutt and Alicante grapes and splendid apples and pears; Mr. Pateman was awarded a silver cup. Mr. C. E. Martin won second prize; he had good melons and some figs, as well as grapes, apples, and pears; he had greater variety than Mr. Pateman, but not such good quality.

Mr. Pateman led for six dishes of apples, for three dishes of pears, and for three dishes of culinary pears. Mr. R. H. Crockford led for black grapes, with Muscat Hamburgh, and Mr. A. Jefferies scored for white grapes.

In Messrs. Sutton's class for a collection of six kinds of vegetables, Mr. T. J. Hartless scored with beautiful broccoli and fine celery and onions; Mr. R. H. Crockford, Weston Park Gardens, Stevenage, second, and Mr. E. Kimms third. Mr. Hartless was also first in Messrs. Carter's class, and his leeks, celery, and onions were very fine; Mr. Kimms second, and Mr. C. E. Martin, gardener to the Viscount Hampden, The Hoo, Welwyn, third.

Mr. E. H. Palmer, Warrenhoe, Hertford, led in the society's class for six kinds of vegetables, and was followed by Mr. Isaac Fitzjohn, King's Walden, and Mr. J. Spriggs.

Messrs. Laxton Brothers, Bedford, contributed a very fine non-competitive collection of fruits, and Messrs. Abbiss Brothers, Hitchin, contributed a collection of plants.

## Norwich.

Held in St. Andrew's Hall, Norwich, on November 21, 22, and 23, the Norfolk and Norwich Chrysanthemum Show proved to be a great success. There seems to be no tendency (in spite of the critical remarks of some writers) to dispense with the large Japanese blooms. Here they were quite as good as ever, and some even better than usual. Incurved and pompon varieties seem to be losing favour with growers; but, on the other hand, singles and naturally-grown Japanese flowers are gaining popularity. Pot plants were a good feature, and the artistic arrangement of the circular groups was very marked. Fruit was a very strong section, more especially the apples. The wet season had been evidently beneficial to the vegetables, for one saw them in large numbers and much better than last season.

In dealing briefly with the winners we mention first the circular group of chrysanthemums and foliage plants; here Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton Hall, won for the third year, and secured the cup as his own property. For forty-eight Japanese blooms, Sir Carl Meyer was first, but the best bloom in the show was in the second-prize lot from Sir S. Neumann, the variety being F. S. Vallis. For three dozen blooms, T. A. Rising, Esq., was first, while for twelve distinct Sir G. Lacon took the premier award. For six blooms of one variety, white, Sir S. Neumann led with fine examples of W. Turner, and he also led for six blooms of any other colour with F. S. Vallis. The best incurved came from Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, his blooms of Mrs. H. J. Highgate being very fine. He also staged a beautiful bright yellow sport from this same variety, which he calls The Colonel. Mr. H. Cockerill, gardener to G. E. White, Esq., Eaton, won the premier prizes for naturally-grown flowers, and also for singles.

Mr. W. Helson, gardener to Sir F. Adan, had the best collection of cut exotic flowers. Carnations were exceedingly well shown by the veteran gardener at Gunton Park, Mr. W. Allan. He can usually maintain his own with this flower as well as among fruits. The pot plants of Begonia Gloire de Lorraine from Dr. Osborne, Catton, were marvels of excellence. Mr. F. Endersley, gardener to J. H. Gurney Esq., Keswick, had far away the best plants of cyclamen, and his violets, too, were very fine.

Mr. T. Simpson gardener to the Earl of Stradbroke, Henham Hall, distinguished himself in the apple classes, winning first for a collection of dessert and for a collection of kitchen varieties. The best single dish of Cox's Orange Pippin came from Mr. W. Allan, while for a single dish, any other variety, the lot of Allington's Pippin, staged by Mr. Geo. Davison, gardener to Colonel Petre, Westwick, were models of excellence. Mr. Davison excelled in all the pear classes, and his Doyenne du Comice did one good to look upon. Grapes were not quite so good as we have seen them, the best three bunches, Alicante, came from Mr. E. Greene, gardener to Edmund Reeve, Esq., Catton Grange, and they had finished beautifully. Mr. W. Allan's bunch of Gros Colmar was easily first for a single bunch, and he also won first for a white bunch with a grand cluster of Muscat of Alexandria.

In the vegetable classes, good collections were put up by Miss Langworthy, Hon. A. E. Fellows, and Mr. W. Chettleburgh. Mr. A. Woodhouse, gardener to Sir H. Cozens-Hardy, achieved a marked success with potatoes, winning, in a strong competition, six firsts with only eight entries.

The trade growers contributed largely to the beauty of the display. Foremost came the local firm of Messrs. Daniels Bros., Lim., Norwich, and they did themselves great

AT HEADQUARTERS.

*Visitor to Raynes Park:* "You must need to stock a good many of these bright orange seed-pockets; I seem to have known them all my life."

*Manager:* "We have used them for the past sixty years. There are one and a-quarter millions stored in this room. . . . . Here are seventy-five thousand embossed green leather-board postal boxes."

*Visitor:* "They look strong enough to withstand the most vigorous assaults of the postal authorities."

*Manager:* "And they need be, for some of the seeds they carry are most costly. The Holborn Prize Primula seed, for example, is worth as much as £50 an ounce."

*Visitor:* "These are all packed by hand, of course?"

*Manager:* "Yes; but if you will come this way I will show you the filling machines with which we pack the regular illustrated pockets used for export. When I tell you that we occasionally get huge orders you will see that hand-packing would be out of the question."

*Visitor:* "These are the pockets you refer to?"

*Manager:* "Yes; there are close upon five millions of them on hand, but these will barely carry us along till next season. You will see the pockets carry educational matter which is of the greatest value to our customers in all parts of the globe. . . . This is one of the filling machines."

*Visitor:* "What a marvellous machine! Really, it is almost human! I wonder what some of your customers would say if they saw their packets being filled with it?"

*Manager:* "The machine interests everybody. It especially attracted a Cabinet Minister who paid us a visit a little while since. . . . . You would be surprised, I daresay, if you knew how much wrapping-paper we use."

*Visitor:* "Ten tons, at least, I should say."

*Manager:* "Nearer twenty-two tons! Two and a-half tons of tin case-lining, and sixty-seven tons of casing boards as well as enough packing twine to reach from Raynes Park, via Southampton, to New York."

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
RAYNES PARK, LONDON, S.W.

credit with a fine and educational exhibit. Hobbies, Lim., Dereham, had a large display of chrysanthemums, roses, and dahlias, and visitors were delighted with the arrangement. Messrs. Sutton and Sons, Reading, had a characteristic Sutton-like display of vegetables, etc. Messrs. W. Wells and Co., Merstham, had a bold bank of chrysanthemums. Mr. C. Engleman, Saffron Walden, had a grand lot of carnations, such as one does not often see at Norwich. Messrs. Fred Smith and Co., Woodbridge, were well represented by fine vegetables. Besides these there were a few other smaller collections.

The energetic hon. secretary, Mr. C. E. Pilling, is to be congratulated upon the smooth way in which his plans worked.

## Bolton.

NOVEMBER 15 and 16.

This society is deserving of high commendation for the able manner in which the exhibits were arranged in the Albert Hall.

In the class for a circular group of miscellaneous plants, twelve feet in diameter, arranged for effect, Mr. H. Shone, gardener to J. W. Makant, Esq., staged a charming combination, in which highly-coloured crotons, palms, and ferns were associated with fine Oncidium varicosum, cattleyas, and other flowering plants. He was justly entitled to the premier award. The class for a group of chrysanthemums, undisbudded, nine feet by six feet, brought out three competitors, all staging in somewhat similar style, the awards going to Mr. B. Hardy, gardener to Gerard S. Peck, Esq., Heaton; Mr. D. Wilson, gardener to Miss Anna M. Philips; and Mr. H. Bishop, gardener to George Hughes, Esq., Heaton, in the order named. The best group of large-flowering chrysanthemums came from Mr. D. Wilson, with Mr. H. Drinkwater, gardener to Herbert T. Parke, Esq., Chorley, as second; and Mr. Charles Smith, gardener to James Fletcher, Esq., Stoneclough, third. For a table of growing orchids Mr. G. H. Drinkwater secured the premier position with a charming bank, chiefly consisting of cypripediums at the base, with good forms of Cattleya labiata in quantity above, surmounted by Oncidium varicosum; the second award went to Mr. W. Holmes, gardener to J. McCartney, Esq., for a pleasing combination.

For two pots of large-flowering chrysanthemums, Mr. R. Cadwell proved the victor with heavily-flowered examples; this exhibitor also secured first prize for three pots of single varieties, and for one pot, with a fine mass of bloom. Mr. W. Austin scored for a palm with Phœnix reclinata; and for six table plants Mr. J. A. Beresford, gardener to J. C. Waterhouse, Esq., led the way; while for three begonias Mr. W. Taylor gardener to W. Edge, Esq., was successful. For six cyclamen, Mr. J. Trevana was the winner ; for six pots of Roman hyacinths, Mr. D. Wilson led; and for six primulas Mr. W. Reid, gardener to C. H. Chapman, Esq., scored.

For twenty-four blooms, twelve incurved and twelve Japanese, distinct, Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., Warrington, was first, with Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., Woolton, second; and Mr. A. Chandler, gardener to A. James, Esq., Rugby, third. The best flowers in the winning stand were Mrs. G. Denyer, G. F. Evans, Romance, Marjorie Shields, F. S. Vallis, A. T. Miller, W. Turner, and W. A. Etherington. Prizes for thirty-six Japanese, in not less than twenty-four varieties, brought four good stands, and Mr. C. Jones, of Abergele, proved the winner with a very fine lot, that included Lady Talbot, Frances Jolliffe, Master James, President Viger, W. Mease, Mdme. G. Rivol, and His Majesty; Messrs. C. Goves and A. Chandler were second and third respectively. For six vases of singles the awards went to Messrs. A. Adshead, H. Shone, and W. P. Rylands.

For two bunches of black grapes, Mr. W. Burgess, gardener to John Harwood, Esq., was first, with Mr. H. Shone second. For two bunches of white grapes, Messrs. J. C. Waterhouse and James Amphlett, Colwyn Bay, were placed as named.

In the local classes leading prize-winners were: Mr. L. Southern, gardener to T. M. Percy, Esq.; Mr. W. Byrom, gardener to Viscount Brackley; Mr. W. Wainwright, Mr. T. B. Henderson, and Mr. W. Eckersley.

The exhibition was managed by Mr. R. Smith, chairman; Mr. Henry Shone, treasurer; and Mr. George Corbett, secretary, and a capable committee.

Messrs. Dicksons, Chester, staged an exhibit of apples and cut chrysanthemums; and the Liverpool Orchid Company, Gateacre, put up a table of orchids.

## Reading Gardeners' Association.

The fortnightly meeting of this Association was held in the Abbey Hall (by kind permission of Messrs. Sutton and Sons) last week, when, notwithstanding the unfavourable weather, there was, as usual, a good attendance. Mr. F. G. Drew, chairman of the committee, presided at the opening of the meeting, but as he on this occasion had undertaken to give a lecture, he later vacated the seat to Mr. E. Blackwell (vice-chairman).

The all-important question of "Fruit Tree Stocks" was the subject of Mr. Drew's lecture. He touched lightly on the historical aspect of the subject, pointing out that, as with gardeners of the present day, the old-time fruit growers were not agreed as to the use or value of many of the stocks then in vogue, much of their advice being very conflicting. The origin, as well as the use, of the stocks employed to-day for the various kinds of fruits were treated with in turn, as well as their influence on the growth and the fruit of the respective kinds for which they are used. The lecturer also gave his experience as to the comparative values of various stocks on different types of soil. Trees worked on apple and pear stocks in different stages of growth were exhibited, and also specimens of the stocks themselves, showing their respective root systems, characteristic growth, etc.

At the conclusion of his lecture, Mr. Drew was accorded a very hearty vote of thanks.

A fine collection of vegetables was the leading feature among the exhibits. This was staged by Mr. F. Townsend, head gardener to the vice-president, Mr. Leonard Sutton, Hillside, Reading, who was awarded a certificate for cultural skill. Mr. G. Smith, gardener to Mr. Eric Palmer, Shenfield Grange, exhibited an excellent collection of apples and pears, the latter being particularly good; and Mr. G. Carter, gardener to Mr. S. Griffith, showed a specimen tillandsia.

## Ancient Society of York Florists.

At the monthly meeting of this society a lecture on apples, at once interesting and instructive, was given in the De Grey Rooms, York, by the Rev. J. Bernard Hall, secretary of the North of England Horticultural Society. There was a large attendance, and the chair was occupied by Alderman E. W. Purnell, president of the society.

The Rev. J. Bernard Hall, referring to an observation by the chairman in the course of his introductory speech, stated at the commencement of his lecture that, so far as they knew, apples did not exist in the days of Adam. It was a quince, or some sort of an orange, but still they could go on calling it an apple. With regard to his subject, he gave them much useful information with regard to the planting and pruning of the trees, and he particularly pointed out that it was very necessary to perform the latter operation with a clean knife. He said that the apple sucker could be got rid of by the use of tobacco juice or nicotine, which did not hurt the blossom or the bees, and it must not be forgotten that the latter were absolutely necessary in a garden. Speaking of the beauty of the apple tree, he said that if English people were not such materialists, and more like the Japanese and Chinese, in whose countries he had spent two years, they would grow apples purely for the beautiful blossom. He asked them not to forget to plant in their orchards crab apples, which were not only beautiful to look at, but gave them apple jelly, and they possessed a strong pollen. In dealing with the diseases of apple trees, the lecturer referred to scab, which was dirt disease, and which, he said, they would not get rid of unless they got rid of the dead and decaying wood, subsequently spraying with lime sulphur. Scab was always worst on the apples with the hardest skin. Canker would never touch their trees unless there was a wound, which showed the importance of clean culture. The only thing to do to get rid of canker was to cut back to clean wood with a clean knife, and disinfect the wound. The woolly aphis, or American blight, was a terrible scourge which not only got into the tree but into the ground. If they wanted to get rid of many of these pests they could do so by keeping poultry in the orchards.

With the aid of a large number of lantern slides the lecturer showed many beautiful specimens of trees and varieties of dessert and cooking apples. In reply to questions, Mr. Hall said it was generally advisable to obtain their trees from local dealers, who knew, or should know, the ground and the conditions.

## East Anglian Horticultural Club.

At the November meeting of this club Mr. E. Peake gave a very interesting lantern lecture entitled, "Some Garden Memories." Besides being a lover of flowers Mr. E. Peake is a keen photographer, and when he visits a garden he usually brings away some memento in the way of a picture. It was most interesting to see the glories of a spring or summer display in Mr. So-and-so's garden depicted upon the screen upon a damp, chilly November night. Besides this Mr. Peake has a splendid store of anecdotes connected with many of his pictures, or interesting points of culture, all of which add charm to the lecture. It was amusing to many members to find themselves appearing upon the screen when least expecting it. A very hearty vote of thanks was accorded him.

There was a fine exhibit of fruits, flowers, and vegetables. In the former section the apples in a special prize class were very numerous, and splendid in size and colour. For flowers the most praise was due to the plants of Gloire de Lorraine begonia from Mr. E. F. Greene, gardener to E. Reeve, Esq., Catton, and to Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., Cringleford, for his orchids. Potatoes and onions for special prizes given by Messrs. Daniels Bros., Lim., Norwich, made a bold display.

## GARDENING ENGAGEMENT.

Mr. J. L. Edginton, formerly nursery manager to Messrs. W. Artindale and Son, Sheffield, has now taken up the duties of managing director of the Sheffield Horticultural Company, Lim., Silver Hill Nurseries, Ecclesall, Sheffield.

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1½ × 20 in. 12/6 or with Angle Joint, 18/-

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

---

CATTLEYA WALKERIANA.—M. E. W., Oxford: I shall be greatly obliged if you will give me some information concerning Cattleya Walkeriana, with special reference to its mode of flowering.—C. Walkeriana is a somewhat rare species in cultivation, but, as it produces its bright rose-purple, flattish flowers in the dull season, it is worthy of attention. It thrives best in baskets suspended in a warm, light position in the cattleya house. It requires little water, except when rooting freely, and is easily ruined by excess of moisture. The method of flowering followed by Cattleya Walkeriana is very interesting and distinct. Generally, cattleyas produce their flowers from the apex of a well-developed stem or pseudo-bulb, but in C. Walkeriana the process is reversed, an. the stem and leaves are developed after the flowers have faded. From the rhizome, near the base of a foliar stem, a slender shoot appears, and grows an inch or two high; from the apex of this shoot the peduncle extends, and carries one or two flowers. When the flowers have faded, a new bud is formed, and this develops into a true cattleya-like foliar stem. There are several varieties of C. Walkeriana, and all these, except dolosa, flower like the type, but dolosa flowers from between the leaves of a fully-developed stem.

DUMELOW'S SEEDLING, OR WELLINGTON, APPLE.—F. E. J., Ashby-de-la-Zouch: The apple popularly known as Wellington, but more correctly as Dumelow's Seedling, was, I believe, raised in this district. As I have noticed replies in your columns referring to the origin of fruits, I write to ask if you will kindly say how and when this useful apple originated.—Dr. Hogg records that this excellent apple was raised by a person of the name of Dumeller (probably Dumelow), a farmer at Shakerstone, a village in Leicestershire, six miles from Ashby-de-la-Zouch, and is extensively cultivated in that and the adjoining counties under the name of Dumelow's Crab. It was first introduced to the neighbourhood of London by Mr. Richard Williams, of the Turnham Green Nursery, who received it from Gopsal Hall, the seat of Earl Howe, and presented specimens of the fruit to the Horticultural Society in 1820. It was with him that the name of Wellington Apple originated, and by which it is now generally known in the London markets.

BOOKS ON GARDENING.—A. E. C., North Bucks: Our publisher is sending you a list of the books published at the office of the GARDENERS' MAGAZINE. The particular orchid book to which you refer is published at 2s. 6d. by Mr. John Lane, Bodley Head, E.C., and can be obtained through your newsagent.

SCALE INSECTS ON CURRANT BUSHES.—S. E. D., Bedale: Will you kindly inform me what the insect pest is which attacks currant trees; specimens herewith. In the summer I observed little white patches here and there on the trees (against walls), and now a scaly pest appears. These appear to be of the same nature as Mussel Scale on apple trees, but of different shape. —The pest is the White Woolly Currant Scale (Pulvinaria ribesiæ), and one that seems to have a decided preference for bushes trained against walls. High cultivation and abundance of moisture in due season are very material helps in any attemps to get rid of the pest. No doubt some of the insecticides on the market would provide an easy means of affecting a clearance, but it must be remembered that scale insects are not easily killed by spraying unless the mixture used is so strong that it might prove injurious to the trees. A somewhat old-fashioned remedy is that of painting the bushes with hot lime-wash made up of two pounds of lime to a gallon of water. This should be painted on carefully, so as not to break out the buds, but a good coating should be given. Presently, the lime-film will crack and fall away, bringing with it the loose bark and the scale insects.

BITTER ROT IN PEARS.—S. E. D., Bedale: We cannot verify your reference. Will you write us again, giving page and date of issue; we fancy you are under a slight misapprehension.

KEI OR KI APPLE.—W. D., Horeham Road: Some years since a friend presented us with a few fruits (and also jars of preserve), called the Ki-apple, and, though we have made numerous enquiries, we have been quite unable to find out what plant yields the fruit. Can you inform us? We should like to know the name of the plant and something about it. I may say that the fruit was about the size of an apricot and similar in colour, but more brisk and pungent in flavour.—Your rendering of the name is phonetic. The fruit in question is known as Kei-apple, Kai-apple, or Kau-apple, and Aberia Caffra is the plant that yields it. Aberia Caffra is a shrub belonging to the natural order Bixineæ; it is a native of South Africa. The fresh fruits are acid, and make a good pickle, while the ripe fruits are made into a preserve. If you are ever at Kew, you will find specimens in Case No. 46, in No. 1 Museum, and plants in the Economic Houses.

LOSS OF FLOWERS AND FOLIAGE FROM BEGONIAS AND CROTONS.—J. E. S., Otley: I am sending a plant of Begonia Gloire de Lorraine for your inspection. Can you tell me why the flowers and buds have dropped, as well as many leaves? I have about forty very fine plants, and these I fumigated a fortnight ago, and the next morning I found a lot of the bloom had fallen. Ten days later nearly all the blooms and buds had fallen, and lots of the leaves as well. Would fumigation with XL All cause the flowers to fall, or is there anything wrong with the roots? I have given weak soot water occasionally, but water has always been given at about 60 degrees. I am rather afraid some sulphur gets into the house as croton leaves have also fallen. The house has a lean-to roof, and the stoke-hole joins it. The stables are at the back of the house. Would they be likely to cause trouble? Any help you can give me I shall be grateful for.—Excessive fumigation, especially if the plants and flowers are moist at the time, will do a great deal of harm, flowers and leaves falling freely afterwards. If your plants were dry (not at the roots), and fumigation was conducted in accordance with instructions, little harm should have followed, although we believe plants in flower should not be fumigated except in case of special need. Ammonia fumes from the stables might do some harm, but the adjacent stoke-hole is probably the source of the trouble, and the sulphur fumes have no doubt worked destruction. Means must be taken to keep the fumes from the house.

---

### NAMES OF PLANTS.

W. D., Aylesbury.—1, Sequoia gigantea; 2, Cupressus macrocarpa lutea.

N. S. C., Ealing.—1, Cypripedium Leeanum (good variety); 2, Begonia Gloire de Sceaux.

N. J. N., Durham.—1, Asparagus verticillatus; 2, Libonia floribunda; 3, Centropogon Lucyanus; 4, Helxine Solieroli.

A. E. C., North Bucks.—1, probably Thuia gigantea; 2, Cupressus pisifera filifera; 3, Cupressus torulosa; 4, Cattleya Bowringiana.

N. D. D., Newport.—1, Piper porphyrophyllum; 2, Sarracenia Drummondi; 3, Anthurium Andreanum; 4, Sedum Anacampseros; 5, Polypodium vulgare cambricum.

## OBITUARY.

### REV. DAVID LANDSBOROUGH.

We regret to announce the death of the Rev. Dr. Landsborough, of Kilmarnock, a well-known observer of the botany of the West of Scotland, and one who took a warm interest in the horticulture of that district. The Rev. David Landsborough, the son of a man of scientific tastes, early gave up his leisure to the study of botany, geology, and kindred pursuits, and, in the course of a long and busy life, proved of great assistance to many in and beyond the town where his duties lay. Dr. Landsborough's services to botany and gardening were considerable. He loved flowers and plants, and made a special study of the effects of winter on tender plants in the Island of Arran, publishing, through the medium of the Edinburgh Botanical Society, a series of papers on the subject. These were followed by others in which he gave many useful and interesting particulars respecting the culture of such things as tree ferns, palms, etc., in Arran. He was one of the leading spirits in, and the first honorary president of, the Glenfield Ramblers, a natural history society which has done much good work in and around Kilmarnock. The late Dr. Landsborough did much to foster the taste for plants and flowers in his district, and his garden contained a number of interesting plants not often met with in gardens.

### MR. ALEXANDER FRASER.

Much regret was expressed among his large circle of friends in the North at the death, in Edinburgh, of Mr. Alexander Fraser, late gardener at Drumduan, Forres, N.B. Mr. Fraser was for many years in the employment of Mr. Campbell Macpherson-Grant, and of Miss Macpherson-Grant, of Drumduan, and by both of them he was held in the highest esteem and regard. A tasteful and skilful gardener, and one who took a great pride in his work, Mr. Fraser invariably gave an excellent account of himself at horticultural exhibitions. He took a very prominent part in the Forres Chrysanthemum Society, in the welfare of which he was deeply interested. He retired from the post he held so long and faithfully about twelve months ago, and went to reside in Edinburgh where several members of his family had been settled for some years.

## CATALOGUES RECEIVED.

R. C. NOTCUTT, WOODBRIDGE.—A thoroughly well-produced catalogue of general nursery stock. Descriptions and illustrations are alike good.

"BUCKS," TRESCO NURSERIES, IPSWICH.—A neat little catalogue of roses, fruits, shrubs, etc., and containing an announcement of an interesting competition among customers, to be held next July.

REVOIRE, PERE ET FILS, LYON.—A very interesting illustrated advance list of novelties in plants, flowers, vegetables, and fruits for 1913.

## A NEW ROSE TRAINER.

The increasing popularity of weeping standard roses of the Rambler and hybrid Wichuraiana types has given rise to a demand for an effective support and trainer, and we can confidently recommend to the notice of our readers the excellent support introduced by Messrs. Wm. Wood and Sons, Lim., Wood Green, London, N., and herewith illustrated. It will be seen that the columns are made of three separate lengths of iron, which are bent at the top (A) to form triangular arms to hold a hoop of iron, which is passed under the head of the rose tree, and is held in position by the clip-like ends of the iron arms; and at the bottom (B) to form holdfasts. The three legs are held together by two bands united by screws and nuts. Thus the standard is effectually supported without the slightest risk of injury, and the fact that the split ring slips under the head of the rose instead of the branches having to be dragged through the hoop, constitutes one of the chief advantages of this admirably designed appliance.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### The Life of a Leaf.

Although in the microscopic domain of organic life the distinction between the animal and vegetable kingdoms is by no means quite definite in many cases, it becomes clear enough in the more highly-developed plants by the production of foliage, nothing akin to which is produced by animals. In the higher realm of plant life, as distinct from the fungi and other parasitic plants, which are leafless, and can consequently only derive their nourishment secondarily from vegetable matter already formed by the leaf-bearing plants, the leaf rather than the plant itself is really the individual, of which the plant is a colony. Thus from the smallest tuft of grass to the mighty sequoia, of a girth and height which implies many centuries of growth, in both and all forms between, we see growths which are entirely the outcome of leaf activity of shorter or longer duration, and of few or many successive generations of contributory leaves, precisely as we see towns and empires developed by the activity of successive generations of human beings. In both cases the individual, during its limited existence, whether as leaf or man, adds, or should add, something to the concrete accumulation in which, and by virtue of which, it is created. The life of a leaf in the vast majority of cases, is, compared with that of the associated plant community, a very short one, usually confined to a single growing season, during which period it performs its office of absorbing nutrition from the air and from the soil, and working this up by the aid of sunlight into all the varied materials which are needed for the community — i.e., the plant, shrub, or tree, with which it is associated. These materials are then distributed throughout the social system, so to speak, to form the wood, bark, flowers, and finally the fruits, plus the incipient buds, which really represent the leaf's offspring, or successors, in the season next following. These functions fulfilled, the leaf, as a rule, perishes, falls to the ground, and normally contributes by its decay to future vegetative growth. As usual, however, in Nature there are many exceptions to the general rule, and in some cases the life of a leaf extends over many seasons, instead of only one. This occurs particularly in those instances where the plant concerned takes an indefinitely long period in perfecting its life cycle by the production of flowers and seed. As an example, we may take such plants as the aloes, agaves, and similar fleshy-leaved plants, including the so-called century plant, which only flowers after a very long preparative interval, and then perishes. With such plants the leaves last throughout their existence, and are engaged the whole time in enlarging themselves, and fattening up, as it were, the axis of growth or heart of the plants, to form a mass of nutrition, upon which, when the time comes, a huge mass of flower and seed is developed with wonderful rapidity at the expense of the accumulated nourishment. In the cacti and euphorbias we have examples of the opposite character. In the case of the cacti, in order to adapt them to extremely dry conditions, the leaf proper is entirely suppressed, and its functions transferred to the stems, no leaves consequently appearing, even the so-called phyllocacti or leaf cacti owing their name to the somewhat leaf-like appearance due to flattened stems, upon the edges of which, as with the rest of the cactus tribe, the leaf-sites are indicated by small clusters of thorns. In some of the euphorbias we see probably a prior stage of evolution of such leafless plants, since the cluster of thorns are preceded by small leaves, which are shed as soon as formed, and hence have a very short life indeed. The more remarkable case of leaf longevity is seen, perhaps, in that curious plant, the unique Welwitschia, in which the two cotyledons or primary leaves produced from the seed persist for many years, and grow very large and woody, lying flatly on the ground, and constituting the only foliage the plant, really a tree, produces. In evergreen trees and shrubs, the longer life of the leaf is probably, as regards its active functions, more apparent than real, since, as a rule, they are shed the following season, and can, during the dormant period, do but little or nothing in the structural line. In annual plants the life of the leaves is but brief, and, as the next season's growth is confined entirely to the seed, they leave no successors behind them in the shape of buds. With biennials, the leaves live through two seasons, their functions in the first one being to store up nutrition, and in the second to use this for the manufacture of the flowers and seed, on similar, but brief and more regular lines than the agaves, etc., which we have mentioned above. The life of a leaf, in short, depends entirely upon the period required by the plants concerned for the fulfilment of Nature's command to increase and multiply; this done, the next step is to perish in order to make room for the next generation, and to return, as far as possible, its constituents to the general store.

MR. T. PATEMAN.

**Mr. T. Pateman,** whose portrait is given herewith, has fully justified the high position he occupies among the gardeners who pursue their avocations in the county of Hertfordshire, for while he has become best known as a cultivator and exhibitor of fruit, he has been not less successful in all other branches of his work. It is of interest to recall the fact that Mr. Pateman commenced his horticultural career in the gardens of The Node, Welwyn, the residence of C. A. Cain, Esq., of which he has now charge, and remained there five years. It is interesting also that during this period he served under three Scotch and two English gardeners, so that his training must have been somewhat varied. Subsequently, he occupied positions in several gardens of note in Hertfordshire, and in 1898 he returned to The Node as head gardener when the estate was purchased by his late employer. Mr. Pateman proved himself quite equal to his task. He proceeded to set the vineries in proper order, and in 1900 he obtained permission to grub up a portion of the hardy fruit trees each year, and to replant, and this work was proceeded with until the whole of the then existing trees had been replaced. The subsoil of The Node gardens is a strong gravelly clay, which previously had not been worked, and before replanting Mr. Pateman had the area trenched to a depth of three feet. The results have proved to demonstration the great value of the thorough preparation of the soil. Mr. Pateman tells us that he commenced exhibiting by staging a collection of eight dishes of ripe fruit and several single dishes at Harpenden. He obtained premier honours for the collection and five other first prizes in the single dish classes. In 1907 he entered into competition at the Royal Horticultural Society's fruit show, and obtained the second place for a collection of six dishes of ripe dessert fruit, which was by no means unsatisfactory, seeing that there were nine entries; and a first for pears. In the following year Mr. Pateman succeeded in obtaining the premier position in the same class, thereby winning his first cup for fruit, and some other awards, and in the fortnightly competitions, which were in 1909 substituted for the annual fruit show, Mr. Pateman was successful in taking a number of first prizes. This year his successes at Westminster included firsts for twenty-four dishes of apples, six dishes of cooking apples, and a dish of "any other" white grapes, and second for eighteen dishes of pears. At local exhibitions this year Mr. Pateman has won two challenge cups for fruit, one of which has become his property. The Node gardens, which have an area of about thirty acres, have had their interest and attractions greatly enhanced by the rock and water garden, which has an area of about two acres, an Italian garden, and an Old English garden, which were made last year.

**Royal International Horticultural Exhibition.**—The directors of the Royal International Horticultural Exhibition, 1912, met at the Royal Horticultural Hall, Westminster, on November 26, to consider a resolution for disposing of the property of the company, after payment off all debts and liabilities. The balance-sheet showed a net profit of £2,870 3s. 7d. Allowing for payments which have still to be made, the balance may be taken as approximately £2,500. It was decided to disburse the profits in the following manner: To the Irish Gardeners' Association and Benevolent Society, £100; towards the reprinting and bringing up-to-date of Dr. A. G. Pritzel's "Botanical Index," £250 (to this latter purpose the R.H.S. have already promised to give £1,000). The remainder of the profits (about £2,150) will be divided between the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, in the proportion of two-thirds to the former institution, and one-third to the latter. A second resolution was passed, namely, that the company be voluntarily wound up, and that Mr. G. J. Ingram be appointed liquidator. These resolutions will be confirmed at a later meeting.

**National Rose Society.** — The thirty-sixth annual general meeting of the National Rose Society will take place in the ante-room to the Crown Room at the Holborn Restaurant, London, W.C. (corner of Kingsway, Holborn), on Tuesday, December 17, at three p.m., to receive the report of the Council; to pass the accounts; to elect the officers and Council for the ensuing year; and to award the Dean Hole medal. Numerous alterations in the rules and regulations will be submitted for the approval of the members, but none of the alterations are of a drastic character, and no great changes will be made in the clauses. The nominaton of officers are: C. E. Shea, Esq., president; G. W. Cook, Esq., hon. treasurer; E. Mawley, Esq., V.M.H., hon. secretary; and the acting vice-presidents, Rev. F. R. Burnside, H. R. Darlington, Esq., George Gordon, Esq., V.M.H., G. A. Hammond, Esq., E. J. Holland, Esq., H. E. Molyneux, Esq., O. G. Orpen, Esq., Rev. F. Page Roberts, Rev. J. H. Pemberton, Dr. Shackleton, J. T. Strange, Esq., and Dr. A. H. Williams. As nominations for officers and vice-presidents are only equal to the number of vacancies, the foregoing will presumably be elected. The nominations for the Council exceed the vacancies by four, and consequently there will be a contest for seats.

**Moving Pictures at the Royal Horticultural Hall.**—In the Orchid annexe of the R.H.S. Hall, Westminster, there was an additional attraction on Tuesday last. During the afternoon a representative of the Government of British Columbia gave a display of moving pictures showing the Timber, Mining, Fisheries, Agriculture, and Fruit Growing Industries of British Columbia. Many visitors took advantage of this exhibition to avoid the crush in the hall, and secure a brief rest, as well as instruction.

**The Cold Snap.**—The end of November and the beginning of December were notable for the cold weather that prevailed throughout the country. In Durham and Yorkshire skating was indulged in, and at Buxton the snow permitted tobogganning, as it did also at Wallasey, Cheshire. At Carlisle the temperature fell to zero on Sunday morning; at Hampton Court and in many parts of the Thames Valley ten or twelve degrees of frost were registered, and previous to the heavy rains of Sunday evening the ice was half an inch thick. Snow fell heavily in Berwickshire and the Lothians, and in some place 27 degrees of frost were registered. North Wales experienced a heavy snowfall, and in Dublin snow followed frost, but rain soon cleared both away.

**A Curious Orchid.** — It is now a well-known fact that if Zygopetalum Mackayi is crossed with pollen from Odontoglossum crispum, seed capsules and fertile seeds result, but the progeny is invariably Z. Mackayi, without the slightest suggestion of Odontoglossum influence. Messrs. J. Veitch and Sons have on two distinct occasions made this cross, and raised batches of seedlings, and on Tuesday last they exhibited about a dozen such seedlings, in bloom, and everyone was Zygopetalum Mackayi pure and simple.

**Frank Ashton Relief Fund.**—We have received the following appeal: A small committee of orchidists has been formed to assist Mr. Frank Ashton, who has unfortunately fallen into indigent circumstances, and who is no longer able to follow his employment as a traveller in orchids. He has been struggling against fate for the past two or three years, but has at last been compelled to give up owing to a very badly poisoned foot, to attacks of chronic rheumatism, and to an affection of the eyes. He is no longer able to travel, and his resources are practically at an end. An appeal is therefore made to all those who have been associated with Mr. Ashton in the orchid business to show their practical sympathy with him in his affliction by contributing towards a fund which will be utilised to establish him in some small home business. The committee of the Kew Guild (of which Mr. Ashton is a life member) have generously made a grant of £5 towards the fund. Further donations may be sent to the secretary of the Kew Guild (Mr. Herbert Cowley, South Side, Kew Green), or to me, and will be gratefully acknowledged on Mr. Ashton's behalf.—John Weathers, 7, Talbot Road, Isleworth, Middlesex (secretary).

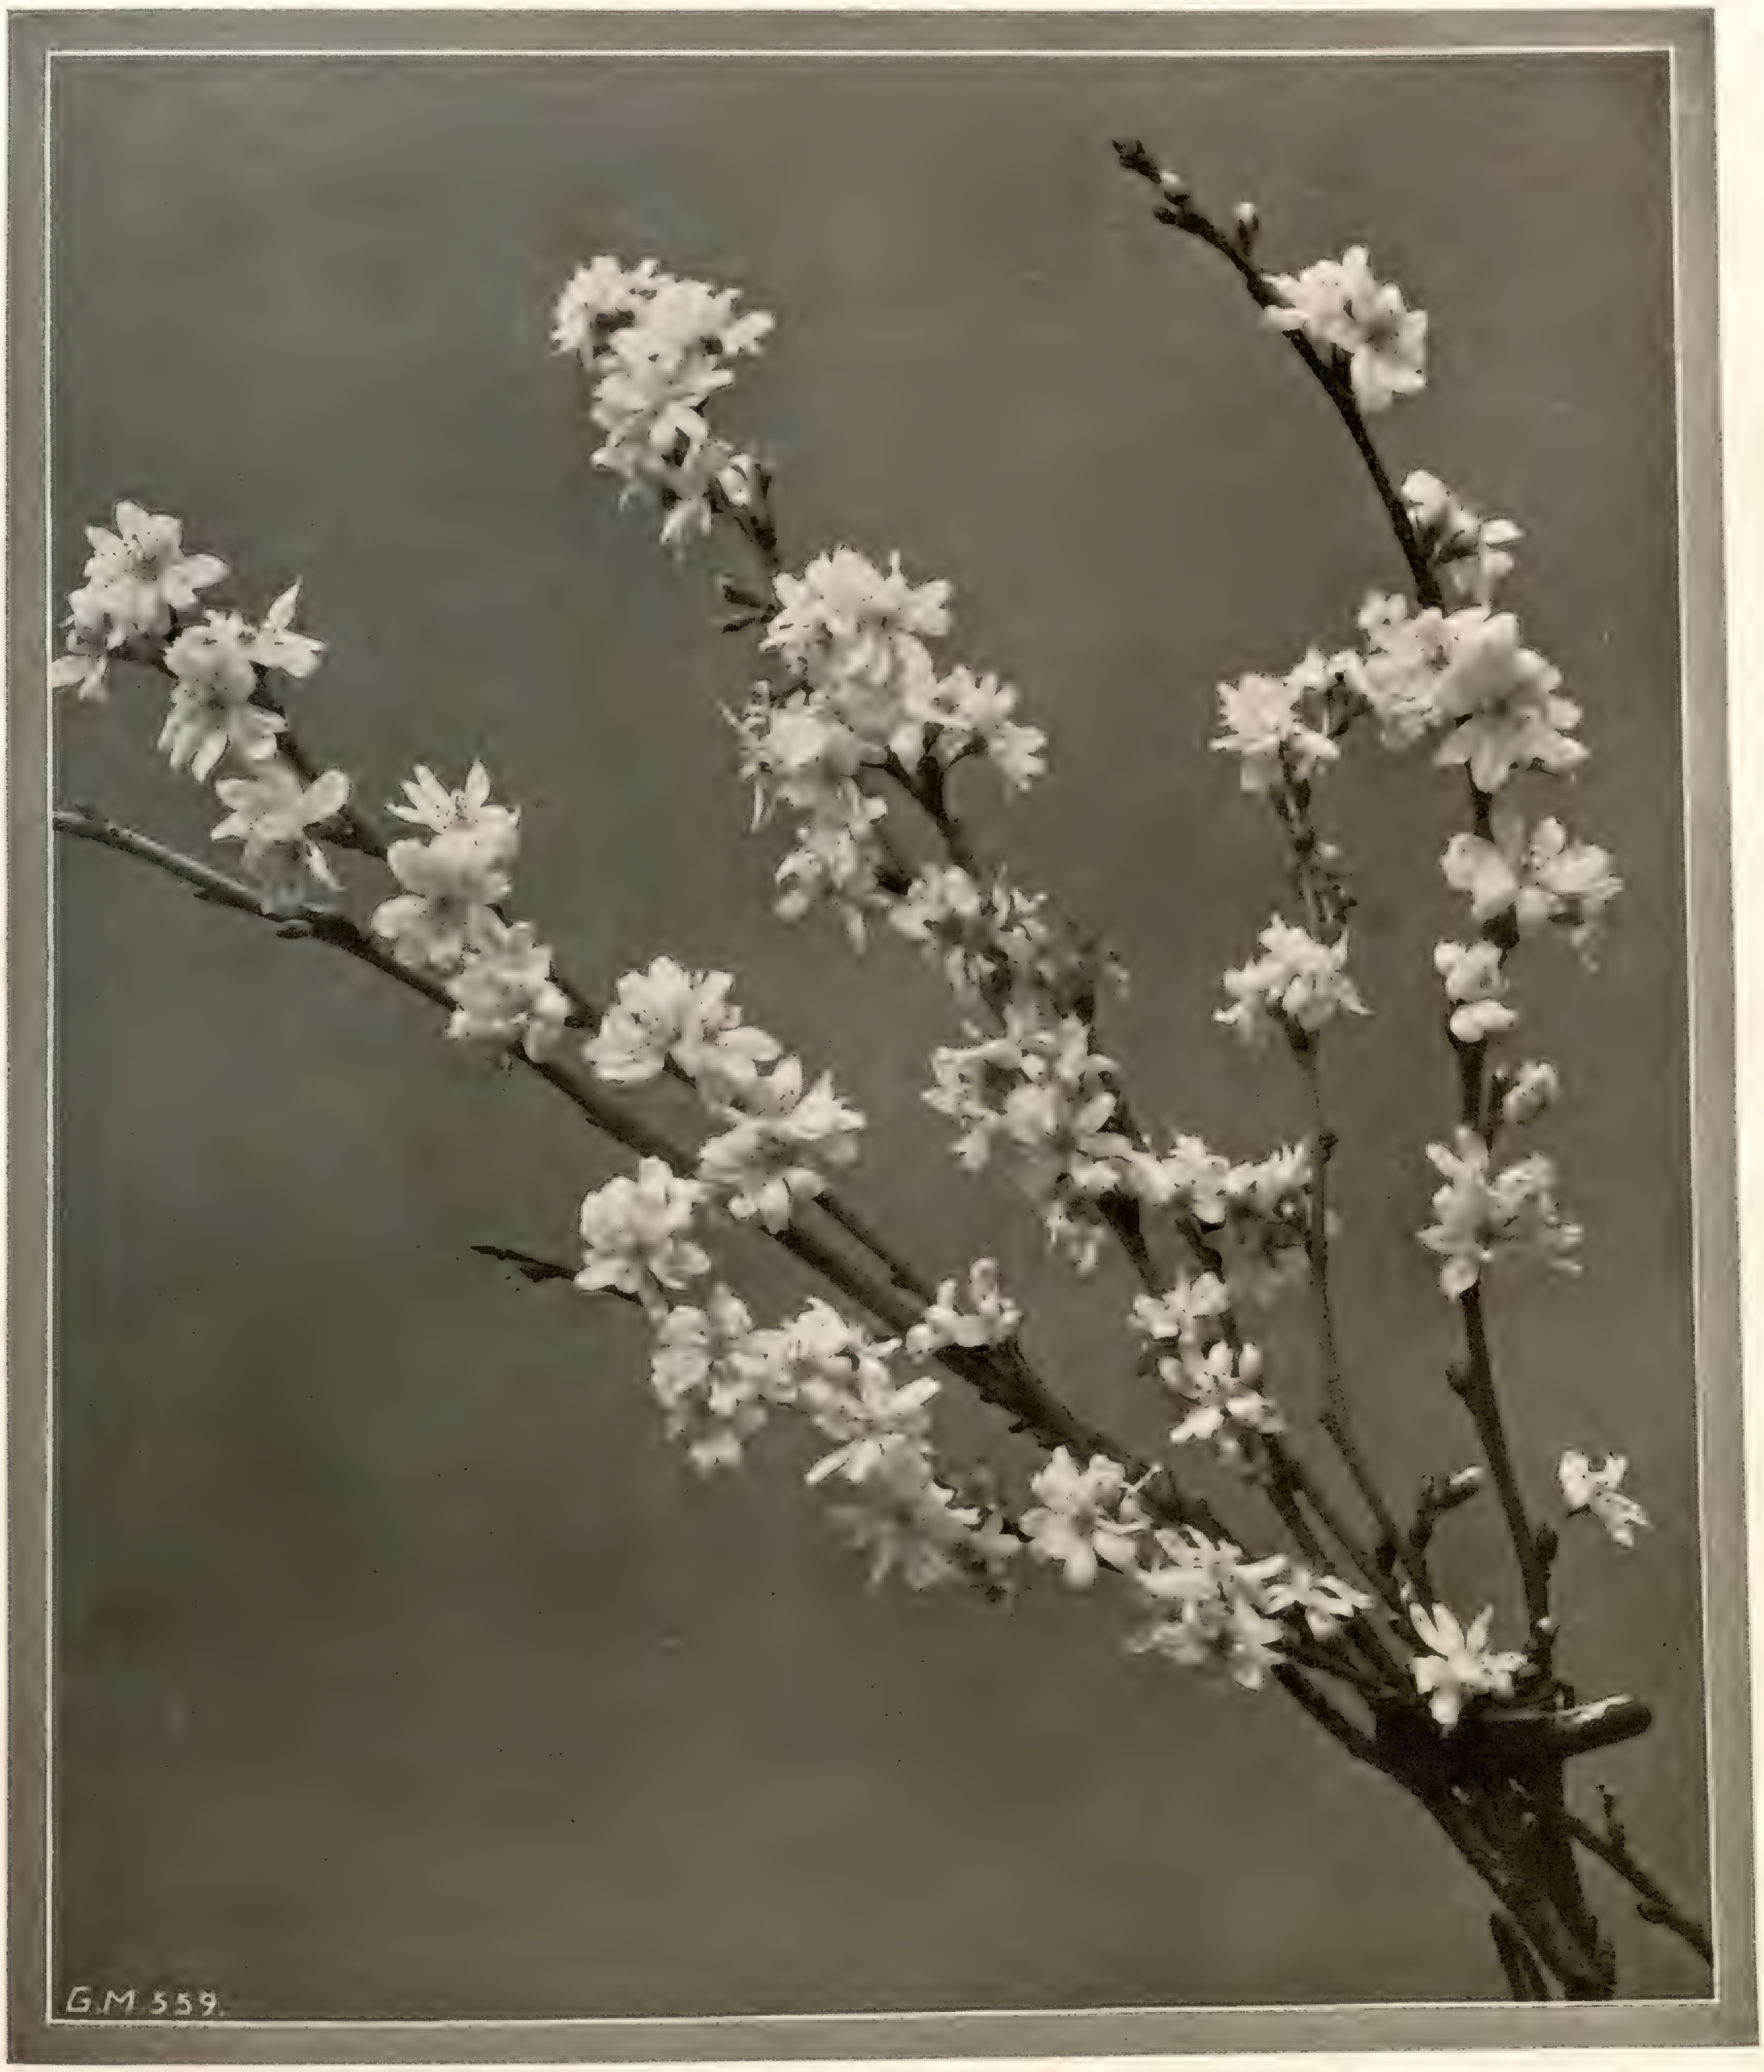
**A Christmas Number for Garden Lovers.**—We have received a copy of the Christmas Number of "Amateur Gardening," and at once congratulate all concerned upon the beauty and excellence of the production. The issue cannot fail to please, and, although it is, in the first instance, designed for garden-lovers, it is sure to appeal to an even wider circle of the reading public. A special feature is an eight-page supplement of beautifully coloured pictures, reproduced from direct colour photographs and water colour drawings, and representing plants, flowers, and garden scenes. Best of all, is the double-page illustration of the splendid herbaceous borders at Welbeck Abbey, Notts, the seat of the Duke of Portland, K.G., reproduced by permission from the water colour drawing by A. C. Wyatt, Esq. A key plan of the border adds to the value of the picture. Besides all these good things, the issue contains numerous beautiful half-tone illustrations, and an abundance of literary matter written in a less serious and technical manner than usual, and, for that reason, all the more welcome at the festive season.

**National Rose Society's Conversazione.**—The conversaziones that have within recent years been held by the National Rose Society, in conjunction with the annual meetings, have been so popular with the members that a similar function will be held this year in association with the annual gathering. As in the case of the latter, the conversazione will take place at the Holborn Restaurant, corner of Kingsway, Holborn, W.C., on December 17, and the time will be from 4.30 to 6 p.m. The President will deliver a short address, and Dr. George G. Hamilton will say a few words about "Roses and Some Bournemouth Gardens," illustrated by lantern slides in colour. For several years past Dr. Hamilton has devoted special attention to the photography of flowers in their natural colours, and, having seen the slides, which have been photographed direct from Nature, we can say that in their fidelity and effectiveness they are far superior to any coloured photographs that we have previously seen. There will also be light refreshments, and selections of music. Members should not overlook the fact that they are entitled to one ticket free, provided application be made to Mr. E. Mawley, V.M.H., Rosebank, Berkhamsted, Herts, not later than Thursday, the 12th inst. Tickets (2s. each) may be purchased for friends at the same time.

**Ontario's Apple Crop.**—Although complete figures respecting the apple crop have not been received, preliminary reports state that this year's crop in Ontario will be a good one. The province produces 70 per cent. of the total crop of apples in Canada; the bulk is sold within the province, but, at the same time, Ontario exports more apples to Great Britain than any other province. The shipment last year amounted to about 1,000,000 barrels or 3,000,000 bushels. Ontario apples are very much in demand in the Western Provinces, which annually take nearly 1,000,000 bushels. It is calculated that apple growers in the province receive from the export trade alone the sum of one million sterling. Where the growers have united to form co-operative shipping associations—as in Norfolk and other counties—their returns have been much higher than under the old system of selling in the orchard.

# ROYAL HORTICULTURAL SOCIETY.

During the afternoon of December 3 there was a great crowd of visitors at the Royal Horticultural Hall, Westminster, to see the last show of the year. From about 2.30 to 4.30 the hall was packed with people. The display was a good one, and there was plenty of variety, as begonias, orchids, carnations, fruits, bottled fruits, chrysanthemums, and paintings were all shown freely, so that the exhibition did not lack either variety or brilliance.



PRUNUS MIQUELIANA.
A beautiful white, autumn-flowering species. A.M., R.H.S., December 3. Colonel Stephen Clarke, C.B., Cuckfield.

FLORAL COMMITTEE.

Very gay were the winter-flowering begonias so well shown by Messrs. Jas. Veitch and Sons, Chelsea; we have many times referred to the varieties raised by this firm, but a special word of praise seems due to the variety Elatior, which carries its numerous bright salmon-pink or carmine flowers erect and in sturdy clusters; this should make a fine market plant, as it "carries" well. Of B. Julius we may say that at Feltham it has proved a capital basket plant. Bouvardias, azaleas, and single chrysanthemums in pots formed part of the display made by the Chelsea firm. Messrs. J. Peed and Sons, Norwood, also put up an exhibit of winter-flowering begonias.

Begonia Glory of Cincinnati, in the way of B. Gloire de Lorraine, was shown in quantity and in capital condition by Mr. G. Lange, Hampton. Mr. Lange also showed fifteen plants of hydrangeas in 48-sized pots, carrying enormous heads. The varieties were Mdme. Emile Mouillère, Mdlle. and Renee Gaillard, and of the former one head was a foot wide and ten inches deep. Mr. A. Shambrook, gardener to the Rev. H. Buckston, Sutton Hall, Derby, contributed a batch of cyclamens, in which the papilio or fringed varieties were in especially fine condition, large, and freely-flowered.

Poinsettias and cyclamens from Messrs. H. B. May and Sons, Edmonton, were very bright, and they were pleasingly associated with the graceful Plumbago rosea and the choicer nephrolepises, Adiantum Farleyense gloriosum and the bright Centropogon Lucyanum. Retarded liliums, notably L. auratum, L. longiflorum, and L. speciosum, were exhibited over a groundwork of dwarf polyantha roses by Messrs. Wm. Cutbush and Son, this firm also displaying winter-flowering begonias. Indian azaleas were submitted by Mr. L. Russell, Richmond, and the freely-flowered plants of Mdme. Petrick, J. B. Veronne, and Deutche Perle attracted a good deal of attention; ivies and a few anœctochilus, with their prettily veined leaves, were also contributed by Mr. Russell.

Very interesting were the alpine plants exhibited by Messrs. Thos. S. Ware, Lim., Feltham; these were staged in pans, and included a wide range of sedums, sempervivums, saxifragas, androsaces, dwarf shrubby veronicas, primulas, and the moisture-loving Sarracenia purpurea. Mr. Clarence Elliott, Stevenage, had a little rock garden, wherein Gentiana acaulis was flowering, and where saxifragas were grouped. A feature of the exhibit was the dwarf bushes of Abies excelsa Remonti, A. pygmæa, Retinospora obtusa nana, R. pisifera nana, and Juniperus tamariscifolia—all suitable for Mrs. Swinburne in the gardens under his rock gardens.

Chrysanthemums were again fairly well represented, and a quite large display was made by Messrs. W. Wells and Co., Merstham. The flowers were set up pleasingly in stands and vases, and associated with crotons, ferns, and other foliage subjects. The single and decorative varieties were fine features, and of the former Eric Wild (A.M.), pink; and Mrs. Wingfield Miller, deep rose, were very attractive, while Miss A. Brooker, a chestnut-scarlet decorative variety of incurved Japanese form, was a notably bright variety; an A.M. was granted to each of these three. Wells' Late Pink, Mensa, Merstham Jewel, Brightness, and Ethel Thorp were other fine varieties on view.

A particularly fine exhibit of chrysanthemums in pots, all in small 40's, and carrying from four to ten fine flowers apiece, was made by Mr. Cradduck, gardener to Colonel Mark Lockwood, C.V.O., M.P., Bishop's Hall, Romford. There were forty plants in all, and the group was greatly admired, and everyone was loud in praise of the splendid cultivation thus exhibited. The variety was considered by the Floral Committee to be Mrs. Swinburne, but a large number of experts were equally certain the variety was Maud Jefferies. Mr. Cradduck told us the variety appeared with Moneymaker, and to his knowledge he had never had the variety Mrs. Swinburne in the gardens under his charge.

From the Manor House Nurseries, Cardiff, was brought a selection of single chrysanthemums, and notable varieties were Daisy, Audrey, Idris, Sir G. Bullough, Strawberry, and Doris Chaplin. Godfrey's Perfection chrysanthemum, a very free decorative white anemone variety was shown in capital condition by Mr. W. J. Godfrey, Exmouth, Devon.

Very graceful was Asplenium divaricatum elegans, with finely divided fronds, shown by Messrs. J. Parker and Co., Whetstone; it deservedly gained an A.M.

Messrs. H. Cannell and Sons, Swanley, made up a bright exhibit of pelargoniums, showing several dozen bunches of brilliant trusses of flowers. Prunus Miqueliana, a twiggy shrub that produces an abundance of white flowers out of doors at this season of the year, caused some surprise; it is a pretty subject, and was quite well shown by Colonel Stephen Clarke, C.B., Cuckfield, and it gained an A.M.

Paintings of floral subjects and garden scenes were submitted by Miss Fanny Farrer, 38, Burlington Gardens, Acton, W.; Mrs. Malone, Cheyne Walk, Chelsea; Mr. R. Hughes, Potters Bar; and Miss di Guarda. Mr. W. R. Dykes, Charterhouse, Godalming, showed a fine series of coloured drawings of iris species, and this exhibit was greatly admired.

## CARNATIONS.

A very large exhibit of carnations staged across the end of the hall by Mr. C. Engelmann, Saffron Walden, was a great attraction, for not only were the flowers good, but they were well grouped and shown in quantity. Particularly good were the great sheaves of Lady Northcliffe, the crimson Triumph, White Enchantress, May Day, the new Rosette, the old Enchantress, Carola (bold as ever), the showy orange-apricot Elektra, the yellow Golden Ray, and Scarlet Carola, a bright scarlet form of the crimson Carola, and also a rose and crimson splashed sport from Carola. "A glorious exhibit," as some of the ladies suggested, and also a most interesting one. Mr. G. Lange, Hampton, had a small stand of carnations, and his best varieties were Mikado, May Day, Beacon, Wodenethe, and Scarlet Glow.

Messrs. Young and Co., Hatherley, Cheltenham, put up a quite attractive exhibit of carnations in about twenty varieties. The flowers were good and bright, and set up in vases of varying height, with sprays of asparagus. Outstanding varieties were Hon. John Boscawen, a new pink; Mrs. Brodie Henderson, deep crimson-red; Mrs. Greswolde Williams, Duchess of Devonshire, May Day, Superior, Mrs. C. W. Ward, and a good seedling from the popular Marmion. Messrs. Allwood Brothers, Haywards Heath, had a quite pretty exhibit of carnations, artistically arranged. They had baskets, vases, and bowls of blooms, and a few of their leading varieties were Salmon Enchantress, White Wonder, Mary Allwood, Geisha, May Day, Baroness de Brienen, Rosette, Empire Day, and Fairmount, the latter a soft heliotrope variety of large size and substance.

Very bold and well arranged was the exhibit of carnations set up by Messrs. Stuart Low and Co., Enfield. In the centre of a large contribution they had lovely bunches of the pink Baroness de Brienen, surrounded by Rosette, Marchioness of Linlithgow (white), and Mikado. At either side were fine sheaves of White Enchantress, Mrs. C. F. Raphael, Enchantress, Gloriosa, Carola, and Pink Enchantress. Ferns, palms, and green moss were freely used under and among the flowers, and added to the elegance of the display. Mr. W. Lawrenson, Yarm-on-Tees, Newcastle, was an exhibitor of finely-grown carnations, and of great excellence were the bunches of the lovely new white Snowstorm, Mrs. Burnett, Lady Meyer, May Day, and Pink Enchantress.

Mr. A. F. Dutton, Iver, Bucks, adopted a new method of showing his carnations, and set up three big baskets of lovely blooms of the pink variety Mrs. A. F. Dutton (A.M.), with a small vase of selected flowers in the foreground. The variety is of fine size and form, and slightly scented. Mr. H. Burnett, Guernsey, had a delightful exhibit charmingly arranged, and the flowers were large and very beautiful. Mrs. C. F. Raphael was grandly shown, and so were Rosette, R. F. Felton, Marmion, Sunstar, White Wonder, the lovely pink Empire Day, Sultan, the striped Benora, and White Chief—all first-rate varieties.

Messrs. Wm. Cutbush and Son, Highgate, had a large exhibit of perpetual carnations, and showed flowers and flowering plants, and arranged these in capital style. The vases of R. F. Felton, Mrs. L. Mackinnon (rich scarlet), White Perfection, Lady Meyer, Mikado, and Hon. R. James were fine, and so were the plants of Lady Coventry, Viscountess Goschen, and F. Galsworthy.

## ORCHID COMMITTEE.

Over a score of members attended this committee, and, though they had not such a busy time as usual, they had plenty to do for about three-quarters of an hour. The question of admitting a "disbudded" spike of an orchid for consideration was discussed; at present it would be disqualified, but there seems to be a feeling that the regulation should be relaxed.

An effective and interesting exhibit of orchids from Messrs. James Veitch and Sons, Chelsea, contained a number of well-flowered examples of Zygopetalum Mackayi, carrying a total of about three dozen spikes. Brasso-catt-lælia Morna, with large rosy flowers, the fringed lip having a buff centre, was another good thing; while among cypripediums the pick were C. insigne Sanderæ, C. Germaine Opoix, C. Edina—a bold, richly spotted flower, C. San-Actæus, and C. Tracyanum, the latter a cross between C. aureum Hyeanum and C. Leeanum giganteum. Cypripediums, chiefly insigne varieties, with a few Cattleya labiata, a plant of Vanda tricolor, and some odontoglossums were staged rather poorly by Messrs. Baylor, Hartland, and Sons, Cork.

A novel and rather high arrangement of orchids from Messrs. Sander and Sons, St. Albans, brought the flowers well up to the line of vision. Ferns and green moss were freely used to hide the pots and add finish to the group. A very important subject was Chondropetalum Fletcheri—a most interesting hybrid between Zygopetalum Mackayi and Chondrorhyncha Chestertoni, two very distinct plants. The hybrid has zygopetalum habit and general form of flower, but the lip is cream-coloured with fimbriated margins that show the influence of Chondrorhyncha Chestertoni. Lælio-cattleya Golden Oriole, Cattleya Sylvia, Cypripedium St. Andre, C. Actæus, C. Vandyck splendens, C. Arthurianum Sanderæ, and C. Troilus.

A small set of well-grown cypripediums was staged by Messrs. Hassall and Co., Southgate, including fine flowers of C. Mdme. Jules Hye, C. insigne Harefield Hall, C. i. Sanderæ, C. Fulshawense, and the bright C. Triumphans. Messrs. J. Cypher and Sons, Cheltenham, presented cypripediums in good form, together with the pure white Calanthe Harrisi, the fine Cymbidium Tracyanum, Zygopetalum crinitum, and the free-flowering Masdevallia Schröderiana. Messrs. J. and A. McBean, Cooksbridge, showed a few good odontoglossums, the pretty Cattleya aurensis, cymbidium, and some cypripediums.

In the little bank of orchids staged by Mr. F. W. Thurgood, gardener to H. T. Pitt, Esq., Rosslyn, Stamford Hill, N., we noticed a plant of Chondropetalum Fletcheri with two spikes of its green and cream flowers; Miltonia Bleuana with two spikes, Cypripedium Sir Redvers Buller, C. Triumphans, C. Chapmani, the bright C. Baron Schröder, and the neat C. Niobe.

Messrs. Charlesworth and Co., Haywards Heath, showed a fine example of Angræcum sesquipedale, carrying eight of its ivory-white flowers; the pretty Brasso-cattleya Rutherfordi, Sophro-cattleya Heatonense, Odontioda Diana, some capital cypripediums, and the handsome Sophro-lælio-cattleya Carna (A.M.) with crimson petals. The beautiful rosy-tinted Vanda cærulea Sanderæ, carrying two fine spikes, was shown by Mr. Alexander, gardener to Sir George Holford, Westonbirt, Tetbury, Gloucester; with this came Cattleya Golden Oriole Ruby (F.C.C.), with brilliant ruby-crimson petals and lip; Cypripedium Viking (A.M.), a shapely cross between C. Buchanianum and C. illustre.

Mr. W. H. White, gardener to Sir Trevor Lawrence, Bart., Dorking, gained an A.M. for Cypripedium Eurybiades, a handsome flower, with dark purple spots on the white and green dorsal sepal. Odontioda Latona Fowler's var. (F.C.C.), a very beautiful hybrid between Odontioda Bradshawæ and Odontoglossum crispo-Harryanum, caused some discussion, as a bud or flower had been removed recently from the apex, and there is a regulation aginst disbudding. The flowers have a rosy-blush ground, red margins, and large crimson blotches, and there is a yellow disc on the lip; this was shown by J. Gurney Fowler, Esq., Glebelands, South Woodford. Messrs. Stuart Low and Co., St. Albans, and Messrs. Swan and Price, Keyfield Nursery, St. Albans, each showed a few orchids.

(Continued on p. 947.)

# PERPETUAL FLOWERING CARNATIONS IN WINTER.

In the case of perpetual-flowering carnations the amount of heat must be governed by the amount of light. In short, heat and light work hand in hand. If you gave a high temperature with a poor light you would be forcing the plants. That is why it is a prime necessity to have a lower temperature at night than in the day. With the light of day, however, the plants benefit by the additional heat. On bright, sunny days the temperature of the greenhouse will rise very high, with an abundance of air upon the house, but this does no harm. On the contrary it does good, because you have increased light with the increased heat, and that is the root of the whole matter, as all good gardeners know.

In the case of an old-fashioned dark greenhouse, or one with a northern aspect, the light during the day cannot be so strong as in a modern house more favourably placed, so that more air, consequently a lower temperature, should be aimed at. This also applies to those who grow perpetual-flowering carnations near large towns where fog has to be contended with.

Man may cheat his fellow-man, but he cannot cheat Nature, and anyone who endeavours to force perpetual-flowering carnations in a high temperature will learn the truth of this. The recognised best temperatures are between 45 and 50 degrees at night, and between 55 and 60 degrees during the day, with a further advance in bright weather. But, as we all know, perpetual carnations can be grown in cold greenhouses, for while the frost will retard their flowering it will not kill the plants. MONTAGU C. ALLWOOD.

# THE GRASS LAWN.

## Its Place in the Garden.

In these days of plenitude in advertising, when almost every post brings an autumn catalogue of plants, roses, bulbs, or alpines, the amateur gardener—as a last resort after filling his every border is perhaps tempted to cut into his lawn and make beds for the accommodation of some desired purchase.

He remembers the noble Darwin tulips that graced a friend's garden last May, and the Polyanthus Miss Jekyll. He has no room in his rose beds for the brilliantly coloured Polyantha Rose Jessie that took his fancy when visiting a brother gardener lately. He must really find room for some of the old-fashioned, dwarf-growing, multi-flowered pompon chrysanthemums, or for border carnations and pinks in variety. But every available yard of his ground devoted to kitchen garden produce is required for its lawful use; and finally, he cannot enlarge his boundaries. There is only one thing he can do; he can reduce the size of the lawn, or, at any rate, cut some beds in it.

If he be a finnicky man he will be tempted to make beds, some pear-shaped, some oval, or, maybe, some lozenge-shaped. If he be a man of method and decision, he will probably make fewer beds and of one proportion. But if he be a really wise man he will leave his lawn alone and forego the pleasure of growing the desired plants, unless he can throw out from existing beds or borders some unimportant subjects, to be replaced by the coveted ones.

A lawn should possess one superlative attraction in the garden, that of restfulness and space. The borders of herbaceous plants rejoice the eye with colour and with varied growth and foliage; the rose garden has its own unchallenged charm, and the rock or water garden invite the plant-lover to investigate each individual saxifrage or water lily; but when all has been seen and admired, the visitor turns with delight and satisfaction to rest his eyes on the cool green lawn, where the dainty little wagtails dance in the sunshine, or the long evening shadows mark the rough outline of friendly trees. If possible, a good sized piece of ground should be reserved for the lawn, and if it can be easily seen from the lower windows of the house, so much the better. But where space is limited a long, wide strip may suffice in place of a more square one, and on either side may be herbaceous plants in borders.

One very restful garden comes to mind, in which occurs a rose garden with long central rose beds, and generous breadths of lawn on either side and at either end, while climbing roses mark the boundaries of this retreat. It is only entered by two slight openings in the fence of climbers, and the tired man can truly there find rest. One does not soon forget the soft shadows on this lawn, nor the light petals of the climbing roses scattered on the turf.

Beechwood, WALTER JESPER.
Menston-in-Wharfedale.

SUN AND SHADE ACROSS THE LAWN.

**Urceolina aurea.** — This pretty South American bulbous plant, whose introduction we owe to Richard Pearce, of tuberous begonia fame, flowers naturally during the autumn months. It is exceedingly pretty when in bloom, and is, in addition, totally distinct from any other occupant of our greenhouses. The leaves are much like those of a eucharis, and the flower scape, which well overtops the foliage, is terminated by an umbel of strictly drooping flowers, in shape like inverted urns, and in colour yellow and green. It is also known as Urceolina pendula.—W. T.

# THE EDUCATION OF A GARDENER.

I have followed with considerable interest the correspondence that has for some time past appeared in the Gardeners' Magazine respecting the education of the gardener. On such a topic there must necessarily be differences of opinion; but the tendency in discussing it, as in all discussions, is to become so deeply involved in detail that the general outlook is narrowed and the vital points obscured.

The two fundamental questions appear to me to be—(1) What are we out for? At what do we aim? (2) How can we best attain it? All other questions are subsidiary to these, and I would submit that these are just the questions which the rising generation of gardeners must put to themselves.

As bearing on the recent discussion, I believe the answer to the first is—Proper recognition and a fitting standard of remuneration. Gardeners are not the first to lay claim to either one or the other, so the horticultural profession is not peculiar in this respect. The next query—How can we best attain it?—is not so easily answered.

Mr. Donoghue suggests organisation. Agreed. But how, or on what lines? He cites the recent case of the medical profession as being testimony to the value of professional organisation. Yes; but we are not told anything of the basis of that organisation.

The apprenticeship system has been mooted as containing the solution of the difficulty. Apprenticeship in horticultural circles has been for many years a dead letter, and it does not appear probable that it will ever be revived. Even if it were, there dening were merely a craft the matter would not alone have the desired effect. If gardening wer merely a craft the matter would be more simple; but the case of the gardener is not analogous to that of a bricklayer or engine-fitter. The gardener is much more. An adequate training of the eye, the hand, and the mind of the young gardener can hardly be given by one man, however great may be the sense of responsibility. Further, the uncertainty of tenure frequently attaching to the office of a private gardener would rule out the apprenticeship system in the case of many good men. Apprenticeship, to be of any value, must mean personal obligation and personal supervision to some extent. In so far as I have seen the system at work in either private gardens or nurseries, it has not commended itself to me.

A PLEASING GRASS WALK IN A ROSE GARDEN.

Failing apprenticeship, we have to consider other means as a basis for the training, subsequent classification, and organisation of gardeners. For enlightenment we can hardly do better than consider the case of agriculture, and the training of the professional agriculturist. I am not putting this forward as being generally an ideal one; nor is there any necessity here to enter into the vexed question of the relative importance of horticulture and agriculture in the economy of the nation. There are, however, points in the agricultural training which, in their effect, make the horticultural man somewhat envious of the men who turn their attentions to agriculture as a profession. It has been said—perhaps at one time with considerable truth, though it is not by any means as true as formerly—that all higher agricultural education had only gone to create teachers. Presuming that we grant it has tended chiefly to the creation of teachers, it must be admitted, too, that, with higher education, the claims of agriculture have been pressed and (more satisfactory still) acknowledged, and in a way hardly probable in the case of horticulture.

It is useless lamenting the fact that the interests of horticulture are not properly represented on our public bodies, so long as the majority of our best men lack that kind of training which alone, in most instances, can give them either a hearing or a place. We must face the facts squarely. We complain that horticulture pays £10 to £12 per acre rent, as against £2 to £2 10s. of agriculture, and, in a case vouched for by a well-known grower to me, £6,000 in wages, annually, against an original £300 from agriculture. And yet horticultural interests are not considered in the same way as those of the sister science. It may not be out of place here to point out that, whatever may be the achievements of the trade to-day, the private gardener has been the pioneer in practically every side of trade development. The credit of initial creation of taste or demand belongs to him. The raising of the standard of cultivation began in the private garden, and yet——! There is much here that the horticultural profession may take to heart.

The effect of higher agricultural education is seen in the Development Act, and, equally, in its application. It gives us food for thought. I join hands with Mr. Donoghue when he says, "every young man ought to have a fixed determination to qualify for any post that horticulture may offer."

The lack of objective, and the policy of drift, are the bane of many young men. But in our efforts to raise our status let us have no narrow views embracing craftsmanship as the sum total of qualifications. Something more is requisite. After all, there is a fairly well-defined limit in the direction of craftsmanship; to intelligence there is none.

To the oft-repeated question—Is it worth while?—every young man must provide his own answer. At any rate, it can be said that horticulture has never offered more or better openings than it does to-day. There are indications that still better ones will come to those who will qualify for them. The young gardener who to-day strives to give breadth and depth to the educational foundation on which his technical knowledge and technical skill has to be built, and follows his profession with single-minded purpose, will assuredly come into his own.

Whatever may be done in the future in the way of "hall-marking" the best qualified men who follow horticulture, I am convinced that for the higher grades the bestowal of such marks must necessitate a higher standard of general education, together with a better training of the intelligence, than has been the rule in the past, if those bearing them are to command the respect, and be given that recognition which everyone connected with horticulture desires.

# THE NEWER HYBRID TEA ROSES.

During the last few years new varieties of roses have been introduced in considerable numbers, especially in the hybrid tea section, so that it is most difficult for the ordinary grower to keep pace with the latest introductions. With a view of assisting the inexperienced during the planting season, I purpose noting some of those most desirable.

British Queen is a desirable variety; it flowered well at the end of summer when many other varieties were on the wane. The flowers are of full size, quite solid and shapely, with nicely imbricated petals of a dull white colour, with just a shade of lemon in the centre.

Sunburst.—There has been much criticism of this variety, but I think highly of it, especially for culture under glass, and for indoor decorations, and am under the impression that it will replace Lady Hillingdon for indoor culture, being so much stiffer in the stem, in addition to having good foliage. The colour is better under glass than out of doors, and it is yellow with orange centre. The buds are quite shapely and full.

Mrs. Edward Powel.—In colour this is a remarkable rose, bright crimson, with a velvety suffusion, and in bud or when fully expanded it is attractive. As a bedding rose this should be in great demand; it is free in flowering, and has deep green foliage, and a vigorous yet compact habit.

Gaston Bounier is a shapely flower of a silvery-flesh colour, with a rich golden-rose centre. In growth it is not vigorous, but free flowering.

Countess of Shaftesbury is one of the most promising, shapely roses sent out for some years; the colour is a rich rosy-pink.

Lady Greenall has a long, pointed bud, rich orange at the base, heavily toned with pink over creamy-white.

Leslie Holland is deep scarlet-crimson, heavily veined with velvet red; large, shapely blooms, deliciously perfumed, and a capital grower.

Auguste Rodrigues has a sweet perfume; the large loose petals are crimson, flushed with a velvety sheen.

Carine is well worth a place in any collection where cut blooms are appreciated. The flowers are small, pointed, most charming in the bud state, orange-carmine, suffused with buff; an excellent habit of growth.

Edward Mawley has surprised me by its manner of growth and freedom of flowering out of doors. I look upon it as one of the finest roses we have. The massive petals are sweetly perfumed, deep velvety crimson.

Lady Downe has buff-coloured flowers, shaded with deep yellow in the centre, paling with expansion, and is of great value.

Mabel Drew is quite one of the finest light-coloured roses we have. The flowers are at all times shapely; canary-yellow, passing to almost white, deliciously fragrant.

Lady Margaret Boscawen has a fawn base, flushed with pink.

Radium is a sport from Caroline Testout, deeper in colour and more shapely.

Pink Liberty is a sport from the well-known Liberty, but the colour is carmine rather than pink; a desirable variety, having all the good points of its parents in shape and fragrance.

Nerissa is a most shapely flower, creamy-yellow, shaded white, centre tinted with peach in its early stages of development; free flowering.

Ophelia is a beautiful rose; salmon-flesh, shaded with rose; a finely shaped flower, most promising as an exhibition variety.

Portia, as a pot rose, is not excelled; the large, pointed flowers open evenly out of doors, and it grows freely and blossoms profusely; in colour delicate pink, shaded white.

E. Molyneux.

# CHRYSANTHEMUMS.

## Early Propagation of Late Varieties.

It is very disappointing to the cultivator when a batch of plants representing some good late varieties fail to break in good time in spring. Of course, the only way out then is to pinch the shoots and cause a break.

If a late-flowering variety makes a natural break early in April, we will say, the probability is that the first crown bud on the plant will appear in good time in August. But if the same plant be pinched at the date in April the crown bud will, most likely, appear a week or ten days later in August. The difference in time does not seem to matter much, but there is a vast difference in the resultant blooms. Those from the plant which made the natural break will be full and deep, but those from the plant which was stopped will, probably, be thin and show an open centre full of seed florets. The propagation of the cuttings has much to do with the nice timing of breaks, and buds and early propagation of naturally late sorts is certainly advisable, independent of the propagation of them in spring, when the after treatment is different to that in the case of early rooted plants.

No bottom heat should be given to these early-rooted cuttings. They may be placed in a heated frame or in a propagating case in a warm greenhouse, but not in any position where the stems will be weakened by undue forcing. The cuttings will take a if they were subjected to a bottom heat, longer time to root than would be the case but the progress of the young plants will be more satisfactory.

THE LAWN AND BOUNDARY.

## A Few Leading Varieties to Propagate Early.

Mrs. Gilbert Drabble, white; Mrs. H. Thornton, blush-white; Master David, deep crimson; Hon. Mrs. Lopes, yellow; H. E. Converse, reddish bronze, with gold reverse; Fred Green, rich purple; F. Chandler, red, gold reverse; Madame J. Rivol, yellow, flushed rose; Madame P. Radaeli, white, tinted rose. Duchess of Fife, in the incurved section, should also be rooted early.

Geo. Garner.

## IMPORTANT POINTS IN PLANTING.

Too deep planting is the chief cause of failure in connection with the transplanting of trees and shrubs. Many planters, unfortunately, have few opportunities for acquiring experience in this branch of garden work, and as a consequence they do not trouble themselves about plant physiology, or the reason why certain results follow certain operations. In proof of this I am constantly coming across young trees with their stems buried; and recently, finding a plantation of birch and conifers with from 12 inches to 18 inches of their stems under the surface of the soil, I thought a note on the evils attending such a practice might afford some folks an opportunity of putting their trees right.

In much-exposed situations inexperienced planters put the roots well down to secure the trees in their places. Under such conditions, especially on heavy soils, very few of them live through the following summer. I once saw several acres of land which had been planted with Austrian pine in this manner, with not a single plant alive. The evils of deep planting, therefore, cannot be made too clear, to prevent disaster and avoid disappointment. If the stem of a conifer, or hardwood tree, is buried, the bark is killed on the portion below the surface, and the returning sap is unable to reach the roots. When this takes place root extension is stopped, and the tree dies of starvation. In some soft-wooded trees and shrubs the buried stems will throw out adventitious roots, and by this means save themselves. Those, however, which will do this are few in number, compared to plants in general, so that, when dealing with those we are not sure about, it is better to err on the safe side and keep their stems out of the ground. There is a space between the true stem and true root, which is so constructed that it will adapt itself to either being buried or left exposed. This is the space between the root and seed leaves, but except in melons, cucumbers, and other rapid-growing plants, the seed leaves (cotyledons) are gone before the plant reaches a size large enough for permanent planting.

In the absence of these defining marks (cotyledons), an allowance of from one to two inches of stem can be made for it, when the tree or shrub is being planted. Any trees or shrubs that were planted too deeply during the last planting season should be raised at once to the proper level. In exposed positions stakes should be provided for all the taller, and more bushy plants, to prevent them being swayed about by strong winds. At all seasons it is very important to successful planting that the roots of trees and shrubs should be moist when they are put in the soil, but more especially is this the case in the spring months. An excellent plan is to unpack a consignment immediately it arrives, and place the roots in water for a couple of hours, then plant. Even thoroughly moistening the roots in a bucket or tub of water just before planting will be found very beneficial. Roses and other deciduous shrubs that are shrivelled from long exposure should be wholly submerged in water for twenty-four hours before they are planted.

A common error among the uninitiated is that of putting farmyard manure directly upon the roots of trees and shrubs at planting. This is a pernicious practice and is usually followed by injurious results, especially if a large quantity of manure is employed, as it decomposes the existing roots, and kills any young rootlets that make their appearance. If the land is poor, and the plants will benefit from a richer medium, the roots should first be covered with soil, then a light layer of manure applied, finishing with soil on the top. Or the manure can be used entirely for a mulch, when its virtues will be washed down to the roots by rains, and the strawy matter serve to preserve moisture in the surface layer.

If these points were more carefully observed when trees and shrubs were planted there would be fewer failures to record than there usually are, and planters would derive more satisfaction and gratification from the results attained.

Planter.

## THE GARDEN OF NATURAL BEAUTY.

The garden-maker of to-day must face the fact that he has to provide for differing features, and for a greater diversity of artistic phases than his fore-runner of a few years back.

The garden of to-day has to be a garden that is singularly free from stereotyped ideas. The sameness which characterised stone-walled terrace gardens, which cropped up in every ornamental bedding-out design, has to be a thing of the past. The garden-maker must strive to produce a garden which shall be original in design, pleasing in its outlines, and ornamental in effect when planted up. To do this he must study both the ground at his disposal, and the possibility of using new ideas to produce the most pleasing effect.

The many aspects of natural gardening in vogue at the present day offer a ready mine of suggestion to the garden-maker. The rock garden, the water garden, the bog garden, the wild garden, the heath garden, the Japanese garden, and many other charming features, all give of the beauty and suggestion to the formation of a new garden. I do not advise anyone to study a garden, or a garden feature, with a view to repeating it in another. Study gardens as much as you like, but don't copy. Utilise existing ideas as a means of inspiration to new ideas, as stepping-stones to carry one over to new fields of beauty.

It is a wise policy to consider first what one's ideal garden would be, and then with a free hand, and a free use of the varying ideas, arising from the above-mentioned aspects of garden art, one should assuredly evolve a garden worthy of the name. Where rocks are utilised, one can easily give great diversity to the garden scene. A few outcropping layers, showing in a sloping bank or bold bluffs judiciously placed on rising mounds, nicely clothed on the crowns with low-spreading conifers, will ofttimes provide the key of the whole scene.

Flat stones for a permanent pathway are perhaps, the best medium for a footway in the natural garden. Smooth-faced stones are best for semi-formal direct paths, and for use under pergolas, etc., but for wandering through the low-valleyed depressions or up the slopes, or through the waterways, a natural stone, with roughish (though flattened) face will be found more suitable, as they not only harmonise freely with the landscape, but also ensure a firmer foothold.

In all gardens trees and shrubs must bear a part in the general scheme; and, indeed, during the spring months the beauty of flowering trees is really the most noticeable and charming feature of the landscape. But trees in the main are useful as backgrounds, giving tone and colour to the picture, and to break up the flatness of a landscape, which they do effectively.

Of slopes clad with beauty, and vistas of blossom seen between "breaks" of tree life, and through valleyed depressions, much might be written. Here is the colour dominant of the scene, life aglow with waving beauty, the finish of the picture, to which the backgrounds and broken landscape supplies the frame. It would be too great a task to specify typical flowers for these slopes and vistas, for so many are available and effective.

Where would one begin and end in the selection of species and varieties? Good for us that they are so many; one can obtain a wider choice and a greater display of beauty.

Tritomas (kniphofias, if you will), flaming their glowing spires of blossom in late summer, are an example. Intensity of colour, stately appearance, tell greatly, and for distance effects they are superb. Golden glowing solidagos gleam in the August sunshine. Drifts of montbretias running through the hollows and masses of Tiger lilies against grey stones and sloping banks, call for the attention of all beholders. Whatever is planted, let the area be planted for telling display. Dot planting is a dismal failure in the garden of natural beauty. Tiny plants are capable of great effects when used in large quantities. May I instance carpetings of mossy saxifrages, of banks with cloud-drifts of Viola gracilis, of aubrietias hanging in great masses from an old wall, of golden alyssums glowing on sunny slopes, and anemones or scillas on shady ones? These small plants certainly tell, and so do many other associated subjects. The great idea is to plant in colonies; winding drifts, broad masses, sweeps of colour must be brought into being. Bulb beauty must inevitably have its place, for among the bulbs we obtain some of our finest effects.

Tall flowers, particularly those of a graceful habit, including delphiniums, verbascums, eremurus, foxgloves, campanulas, etc., are of the utmost value; for the back of lower-growing plants, for coming up between the greenery of shrubs, and for making striking displays of beauty, these tall-growing plants are of the utmost service. A narrow, winding walk of grass or stone, flanked on either side by masses of these delphiniums, foxgloves, etc., which tower up to shut one off from the outer world, is usually one of the best-loved features of a garden.

But my topic is without ending, and missing many features; may I point out that the garden should have water in some shape or form, winding pool, mirrored well, rippling stream, or lily-clad lake; it should be existent in some form or other. The music of falling water, and the reflecting power of pools, are two strong reasons for its existence in gardens. The colourings of foliage and flowers mirrored in water gives two-fold beauty, and the many charming effects of light and shade, and the silvering glow at twilight, and in moonlight, must be personally known to be fully realised. Furthermore, the use of water brings much of interest in its train. The hosts of water-loving plants, the great additions to the bird and insect life, and the charm of fishes darting in rapid movement, add to the charm of a garden.

And, in conclusion, may I remark that "arbours clad with greenery and blossom," the free use of roses in the old-fashioned way, the garden of sweet-scented plants, great groups of white lilies, masses of tall May-flowering tulips, and an ample allowance of long-stemmed blossoms for cutting, gives the natural garden such a tremendous advantage over the formal garden as to defy any comparison.

P. S. Hayward.

# POT CULTURE OF PEACHES AND NECTARINES.

Probably more peaches and nectarines are grown in pots than any other of the kinds of dessert fruits. It is a most convenient method of cultivation, and has much to recommend it. We often hear of very large trained trees of both of these fruits with immense crops upon them, which, when ripe, provide an abundance of useful material for the dessert; but there is such a thing as having a glut, with little prospect of successional supplies in the immediate future. It is not of such moment, of course, when the surplus is disposed of upon the market. It is possible to grow a greater variety of both peaches and nectarines under the pot system of culture than can be reasonably expected from trained trees in the same amount of space. As with plums and cherries, so with the fruits now under notice, the longevity of the trees when grown in pots is most remarkable, and the average of life will compare favourably with trained trees. Pot culture is advantageous both for early forcing and for the latest of the supplies in the autumn.

## Early Forced Trees.

In making a comparison between the peach and the nectarine, I find that the latter is really the better of the two for early forcing. The fruit, as a rule, sets better, and certainly there is not the same amount of bud-dropping at the starting time. This failing with some of the first early peaches is, to say the least, somewhat disconcerting. There was more than usual of this failing last season—the result, no doubt, of the excessive heat and the over-ripened wood of the previous summer. I do not anticipate seeing so much bud-dropping this time. The trees are well ripened, the wood looks all that one could wish, and the buds are already somewhat prominent. Before these lines are in print our earliest house will be started.

## Nectarines to Force.

For first early uses there is no nectarine at present upon the market to equal Rivers' Cardinal. The tree is of good constitution and habit, and the set of fruit is almost invariably good, too. The flowers are of medium size, somewhat pale in colour, but strong. The colour of the fruit is indicated by its name. Though it belongs to the clingstone section to some extent, it is very juicy and rich. It should be used before it becomes at all over-ripe, for when in this stage it becomes somewhat woolly. There is a tendency to split when the fruits are taking their final swelling. To obviate this, it is not advisable to syringe so much during the sunless weather that may intervene. I do not recommend this variety for planting out. For that purpose Early Rivers is excellent, and some very fine fruits are so produced. This is also the case from pot trees when not overcropped. Early Rivers is about ten days later in ripening than Cardinal; hence it is a good plan to have some trees of each variety in the early house, and to repeat it in the second as well. The fruit of Early Rivers, I find, will remain in good condition somewhat longer than Cardinal when fully ripe. The tree is of equally good constitution, but not of such erect habit as the first-named—in fact, I find it has a tendency to assume a pendulous habit. The flowers are larger in this case, and it sets quite as freely. The next to ripen is Lord Napier, if we except one called Advance, which does not, with us at any rate, set freely. Lord Napier is a well-proved variety, and needs no further comment. After these we have such as Humboldt, Pine Apple, Dryden, and for the latest in pots Victoria.

The first three varieties now named are simply gorgeous when in flower, and are well worth growing from that standpoint alone. Victoria, on the other hand, belongs to the small-flowered section, like Crimson Galande peach; it sets freely, however, and is an excellent nectarine to grow for later forcing. It ripens with us towards the end of July in our third house of pot-grown trees.

## Peaches to Force.

Of the first early peaches I prefer Duchess of Cornwall and Duke of York to either Amsden June, Alexander, Waterloo, or Hale's Early—the last four are, I believe, American varieties. With us they are bad bud-droppers, and not nearly so good or dependable as the two first-named, both of which set well, on the whole, and swell up to quite large fruit. To follow these, in my opinion, there is but one choice, and that is Peregrine, one of the best varieties raised at Sawbridgeworth. It is an all-round, excellent peach. I am also fond of Crimson Galande for use a little later on; but Peregrine, if started at different times, will carry the season of forcing almost through. True, we grow both the Nectarine Peach and Sea Eagle. These, for July use, are excellent. They hang well, too.

NECTARINE CARDINAL.

An early-ripening nectarine raised by Messrs. T. Rivers and Son, and remarkable for its rich flavour and brilliant cardinal-red skin.

## General Treatment.

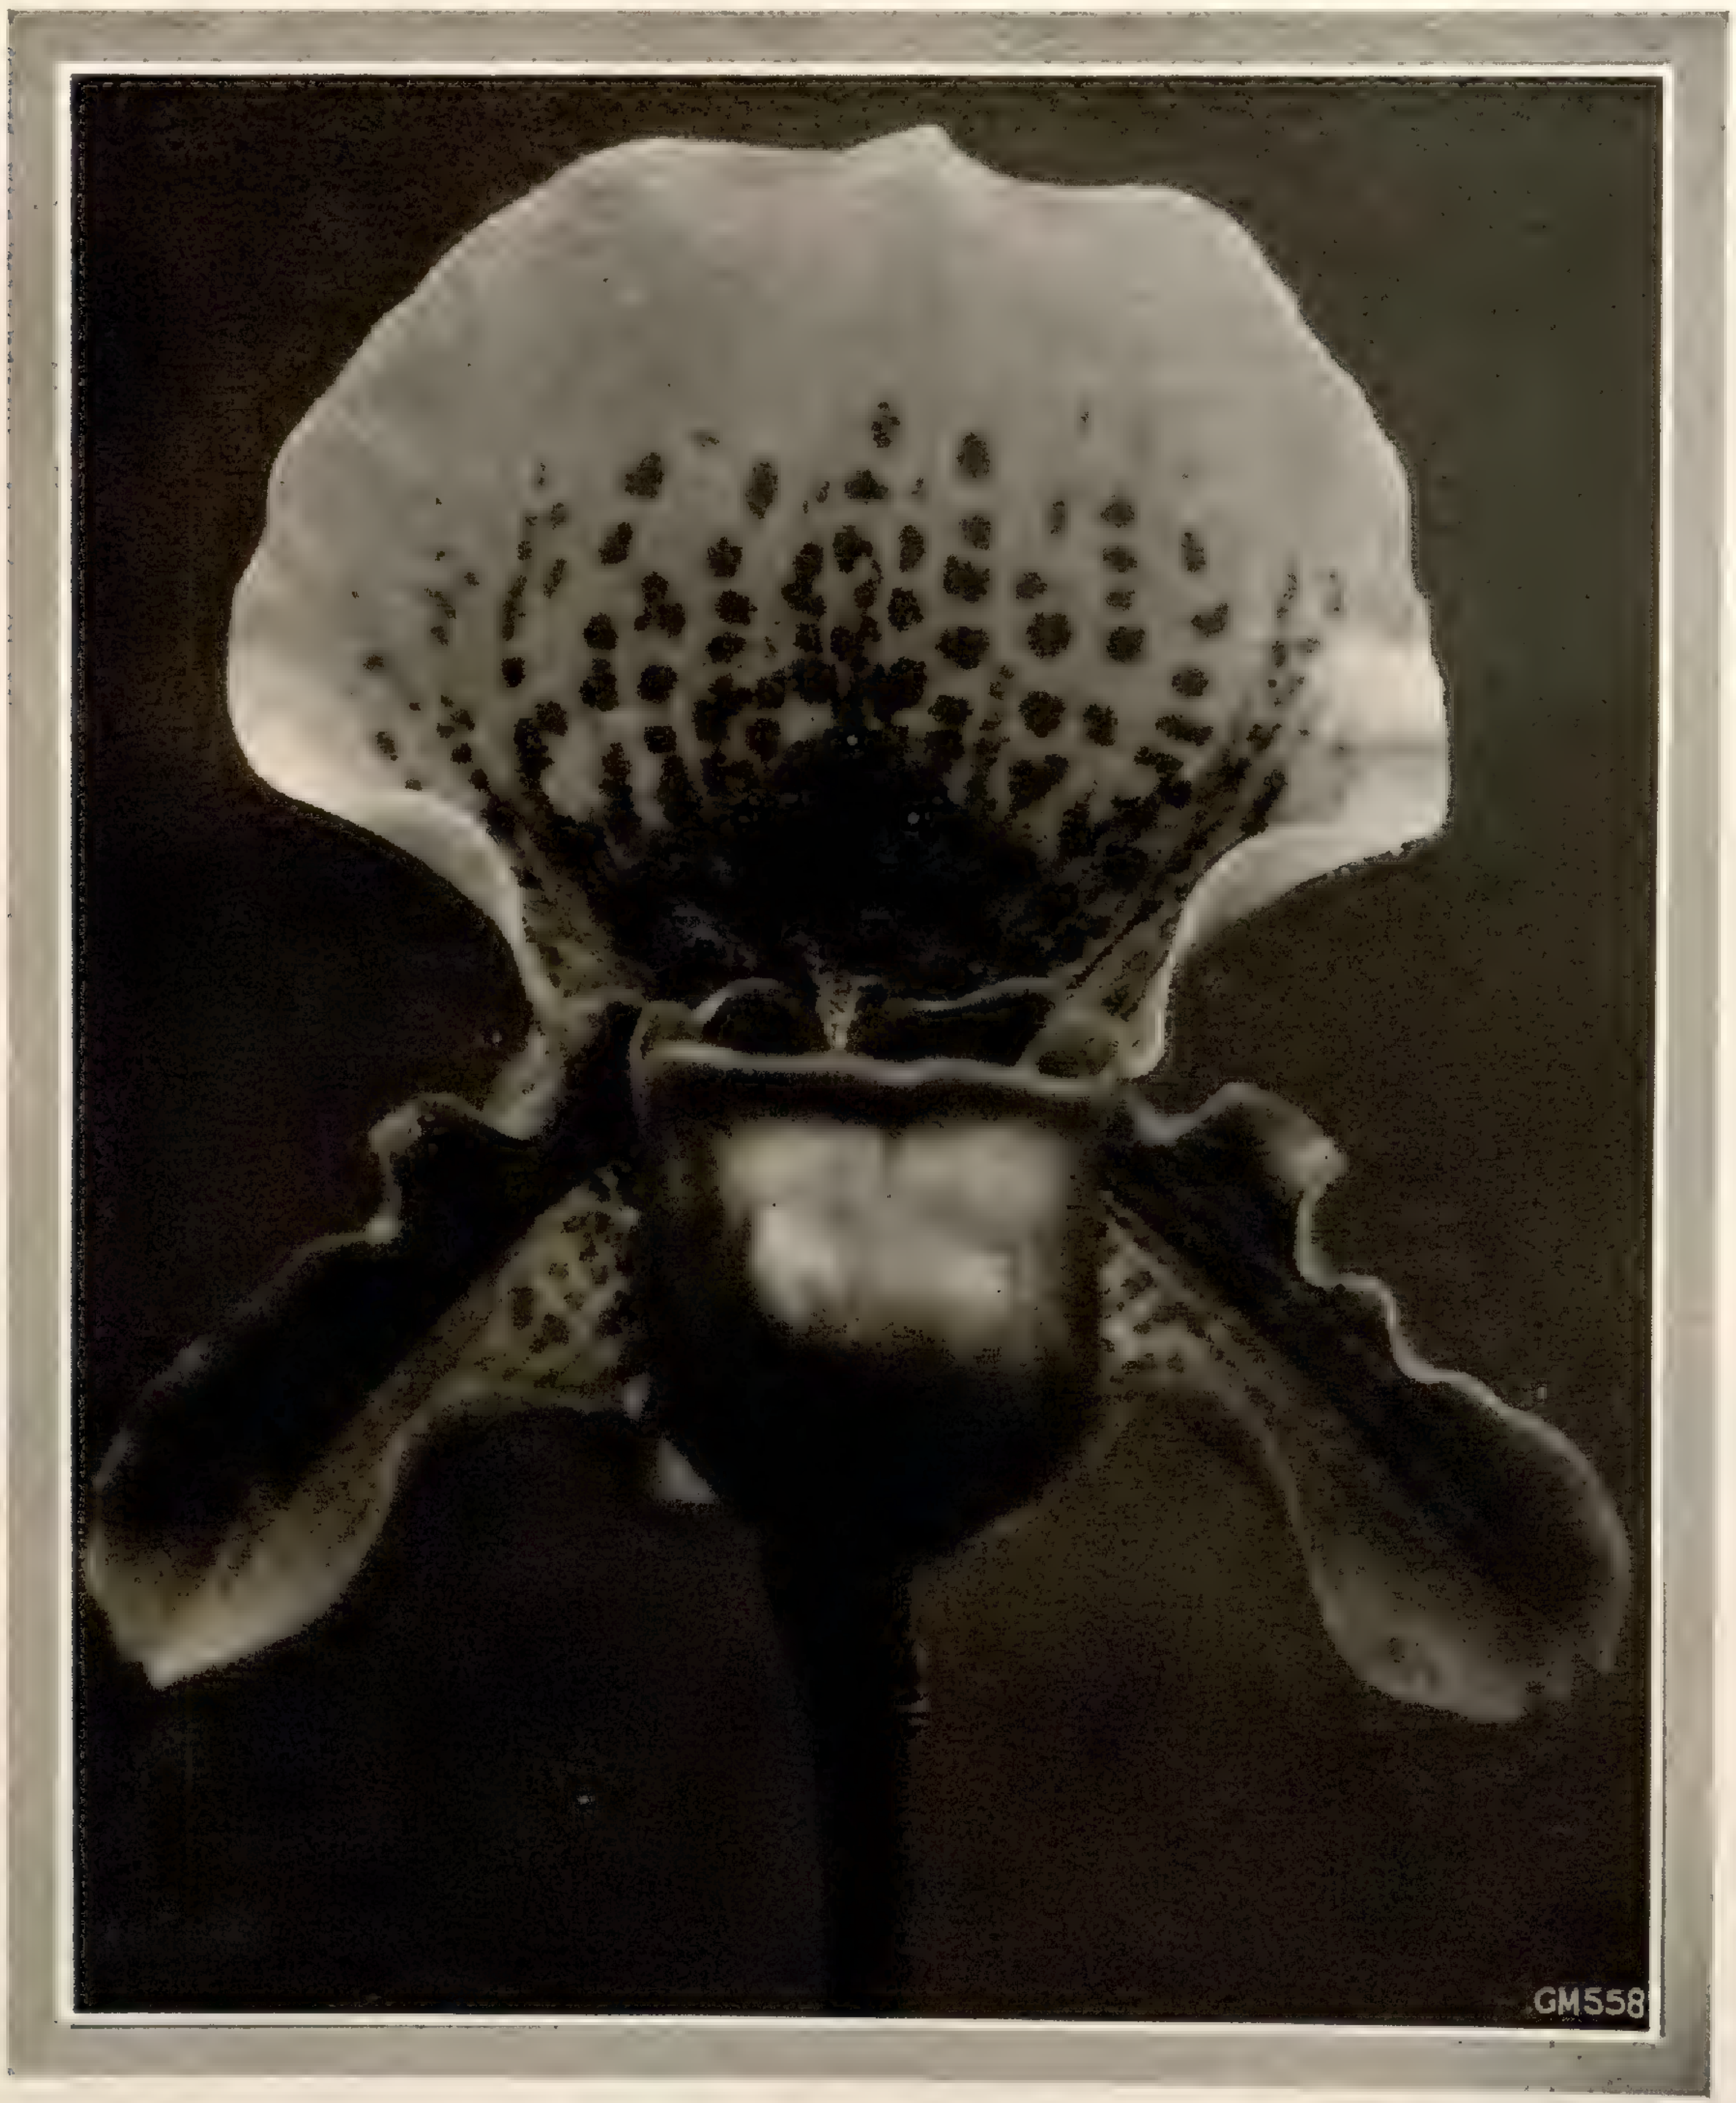
As regards temperatures, we make but slight variation from the orthodox routine in dealing with trained trees. The only alteration of any moment, in my opinion, is that the minimum temperature until the flowering period is reached is lower on the average. I do not mind even a temperature of 36 degrees being recorded in the early morning; this is better than too much fire heat at this early stage. As for cherries, so with peaches, nectarines, and plums, we depend upon our bees for fertilisation purposes. We do not prune our trees at the commencement, as pruning is generally understood, but depend more upon disbudding and pinching, with the object of forming short, spur-bearing wood. After the trees have set their fruit, we shorten the wood back wherever it is desirable to do so. As soon as a house is arranged in order for forcing, we always give one application of nicotine insecticide in the form of a vapour, and then again one more application just as the flowers are about to open.

JAS. HUDSON, V.M.H.

## NEW PLANTS AND FLOWERS.

### CYPRIPEDIUM LATONA.

A neat and shapely hybrid, with green and brown sepals, petals, and lip, and a wide white, green-based dorsal sepal, with rows of purple spots. The parents are C. Niobe and C. Alcibiades. A.M., R.H.S., November 21. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.



[Photo: J. Waldock.

CYPRIPEDIUM LATONA.

A very fine hybrid, with white, brown, and yellow-green markings, and purple spots. A.M., R.H.S., November 19. Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury.

### LÆLIO-CATTLEYA SCYLLA.

A charming hybrid derived from L.-c. Cappei and Cattleya Lord Rothschild. The flowers are of fair size, and several are carried on a spike. The sepals and petals are rich golden-buff, the lip being more yellow, with light rose markings. A.M., R.H.S., November 19. F. Menteith Ogilvie, Esq., Oxford.

### CARNATION MARY ALLWOOD.

A very fine perpetual-flowering carnation that has many good qualities. It has a very sweet clove-like fragrance, large salmon-red or rosy-cerise flowers, broad petals, and a stiff stem. We previously described this variety, when Messrs. Allwood Brothers, of Wivelsfield, Hayward's Heath, gained an Award of Merit for it from the Royal Horticultural Society, and we now have pleasure in illustrating it.

### CHRYSANTHEMUMS.

Audrey.—A showy, large-flowered single variety, with three rows of flat, deep yellow florets. A.M., R.H.S., November 19. The Manor House Nurseries, Cardiff.

Crimson Queen.—A showy single variety, medium-sized, and with regular, blunt-ended florets. The colour is vivid wine-crimson, with a very narrow yellow ring round the disk. Commendation, N.C.S., November 21. Messrs. Cragg, Harrison, and Cragg, Merivale Nurseries, Heston, Hounslow.

Snow Queen.—This beautiful anemone-centred pure white single variety was figured on page 871 of the Gardeners' Magazine of November 16. F.C.C., N.C.S., November 21. Messrs. Cragg, Harrison, and Cragg.

Elfrida.—A very pretty large-flowered single variety that appeared to lack something of substance. The deep apricot shade was very beautiful and effective. Commendation for colour N.C.S., November 21. Messrs. Cragg, Harrison, and Cragg.

Portia.—A very beautiful single variety of reddish terra-cotta hue, and yellow reverse. The flowers are large and elegant, the florets being somewhat pointed. As it has good substance, fine stems and foliage this is in every way a good variety. It gained the special award as the best new seedling single variety shown at Essex Hall on November 21. F.C.C., N.C.S., November 21. Messrs. Cragg, Harrison, and Cragg.

Thorp's December Pink. — A beautiful medium-sized Japanese variety that promises well as a market and decorative sort. The florets incurve a very little at the tips. The colour is warm pink, a lovely and effective shade. F.C.C., N.C.S., December 2. Mr. H. W. Thorp, Worthing.

Marion.—A large single variety with about four rows of florets. The flat florets lay out gracefully, and their colour is deep rich rose. Commendation, N.C.S., December 2. Mr. H. W. Thorp, Worthing.

Bronze Cheer.—A neat and solid flower of the Source d'Or class. The name was called into question, as it suggested the variety was a sport from Winter Cheer. The colour is golden-bronze, very warm and pleasing. Commendation, N.C.S., December 2. Mr. H. W. Thorp, Worthing.

W. Head.—A very pretty Japanese variety of good size, but not exceptionally large. The fairly broad florets droop gracefully, and curl and twist a little. The colour is rich golden-yellow, with paler yellow reverse. F.C.C., N.C.S., December 2. Mr. H. J. Jones, Ryecroft, Lewisham.

Arthur Pickard.—This handsome Japanese variety has large blooms, with flattish reflexing florets. The colour is light chestnut-crimson over a yellow ground, and there is a yellow reverse. F.C.C., N.C.S., December 2. Messrs. J. Stredwick and Son, St. Leonards.

Miss A. Brooker.—A useful and effective late-flowering variety belonging to the incurved Japanese section. It is of decorative size, and the colour is bright chestnut-red, with dull gold reverse; very showy. F.C.C., N.C.S., December 2. Messrs. W. Wells and Co., Merstham.

Autocrat.—A pearly white Japanese variety of excellent substance. It is of medium size, and probably of far more value for market and general decoration than for the exhibition table. Of refined appearance, and with slightly reflexing broad florets. F.C.C., N.C.S., November 21. Messrs. Low and Shawyer, Uxbridge.

Ruby.—A useful small Japanese variety of decorating style. The reflexing florets are rich ruby-crimson, with bronze reverse. A very effective flower with good stem and foliage. Commendation, December 2. Mr. Walter Jinks, Thames Ditton.

Eric Wild.—A charming single variety of fair size and excellent substance. It is of first-class form, the florets laying out regularly. The colour is soft satiny-pink with a narrow white zone round the deep yellow disc. The flowers have three rows of florets. F.C.C., N.C.S., December 2. Mr. G. W. Mileham, Leatherhead.

Marguerite de Quincey.—A large single variety of good form, and with regular, flat florets of a light blush colour. The disc is a trifle large. Commendation, N.C.S., December 2. Mr. E. W. Read, Avonhurst, Chislehurst.

## JASMINUM PRIMULINUS AS A STANDARD IN A POT.

This lovely large-flowered jasminum is not sufficiently hardy to plant in the open air, either as a wall or a pillar plant. In a glass-covered verandah or a greenhouse or conservatory it does remarkably well. There are, however, not always convenient and suitable spaces under glass for specimens trained on walls or trellises. As standards the species is charming during the months of March, April, and May. If a strong stem be made secure to a stake 5ft. long, a number of top branches will soon grow and form a pendulous head of great beauty. Plants so treated need only be placed under glass from November to June; the remainder of the season they should be grown in the open air, and this exposure is best for them, as the wood matures and flower buds form freely enough. Even one well-grown, weeping standard will be found a striking and beautiful object in a conservatory. G. B.

**Pernettyas.**—Not only are the various coloured berries of these neat evergreen shrubs much appreciated when in the open ground, but they are also very attractive and valuable for various decorative purposes when grown in pots. In the cool greenhouse they form a pleasing winter feature, and under such conditions retain their brightness for a considerable time. Having the dense, fibrous roots common to most ericaceæ, they can be lifted with but little check.—K.

## CATTLEYAS AND LÆLIO-CATTLEYAS.

### Autumn and Winter-flowering Kinds.

Those who were privileged to see the recent Orchid Show, held by the Royal Horticultural Society at Westminster could not help admiring the marvellous exhibition, and appreciating the enterprise of those who initiated the movement which led to a display which even the orchids at the Temple Show could only be favourably compared with. To those of us who can carry our experiences back 25 to 30 years, the display of hybrid cattleyas and allied genera was a revelation. It seems only a few years since the only autumn-flowering cattleyas consisted of C. Dowiana, C. D. aurea, C. Harrisoniæ, C. Boweringiana, and C. labiata, with Lælia crispa. Practically the only autumn-flowering hybrids were Lælio-cattleya Exoniensis, a few Lælia Perrini hybrids, and L.-c. Bella.

To the introduction of C. Boweringiana, the re-introduction of C. labiata, and the extensve importations of C. Dowiana aurea, may be traced the origin of nine-tenths of the hybrid cattleyas and lælio-cattleyas, which made such a glorious display in the group of Sir G. Holford and in those of other exhibitors.

It is more particularly to the cattleyas and allied genera that I am requested to confine these notes. It will perhaps be desirable to divide these into two sections, and to refer in a separate note to the bronzy and yellow-flowered forms, as it would be impossible to include these in the space at my command.

The first great development in the late-flowering cattleyas was due to the influence of C. Boweringiana, and for general utility and for decorative effect, finely-flowered plants of these hybrids are always appreciated. They are too numerous to list, and it must suffice for our purpose to mention only one or two of the most prominent. In C. Mantini we have one of the most beautiful and variable hybrids; C. Portia is one of the freest; C. Wendlandiana, C. Ariel, and C. Whiteleyæ are good subjects to deal with, and can be relied upon to give a good crop of flowers, where they are grown under favourable atmospheric conditions. Then there are the secondary hybrids, Lælio-cattleya Messina, L.-c. Milly, L.-c. Pero, and others which are always worthy of consideration.

The larger-flowering kinds, which include the natural hybrid C. Hardyana, are now a host in themselves. One of the finest of these for general use is L.-c. Bella (labiata x purpurata). The Lælia crispa hybrids, L.-c. Nysa, and others, are of good constitution, and are always useful, C. Armainvilliersense (Gigas x Mendeli), combines the good qualities of the parent species, and is most useful when flowering in November and December. Probably the finest of all the large-flowered group is C. Fabia (labiata x aurea). This hybrid is exceedingly variable, and no doubt this may be accounted for by the considerable variation in the forms of C. labiata, which range from pure white to intense purple. When grown vigorously they outclass altogether the forms of C. labiata, both in constitution and the fine character of their flowers. In C. Peetersi (labiata x Hardyana) we have the rival to C. Fabia, and the varieties of this hybrid that have been derived from the white forms of C. labiata are most remarkable. The beautiful crimson lip is a striking contrast to the almost pure white sepals and petals. It is certainly one of the most desirable of the more recent introductions. I can only refer briefly to the secondary crosses from L.-c. Clive, L.-c. Ingrami, and others, which are not generally so extensively grown as many of the larger-flowered section, but they are well worthy of every consideration. The Lælia Perrini crosses are easily procurable, and useful where small flowers are required. Some of the C. Trianæ hybrids are also serviceable for midwinter flowering. C. Chapmani (Hardyana x Trianæ) resembles some forms of C. Fabia, but flowers in December and January. The Lælia elegans section of hybrids, and others, derived from the influence of C. Forbesi, C. Harrisoniæ, and C. Loddigesi, are generally appreciated, and worthy of cultivation.

## THE SCARLET PLUMBAGOS.

The plants of Plumbago rosea and its variety coccinea, which were exhibited at a recent meeting of the Royal Horticultural Society, illustrated a trait in the behaviour of these beautiful winter-flowering plants which is not generally studied. Neither of the two batches exhibited would induce anyone to take up their cultivation. The plants had a decidedly weedy appearance, the flowers appeared to be few in number, and thin in colour. Altogether, the specimens exhibited signally failed to do justice to themselves, and yet they were really well-grown examples, and carried good spikes of flowers, but they looked anæmic and too delicate for the present-day requirements of pot plants. Nowadays nearly everyone needs sturdy subjects, bearing flowers which boldly flaunt their charms, whereas the plumbagos under notice are of such retiring disposition that such a trifle as being moved from the houses in which they have been grown is quite sufficient to cause them to temporarily droop, and present the unhappy appearance manifested by the plants instanced.

It must not be inferred from these remarks that the plants have no decorative value outside the houses in which they have been grown, for such is far from being the case, but the plants or cut flowers must be allowed twenty-four hours to recover from the disturbance.

This type of plumbago is, in many respects, valuable for winter decorations. Personally, I do not favour large plants, except to provide cut flowers, or for growing Plumbago coccinea as pillar or low roof plants, in which latter case large examples are, of course, necessary. But I have found that the best decorative effects are obtained from plants growing in 3in. and 5in. pots, for these plumbagos are not suitable for the massing which is so popular at the present time, in order to produce broad colour effects. In many instances this style of arrangement is necessary and very harmonious, but the place of the plumbago is in the daintier and more artistic combinations. Their rose-coloured flowers require a foil and a setting, and when large plants are used it is somewhat difficult to conveniently hide the pots, which, as a rule, seem to be somewhat out of proportion. Nothing can exceed the beauty of small, well-grown plants of Plumbago rosea, when tastefully placed in jardinières, or similar receptacles, with suitable companions.

The commonest mistake made in the cultivation of the rosy-scarlet Plumbago rosea and its variety coccinea is that of growing them as stove plants. We are too apt to conclude that because a plant is a native of, as in this case, the West Indies, a tropical climate is the only one in which it will grow. So we place it in a house which has a tropical temperature, and, still worse, keep it in almost the same temperature all the year round, entirely overlooking the fact that, in spite of the alluring railway advertisements, Nature does not provide an equable temperature. The tropical climate, as well as ours, is capable of great variations.

The aim of the cultivator of such perennial winter-flowering plants as these plumbagos should be to grow them as short-jointed and sturdy as possible throughout the summer months, and this may best be done in a cool house or a light, airy pit. Cold rains are dangerous, but artificial fire-heat is not necessary until the middle of September, when the plants should be removed to a structure which has an intermediate temperature. Stove heat causes the flower-spikes to become spindly, and the petals lack substance. It will be found that plants grown under the conditions indicated will show very little signs of distress when moved from the house in which they are flowering.

CECIL AUBREY.

# ESTATE FRUIT PLANTATIONS.

## Planting and Pruning.

(Continued from page 896.)

Autumn planting for preference is advised, and at this operation take out holes wide enough and deep enough to accommodate the roots; tread the soil firmly round as it is filled in; and, above all things, avoid deep planting. The soil mark on the stems will tell how far they should be put into the ground. Pruning is a very much debated point, and I have no wish to open up another controversy in respect of it, but simply to say that my own rule, which has answered very well in practice, is to remove any superfluous side shoots when planting that are not wanted in the formation of the tree, but not to shorten back leading shoots. I prefer to leave the latter until the trees have stood in their permanent positions for a year, and then shorten the leaders to about one-third their original length. The object of this pruning is to create growth, and the cutting back of leaders may go on for a few years until there are enough branches and the tree is formed.

Newly-planted gooseberries should be pruned hard to start them into growth, but afterwards judicious thinning of overcrowded shoots is all that is required, and to spur back young wood year after year, as is often done in private gardens, only leads to an overwhelming amount of useless shoots. Red currants, for which there is not so much demand as for blacks, or gooseberries, should be pruned hard after planting, and then be grown in cup-shaped form, with the main branches radiating from the central stem, and the side shoots on these main branches should be spur pruned. Cut black currants nearly to the ground after planting, and when the bushes are fruiting take out annually old wood that has done its work to make room for young shoots from the base.

## Varieties.

In arranging a fruit plantation avoid too many varieties, but select those of known market value, and endeavour to grow fruit of each in quantity. A commercial fruit show like that recently held at Maidstone is the place to see the apples that are best suited to market culture, and the names of them are household words.

In the way of dessert apples, the types to select are such apples as Worcester Pearmain (one of the best for market), Allington Pippin, Cox's Orange Pippin (on good land), King of the Pippin, Gascoyne's Scarlet, Rival, and Court Pendu Plat, a late-flowering variety of pleasing appearance that keeps well. Good commercial culinary apples are Lord Grosvenor, Pott's Seedling, Stirling Castle, Warner's King, Lord Derby, Bismarck, with Lane's Prince Albert, Bramley's Seedling, Newton Wonder, and Annie Elizabeth, the last four being good for late use. A few good pears are Hessle, Williams' Bon Chretien, Louise Bonne of Jersey, Clapp's Favourite, Fertility, Pitmaston Duchess, and Beurré Clairgeau, but in the selection of pears a good deal depends on the situation and nature of the soil. Early Prolific, Victoria, Czar, Pond's Seedling, and Belle de Louvain are amongst the pick of the plums, but in some districts there are local varieties, like the Pershore, which are prolific and profitable in their own localities. Keepsake, Whinham's Industry, Crown Bob, and Lancashire Lad are popular market gooseberries. Raby Castle is the leading red currant, and there are several large-fruited black currants of the Baldwin type, but the great thing in black currants is to get and keep them free from "big bud." If this can be done they are a very remunerative crop, particularly on strong, retentive land.

## Spraying.

It is not the object of this article to deal with insect pests, because the whole of the space at my disposal would be wanted to do this adequately, but let me say that the commercial fruit grower of to-day, like his neighbour abroad, cannot afford to ignore spraying and insecticides. It is the cleanest, brightest, and best fruit that brings the most money, and, in order to get this in abundance, not only must the cultivation be good and the manuring adequate, but a sprayer of some approved type must be part of the apparatus, and this must be used as part of the cultural routine; in the first place to prevent, so far as possible, and secondly to eradicate the fungus diseases and insect foes which not only spoil fruit and reduce crops, but cripple the energies of the trees. No more need be said here except to add that the establishment of an estate plantation should be accompanied by a study of the diseases to which fruit trees are liable and the insect pests that are capable of doing so much damage.

## Packing and Marketing.

The system of marketing fruit in this country is anything but perfect, and its faultiness is very frequently responsible for the gluts and low prices that prevail in some seasons, but until there is more co-operation amongst growers and better ways adopted for bringing the fruit from the producer to the consumer, these periodical disappointments will remain. And much more might be written on this subject. Let it be added, however, that the starting of an estate plantation should be accompanied by the provision of storage accommodation for apples that will keep, so that produce can be kept back if necessary until there is a better demand for it. I am convinced that the bad English apple trade which often prevails in the autumn is brought about by the desire of many growers to get their fruit into market with the least possible delay.

Much might be written about packing and the need of improved methods, but obviously the desire of the grower should be to place his fruit before the consumer in the best and most presentable condition. What will be the particular type of receptacle in general use for marketing fruit in the future is an open question at the moment, but it is not unlikely that boxes of standard sizes will prevail for the best apples and pears, and chip receptacles will be used for soft fruits. A splendid illustration of the use of light non-returnable boxes for apples was seen at the recent commercial fruit show at Maidstone, and it looks as if the day of the wicker-work basket or sieve is reaching its end.

Retailers do not want to be bothered with returning empties; to get them back is a source of trouble to growers, and very often a good market is lost because the producer has nothing to pack his fruit in. The non-returnable box for apples and pears does away with this, and in the present season many growers have used light chip baskets for sending away soft fruits, and are so pleased with the results that, though the annual outlay on chips is considerable, they will not go back to the old-fashioned sieve or basket. Whatever the receptacle is, however, honest packing is the only right method where the commercial grower is concerned, and, while in his own interest he should display his fruit to the best advantage, he must be honest to his customer—the public—by giving the same sample at the bottom as at the top.

H.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

SOPHRONITIS GRANDIFLORA. — This species, on account of the effectiveness of its brilliant scarlet flowers, is indispensable at this season of the year. It is now producing its flowering shoots from the partially developed growths, and will need plenty of water at the root till the flowers have lost their freshness, but none must be allowed to come in contact with them. Repotting may be performed immediately after flowering, or when growth commences, using a compost similar to that required by cattleyas. This plant succeeds best grown in shallow pans, suspended at the warmest end of the cool house.

SOPHRONITIS HYBRIDS. — There are between fifty and sixty beautiful and remarkable hybrids which have been obtained by crossing and inter-crossing the preceding species with cattleyas, lælias, lælio-cattleyas, and epidendrums. They flower at different seasons of the year, and a collection of hybrids will rarely be without one or more being in bloom nearly the whole year round. Amongst those in flower at the present time must be mentioned the lovely S.-c. Doris, S.-c. Saxa, Sophro-lælia Leda, S.-l. Gratrixæ, and numerous secondary hybrids, between this family and other lælio-cattleyas. With plants having such complex parentage there is a great diversity in the size of the bulbs, and general characteristics, but all are amenable to cultivation. They will succeed under the same conditions as cattleyas, both as regards temperature, compost, and moisture. Those plants which have recently bloomed, and are in need of new rooting material, may have it provided them whenever they are producing new roots. Great care is necessary in giving water at the roots, not only to newly-potted plants, but at all times. They should enjoy a light and airy position in the cattleya house at all seasons.

EPIPHRONITIS VEITCHI is a very fine hybrid, raised from sophronitis and epidendrum, and when grown well is nearly always in bloom. It is easily grown if a suitable temperature is provided, and will produce young plants from the old growths and flower stems. These, as soon as they begin to push forth new roots, should be removed with a portion of the old stem attached, and placed in shallow pans, in a similar compost to the preceding species and varieties.

ORNITHIDIUM SOPHRONITIS. — This dwarf-habited species, a fitting companion to the sophronitis on account of its effective scarlet flowers, is of easy cultivation if treated in the same manner as the preceding. On the completion of their growths they should be placed in a light position in a cool intermediate house, or at the warm end of the cool house, when an abundant crop of their brilliant flowers make it a most effective object.—J. T. Barker, The West Hill Gardens.

## STOVE PLANTS.

FERNS.—Adiantums that have done duty in the furnishing of the house and have become shabby should now be rested preparatory to restarting them into growth early next year. Provided the majority of the fronds are ripe, no harm will be done if the whole of them are cut off and the supply of water at the roots be gradually reduced. It should, however, be borne in mind that at no time do ferns require what is termed "drying off," although, like most plants, a partial rest is necessary. A good supply of fresh, green fern fronds is most useful in a variety of ways early in the year, and by resting a certain number of plants about this time, and after an interval of a few weeks, repotting them, using rich friable soil, this will be ensured. Other batches may be treated in like manner later on to form a successional supply of fronds.

NEPHROLEPIS. — Immense improvements have been made during recent years in the genus nephrolepis, many beautifully crested varieties having been raised. They are now unsurpassed by other warm-house ferns for decorative effect, or for the supply of fronds. These latter retain their freshness for a long time when cut and placed in water. Most of these new varieties may be readily increased at this season of the year, either by division or by the stolons. These should be carefully severed from the parent plant and put singly in quite small pots filled with open peaty soil. The pots should be plunged in the propagating frame until the young plants are well established, when they should be removed to a light position in a warm house and grown on freely.

SPECIMEN FERNS.—Large specimens of most kinds of ferns should now be kept quiet by reducing the water supply both at the roots and in the atmosphere of the house. Where a fern house exists now is a good time to thoroughly clean both the structure and the plants. Many species and varieties being of an evergreen character must not be cut down indiscriminately, but the decaying fronds only need be cut away; neither should these be kept so dry as is recommended for the deciduous kinds. Keep insects, such as thrips and the white fly, in check by occasional mild fumigation. Having regard to the extreme tenderness of fern fronds, it is very essential to prevent insect life spreading, as it is not safe to apply strong solutions to destroy them. The dull season is the best time to wage war with them.

BERTOLONIAS. — These dwarf-growing tropical plants are remarkable for their richly-marked foliage, and are exceedingly pretty when arranged as an edging to the stages where a close, moist atmosphere is maintained. The plants should be arranged at the warmest part of the plant stove for the winter months.—H. T. Martin, Warren Wood Gardens.

## FRUITS UNDER GLASS.

CUCUMBERS.—The mild weather which we have experienced here up to the present time has been favourable to the growth of the fruiting plants, and also to the young plants that have been recently planted out. Maintain a bottom heat of from 70 to 75 degrees, and the house temperature about the same, with artificial heat. It will not be necessary to admit air to the house, and though on bright, sunny days the temperature will rise, no harm will be done if the paths and walls are well damped down with tepid water several times. Give water to the roots when required, heated to a temperature of 75 degrees. Give the plants a light top-dressing occasionally, with equal parts of well-decayed manure and fibrous loam; avoid the use of a too stimulating manure at this season of the year, or an over-luxuriance of foliage will be the result; carefuly attend to the stopping of the laterals, but no hard-and-fast rule can be adopted at this season of the year. Exercise judgment, and allow a little more freedom of growth to assist the plants to become strong and vigorous; at the same time stopping must be done to promote an even growth, and also fruitfulness. Keep the glass clean, so as to admit as much light as possible. Bear in mind that daily attention and watchfulness will have to be exercised if the best results are to be obtained.

TOMATOES.—Seeds should be sown this month, for plants to supply ripe fruit early in the spring months. Sow the seeds thinly in shallow pans, in a light sandy compost, and place in a temperature of 65 degrees. When the seedlings have made their first pair of rough leaves, they should, without any delay, be transferred into thumb pots. When well established in these pots they will require another shift into a larger size, and to be grown on in a temperature of from 55 to 60 degrees. No attempt should be made to subject the plants to a high temperature in the winter months; allow the plants to develop in a fairly moderate temperature to secure stout-jointed growths. Allow plenty of ventilation when the weather permits.

FIGS.—Introduce a small batch of trees in pots, into heat; the pots should be plunged in a moderate bottom-heat, which can be supplied by means of a mixture of half beech or oak leaves and stable litter. Give the soil in the pots a good soaking with tepid water, and carefully examine the trees to ascertain if they are free from insect pests.

STRAWBERRIES.—Protect the pots from frost, and allow the crowns to be exposed to as much light as possible; introduce another batch of plants to a temperature of 45 degrees, and allow the earliest batch a temperature of 55 degrees at night and 60 degrees by day, with artificial heat. Exercise care in giving the plants stimulating manures, or otherwise there will be a tendency to produce leafage rather than fruit. —Henry R. Farmer, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

TRANSPLANTING SHRUBS.—The recent mild weather has been very favourable to planting operations, and every opportunity should be taken for carrying it out before there is a change in the condition of soil and weather. When moving shrubs of all sizes it is important to lift them with a good ball of soil about their roots, so that there may be only a slight check to growth the following season. It is necessary to take out a trench at a sufficient distance from the main stem to enable removal to be carried out without damage to the roots. When planting it is of the utmost importance to take out holes large enough to enable the roots to be spread out fully and evenly, as to cramp them into insufficient space is decidedly harmful. In dealing with delicate or tender subjects where the soil is heavy and retentive it is a decided advantage to place some specially prepared fine soil around the roots to give them a good start in their new positions.

PAMPAS GRASS.—This elegant subject is now seen to advantage, and the tall, erect plumes render it a striking object whether planted as isolated specimens on the lawn or near ornamental water. Pampas grass looks well associated with bamboos, but it should be given a fairly sheltered position, as strong winds do considerable damage to the feathery plumes. It is practically hardy, but in very cold districts it is well to provide it with some protection during severe weather.

HARDY BAMBOOS. — It is during the autumn and winter months that these are seen at their best, and this season they are especially fine. Although detrimental to so many subjects the wet summer suited bamboos admirably, and several varieties have made unusually tall growths, especially Arundinaria aristata, which has attained the record height for this species of 16ft. This is a distinct and handsome bamboo with purple branchlets that should always be planted, and it is perfectly hardy. The plants in these gardens thrive remarkably in the rich, calcareous loam. They are growing at a height of 800ft. above sea-level, and do not receive any protection. They are sheltered from all the cold winds by groups of evergreens and conifers, and there is no doubt those are the conditions most suited to their requirements. When seen at their best they are graceful, and impart quite a tropical aspect to the gardens. Cut out any dead canes in the spring, and apply a top-dressing of rich manure annually at that period until the plants are well established. The best time to plant is just before growth commences.

TRACHYCARPUS EXCELSUS. — This palm is quite hardy, and is invaluable for associating with bamboos, but, like them, requires a sheltered position. It has an attractive appearance on a terrace, and is greatly benefited by a liberal mulch of well-decayed manure in the spring.—J. Gardner, Batsford Park Gardens.

# EXHIBITIONS AND MEETINGS.

## Aberdeen Chrysanthemum Society.

NOVEMBER 22 and 23.

The annual show of this society, held in the Young Men's Christian Institute Hall, Aberdeen, on the above dates, proved, despite the untoward and sunless season, remarkably good. True, the hall in which it was held was rather small, compared with the magnificent proportions of the music hall, where in former years the show was wont to be held, but, nevertheless, the event turned out all right. The secretary, Mr. M. H. Sinclair, was at his post a of yore, and had all the arrangements properly carried out with his usual ability.

### POT PLANTS.

The entries in this section were certainly somewhat smaller than has been the case in former years, but the quality was well kept up. There were few entries for groups arranged for effect, chrysanthemums to be the leading feature, but those staged were really very good. Mr. Robert Begg, gardener to A. R. Gray, Esq., Garthdee, by Aberdeen, led the way here. His was a capital group, and, from the point of quality, it well deserved premier place. We would have liked, however, had the edging not gone so far up before meeting the blooms. The group was topped by a finely-grown Kentia palm, while fine examples of Cocos Weddelliana variety added considerably to the effect. Mr. Begg's blooms were undoubtedly far and away the best in quality, and included capitally-grown specimens of Hon. Mrs. Lopes, Mrs. A. T. Miller, the new white Master James, J. H. Silsbury, and several beautiful singles, such as E. Pagram and Dickson's Ruby. The ferns forming the foliage included some very fine specimens of Nephrolepis Whitmanni. Second place was taken by Mr. John E. Davies, gardener to Colonel Stuart Richardson, of Ballathie, Perthshire (an estate, it may here be noted, that changed hands on November 22). From the point of view of value, this group was a very fine one. Visitors to Aberdeen shows have not for a very long day seen a more admirable collection of crotons than formed part of Mr. Davies's group. Indeed, they were superb, being finely grown, and beautifully coloured. The wonder was often expressed that such valuable plants were taken so long a journey at this time of the year. That they must have deteriorated considerably before they reached Ballathie again goes without saying. White, yellow, crimson, and pink shades of chrysanthemums made up a very fine group. It was the quality, however, which gained for Mr. Begg his leading place. In this respect his blooms were unquestionably the best.

Mr. Begg was also first and second for specimen chrysanthemums in pots with grand entries. These included a magnificent pot of Nellie Pockett, and an entry which was universally admired. Mr. Begg also took leading honours for single and decorative chrysanthemums.

### CUT FLOWERS.

If somewhat thinner than we have seen it in former years, nevertheless, this proved a most delightful section, and one which reflected the greatest possible credit on the growers. For the best eighteen blooms of Japanese chrysanthemums, six varieties, Mr. John E. Davies won an easy first. His entry included exquisite specimens of Mdme. Paolo Radaelli, Mrs. F. W. Vallis, Mrs. Eric Crossley, Master David, Mrs. F. S. Vallis, and William Turner. Mr. John McRobbie, gardener to Sir Charles Forbes, Bart., of Newe, Strathdon, Aberdeenshire, made a very good second, his blooms also being very much admired. In the class for six blooms of yellow and white Japanese chrysanthemums, Mr. Duncan McLean, gardener to Mrs. Thornton, Thornton Castle, Kincardineshire, led the way, closely followed by that well-known grower, Mr. J. A. Grigor, gardener to Mrs. Dunbar-Dunbar, Seapark, Forres, N.B. Mr. Grigor secured first place for best twelve blooms with a really fine entry, which included capitally-grown specimens of Lady Talbot, Mrs. A. T. Miller, Pres. Viger, R. Vallis, Lady Conyers, Mrs. L. Thorn, Bessie Godfrey, J. H. Silsbury, and White Queen. Mr. John Day, gardener to Mr. J. C. O. Couper, of Craigiebuckler, by Aberdeen, made a really good second.

For the best three blooms of one variety, Mr. Duncan McLean, Thornton Castle, won grandly with exquisite specimens of Mrs. A. T. Miller. Mr. J. A. Grigor, Seapark, Forres, was second with much-admired specimens of Sir F. Crisp. A very fine display was made in the sections devoted to single and decorative chrysanthemums. For the best eighteen vases of decorative chrysanthemums, Mr. J. A. Grigor, Seapark, had matters pretty much his own way. Mr. John Petrie, gardener to Sir Thomas Burnett, Bart., of Leys, Crathes Castle, near Aberdeen, had a really fine win for the best nine vases of decorative chrysanthemums. His entry comprised beautifully-grown specimens of Bronze Triumphant, White Quintus, Le Friquet, La Triumphant, Soleil de Octobre, Chateau St. Victor, Mrs. A. Kirk, and Radium. Mr. Alex. Grigor, gardener, Duff House, Banffshire, was a very good second.

For the best twelve varieties of single-flowering chrysanthemums, the premier honour went to Mr. J. A. Grigor; Mr. W. Scorgie, gardener to the Misses McLennan, Springhill, Aberdeen, taking a very worthy second place. For the best six vases of single varieties, Mr. Robert Begg, Garthdee, had a very fine entry, which rightly earned for him premier place. No doubt the weather has been far from propitious of late, but the Christmas roses shown here were really very good, being large in size and of very good quality. For these, Mr. William Milne, gardener, Corsindae, Midmar, Aberdeenshire, had first and second places here, Mr. W. Scorgie, Springhill, taking third place.

The display of orchids was certainly small, but what they lacked in numbers they amply made up for in quality. Than the specimens shown by Mr. Andrew Reid, gardener to Mr. Baird, Durris House, by Aberdeen, nothing finer has been seen in Aberdeen for a long time. He had a very strong and worthy antagonist in Mr. Alexander Duncan, gardener to Lord Provost Maitland, Rubislaw Den House, Aberdeen. Chiefly of the cattleya and cypripedium families, they attracted great attention, and were much admired. For the best six varieties of cut flowers, Mr. John Petrie, Crathes Castle, took first and second places with exceedingly fine entries, Mr. Andrew Reid, Durris House, bringing up the rear.

Bouquets, if not numerous, were very chaste in design, leading places here being taken by Mr. Alexander Cummings, Granite Hill Nurseries, Aberdeen, and Mr. J. A. Smith, Union Grove, Aberdeen. Mr. Davies, Ballathie, had a very fine win for baskets, while Mr. John Petrie, Crathes Castle, and Mr. J. A. Grigor, Seapark, divided the honours for lady's sprays and buttonhole bouquets.

### FRUIT.

A very fine show was made in this section, and one that reflected the greatest possible credit on all concerned. The outstanding feature was the fine display of apples, and those who believe in the theory that an abundance of sunshine is essential for the development of rich colour in apples, had a surprise in store when they saw how beautifully coloured many of the entries were, despite the dull and sunless season through which we have just passed. Mr. C. Stuart, gardener to A. B. Innes, Esq., of Raemoir, near Aberdeen, had a fine win for the best collection of kitchen apples, his specimens of Belle de Pontoise, Blenheim Orange, Cellini, and Warner's King being greatly praised. Mr. Stuart also led for dessert apples, his entry comprising Allington Pippin, Blenheim Orange Pippin, Worcester Pearmain, and King of Pippins. Mr. C. A. Cumming, gardener to Captain Dunbar Brander, of Pitgaveny, Elgin, had a really fine win for baking apples, his entry comprising capitally-grown specimens of Peasgood Nonsuch. Mr. J. A. Grigor, Seapark, Forres, was second with Lord Derby. Dessert apples were not very numerous, but the plates of Charles Ross shown by Mr. John Coutts, Rosefield, Elgin, worthily earned for him premier place. Pears formed an admirable feature, the baking specimens—Grosse Calebasse—entered by Mr. C. A. Cumming, Pitgaveny, Elgin, well meriting first place. Mr. J. A. Grigor, Seapark, Forres, carried off leading honours for dessert pears.

Grapes were not very numerous, but those from Craigiebuckler, Aberdeen, worthily took first place. Mr. Andrew Reid, Durris House, and Mr. Davies, Ballathie, Perthshire, came next in order. Mr. John Petrie, Crathes Castle, had some very fine plates of tomatoes forward, which well deserved the honour awarded.

### VEGETABLES.

In this section the competition was keen. For the best collection, Mr. J. Gordon, Broomend, Inverurie, Aberdeenshire, had a really fine win, his entry comprising cauliflower, Autumn Mammoth; carrots, St. Valery; onions, Cranstone's Excelsior; leek, Dobbie's Prize; Brussels sprouts, Solidity; and Up-to-Date potatoes. Cabbages were not very much in evidence, but those sent in by Mr. John Paterson, gardener to Messrs. Pegler and Co. were really good. Mr. A. Gardiner, gardener to Colonel Stewart, of Drumduan, near Aberdeen, had a fine win for Brussels sprouts. Mr. W. Scorgie, Springhill, was first for cauliflowers, and Mr. Garden, Broomend, Inverurie, had the best celery. There was a capital show of turnips, the samples forward being clean, well-grown, and finely-shaped. Mr. Milne, Corsindae Gardens, Cluny, Aberdeenshire, led the way here, while for leeks, which were a very fine lot, Mr. Garden and Mr. Scorgie divided the honours.

Onions were a capital display, those sent by Mr. R. A. Grigor, Dalswinton, Dumfries, being much admired. Beetroot showed up very well, the quality and texture being very good. Mr. J. Coutts, Rosefield, Elgin, was first here, while for carrots Mr. John Paterson (of Messrs. Pegler and Co.) was first with admirable specimens. Ever a strong feature at this show, the potato section was, as usual, a fine display. That well-known and most successful grower, Mr. J. Ferguson, Linton House, Souchen, Cluny, Aberdeenshire, was, as is his wont, again well to the front, his entries comprising exquisitely-grown specimens.

### AMATEURS.

Very meritorious indeed, was the display made by the amateurs. It is evident the amateur finds the recreation of growing the chrysanthemum a fascinating one. He is constantly learning something, profiting by his errors, and finding ample scope for his ingenuity. And not least of the many allurements of "mum" growing is the gratification of the artistic sense. Leading places in this section were taken by Mr. John Davidson, 223, Hardgate, Aberdeen; Mr. John Milne, 357, Hardgate, Aberdeen; and Mr. John Thomson, Allan Street, Aberdeen, each of whom sent in entries that were a credit and honour to them.

## North of Scotland Horticultural and Arboricultural Association.

There was an exceedingly large attendance of members at the meeting of this association in the Botanical Class-room, Aberdeen University, on Wednesday evening, 20th inst. Mr. A. Robson (in the unavoidable absence of Mr. J. McKinnon, Haddo House), occupied the chair. Several new members having been admitted, making a membership now of nearly 300, the Chairman introduced Mr. A. Brown, of Messrs. Alexander and Brown, Perth, who gave a paper on "A Trip to Holland and the Bulb Fields."

Mr. Brown stated that, although he had been in the habit of visiting Holland annually for many years past, it was seldom he could find time in the spring, which, with him, was usually a busy period, to go to that country, but two years ago he had taken a week-end trip there, and it was that visit he proposed to describe that evening, and to show them how much could be seen in Holland in a comparatively limited period at a most interesting time of the year, so far as the bulb fields were concerned. Mr. Brown then proceeded to describe his journey from Perth to London, thence to Harwich, and across to the Hook of Holland by steamer, and then by rail to Leyden, and the country between there and Haarlem and Amsterdam, where the principal bulb fields were to be found. He described in racy language the scene of rich colour when the hyacinths, tulips, narcissi, and other bulbous plants were in flower, and showed with the aid of a lantern a large number of views of the principal places through which he had passed and also a capital selection of photographs of beautiful and popular varieties. Mr. Brown also gave some valuable and practical information on the culture of Dutch bulbs, described the way in which the sandy soil was rendered best adapted for cultivation, and the elaborate but simple system of irrigation prevailing in Holland.

It was altogether a delightful lecture, and, in the course of a short discussion which followed, Mr. Slorach, Aberdeen, who has been several times over the fields described by Mr. Brown, highly complimented the lecturer on his admirable address, as did also the chairman.

On the motion of Mr. W. B. Clark, gardener, Balgownie Lodge, Aberdeen, Mr. Brown was warmly thanked for his interesting and instructive paper.

### NOVELTIES OF THE YEAR.

The Chairman said the next business was to hear reports from the conveners of the various sections of the association as to the novelties which had come under their cognisance during the past season.

Mr. W. Ironside, gardener to Sir David Stewart, Banchory House, and convener of the vegetable section, in the course of a few remarks, stated that in his section one or two new peas had claimed a good deal of attention, and were likely to prove of some advantage as heavy croppers. Mr. A. Douglas, gardener to Mr. Thomas Ogilvie, of Kepplestone, Aberdeen, after referring to novelties in sweet peas, remarked that those which had done best with him during the past unpropitious season had been Lady Evelyn Eyre, Hercules, Dobbie's Cream, and Juliet. Referring to primulas, Mr. Douglas said that since the introduction of Primula obconica several fine varieties had been sent out with flowers of varying shades of rose and rosy-red, but the aim of many lovers of that plant had been to obtain a really bright red variety. That had now been secured. Queen Alexandra (or Snowdon) was a new giant white variety of Primula sinensis. The new Stellata, or Star primulas, were grand introductions, which should be grown by all. Mr. Douglas, in a most instructive manner, also referred to several new herbaceous plants, and very warmly commended to his hearers a lovely salmon-pink astilbe.

Mr. W. B. Clark, Balgownie Lodge, described in a very interesting manner experiments in which he had been successful with collarette dahlias. One of the finest varieties was Queen Mary, which bloomed freely, was of a fine shade of bright rose, with a white disc, and prettily tipped with white, while the collar was of a pleasing blush. Mr. Clark also commended pæony dahlias, and went on to speak of perpetual-flowering carnations and begonias. He especially mentioned, and showed, an improved Begonia Gloire de la Lorraine. He also emphasised the value of the beautiful Viola gracilis.

Mr. W. Smith, gardener to Lord Sempill, Fintray House, by Aberdeen, made some interesting remarks on a new tomato, the Laxton berry, and loganberry.

Mr. Robson, jun., a son of the chairman, dealt in a most intelligent manner with new varieties of trees and shrubs, particularly some lately introduced by Mr. Wilson, and sent out by the Messrs. Veitch.

Interesting discussions followed the various reports, at the close of which warm thanks were awarded the respective reporters, who had so ably fulfilled their tasks.

The Chairman then presented the association's certificate of merit to Mr. Ironside, Banchory House Gardens, by Aberdeen, for his admirable work in the cultivation of new varieties of onions and carrots, and a similar honour was awarded Messrs. Adam and Craigmile, Ferniclea Nurseries, Aberdeen, for their beautiful new rose Bon Accord, named after the motto on the City of Aberdeen's coat-of-arms.

The Chairman then intimated that at the next meeting Mr. Elder, Hursley Park Gardens, would give a paper on "Rock Gardens," and Mr. Whyte, Aberlour, would speak on "The Begonia."

Needless to say, after so very instructive an evening, the audience, which included several ladies, cordially thanked the chairman and all who had contributed, and retired highly delighted with a well-spent couple of hours.

---

## Blackburn.

NOVEMBER 15 and 16.

The Town Hall was again used for the Blackburn Exhibition, but the entries were so numerous that an extra room was required to hold the exhibits.

As orchids are the predominant feature of the exhibition, it will be well to give them first consideration. For a table, 8ft. by 4ft., Mr. J. Lupton, gardener to Colonel J. Rutherford, M.P., was the only exhibitor, but he arranged a splendid bank in which oncidiums, cymbidiums, odontoglossums, cattleyas, and cypripediums were admirably blended with palms, ferns, etc. For a table of cypripediums, Mr. A. E. Strafford, gardener to William Thorn, Esq., led with a fine exhibit, which included many choice kinds and good flowers. Mr. T. Cass, gardener to Alfred Nuttall, Esq., was second, and Mr. C. Parker third. Mr. Strafford was successful for three cypripediums, with Mr. J. Pimplott, gardener to T. Mitchell Eccles, Esq., and Mr. J. Sumner, second and third. Mr. Strafford maintained his position for a single plant, staging Cypripedium insigne Sanderæ in good form with seven flowers.

The best three hybrid orchids came from Mr. J. Hardy, gardener to H. Bell, Esq., with Mr. Lupton second. For four orchids Mr. Lupton improved his position, and took the lead, which he continued for three oncidiums. For the single specimen, eleven competitors made an effort to win, and Mr. Price was successful with a fine Cymbidium Traceyanum, carrying seven good spikes.

Among other plants, the most prominent classes were the groups of chrysanthemums, two of large-flowering and two of single-flowering varieties being staged. In the former class Mr. Bradburn won with good-sized blooms, with Mr. J. Pimplott a strong second. For the singles Mr. Pimplott improved his position, having a fine half-circle, some ten feet in height, filled with pleasing and bright flowers; Mr. C. Samways, gardener to J. Thompson, Esq., was an excellent second. For a group of miscellaneous plants, Messrs. A. Lodge and Son, Beardwood, were adjudged the best exhibitors, Messrs. J. Battersby and Son, Blackburn, and Mr. Thos. Bury, Arley Nurseries, following. Six chrysanthemums found Mr. Bradburn with the premier lot, and he also won with a single specimen, but Mr. Pimplott had the best pair. Mr. Bradburn proved successful in the classes for three bouvardias and four salvias. Mr. J. McCullock proved the winner for six flowering plants, Mr. Barker for a like number of cyclamen, Mr. Samways for three begonias and two amaryllis, Mr. J. Bartlett for six solanums, and Mr. J. Pimplott for three ferns.

In the cut flowers section, for twenty-four incurved, not less than eighteen varieties, Mr. R. H. Jones, gardener to A. E. Troop, Esq., gained the premier position, having good blooms of Buttercup, Romance, W. H. Thorpe, etc.; second prize went to Mr. H. Boyd, gardener to Captain Fielden, and the third to Mr. J. Pimplott. For twelve blooms Messrs. H. Bradburn, J. W. Wells, and R. H. Jones were placed as named.

For twenty-four Japanese blooms, not less than eighteen varieties, Mr. H. Boyd secured top place, his leading flowers being Hon Mrs. Lopes, Countess of Granard, A. T. Miller, and White Queen; Messrs. H. Bradburn and R. H. Jones were second and third respectively. For twelve varieties Messrs. H. Boyd and J. Pimplott were placed first and second; and for three vases of blooms Mr. John Thompson proved the victor.

For a basket of chrysanthemums, Mrs. Pimplott won with a most effective exhibit, and Mrs. Edith Lodge was second. For a basket of autumn foliage, berries, etc., Mrs. Sharples and Miss Pimplott were placed as named, and for a centre-piece Miss Lupton and Mr. H. Arthur had pleasing designs.

Mr. J. Wright, gardener to Edmund Lord, Esq., Rawtenstall, scored for grapes with two bunches of Alicante, two of Muscat of Alexandria, and one of Muscat of Alexandria. Mr. C. Samways was second in the two-bunch classes. Mr. J. Barker scored for the collection of vegetables, his Brussels sprouts and leeks being excellent. Mr. H. J. Wells proved a good second; Mr. Wells staged extra fine onions, which secured the first prize.

---

## Dundee.

The annual two days' exhibition of this society was held in the Kinnaird Hall, on November 22 and 23. Bailie Walter S. Melville, D.L., J.P., presided at the formal opening ceremony, gracefully performed by Mrs. W. D. Graham Menzies, of Hallyburton. The exhibits, although not so numerous as usual, were of a high order of merit, and pronounced by experts to be the best seen this season.

Our own opinion was that the thirty-six blooms (twelve vases in twelve varieties) staged by Mr. J. W. Robertson, Letham Grange Gardens, Arbroath, and the eighteen blooms (six vases) staged by Mr. D. Keillor, Seaborne Gardens, Broughty Ferry, and Mr. R. McNaughton, Battleby Gardens, Perth, would require a great deal of beating. The latter two lots were not easily decided between as named, containing as they did notable examples in every way, but the most outstanding flowers certainly were Hon. Mrs. Lopes, W. S. Thorn, Countess of Granard, Mary Poulton, J. H. Silsbury, Elsie Fulton, Eclipse, Mrs. A. T. Miller, and Lady Talbot. Mr. Robertson's collection was in the pink of condition in every detail, and only individual preference would account for noting the best; his Purity was the best we have yet seen, while his F. S. Vallis, Reg. Vallis, White Queen, and Victoria and Albert won universal admiration amongst grand flowers of W. S. Thorn, Hon. Mrs. Lopes, Mrs. A. T. Miller, Master David, and George Hemming. Mr. Keillor was also first for twenty-four blooms (eight vases), his lot containing Mary Poulton, W. S. Thorn, Lady Talbot, Hon. Mrs. Lopes, and Mrs. A. T. Miller; Mr. McNaughton was a good second, his Dorothy

Goldsmith and White Queen being leading flowers.

Mr. Keillor again led for twelve Japanese incurved (four vases); Mr. James Rae, Ethis Castle Gardens, Arbroath, being second. In the smaller classes Messrs. George Scott, James Beats, Alex. Duncan, J. W. Robertson, J. E. Davis, and T. C. Brown were winners, while for baskets, bouquets, sprays, etc., Messrs. Wm. Cooke, Beats, Scott, and Summers were successful. For a table of single chrysanthemums, 4ft. by 4ft., Messrs. Beats, Scott, and Duncan won, as named, with good collections, the following varieties being prominently set up in each lot: Pink, Bronze, White, and Yellow Pagrams, Sir Walter Scott, Metta, Mensa, Sylvia Slade, and Mary Richardson

For a decorated dinner-table three competitors were forward, Messrs. George Scott, James Beats, and John Fraser scoring as named. In the plant section the same three names appeared in similar order in most cases, except for winter-flowering begonias, when Messrs. Alex. Duncan, Wm. Grieve, and J. Beats were successful.

As on former occasions the amateurs upheld their traditions for quality, although their numbers were small. Messrs. John Denholm, J. Higgins, Anstruther, A. Guild, W. Davidson, Jas. Clark and Andrew Batchelor were prominent winners for cut blooms. Messrs. Davidson, Clark, and J. Keill were also exhibitors of pot plants, while Messrs. J. R. Butchart, D. Smith, and D. Orchiston were the only exhibitors of vegetables.

In the displays put up by the local nurserymen, none were so interesting as that of Messrs. Harley and Sons, who excelled in their choice of high-class and rare fruits, beautifully staged in an artistic floral scheme, where poinsettias were a leading feature. Messrs. Laird and Sinclair had a beautiful table of designs in floral art made up in the usual artistic fashion, for which the firm is famed.

Messrs. D. and W. Croll set up a table of beautiful cyclamen and other flowering and foliage plants, among which vases of large chrysanthemums were artistically arranged.

An excellent programme of music was admirably sustained during the two days, while a variety concert on Saturday night proved a success, and ought to help the funds of the society, which for some time have been dwindling.

## Perpetual-Flowering Carnation Society.

This society held the competitive part of its winter exhibition at the Royal Horticultural Hall, Westminster, on December 4, but the non-competitive portion was on view the day previous in conjunction with the R.H.S. meeting, and is dealt with by us in that connection.

The exhibition was a capital one, and we were pleased to see such a brisk competition in the amateurs' and small growers' sections. The blooms were of fine size and colour, as a whole, and the display was altogether interesting and attractive.

During the evening of December 3 the society held its annual dinner at the Holborn Restaurant, when Mr. J. S. Brunton presided over a fair attendance. The annual meeting followed this function, and the business was of a general routine character. There is a membership of 325, a net increase of 24 for the year. The turnover for the year was £275 5s. 3d., and there is a balance of £7 7s. 5d. to the good. Subscriptions amounted to £159 5s. 6d., and £112 14s. was paid away in prize-money, while postages amounted to £16 15s. 11d., printing and stationery to £42 9s. 11d., and the year book cost £25 10s.

Lord Howard de Walden was re-elected president, Mr. J. S. Brunton as chairman of committee, Mr. W. E. Wallace as vice-chairman, and Mr. Laurence Cook as treasurer, while Mr. T. A. Weston was elected hon. secretary in place of Mr. E. F. Hawes, whose business engagements prevent him from continuing in that office.

### OPEN CLASSES.

The gold medal offered as premier award for the best group of cut carnations arranged on a space 10ft. by 3ft. was worthily won by Mr. C. Engelmann, Saffron Walden, with a beautiful group of beautiful flowers set up gracefully in stands and vases, and the colour combination was excellent. Sunstar in the centre radiated its golden colouring and gave life to the whole; behind this were Lady Northcliffe, White Perfection, and White Enchantress, while in the foreground Harlequin, Rose Doré, Elektra, Enchantress, and Carola were presented in fine form. The second prize was won by Messrs. W. Wells and Co., Merstham, with flowers of equal quality, but not so well arranged and Colonel Rideout, Langley, Bucks, came third.

Mr. Brunton's challenge cup for the best three vases of British novelties was won by Mr. Engelmann, with good vases of Sunstar, Lady Northcliffe, and Carola.

The best three novelties raised in America were staged by Mr. H. F. Mason, Church Farm Nurseries, Hampton Hill, and his selection was Dorothy Gordon, White Wonder, and Gloriosa, all in fine form; Mr. W. E. Wallace, Eaton Bray, second; and Mr. C. Engelmann third, the latter having a fine vase of Rosette.

The series of classes for a vase of blooms of one variety of a given colour or group again proved a great attraction. For a vase of Enchantress or similar variety, Mr. C. Guile, The Gardens, Short Grove, Newport, led with Enchantress in grand style, Mr. W. E. Wallace following with the same variety, and Col. Rideout third; eight entries. In the Mrs. H. Burnett class there were seven entrants, and first place was won by Messrs. Stuart Low and Co., Enfield, with the prettily-fringed Baroness de Brienen; Mr. W. E. Wallace second, with Pink Delight, and Mr. Engelmann third.

Among varieties of the Rose Pink Enchantress class Mr. W. E. Wallace scored with Gloriosa, beautiful in form and colour. In the Lawson class Mr. W. E. Wallace was premier prize-winner with a fine vase of the bright cerise Una Wallace, a very attractive variety; Mr. Engelmann second with Mrs. C. W. Ward. The best vase of a scarlet variety was Scarlet Glow, of very dense and solid colouring, shown by Mr. W. E. Wallace; Mr. H. F. Mason second with Beacon, and Mr. H. J. Dudney, Erith, third.

Seven competitors came forward in the class for white flowers, and Mr. Mason led with a champion vase of White Perfection, followed in order by Mrs. Collins, who showed White Perfection, and Colonel Rideout, who staged White Enchantress. Only two competitors came forward in the crimson class, and here Mr. W. E. Wallace scored with fine examples of Carola, Mr. Engelmann coming second.

In the fancy class Mr. Wallace was successful with the white, scarlet-flaked Benora; Messrs. Stuart Low and Co., Enfield, second, with the same variety. In the class for selfs not eligible in other classes there were six competitors, and Mr. A. F. Dutton led with large blooms of Mikado; Col. Rideout second, and Mr. S. F. Jackson third.

Messrs. Allwood Bros., Haywards Heath, led for any registered variety not yet in commerce with Mary Allwood, figured in the present issue; Mr. W. E. Wallace second with Una Wallace.

Mrs. A. R. Bide, Highlands, Farnham, scored for a basket of carnations, and did so with blush and crimson flowers associated with asparagus fronds. Mr. S. F. Jackson, Danehurst, Epsom, had the best three ladies' sprays, and was followed in order by Mr. Guile and Mr. R. B. Leach, Wood Hall Gardens, Dulwich. Mrs. Bide led in the class for a table decoration with a very pretty arrangement of Mary Day carnations and asparagus; Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., Ranston, Blandford, second with a higher, bolder design, and Mr. Guile third; six entries.

### AMATEURS' AND GARDENERS' CLASSES.

In the amateurs' division Mr. Usher led for a table decoration, and his central feature was a high arch of pink flowers associated with asparagus fronds and croton leaves; Mr. Holder, Adair Place, Englefield Green, second. The best collection of cut carnations arranged on a circular table 4ft. in diameter was the one set up by Mr. A. E. Usher, who had a pleasing grouping of particularly fine blooms of popular sorts; Mr. H. Smith, Epping House, Little Berkhamstead, second with a rather flat arrangement. Captain Weimer was first for six gentlemen's buttonhole bouquets in a strong competition; and Mr. W. Heath, Hylands, Chelmsford, was first for a basket in the amateur's section with scarlet and white flowers and croton foliage; Mr. W. Holder second, and Mrs. A. R. Bide third.

Mr. Grubb, gardener to C. F. Raphael, Esq., Porter's Park, Shendley, put up a capital group of perpetual carnations, and easily secured Lord Howard de Walden's silver-gilt challenge vase with well-grown plants and beautiful blooms of Mrs. C. F. Raphael, Carola, Baroness de Brienen, Lady Northcliffe, and Triumph; Mrs. Bischoffshiem, Bute House, South Audley Street, second, and Mr. W. Holder, Englefield Green, third. Mr. Usher led for the best half-dozen flowering plants, and easily beat Mr. Holder; Mr. Usher was also first for a plant of Baroness de Brienen.

Mr. Usher scored for a vase of Messrs. S. Low and Co.'s novelties, and he had good blooms of Lady Alington, Mrs. T. M. Crook, and Rival. For a vase of Mr. Burnett's novelties Mr. Usher was also first, but the varieties were not labelled; for six blooms of Messrs. Wells and Co.'s novelties Mr. Usher was again to the front, but for six blooms of Mr. Burnett's novelties Captain Weimer came first. For a vase of twenty-five blooms, one or more varieties, wiring allowed, Mr. Usher won first place with May Day not wired; Mr. S. F. Jackson second, and Mrs. Fenwick, The Croft, Hillmorton, Rugby, third; five competitors.

Next followed a series of colour classes, five blooms in a vase being required. In the Enchantress class there were eleven entries, and the leading award fell to Mr. A. E. Usher for Enchantress, and this was the best vase of blooms in the small section; Mr. G. West, gardener to F. Ricardo, Esq., The Friary Gardens, Old Windsor, second; Lord Burnham third. In the Mrs. Burnett class Mr. Usher scored, beating Mr. Johnson, gardener to Lord Burnham, Hall Barn, Beaconsfield, and showing Lady Northcliffe. Mr. Usher for first in the rose-pink class with Rose Pink Enchantress, and Mr. Johnson was second; seven entries. Mr. Usher and Mr. Johnson were first and second in the Lawson class, the former scoring with Mrs. C. W. Ward. Mr. S. F. Jackson beat Mr. Usher for white flowers, but Mr. Usher was to the front again for scarlet flowers, and won with a nice vase of Scarlet Glow, Captain Weimer coming second. Mr. Jackson was first and Captain Weimer second for crimson flowers, each showing Carola. For any other self-colour Mr. G. West scored with Rose Doré in fine form, with Mr. Usher second with Mikado. In the fancy class Mr. Usher scored with the yellow-ground Orpheus.

In a special class provided by Mr. A. F. Dutton, Iver, Bucks, for a dozen blooms cut from plants obtained from him in 1912, Mr. Usher was placed first, winning the £10 prize with noble blooms of Carola, White Enchantress, R. F. Felton, Alma Ward, Enchantress, Rose Doré, Scarlet Glow, etc.; Mr. G. West second, and Mr. Johnson third.

### SMALL GROWERS' SECTION.

An interesting division was provided for amateurs who only employ a part-time gardener, or who grow their carnations themselves. Here only three flowers were required, and there was a quite good competition. Mr. T. C. Loosemore, Rodwell Station, Weymouth, was particularly successful, and we understand he is a railway clerk, with one small greenhouse. Mr. T. H. Plowright, Trinity Place, Windsor, was second to Mr. Loosemore in nearly every case. Mr. J. Mackenzie, Shooter's Hill, was first in a few classes, and Mrs. Alice Whitworth, The Avenue, Datchet, was also a first prize winner.

### NEW VARIETIES.

The Floral Committee granted an Award of Merit to each of the following varieties: Snowstorm (recently figured in our columns), from Mr. W. Lawrenson, Yarm-on-Tees; to Baroness de Brienen (a pink variety recently figured by us), from Messrs. Stuart Low and Co., Enfield; to Mary Allwood (illustrated in the present issue), from Messrs. Allwood Brothers, Hayward's Heath; and to Mrs. A. F. Dutton, a fine pink variety, from Mr. A. F. Dutton, Iver, Bucks.

### NON-COMPETITIVE.

Messrs. Felton and Son, Hanover Square, had a quite attractive exhibit of cut flowers, composed entirely of British-raised perpetual carnations; especially good were their vases of Lady Northcliffe, Mandarin, Baroness de Brienen, Una Wallace, Marmion, Snowstorm, R. F. Felton, and Mrs. C. F. Raphael. We refer our readers to the section of our R.H.S. report headed "Carnations" for description of the other non-competitive displays.

### MEDAL AWARDS.

Large Gold.—To Mr. C. Engelmann, Saffron Walden.

Gold.—To Messrs. Stuart Low and Co., Enfield.

Large Silver-gilt.—To Mr. H. Burnett, Guernsey.

Silver-gilt.—To Messrs. Felton and Sons, Hanover Square; to Messrs. Allwood Brothers, Hayward's Heath; to Messrs. Young and Co., Hatherley, Cheltenham; to Mr. Wm. Lawrenson, Yarm-on-Tees.

Silver.—To Messrs. Wm. Cutbush and Son, Highgate; to Mr. C. Lange, Hampton.

## National Chrysanthemum Society.

The annual dinner of this society, held on Wednesday, November 26, in the Venetian Chamber, Holborn Restaurant, London, was a most enjoyable function. In the unavoidable absence of the President, Sir Albert Rollit, Mr. Thos. Bevan presided. The attendance was excellent, about a hundred and three members, including many ladies, being present.

Mr. Bevan presented the challenge cup and shields, and extended congratulations to the winners. The room and tables were finely decorated with chrysanthemums and foliage plants, the speeches were interesting, and the musical part of the programme very enjoyable.

## Chelmsford Gardeners' Association.

At the second meeting of the winter session of this society, which was held at the Institute of Agriculture, Mr. E. H. Christy presided over a large attendance of members.

Mr. Montague Allwood, of Hayward's Heath, gave a very instructive lecture on Perpetual-flowering Carnations, and in his opening remarks directed attention to the high position these carnations hold, and observed that they were flowers within the reach of both rich and poor. As no great temperature was needed, their cultivation could be easily mastered by those who were able to grow chrysanthemums, air and light, and a temperature just above 50, being the chief requirements. Dealing with propagation, Mr. Allwood said the chief thing was to obtain good cuttings, and to select them from the centre of half-ripened shoots, as those taken from the base were too slow of growth, and those taken nearest the flower were too weak. Cuttings should be inserted in sand, and not loam, as the latter had a tendency to hold more moisture than was good for the cutting. A compost of loam with sand, a fifth of stable manure, and a little lime rubble would be quite suitable to use in potting off the rooted cuttings. The method of stopping was fully explained, and it was advised to stop fairly hard down into the mature wood, such as down to six leaves. Mr. Allwood made special mention of the perpetual carnations for summer budding, and felt certain that the border carnations would soon be a thing of the past, but care should be taken to give them a well-drained soil, as a water-logged bed or border was fatal to their welfare. A cordial vote of thanks was accorded the lecturer.

## Poole.

Under the auspices of the Borough of Poole (Dorset) Allotments Association, Limited, a lecture on "Vegetables for Home Use, Market, and Exhibition" was given by Mr. G. Garner, of Bournemouth, in the Guildhall, Poole, on Wednesday, November 20. The Mayor of Poole (Alderman Herbert S. Carter, J.P.) presided, and referred to the good work being done by the association, which now numbered about seven hundred members. He also referred to the great possibilities in the country in the matter of what he would term intensive culture. During a recent tour through the country he was much impressed by the great amount of uncultivated land that he saw in many counties.

The meeting was an open one, gardeners and the public also attending, also the senior scholars from the neighbouring schools with their teachers.

The lecturer dealt chiefly with the preparation of the soil at the present time, and in spring; also with the application of manure in autumn and spring, selection of crops for certain soils, selection of varieties, planting, summer treatment of growing crops, their gathering and storing, and the selection and preparation of produce for exhibition purposes.

A very free discussion took place at the close of the lecture, and many questions were answered by Mr. Garner. Votes of thanks were passed to the Mayor for presiding, and for granting the use of the Guildhall, and to the lecturer.

## Sanquhar Horticultural Society.

The annual meeting of this society was held in the Town Hall, Sanquhar, the other evening, Mr. James Thomson, Newark, vice-president, in the chair. The report submitted to the meeting of the society's operations for the past year was of a very satisfactory character, the financial statement showing that the debit balance from the previous year had been wiped out and a small balance to the credit of the society remained. The office-bearers were elected as follows: Prsident, Mr. James Moffat, Gateside; vice-president, Mr. James Thomson, Newark; hon. secretary and treasurer, Mr. John Milligan, Sanquhar; assistant secretary, Mr. R. M. Kendrick, jun. After consideration it was agreed to increase the number of classes in one of the sections.

## Royal Horticultural Society.

(Continued from p. 934.)

### FRUIT AND VEGETABLE COMMITTEE.

A number of new apples and pears were staged in the annexe by Messrs. J. Cheal and Sons, Crawley, and made up a very attractive and interesting exhibit. Crawley Beauty, a local raised apple, that flowers late in May, was well-shown, and gained an A.M.; it is a regular cropper, and the shaplely fruits are brilliantly shaded with crimson, and splashed with crimson-scarlet over the green ground; it is a solid cooking apple that will keep well till March. Encore is better known, and so is Rival and Chas. Ross, but Crawley Reinette and Buxted Favourite are less known, but of considerable merit, while Beurre de Naghan pear, a fine late variety, was shown in fine condition.

Mrs. V. Banks, Park Street, W., displayed a fine collection of bottled fruits and vegetables, representing a hundred and sixty-eight varieties; this was a splendid exhibit, and a much larger one than this clever lady has hitherto staged, and it gained the coveted Gold Medal. Miss Sewell, Harcourt Terrace, S.W.; Mrs. D. E. Jones, Pershore; Mrs. Miller, Marlow; and Messrs. Westmacott and Co., Leadenhall Street, all showed bottled fruits, preserves, or confections.

The Agent-General for British Columbia brought up a splendid exhibit of British Columbian apples. The fruits were, as usual, finely graded, of excellent size and beautiful colour, and packed in first-rate style. A variety named Winter Banana gained an A.M. An apple named Steyn's Seedling, from Lady Thornycroft, Isle of Wight, also gained an Award of Merit.

### CERTIFICATES AND AWARDS.

First Class Certificate.—To Lælio-cattleya Golden Oriole var. Ruby, from Sir G. Holford (grower, Mr. Alexander), Westonbirt, Tetbury; to Odontioda Latona Fowler's var., from J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.

Award of Merit.—To Cypripedium Eurybiades, from Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking; to Cypripedium Viking, from Sir Trevor Lawrence, Bart.; to Sophro-lælio-cattleya Carna, from Messrs. Charlesworth and Co., Hayward's Heath; to apple Crawley Beauty, from Messrs. J. Cheal and Sons, Crawley; to apple Steyn's Seedling, from Lady Thornycroft, Isle of Wight; to apple Winter Banana, from the British Columbian Government; to Chrysanthemums Miss A. Brooker, Eric Wild, and Mrs. Wingfield Miller, from Messrs. W. Wells and Co., Merstham; to Chrysanthemum Miss A. Brooker, from Messrs. J. Veitch and Sons, Chelsea; to Prunus Miqueliana, from Col. Stephen Clarke, C.B., Cuckfield; to Carnation Bonfire, from Messrs. W. Wells and Co., Merstham; to Carnation Mrs. A. F. Dutton, from Mr. A. F. Dutton, Iver, Bucks; and to Asplenium divaricatum elegans; from Messrs. J. J. Parker and Co., Whetstone.

### MEDALS.

Gold.—To the British Columbian Government, for fruit; to Mrs. V. Banks, Park Street, W., for bottled fruits and vegetables; to Mr. C. Engelmann, Saffron Walden, for carnations.

Silver-gilt Flora.—To Mr. H. Burnett, Guernsey, for carnations.

Silver-gilt Banksian.—To Messrs. W. Cutbush and Son, Highgate, for carnations, etc.

Silver Knightian.—To Mrs. Miller, Marlow, for fruit, preserves, and confections; to Messrs. Westmacott and Co., Leadenhall Street, E.C., for preserves.

Silver Flora.—To Mr. C. Lange, Hampton, for begonias and carnations; to Colonel M. Lockwood, M.P. (gardener, Mr. Cradduck), Bishop's Hall, Romford, for chrysanthemums; to Messrs. Stuart Low and Co., Enfield, for carnations; to Mr. L. Russell, Richmond, for azaleas, etc.; to Messrs. James Veitch and Sons, Chelsea, for begonias, etc.; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. James Veitch and Sons, Chelsea, for orchids.

Silver Banksian.—To Messrs. J. Cypher and Sons, Cheltenham, for orchids; to H. T. Pitt, Esq. (gardener, Mr. Thurgood), Rosslyn, Stamford Hill, for orchids; to Messrs. Baylor, Hartland and Co., Cork, for orchids; to Messrs. J. Cheal and Sons, Crawley, for fruits; to Miss Sewell, Harcourt Terrace, S.W., for jams; to Messrs. Allwood Brothers, Hayward's Heath, for carnations; to Rev. H. Buckston, Derby, for cyclamen; to Messrs. Thos. S. Ware, Feltham, for alpines; to Messrs. W. Wells and Co., Merstham, for chrysanthemums and carnations; to Messrs. Young and Co., Hatherley, for carnations; Mr. W. Lawrenson, Yarm-on-Tees, for carnations.

Bronze Banksian.—To Messrs. H. B. May and Sons, Edmonton, for greenhouse flowers and ferns; to Mrs. D. E. Jones, Pershore, Worcester, for bottled fruits.

## THE CITY DIARY, 1913.

(Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London, E.C.) Price 1s.

The City Diary, which has been our constant companion for upwards of a quarter of a century, has again made its appearance upon our table, and is certainly not less welcome at the present time than in any previous year during the period over which we have had the advantage of the aid it is so well able to render, in entering up engagements and keeping a record of events of special importance. The present issue is of much interest from the fact that with its publication the City Diary celebrates its jubilee. For our own use we find it unsurpassed in usefulness, and to the City man it can hardly fail to be of immense value, as it not only has ample space for the insertion of daily records, but it contains a large amount of information respecting the City of London, and is a reliable guide to all its institutions. It gives lists alphabetically arranged, according to wards, of the members of the Corporation and its officers; of the City churches with the names of clergy, lecturers, and vestry clerks, and of the City Livery Companies with the names of the clerks and the situation of the halls. Details concerning the London County Council, the City Union, and other governing bodies are supplied, and an exhaustive table of social organisations, forming a singularly practical companion for every citizen. The diary portion, with three days to a page, is interleaved with blotting-paper of excellent quality, and cash columns are ruled on the several pages. It is certainly a remarkable shillingsworth.

## SOIL CONDITIONS AND PLANT GROWTH.

By Edward J. Russell, D.Sc. (Longmans, Green, and Co., 39, Paternoster Row, E.C.) Price 5s. net.

From the earliest period in the history of the world until the present day, the wonders of the soil and plant growth have been a constant source of interest to those who appreciate to the full their immense importance in relation to the prosperity of nations and to the health and enjoyment of the individual members of communities. There is consequently no occasion for surprise that the problems associated with the soil and the development of plants should in all ages have received the close attention of thoughtful men with a scientific turn of mind or that strenuous endeavour should have been made to effect their solution. In Roman times there was an extensive literature in agriculture, in which both the scientific aspects and the practical details of the art were dealt with in accordance with the views that were held at the time. Immense numbers of works have been written since then, and probably at no time have author and printing press been more actively engaged in adding to the literature of agriculture with which in this connection must be associated horticulture, than at the present. One of the most important of the books on the scientific aspects of the soil and plant development is that by Dr. E. J. Russell, the director of the Rothamstead Experimental Station, who has devoted much time to the investigation of the soil and its flora.

This book is of special importance because the information it contains is based on the results obtained from original investigations conducted on carefully devised lines, and it is of importance also because of the remarkable clearness with which the facts are stated. It is in no sense an elementary work, but the text is so remarkable for its lucidity that even the young gardener will not experience any difficulty in reading it or in clearly understanding what the author says with regard to the somewhat complex problems that are dealt with. The introductory chapter in which the search for knowledge of the soil by a large number of investigators is briefly described, is of much interest and of considerable educational value for the light it throws on the necessity for great care in carrying out investigations and in accepting as conclusive the results obtained therefrom.

The earlier investigators, we are told, sought for a "principle" of vegetation to account for the phenomena of soil fertility and plant growth, and Van Helmont considered he had found it in water. He made an experiment by filling an earthen vessel with soil weighing 200lbs., then well moistened it with rain water, and planted therein a shoot of a willow weighing 5lbs. At the end of five years the willow had grown into a tree of considerable dimensions, and weighed 169lb. and about 2oz., although it had not received any assistance other than from supplies of rain or distilled water. The soil was dried and weighed, the weight being the same as at first, less 2oz. Boyle repeated the experiment with "squash, a kind of Indian pomion," obtained similar results, and was satisfied. "Nevertheless," writes Dr. Russell, "the conclusion is incorrect, because two factors had escaped Van Helmont's notice—the parts played by the air and by the missing two ounces of soil."

About 1650 Glauber propounded the theory that saltpetre is the "principle" of vegetation, and this view was generally accepted by later writers. Boerhave taught that plants absorb the juices of the earth, and then convert them into food. Very little progress appears to have been made in the scientific aspects of cultural methods until the commencement of the second half of the eighteenth century, and excellent work was done on the effects of vegetation on air towards the end of the century, but its horticultural and agricultural significance was not recognised at the time. De Sanssure did good work in 1804, and was able to show that carbon dioxide in small quantities was a vital necessity for plants, and that the soil supplied only a small part of plant food, but, as Dr. Russell states, his views were not for some years accepted, or his methods followed.

Then followed experiments by Boussingault, who was the first to appreciate the importance of field experiments; Sprengel, who studied the ash constituents of plants, and others of lesser importance. For a long period it was held that plants derived their carbon from the humus in the soil, but this was demolished by the ridicule that was poured upon it in the report presented by Liebig to the meeting of the British Association in 1840. This great agricultural chemist, as in the case of some who had preceded him, and others who followed him, unfortunately made serious mistakes, for he propounded the "mineral theory," and introduced a patent manure prepared in accordance with his views but the theory was shown to be erroneous by Lawes, and his fertiliser was a failure. This failure was not, we are told by Dr. Russell, wholly the fault of the theory, but only affords a further proof of the numerous pitfalls of the subject. The potassic compounds and phosphates it contained were rendered insoluble by their admixture with lime for the purpose of preventing their nutrient properties being washed out of the soil, it not having been foreseen that in a state of insolubility they would not be able to supply the plants with food. Not until the second half of the last century was it recognised that bacteria were active agents in the process of decomposition in the soil, which had been regarded by Liebig as purely chemical.

The chapter on the requirements of plants, which may be regarded as the commencement of the more practical part of the work, is of much importance, and will be found of great value by those who are desirous of knowing something of the plant as a synthetic agent and accumulator of energy, taking up simple substances and manufacturing complex sugars, starch, proteins, essential oils, colouring matter, and other substances. This knowledge will add much to the interest associated with plant culture, and, coupled with a thorough acquaintance with the information that is given on the processes of assimilation, transcolation, metabolism, and respiration, will be of much assistance to cultivators in contending with the difficulties they are constantly meeting with. In referring to the formation of soils, the author points out that the plant in a natural state returns more to the soil than it takes away as a consequence of a considerable proportion of the complex and other substances manufactured in process of growth falling back to the soil when it is dead. This organic matter introduces a fundamental change, and the difference between the soil and the original heap of mineral matter is that the soil contains sources of energy while the mineral matter does not. The distinguishing characteristics of soil is that it contains part of the complex material synthesised by plants. This material, the author tells his readers, affords energy to numerous micro-organisms, and is gradually converted by them into simple substances that are utilised in the nutrition of plants. Its constituents are regarded as taking part in a perpetual cycle; in one stage nourishing the growing plant and storing up the energy of sunlight, in the other stage nourishing micro-organisms and liberating energy. These are all matters with which the cultivator should be acquainted, and it is of some importance that the author should have broken away from traditional methods and stated his facts and deductions with such clearness that no difficulty will be found by cultivators with a fairly good education in understanding them. The consideration of the biological conditions in the soil forms a chapter of immense interest, and because of this and the high degree of utility of the information it contains, we should have attempted a brief summary, but, having reached the limits of space, this is practically impossible. We therefore lay down the book with some degree of reluctance, and in doing so we strongly advise all who are engaged in the work of the garden to place it on their book-shelves, and take full advantage of their opportunities for mastering its contents.

---

THE
VERY LATEST
AND BEST IN
HAND PNEUMATIC SPRAYERS.

**The "Four Oaks,"** acknowledged by all users to be far and away the best on the market.

**No separate pump.** Self contained. A great advance over those kinds with separate pump. Cannot get out of order. The easiest, handiest, and most economical sprayer for greenhouse and garden work and disinfecting.

**The "FOUR OAKS" Streetley Pattern.**

Capacity, 2 Quarts.
Working capacity,
6 Pints.

Prices:
In Copper - **25/-**
In Steel - **17/6**

The copper machine is recommended where price is not a great consideration. Is **lighter, cleaner, and will not rust.**

Sole manufacturers:—
**THE FOUR OAKS SPRAYING MACHINE Co.,**
**Four Oaks Works,**
**SUTTON COLDFIELD, BIRMINGHAM.**

# ANSWERS TO CORRESPONDENTS.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

PEACHES UNDER GLASS.—S. W., Leicester: I have under my care a lean-to vinery, and my employer wishes to root out the vines and grow peaches instead. The glass roof is 18ft. from back to front, and the house is 24ft. long. The border is an outside one, the bottom of the border being at the ground level. There are 4in. flow and return pipes along the front and part of the end, with staging over them. Down the centre of the house is a staging 6ft. wide, and this is needed for housing plants during the winter. Ventilation can be given at the top of the back wall. Between the staging and the back wall there is an old flue, which we have not cared to move, but if we cleared it out there would be a wall 10ft. high available. Kindly tell me how best to deal with this matter, so as to make the best possible use of the house.—The house has a more lowly-pitched roof than is usually regarded as most suitable for peaches, but no doubt a fair amount of success can be obtained if reasonable care is taken. Several methods of dealing with the problem present themselves, but some of these would involve planting and eventually cutting out supernumerary trees, and so we suggest four fan-trained trees, two for the front of the house and two for the back wall. The long roof will allow ample head room for the front trees and still a fair share of light to reach the trees on the wall. Inside borders back and front will very largely make for success. There would still be room for a central staging for housing plants during the winter, but the old flue would have to be removed, as we understand it, to make room for the back border. The house is hardly long enough for three trees in a row, but if it seems desirable to cover the space as quickly as possible, long-stemmed standard fan-trained trees might be planted between the dwarfs, to be subsequently cut out to make room for the permanent trees. Probably the first method would be the best one, especially if a dozen good pot trees of peaches and nectarines were grown in the house to provide fruit until the planted-out trees are old enough to yield good crops. For the borders take out the soil to a depth of 3ft., and if the subsoil is clayey, it will be necessary to make a concrete base, and arrange so that there is an outlet for the drainage. If the subsoil is gravel, a layer of broken brickbats will suffice, over a system of four-inch drain-tiles, placed end to end in rows 4ft. apart, leading to the main drain and outlet. Turves, grass-side down, should be placed over the drainage. For soil use roughly chopped loam, adding a barrow-load of mortar rubble, a barrow-load of wood ashes, and a few pounds of quarter-inch bones to each cartload of loam. The borders should be 7ft. wide, but only a 4ft. width need be made up at first, using the rougher portions of loam or turves to make a retaining wall. Additions may be made to width of the border in subsequent years. Plant firmly, and get the work done immediately.

REMOVAL OF WEEPING WILLOW.—J. H. W., Riding-Mill-on-Tyne: We have a weeping willow tree, about 7ft. high, and, as far as one can judge, about nine or ten years old. Would it take any harm if moved, and when would be the right time to move it?—If the work is done carefully, there should be no difficulty in successfully moving the tree. Keep as large a body of soil and roots attached as possible; excavate around and under the roots, place stout planks under the root mass, and then, by means of rollers, convey the tree to its new site. Removal should take place at once. After replanting, spread some manure litter over the root area, and provide stakes and ties to keep the tree from harm during the winter.

CALANTHES.—Ignorance: Could you tell me the cause of the disease that has attacked my calanthe bulbs. The plants have been grown in a proper temperature, and, so far as I am aware, they have had no check.—The trouble is due to an excess of moisture during the flowering period, and, possibly, to a low temperature. There was ample evidence of an infestation of scale on the specimens sent. We cannot advise you fully because you have not sent your address, and the post-mark was not decipherable, but we may point out that, while calanthes may be successfully grown in a rich and substantial rooting medium right out in the country, where air is pure and light good, a much lighter compost is necessary in and near towns, and in these circumstances manurial aids are best omitted.

RUST ON CARNATION LEAVES.—Ignorance: Please tell me what is the cause of the disease appearing on the leaves of the perpetual carnation Lady E. James and the Malmaison varieties Princess of Wales and Old Blush.—The disease is popularly known as "Rust," and is due chiefly to excess of moisture. If over-potted, weakly plants are over-watered they soon fall a prey to rust, and it often happens that weak plants are subjected to some heat and a moist atmosphere for the purpose of inducing strong growth. Such a method is fatal, as it renders the plant still more open to the ravages of the disease. A free circulation of air is at all times essential for carnations, and the atmosphere should be fairly dry. Damp can be expelled by the use of a little extra fire-heat, coupled with increased ventilation. Malmaison carnations are especially susceptible to disease, and should be watered with the utmost care, especially at this season of the year; indeed, the soil should be allowed to become fairly dry before water is given.

## NAMES OF PLANTS.

F. F., Exeter.—1, Cupressus funebris; 2, Odontoglossum gloriosum; 3, Azara microphylla.

F. L. E., Horsham.—1, Abies Nordmanniana; 2, Juniperus chinensis; 3, Skimmia japonica.

O. P., Wolverton.—1, Selaginella Kraussiana aurea; 2, Cereus flagelliformis; 3, Tiarella cordifolia; 4 Primula Forbesi.

F. T. J., Dorking.—1, Pteris serrulata cristata; 2 and 3, hybrid cypripediums, rather poor ones; 4, C. Harri-Leeanum; 5, Dendrobium bigibbum; 6, Gymnogramma Matthewsi.

## NAMES OF FRUIT.

C. M., Earl's Colne.—1, Cornish Aromatic; 2, Duchess of Oldenburgh.

S. P., Carnforth.—1, Allington Pippin; 2, a fine example of Newton Wonder.

O. N. S., Chertsey: 1, Claygate Pearmain; 2, Margil; 3, Bismarck; 4, Winter Nelis.

B. J. A., King's Norton.—1, Blenheim Pippin; 2, not recognised; 3, a small Golden Noble.

J. G. H., Newcastle: 1, Lane's Prince Albert; 2, somewhat out of character, but appears to be Bramley's Seedling; 3, Kerry Pippin.

COUGHS, COLDS,
ASTHMA, BRONCHITIS,
and all kindred ailments are speedily cured by
Dr. J. Collis Browne's
Chlorodyne.
The RELIABLE FAMILY MEDICINE
In **DIARRHŒA** and other complaints of the Bowels, **Dr. J. COLLIS BROWNE'S** Chlorodyne acts like a charm, and its soothing and restoring effects are equally marked in **GOUT, NEURALGIA, RHEUMATISM.**
Purchasers should see that the name, Dr. J. Collis Browne, is on the stamp and refuse all substitutes.
Convincing Medical Testimony with each bottle.
Of all Chemists, 1/1½, 2/9, 4/6.
**ALWAYS ASK FOR THE ORIGINAL AND ONLY CHLORODYNE—COLLIS BROWNE'S.**

## CATALOGUES RECEIVED.

ELISHA J. HICKS, HURST, TWYFORD, BERKS.—As Mr. Hicks specialises in roses his catalogue is devoted to descriptions of these flowers, and matters connected with their culture.

FISHER, SON, AND SIBRAY, HANDSWORTH, SHEFFIELD.—An unusually comprehensive catalogue of hardy trees and shrubs, with sections devoted to climbers, stove and greenhouse plants, herbaceous and alpine plants and fruits. The illustrations of this firm's groups at the Royal International Horticultural Exhibition are most interesting.

JAMES COCKER AND SONS, ABERDEEN.—The descriptive rose list from this firm is interesting because of the attention given to special selections of varieties for various purposes; such selected collection should appeal to small growers and beginners.

JONES AND ATTWOOD, STOURBRIDGE.—A most interesting and instructive catalogue relating to hot-water heating, and having special reference to the John Bull sectional boiler.

VILMORIN-ANDRIEUX AND CO., PARIS.—An extensive list of seeds of hardy trees and shrubs for ornamental and forest planting.

BERTRAND W. DEAL, BROOKLANDS, KELVEDON.—An interesting catalogue of sweet peas, including novelties for 1913, with coloured illustrations.

LAXTON BROTHERS, BEDFORD.—With the catalogue of fruit trees and roses, this firm issues hints on planting and spraying. Several fruit novelties are included.

C. F. A. VAN DER SLUYS, RAMEE, GUERNSEY.—A very neat catalogue of perpetual carnations, the varieties well described and grouped in their colours.

THURSDAY, December 19.—Linnean Society.

WEDNESDAY, December 25.—Christmas Day.

THURSDAY, December 26.—Bank Holiday.

FROM HEADQUARTERS.

It is only to be expected that anything which has been steadily growing for seventy-five years should now have reached a high state of maturity.

It was in 1836 that the late Mr. James Carter published his first annual catalogue, which consisted of a single sheet, from 237, High Holborn. Ever since then the yearly catalogues have been steadily growing larger and larger, in a manner worthy of the seeds themselves, until now it has become the most wonderful and the largest catalogue devoted exclusively to seeds in the world.

About December 9th the new Carters Annual, entitled "Garden and Lawn," will be published. It is of nearly two pounds postal weight, and carries close upon 300 pages on art paper! It is profusely illustrated, chiefly with photographs taken by the firm's own staff of photographers, and completed in the Studios on the premises; but there are also photos. from all parts of the world.

The coveted volume opens fittingly with a page showing His Majesty King George inpecting our Japanese Garden Exhibit at the International Exhibition at Chelsea. The firm hold the Royal Warrant of His Majesty King George, Her Majesty Queen Alexandria, H.I.M. The German Emperor, also eleven other appointments to other Royal and Reigning Houses, which we believe to be a record in the industrial world.

An Art Supplement illustrates the unique Raynes Park establishment, justly regarded as one of the most perfect examples of what industrial buildings should be, and always open to visitors. We then have pages on the fascinating story of Testing, followed by beautiful pictures of Vegetables and Flowers.

The Annual is a masterpiece of printing, such as one would naturally expect from printers of the standing of Messrs. McCorquodale, one of the largest firms of printers in the Kingdom, whose resources and appliances for the printing of works of this nature are well known.

It is interesting to know that the requirements of the book include nearly 100 tons of art paper, printing ink, and type, a large number of the latest printing machines, about 80 miles of binders' thread, 350 engraved plates in duplicate, 100,000 embossed stamps; while 25 pair-horse parcel-post vans are required for the conveyance of the work, when completed, to the General Post Office.

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
RAYNES PARK, LONDON, S.W.

A PERENNIAL GARDEN MEANS PERENNIAL PLEASURE, if composed in whole or in part of Kelway Artistic Colour Borders. Quotations for any area by return of post, with full particulars. A copy of "Gardens of Delight" for 6d. (post free). Now is the time to plan.

From Mr. ——, Castle Gardens, Rosneath, Dumbartonshire. (H.R.H. Princess Louise.)

"I take the liberty to write you and to let you know that the herbaceous plants you sent have done exceedingly well—Gladioli, Hollyhocks, Delphiniums especially good. I have not lost a dozen of the plants. The Princess also was very pleased with them when here, and all that saw them said they never saw any better." (Planted April, 1911.)

KELWAY and SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

KELWAY'S PÆONIES.
NOW IS THE TIME TO PLANT Pæonies. No garden is complete without the new Pæonies. Kelway recommend the following collection (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden.

COLLECTION OF PÆONIES.—Agenoria, Amalthea, Czarina, Duc de Wellington, Formosa, Lottie Collins, Nycletius, Princess Maude, Splendida, Tessa, The Lancaster, Zephyrus.

36s. the dozen; good plants, true to name. Immediate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

From ——, Esq., Quetta, Baluchistan, India.

"Your plants, bulbs, and roots which arrived two weeks ago were in a wonderfully good condition, and have almost without exception begun to show signs of growth.

I am especially pleased that the Pæonies have survived the journey, thanks to the excellent packing given them."

KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

DAWES' CHALLENGE RHUBARB.—This variety has gained 12 Medals and Awards, also Diploma of Honour R.I.H.E. Strong roots ready. Lists free. DAWES' NURSERIES, Syderstone, Norfolk.

THE POPULARITY OF XL ALL SPECIALITIES increases every year. All gardeners proclaim that nothing equals these celebrated preparations.

XL ALL NICOTINE VAPORISING COMPOUND, the gardener's favourite Fumigant, both Liquid and Cake.

"ROSES AND THEIR CULTIVATION." A new edition of this Standard Book is now ready, and every Rose Grower should secure a copy. Cloth, many illustrations, 2s. 10d., post free, from Publisher, 149, Aldersgate Street, London, E.C.

VOL. LV.—No. 3,085. SATURDAY, DECEMBER 14, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### Marketing Apples.

In entering upon the cultivation of apples for the supply of the home markets many points have to be carefully considered, and some deviations have to be made from the old methods of procedure before a high degree of success can be achieved. Chief among the matters of importance in the cultivation of apples for profit are the questions of soil and site, the accessibility of the orchards and plantations to suitable markets, the preparation of the soil, planting the trees, pruning and general cultivation, and marketing the fruit. If all these questions have the attention they so well merit, there will be found a remarkable concensus of opinion among those who have had experience in hardy fruit culture as to the lines that should be followed in all but the last detail. With regard to the manner in which fruit should be marketed, there is usually a sharp divergence of opinion, and why this should be so is difficult to understand, even by those who are fully acquainted with what is being done both at home and abroad. Fruit growers who have had some experience in the production of market supplies of apples will readily agree that the site and soil should be such as to meet the requirements of the trees; that the markets for the disposal of the fruit should be within a convenient distance of the markets, or the railway by which they can be conveyed to the place of sale; that the soil should be thoroughly prepared, the trees skilfully planted and pruned, and the varieties be selected with due regard to the climatic and soil conditions that obtain in the respective districts. But when we come to a consideration of the question of marketing the fruit it is found that there is a considerable difference of opinion as to whether any change is desirable. Some market growers will ask what occasion is there for a fuss about such a simple matter as packing apples. Others will tell you that long before boxes and cross-handled baskets were mentioned in connection with apples, and some other of the hardy fruits, half-bushel and bushel baskets were in use for sending fruit to the London and other markets. A few may go even further, and express the opinion that if such baskets were largely used in the past they should be sufficient for present-day requirements. It is surprising that men who are in no way deficient in intelligence, but are constantly alert upon most matters should so closely adhere to antiquated methods, and allow Colonial and foreign fruit growers to take from them annually a considerable proportion of their profits. There cannot well be any difference of opinion as to British apples being, as a whole, the finest apples in the world, provided, of course, the fruit is perfectly sound, and otherwise in the best condition. Not infrequently British apples are not perfectly sound or in the best condition when they reach the markets, and, in consequence, present a much less satisfactory appearance than do fruits received from the Colonial and foreign growers, although the distance they have had to travel has been considerably less. This difference in appearance and condition is largely due to the divergence in the views held with regard to the various methods of packing. The Colonial and foreign fruit growers pack their apples in boxes or barrels, chiefly the former, and as apples when carefully packed in boxes of moderate size can be sent some thousands of miles without injury, they present an attractive appearance when the boxes are opened and the fruits are exposed to view. On the other hand, fruit growers in this country have, with a few exceptions, an objection to boxes, chiefly on account of the additional expense involved, and, as a consequence thereof, they adhere to the baskets that have been in use from time well nigh immemorial. It being practically impossible to pack apples so tightly in sieves, half-sieves, and other baskets that have no lid to prevent movement, the fruits are more or less damaged by being rubbed against the sides of the basket. Not only are they rendered somewhat unsightly by the friction to which the skin is subjected in the course of transit, but the damage done is sufficient to greatly impair their keeping properties. It may, of course, be said that the length of time the fruits remain sound after they are marketed is of no concern of the grower, but so far from this being the case, it has a direct influence upon his returns. The consumer who possesses an ordinary degree of intelligence takes into account, not only the amount he pays for a certain quantity of apples, but carefully estimates the proportion that will remain sound long enough to be used for dessert or culinary purposes, as the case may be. This being so, he will not pay at the same rate for fruit packed in baskets as for that which is packed in boxes. There is a considerable advantage in the use of boxes for culinary apples, because of little injury being done to them in transit, but in the case of choice dessert varieties the advantage is very great. By the use of boxes for the latter the number or weight of fruit can be readily adapted to suit the requirements of the different classes of purchasers, who can not only buy exactly what they want, but they can feel that what they are buying has not been unduly handled or so injured as to have had their keeping properties appreciably impaired. With the much-desired change in packing by the substitution of light deal boxes for the sieves and other baskets there should be an improvement in the grading of fruit that the purchaser may be able to purchase exactly what they require. At the present time first and second-grade fruit is, in too many instances, sent to the market in the same receptacles, with the result that much

MR. ERNEST BALLARD.
(See next page.)

fruit of first-rate quality is sold at the price of "seconds." By some it is thought that a few fine fruits at the top will be sufficient to ensure the highest price for the package, but more often than not this method of packing has the effect of reducing the value of the whole quantity. We have on several occasions referred to the importance of fruit growers adopting the more modern methods of packing and marketing apples, and as much has yet to be accomplished to ensure the growers receiving a full return for their products we shall, in our next issue, deal with the subject in greater detail than is now possible.

---

**Mr. Ernest Ballard,** of The Court, Colwall, near Malvern, has made a name for himself as a raiser of new Michaelmas daisies. It was with some hesitation he acceded to our request for his portrait, because, as he modestly puts it, "I really do not think the work I have done in raising new Michaelmas daisies is of sufficient importance to interest your readers; at any rate, I seem to have accomplished such a very small amount of what I believe can be done, and what I hope to do in the future." Mr. Ballard raised the first double Michaelmas daisy, named Beauty of Colwall, and he has now a series of double forms in varying shades of colour, as well as many promising seedlings of other sections. He believes there is a great future for these autumn flowers, but he is equally sure that about 75 per cent. of the varieties now listed will have to be turned out of gardens before the general public fully appreciate the value and beauty of Michaelmas daisies. Like many others who look into the future, and work unceasingly towards an ideal, Mr. Ballard has had to bear the criticism of his friends, who wonder why he has taken up the improvement of Michaelmas daisies so keenly. Mr. Ballard is an enthusiast, as are all florists and raisers, and he considers that those who regard perennial asters as "uninteresting," have never seen a collection of the newer varieties in flower, for he is persuaded "no real flower lover can fail to admire these glorious plants, which, by their hardiness, ease of culture, variety of colour, habit and wild profusion of bloom, can do so much to adorn the autumn garden, even into the chilly, damp days of November."

**Retirement of Messrs. Adnitt and Naunton.**—Everybody knows that Messrs. H. W. Adnitt and W. W. Naunton have been the secretaries of the famous Shrewsbury Floral Fête for thirty-eight years, and that the abundant success which has attended the annual exhibition has been due chiefly to their untiring efforts, enterprise, and urbanity. Messrs. Adnitt and Naunton were, to all intents and purposes, the originators of the Shropshire Horticultural Society, and they have seen the floral fête grow from a small beginning to a great national floricultural function. Not only so, but by means of the profits accruing the society has benefited the town of Shrewsbury enormously. The enlargement of The Quarry Grounds, the purchase and planting of the foreshore of the Severn, the handsome entrance gates and lodge at The Quarry, improvements on St. Chad's Terrace, a fine statue to Charles Darwin, who was born at Shrewsbury, and gifts to hospitals and the public library, have all been rendered possible by reason of surplus profits. The Gardeners' Royal Benevolent Institution has also received one or two contributions from the society, so that Messrs. Adnitt and Naunton have seen their great work prosper to the advantage of horticulture and the town of Shrewsbury. And now these gentlemen have resigned, and the committee of the Shrewsbury Fête have regretfully accepted their resignation, for Messrs. Adnitt and Naunton are no longer young, and the work is tremendously heavy. Everyone will wish them long years of healthful rest. Shrewsbury Fête is a monument to their industry and integrity, but it seems to us that there should be some fitting recognition of the service they have rendered to horticulture. What do our readers say?

**Market Gardeners' Compensation.**—At the meeting of the Standing Committee of the House of Commons, appointed to consider the Market Gardeners' Compensation Bills, the object of which was to guarantee to market gardeners the right to compensation, it was decided that both Bills should be withdrawn, and that an agreed Bill be introduced next year. Speaking on behalf of Mr. Runciman, who was absent at a Cabinet Council, Mr. Cecil Harmsworth stated that it was the desire of the President of the Board of Agriculture that the two Bills should be discharged from the committee. They were so obviously contentious that he saw no prospect of their being passed into law this season. His suggestion was that the Bills having been withdrawn, an agreed Bill should be introduced in the New Year. Mr. C. Bathurst said that the Market Gardeners' Committee of the Central Chamber of Agriculture had, at a meeting held on the previous day, decided that the course suggested was the best one to adopt. Motions that the Bills be not further proceeded with were submitted by the Chairman, and agreed to, and the committee adjourned.

**Kniphofias.**—Sir Herbert Maxwell writes: Mr. Thomas Smith is in error (p. 901) when he describes Kniphofia caulescens as an autumn-flowering species. It flowers in July, and the plants I have cannot be described as having "red and greenish-yellow" blossoms, for the yellow is clear sulphur colour, and very showy. The variety named nobilis is no use in the north; for, although perfectly hardy, it does not flower till October, when it is pretty sure to get cut by frost. A good substitute for it is K. Northi, not mentioned by Mr. Smith, which grows taller than K. nobilis, and has branching flower stems.

**"Sweet Pea Studies."**—Under this title two bulletins have recently been issued by the Cornell University, Itheca, N.Y., and in each case the bulletin is written by Mr. Alvin C. Beal, who has charge of the floricultural work of the Horticultural Department. One issue (No. 319) deals with winter-flowering sweet peas, discusses cultural methods, origin of the several groups, diseases and pests, and includes lengthy descriptions of the varieties, the "Répertoire de Couleurs" being used as a standard for colours. The other issue (No. 320) is devoted to "Culture of the Sweet Peas," and covers sixty-two octavo pages. This is a most interesting issue, as Mr. Beal gives the botany of the genus Lathyrus, and deals at length in a succeeding chapter with the botanical and horticultural history of the sweet pea, giving an illustration of Kniphof's illustration of a sweet pea (1757-1760), and of Caspar Commelin's drawing (1700). From the chapter dealing with cultivation we cull the following: "Many English growers practise sowing in pots under glass, hardening the plants in frames, and planting out. From the writer's experience with three varieties during the year under discussion, he is inclined to look on this method with favour, especially in growing high-priced novelties or varieties for exhibition. In fact, if the results of experience and observation at this station in 1910 are to be relied on, it would appear that the successful exhibitors of the future will obtain flowers from full-grown or pot-grown plants." The illustrations show in a marked degree the advantages of pot-sown sweet peas.

**A Park for Cheam.**—Seven acres of land, known as the Orchard Meadow, which he had laid out as a park, have been bequeathed to Cheam, Surrey, by the late Mr. John Seear, of The Quarry, Cheam. Mr. Seear was a chartered accountant, and, subject to the life interest of various legatees, he has bequeathed large sums to the Loriners' Company and the Institute of Chartered Accountants for charitable purposes.

**Mr. Ernest Hemming,** who succeeds the late Professor John Craig as editor of "The National Nurseryman," an American trade paper, issued monthly from Rochester, New York, is of English birth, and has been associated with the nursery business for the greater part of his life. Serving his apprenticeship in England, where it is necessary to begin at the bottom, so that first principles are thoroughly grounded in the young horticulturists, he acquired a thorough and broad knowledge of plant life. After leaving the Royal Botanic Gardens at Kew he went to the United States, and for the last fifteen years has been with the firm of Thomas Meehan and Sons. He has an extensive acquaintance with nurserymen and the horticultural trade in general, and with his ability as a writer makes him peculiarly fitted to carry on the work of Professor Craig. Mr. E. Hemming and Mr. Meehan were over here for the International Horticultural Exhibition, and visited numerous British and Continental establishments during their trip.

**Cold Weather in Newcastle.**—From Oakwood Gardens, Wylam-on-Tyne, Mr. H. J. Chapman writes, on December 8: "You will not be surprised to hear that nearly everyone is suffering from a severe cold after the recent weather experiences here. Last week we had snow, and 27, 26, 25, 19, and 18 degrees of frost respectively on successive nights. This was severe after the previous mild weather, and now, today, it is like April rather than December."

**The "Journal" of the R.H.S. Gardens Club** for 1912, which is the fifth of the series, has just reached us, and it is particularly interesting to those who have been, or still are, employed by the Royal Horticultural Society. But though it is primarily for old Chiswick men, and past and present Wisleyites, it is nevertheless of no small interest to all lovers of horticulture. The R.H.S. Gardens Club is somewhat on the same lines as the Kew Guild, and we believe there are no other similar institutions connected with horticulture in the United Kingdom. Quaint and not lacking in humour, is the reproduction of the front page of the first issue of "The Chiswick Bothy and R.H.S. Gardener," a halfpenny journal published by the Chiswick men in 1882 as a mild protest against the action of the Council in objecting to books and papers being removed from the Council Room to be read in the bothies. The educational side of gardening finds expression in "Horticultural Scholarships," by Mr. F. J. Chittenden, F.L.S.; "County Lecturing," by Mr. C. J. Gleed; "A Plea for the Education of Gardeners," by Mr. J. Fraser, F.L.S.; and "School Gardening," by Mr. B. P. Perry. There are cultural notes under such headings as "A Chat about Pinks," "Some

Plants for the Moraine," and "Michaelmas Daisies." The Flora and Fauna of Wisley are discussed, there is a suggestion for a Burbidgean Medal to be awarded to the most successful student of the year (Mr. F. W. Burbidge was an old Chiswick man), and there are some delightful letters from members far from home, the one entitled "Eastward Bound" being especially entertaining.

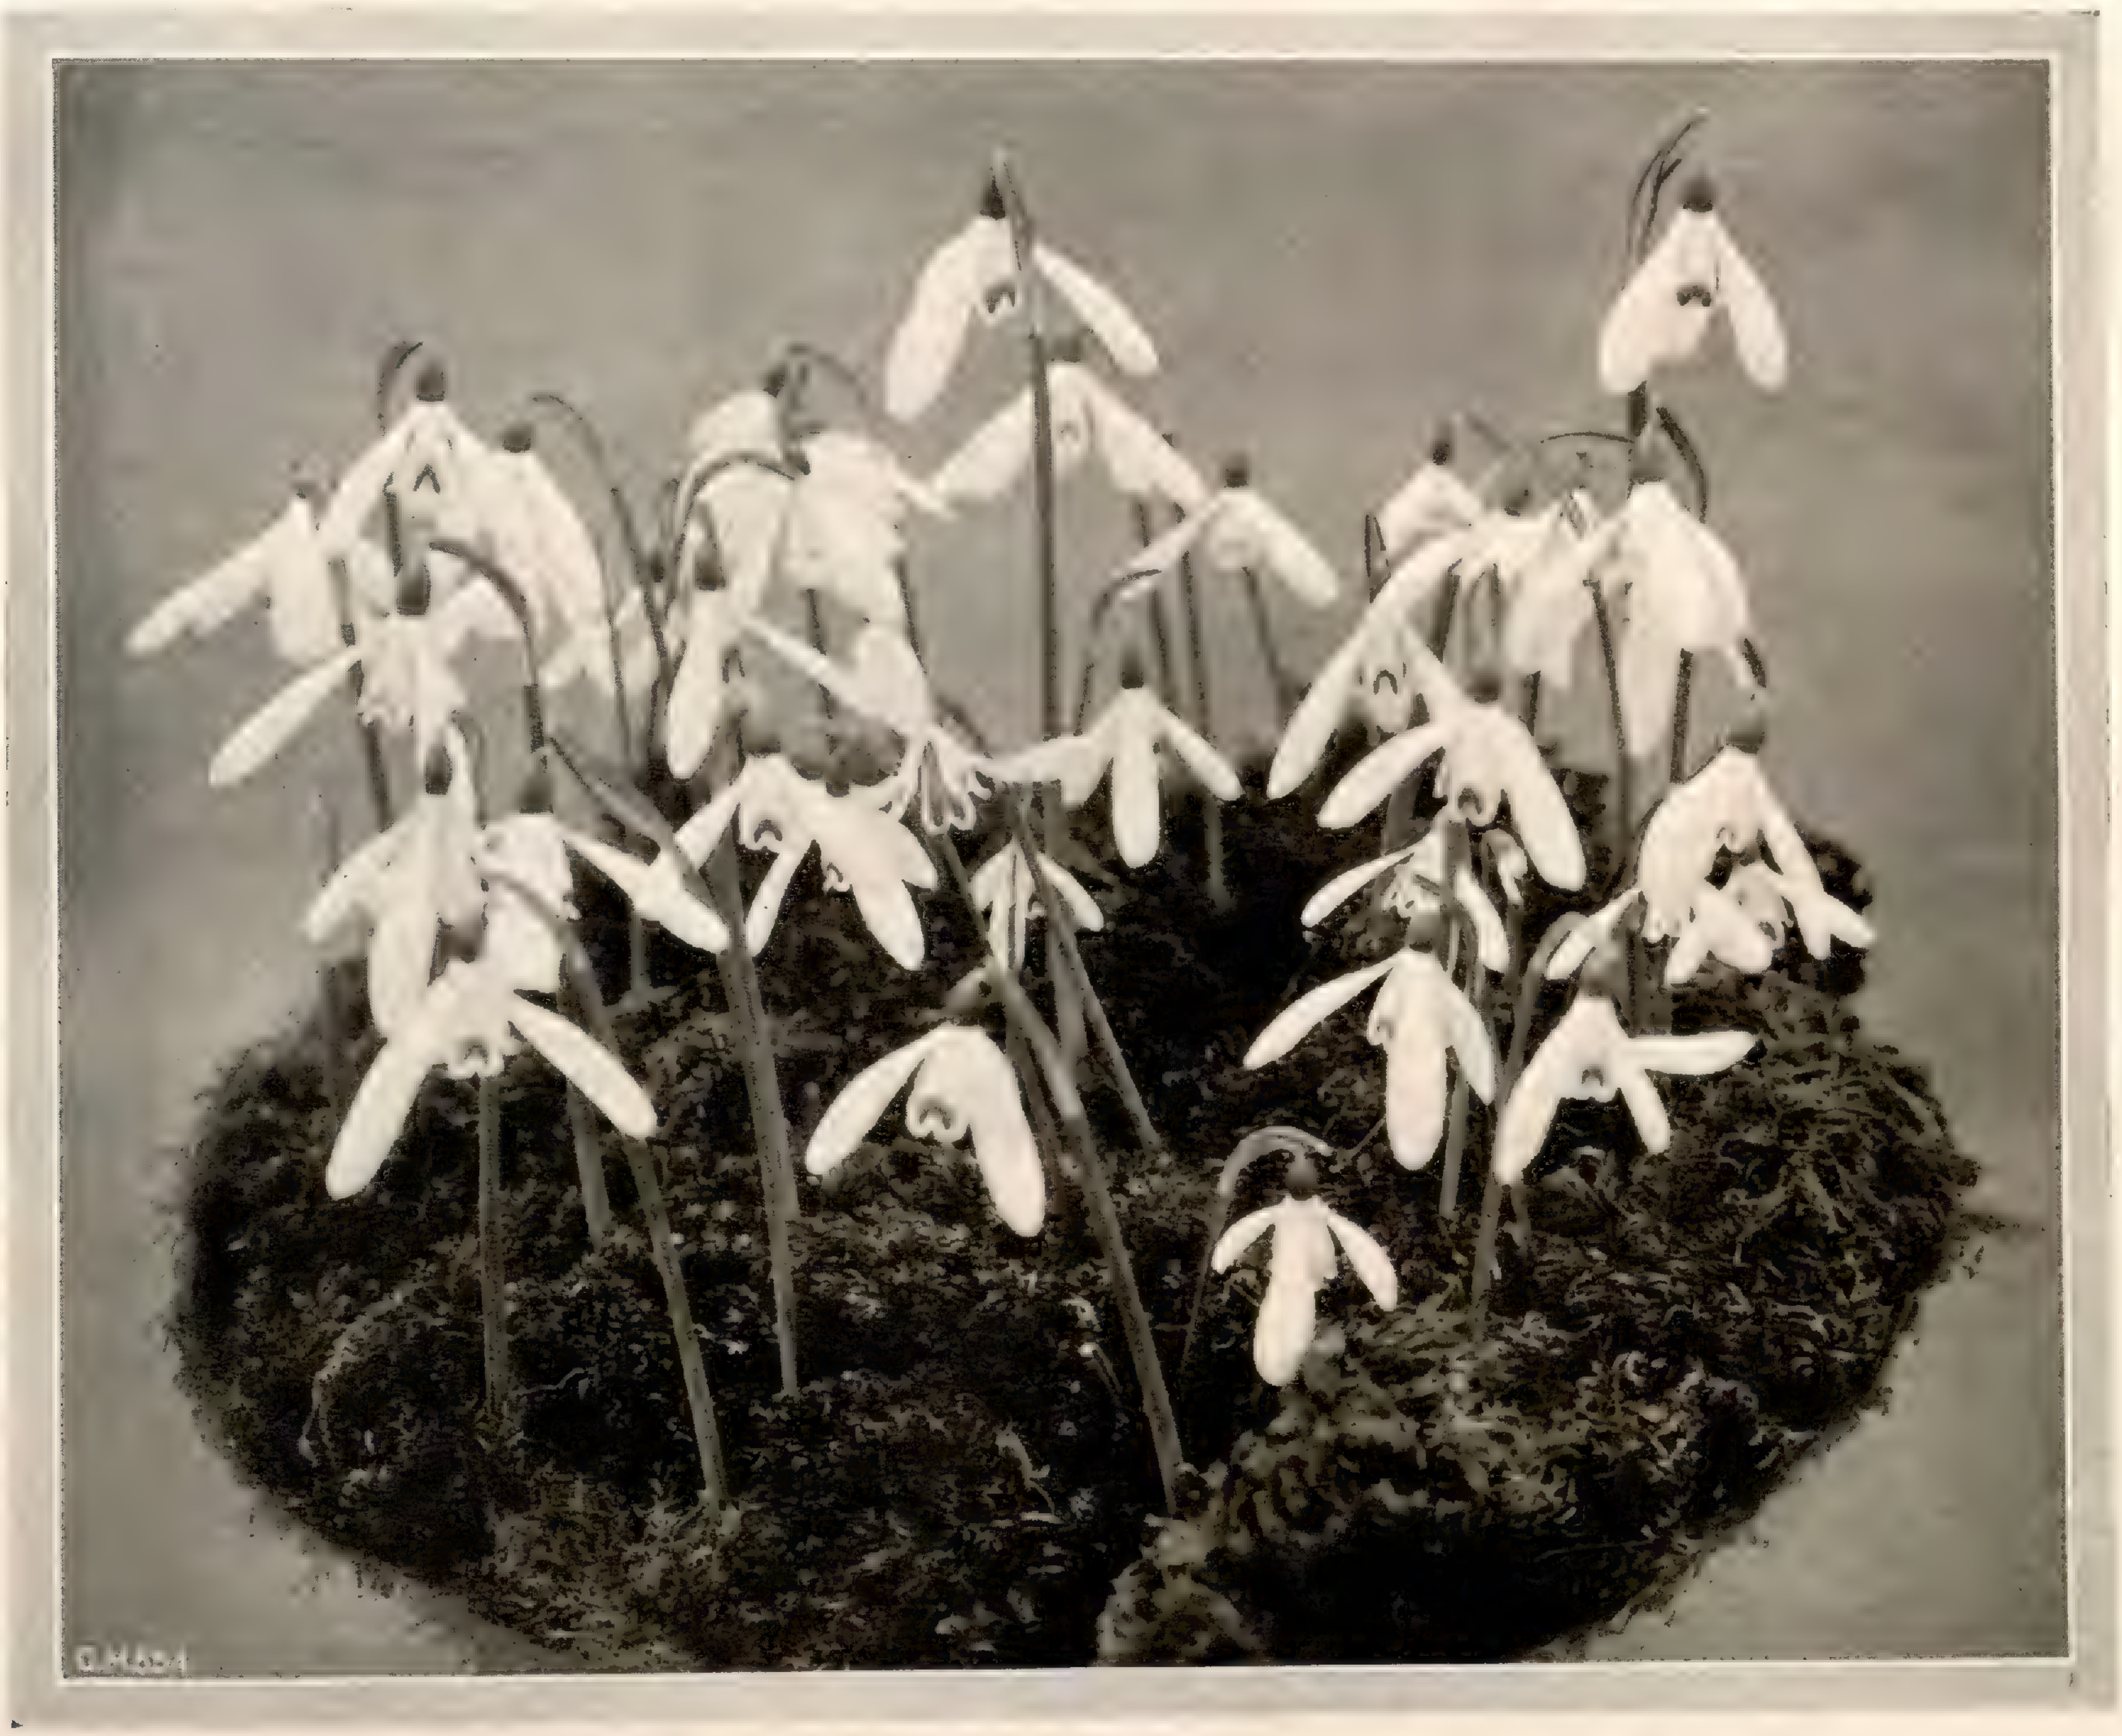
**New Open Spaces for Finchley.**—At the monthly meeting of the Middlesex County Council it was reported that in the whole of Finchley there was only one public pleasure ground, and the Council decided to provide one-fourth of the cost of purchasing two open spaces in the district. One of these is in North Finchley, and has an area of 28 acres; the other abuts on Long Lane, and comprises 15 acres. The cost of the land is £11,721 10s. 4d., and the local Council will contribute three-fourths of the total cost.

**A New Garden Village in Scotland.**—The Fife Coal Company, in providing housing accommodation for the colliers in connection with their new colliery at Valleyfield, near Culross, Fifeshire, have arranged for the construction of a village on "Garden City" lines. The site is a capital one, and practically surrounds the old mansion of Valleyfield, the historic home of the Preston family, and is in a part of Scotland noted for its mild climate for a shire on the east coast. The village is grouped beside the main road, which is to be laid out for business premises. Adjacent to these are to be a series of crescents of one-storey cottages, each having about a tenth of an acre behind, and a plot in front. The centre of the crescent is to be planted with shrubs. This garden village marks a new departure in Scottish colliery villages, and there are many colliers who have hitherto been unable to own a garden who will appreciate the arrangements being made by the Fife Coal Company. A number of colliers are keen gardeners, and these will be glad of an opportunity of indulging in their hobby.

## AN OCTOBER-FLOWERING SNOWDROP.

Although unknown to the vast majority of gardens, the autumnal-flowering snowdrop is well deserving of the consideration of those who admire the chaste Galanthus in all its forms. They are very beautiful flowers indeed, and, although some scorn these snowdrops as unseasonable, they are not so, as in their native haunts they bloom as early as here, if not earlier, and present a most charming appearance when at their best.

For some time the beautiful Galanthus Olgæ, discovered first by Orphanides on Mount Taygetus, in Greece, has been practically lost to cultivation, and could not be found by those searching for it on its native mountain. Lately, however, it has evidently been re-discovered and a somewhat plentiful supply has reached this country. From these bulbs flowers have been produced in several gardens this autumn.



THE OCTOBER-FLOWERING SNOWDROP (GALANTHUS OLGÆ).
As exhibited by Mr. G. Reuthe at the second of the two meetings held by the R.H.S. in November last.

The illustration shows how pretty a group of Galanthus Olgæ appears, either in the open or in a pot. It has done well in gardens in several parts of the country, and bloomed most satisfactorily in October and November last, and only the other day the writer had a letter from the owner of a Cheshire garden where Snowdrops are specialised, and where Galanthus Olgæ has been very beautiful.

This Snowdrop should be planted early, and it will give much pleasure with its charming flowers, which are practically replicas of our common snowdrop, Galanthus nivalis. Some of the plants of G. Olgæ, however, have the green delta-shaped mark at the base of the inner segments prolonged into a green blotch covering the greater part of the segment. This would point to its being possibly of hybrid origin.

An interesting point yet follows, and this is whether the plants of Galanthus Olgæ will retain their autumn-flowering habit when cultivated for some years in British gardens. The subject, though interesting, cannot be pursued at present, but it may be said that the Greek Snowdrops on the lower grounds do not bloom until spring, while those on the mountains flowers in autumn.

It is well worth while, however, to procure Galanthus Olgæ, if only for the benefit of one or more seasons of autumnal flowering. It is an exquisite little flower, and a gem of the purest water. It is described in Boissier's "Flora Orientalis."

S. Arnott.

## LILIUMS.—I.

Liliums are a very distinct and useful genus of bulbous plants, about sixty species being in cultivation. There are also a considerable number of botanical and garden varieties, and a few hybrids. Lilies are wild in almost every country in the Northern Hemisphere, from Japan in the East to California in the West. Explorations during recent years in Central and Western China point to that part of Asia as the headquarters of the genus, thirty-eight species, according to the "Botanical Magazine," being natives of China; North America comes next with seventeen, and Japan fifteen. It seems not improbable that several species regarded as natives of China and Japan have been introduced to Japan from China, where lilies appear to have been cultivated for centuries. The true L. Browni is said to be only found wild in China, though we obtain most of our bulbs from Japan. Several species grow in tropical countries, though at high altitudes, L. philippinense, for example, being found at an elevation of 7,000 feet in the Philippines.

The cultivation of liliums in this country dates back to Shakespeare's time. He frequently refers to them in his writings, and we know from old writers that L. candidum, L. martagon, and L. chalcedonicum were introduced into this country late in the sixteenth century. It is no doubt to the Madonna Lily, L. candidum, that Shakespeare alludes. L. martagon is naturalised in several parts of the country. In passing, it is interesting to note that in so large and widely distributed a genus there is not a single species that can reasonably be considered as unworthy of a place in our gardens. All are worthy of cultivation as decorative plants.

### Propagation.

The increase of liliums is possible by seeds, offsets, or division of the bulbs, scales, and bulbils. It is very probable that if lilies were raised extensively from seeds in this country many more of the beautiful species would become permanently established in our borders, and the necessity to import thousands of bulbs annually from Japan and Holland would be appreciably lessened. The chief drawback to raising lilies from seeds commercially is that it takes from two to six years to flower most of them from seeds. Obviously work for the amateur rather than those who grow for sale, as long as it is possible to purchase the Japanese article at such low prices, even though acknowledged inferior to the home-grown bulbs. While the seeds of some lilies may take six months or longer to germinate, L. giganteum is one of the greatest laggards in this respect, others come up quickly. Germination is hastened by sowing the seeds as soon as ripe.

Sow in well-drained pans of light, sandy soil, and stand in a cool greenhouse or unheated frame to germinate. In due course the seedlings will be large enough to prick out about an inch apart in pans or shallow boxes. The soil this time need not be quite so fine, and may consist of equal parts peat, sandy loam, leaf-mould, and coarse sand. The next move will be to nursery beds, where it will considerably help the more tender kinds if they are planted in such a position as will allow of their being covered in winter with lights as a protection against excessive moisture, and a little assistance during severe weather while the bulbs are in the seed beds.

Propagation by means of scales is somewhat like raising seedlings. A few of the outer scales are taken off the bulbs, or they may be pulled to pieces if large numbers are desired. These are spread thinly over the surface of pans filled with light, well-drained soil, and covered with a thin layer of sand. In due time a tiny bulb develops on each scale, these being, when large enough, transferred to nursery beds with the seedlings.

As the growth of the lily bulbs proceeds they throw up two or more stems, which indicates that the mother bulb is dividing up, or producing offsets. When an increase of stock is required, or the stems become unduly crowded, the bulbs may be lifted and divided.

Bulbils are formed in the axils of the leaves of several species, notably on L. tigrinum, L. sulphureum, L. bulbiferum, and L. Browni leucanthum. Remove these from the stem when they will detach fairly readily. Place in boxes of light sandy soil, and treat as advised for scales. Several lilies which produce stem roots, that is roots at the base of the stem above the bulb, as well as from beneath, develop tiny bulbs on the stem among these roots, these forming a ready means of increase. Instances are L. longiflorum and L. Henryi.

A. Osborn.

## SECLUSION IN GARDENS.

A garden should be at once overlooked and secluded. The house windows should have some of the fairest floral and foliage displays exposed to them, and passers-by should be allowed glimpses of those pleasure-grounds that are so well planted as to constitute triumphs; but nooks, whole portions, should remain shut away from all except those who penetrate them. Unless there is privacy here and there the home feeling of the garden will be lost, and it will have none of that soothing influence so grateful to the artist, the author, or man or woman burdened with many thoughts and cares.

In even a small villa back garden secluded seats can be arranged. If there is only one point from which a pleasant view can be obtained, that should be taken advantage of, and probably the best of all ways in which to make a miniature solitude is by setting up a wooden screen. If the back piece of this is twelve feet long and eight to ten feet high, and two side wings are of six feet width, a considerable area of ground will be shielded from observation. There need be no roofing, branches will supply a partial one in time, if that is considered desirable. An inner border may follow the walls, except where bench seats are set. One of these may be slanted across each corner, which will enable sunshine to be enjoyed or escaped from, according to pleasure, and a short ornamental seat can occupy the centre of the back wall. The flooring ought to be well slanted. If that is done, it can be merely of gravel, especially if foot-rests are given to the seats. In the middle of the gravel might be a miniature round bed containing a pillar rose or weeping standard, with violas beneath, a small rockery mound for delicate alpines, or, for utilitarian value, a rustic table. The screens themselves should be simply closely-fitted deal, the joints puttied over, and painted dull dark grey, a colour that will be found far better in keeping with the environs than would any other. Green paint, if used in gardens, must be of an exceedingly dull shade, as it infallibly clashes with the foliage greens. Brown is apt to prove too warm in tone, giving by contrast a half-dead appearance to the natural wood of shrub and tree branches.

Another way to form a thorough screen to a part of the pleasure-grounds is to plant a hedge of common laurel on the summit of a six-feet bank, either in a round, semicircle, oblong, or square shape, the first being the most ornamental. Shrub-lovers are wont to protest against the employment of the ordinary laurel where a variety of evergreens could be used, but the rapid and close growth is its great merit, and the glossy green is charming in all the months of the year, but especially when new shoots are visible. Laurels should not be clipped; all the pruning necessary should be carefully done by the removal of small branches. There is one method, however, by which additional beauty can be given to the laurel hedge; this is by planting common bracken fern between the shrubs. The fronds will struggle to the light somehow, even if they have to pierce a thicket, and will have a lovely appearance both in spring green and autumn crimson, orange, and gold hues.

Partial screens are a most satisfactory addition to gardens that lack shade or privacy in summer, but are damp in winter, and ought not, therefore, to have the shadow in them added to permanently, or the beneficial drying sunshine of the dull season obstructed. The best partial screen consists of a very tall wire-netting wall, supported by thin deal posts, and the whole painted a green so dark as to be almost black. When rambler roses are well trained over this, with plants of ipomœas, and purple Cobæa scandens, if the climate permits, the protection each year will be most efficient.

A permanent screen can be well made of wire netting, with green Japanese honeysuckle trained against it. If rather more colour is desired, the Flame Flower (Tropæolum speciosum), where it will thrive, may adorn the cool sides, and any of the large-blooming clematises, in mauve, rosy-peach, and purple, can be accompanied by yellow jasmine and the scarlet-copper climbing rose L'Ideale.

Other methods of obtaining secluded spots are by the planting of thickets of hollyhocks, giant sunflowers, delphiniums, mulleins, polygonums, or other extremely tall perennials, by making rose hedges, either on banks or levels, rockery walls, throwing up banks as high as small hills, or excavating dells. Summer-houses and ornamental sheds always make nooks and prevent vision from ranging at once over the garden. Their usefulness is added to immensely by building trellis-wood screens out from their sides, or porches of the painted trellis-work to their entrances.

M. H.

**Primula malacoides.**—Very few greenhouse plants have made their way so rapidly in popular favour as this Chinese species of primula, which has already become a favourite with market growers. It flowers continuously for a long time, and we shall no doubt ere long have a wider range of colour than at present exists, though the typical kind varies somewhat in tint, and there is now also a white-flowered variety. It is first-rate for windows.—T.

**Aconitum Wilsoni** has rapidly attained to a foremost position among our late-flowering perennials. A recent introduction from China, it is a strong, erect grower, attaining a height of some five to six feet, the spikes, which are of massive build, are crowded with large, hooded flowers of a rich, medium blue; the centre spike, as in the case of delphiniums, opens first during September, and the succession is maintained as the laterals flower in October. It succeeds best in soils that do not part too readily with their moisture, while soils of a light character, if liberally treated with farm-yard manure previous to planting, give excellent results, although the growth is not quite so tall. Aconitum Wilsoni is of such sterling merit in the autumn that it should be planted in various aspects, in order to ensure the maximum display.—Thomas Smith, Coombe Court Gardens.

## A FINE LATE CHRYSANTHEMUM.

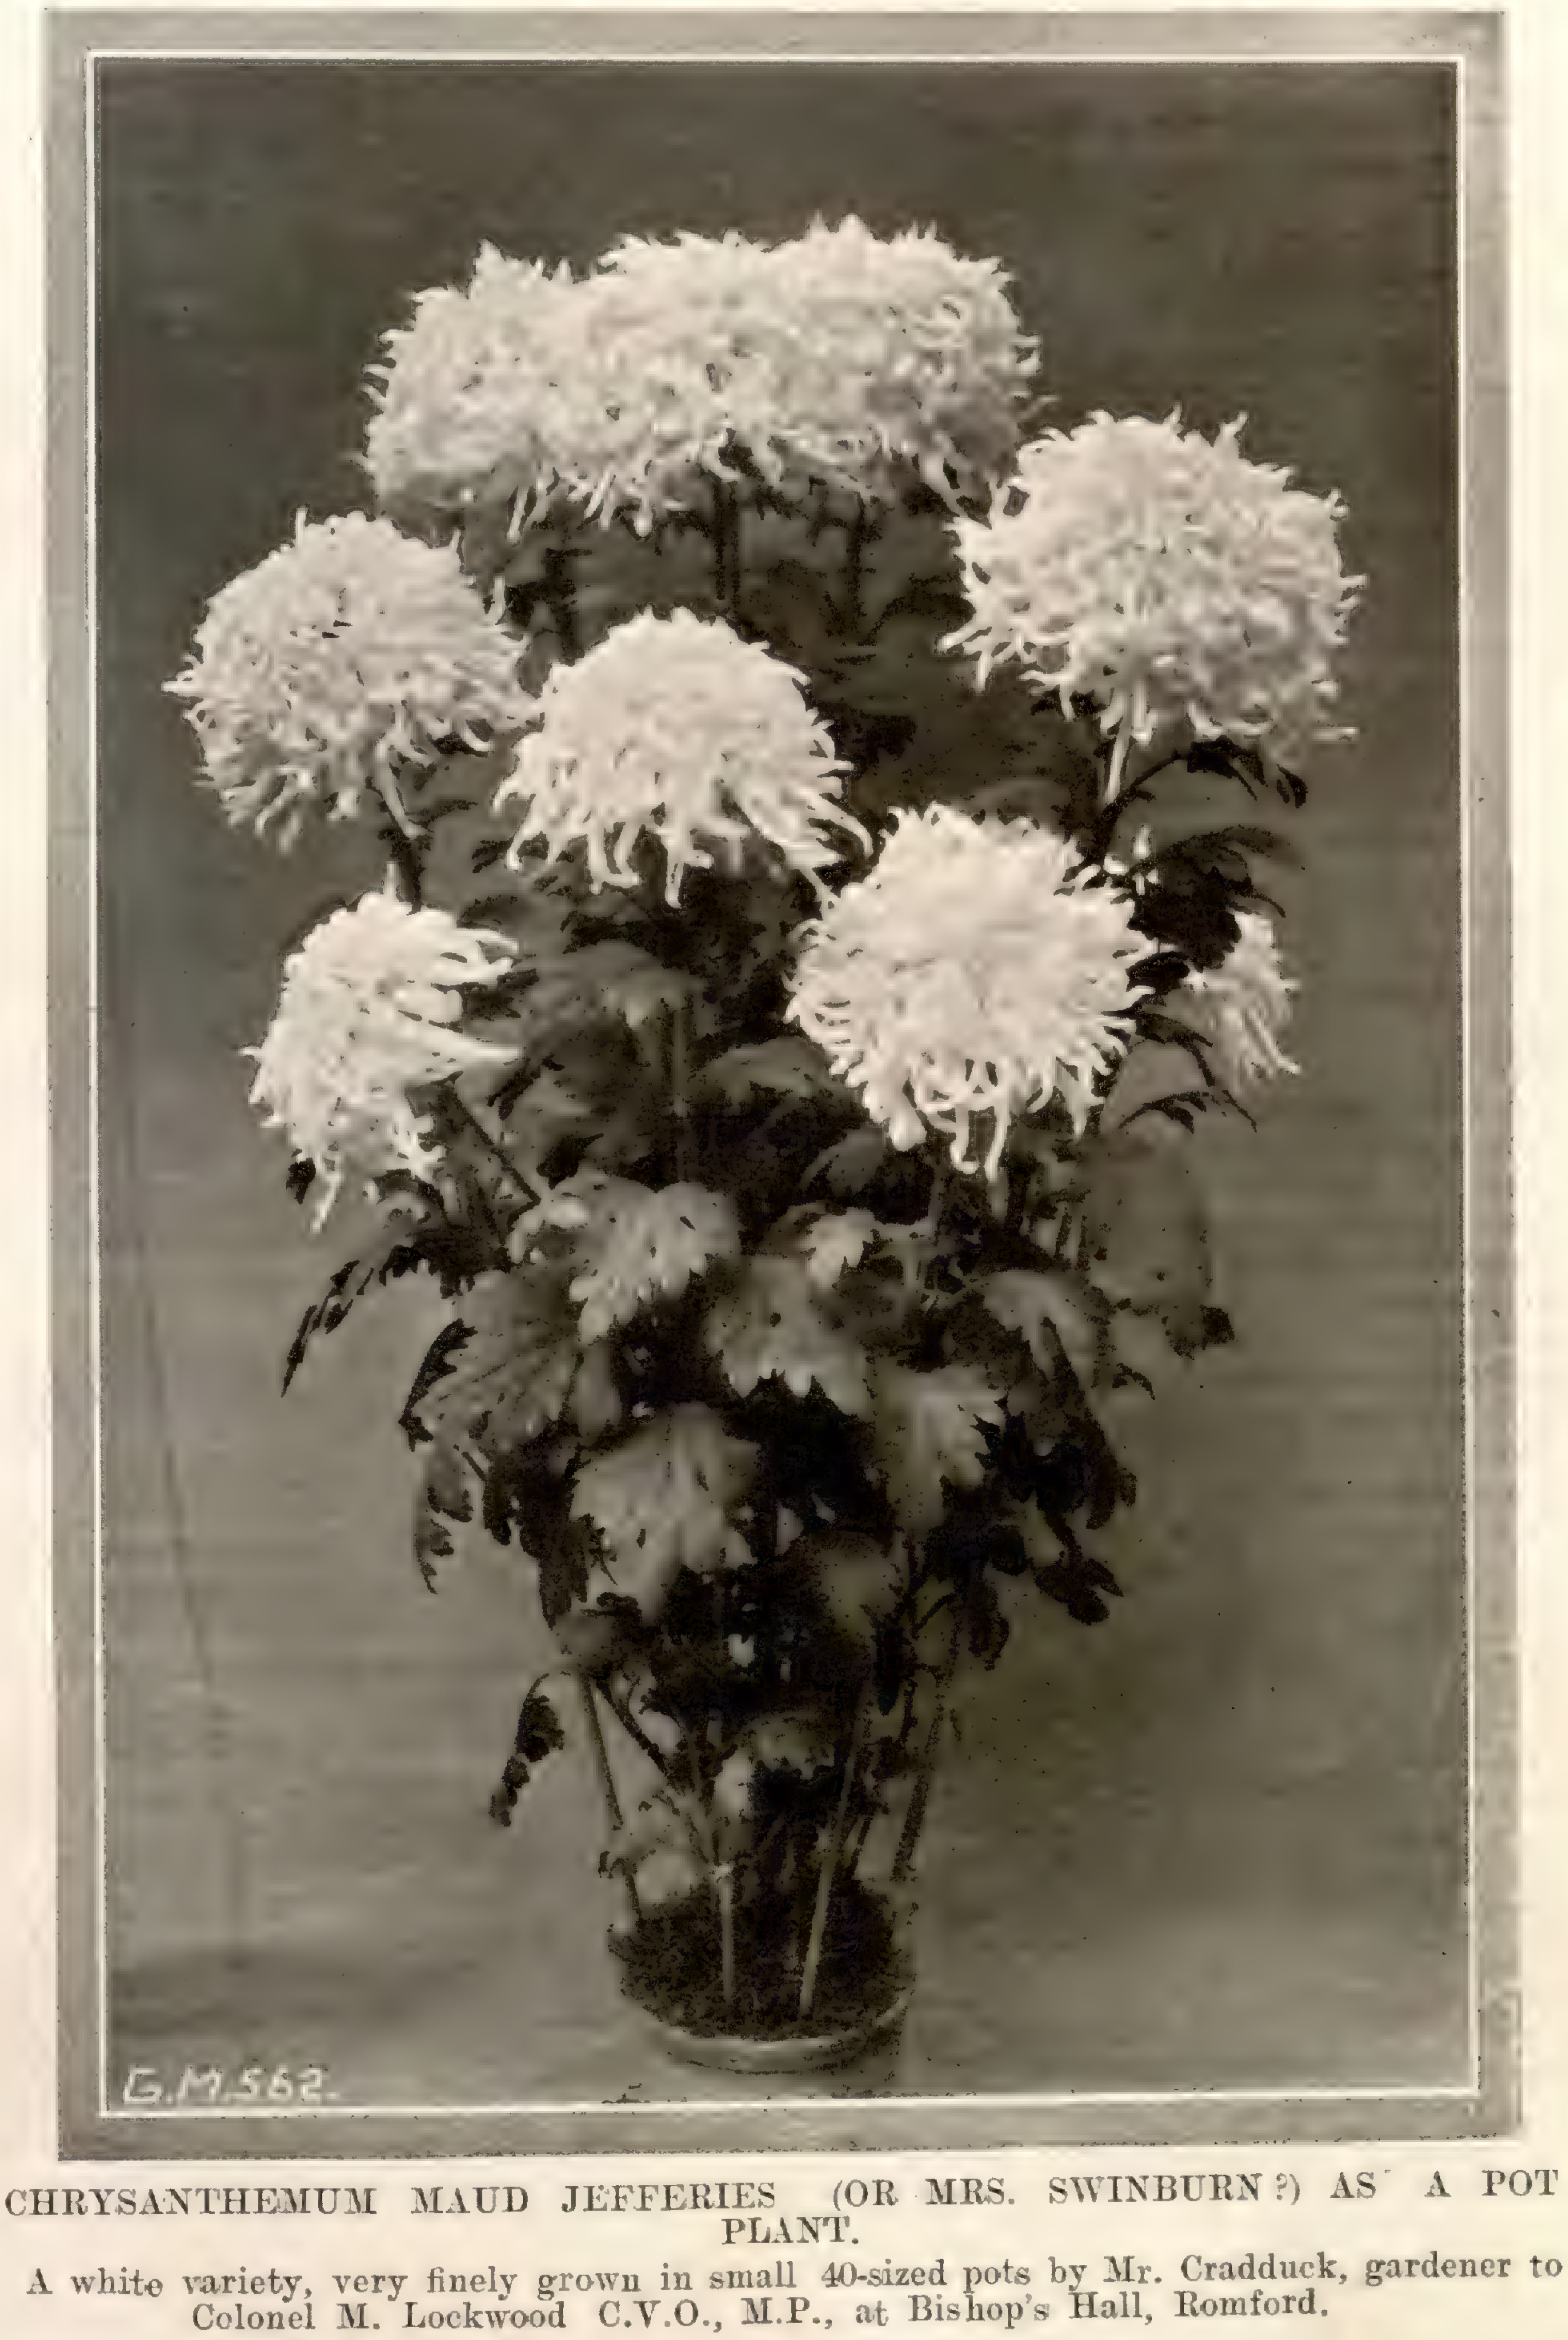
A white-flowered, free-growing chrysanthemum that blooms naturally in December, that finds sufficient accommodation in a small 48-sized pot, won't be hurried into bloom, and "keeps" well, is a treasure. Such a variety is the one exhibited so finely on Tuesday, December 4, at the Royal Horticultural Hall, Westminster, by Mr. G. Cradduck, gardener to Colonel M. Lockwood, C.V.O., M.P., Bishop's Hall, Romford. About forty plants were exhibited, and every one was as perfect a pot plant as could be wished. Mr. Cradduck, who has kindly promised to send us a few cultural notes, confesses that he is not sure what the variety is. The R.H.S. Floral Committee awarded a cultural commendation, and labelled the variety Mrs. Swinburn. This committee rarely makes a mistake, but on this occasion we "had oor doots," as to the correctness of the name. Mr. W. Wells, Mr. W. Wells, jun., Mr. W. J. Godfrey, Mr. J. B. Riding, and others expressed themselves as quite certain that the variety was Maud Jefferies. Mr. Cradduck told us that, to his knowledge, he had not had the variety Mrs. Swinburn at Bishop's Hall Gardens, and that his plants, whatever the name, were produced from one that appeared in a stock of Moneymaker. The variety is such a desirable one, especially as grown by Mr. Cradduck, that the correct name is very desirable.

## THE PYRACANTHAS.

Pyracantha, the "Buisson ardent" of Southern Europe, is familiar to garden-lovers by reason of its evergreen leaves, white flowers, and showy orange-scarlet fruit, for, in addition to being exceedingly useful for clothing walls, it grows into a good-sized bush in the open border, and fruits equally freely in either position. There are, however, two other species which are classed with it, on account of their structural peculiarities being similar, which are less well-known. The three plants have given a considerable amount of difficulty to botanists, for they appear to connect the two genera cratægus and cotoneaster, but do not agree entirely with either one. They have, therefore, been placed alternately in both families, whilst Linnæus included pyracantha under mespilus, and Roemer raised it to generic rank, making it Pyracantha coccinea. Amongst present-day botanists there appears to be a disposition to follow Roemer, for Schneider adopts the generic name of pyracantha for the group, and the species angustifolia appears in the "Botanical Magazine" under that name. All three species are evergreen, but the European one appears to be hardier than the other two, which are natives of the Himalaya and China respectively. P. crenulata, a Himalayan shrub or low tree, has much in common with the ordinary pyracantha, for its evergreen leaves are very similar in size and general appearance, whilst its fruits, though perhaps a little smaller, are the same shade of colour. It may be planted against a wall or in the open border in the southern counties.

P. coccinea, or Cratægus pyracantha as it has been called, may be expected to grow twelve or fifteen feet high in the open ground about London and taller against a wall. Its common name of Fire Thorn is well chosen, for the fiery colour of its berries suggest the first part, and its thorny branches the latter. A common tree or large bush in Southern Europe, it has been an occupant of our gardens for nearly three centuries. It may be easily increased by cuttings, but is difficult to transplant, except when small, therefore a permanent position should be provided early in life. Although not often chosen as a hedge plant it may be utilised for that purpose, and is very effective, especially when not clipped closely. There is a variety with white fruits, and another variety, Lelandi, which has larger fruits than the type. P. angustifolia is the third and most recent introduction. A native of China, it has been met with by several travellers, the Abbe Delavay being said to have been the first to collect it about thirty years ago. Franchet, who has named many of the French collectors' plants, called it Cotoneaster angustifolia, and under this name it was first cultivated at Les Barres by M. L. de Vilmorin, who is said to have received seeds from Eastern Tibet in 1895. Four years later seeds were received at Kew from Lieutenant Jones, and the plant is now fairly well known. It differs from the other pyracanthas by its longer and narrower leaves, which are up to two inches long and half an inch wide, green above and glaucous below, the under surface of the leaves and the young wood being densely pubescent. The white flowers appear about May, and are succeeded by orange-coloured fruits, which ripen during autumn. It is not sufficiently hardy for culture in the open ground about London, but thrives against a wall. Plants have been known to live through a winter or two fully exposed, but, as a rule, they are seriously injured, if not killed; therefore, it is as well to be on the safe side, and provide the protection of a wall when first planting. In the gardens of the south-west counties, however, it may be expected to thrive as a bush in the open or in a shrubbery.

W. D.



CHRYSANTHEMUM MAUD JEFFERIES (OR MRS. SWINBURN?) AS A POT PLANT.

A white variety, very finely grown in small 40-sized pots by Mr. Cradduck, gardener to Colonel M. Lockwood C.V.O., M.P., at Bishop's Hall, Romford.

**Berberis Wilsonæ.**—This must be regarded as the best of all the new Chinese barberries, as it forms a handsome, gracefully-disposed shrub, and the autumnal crop of berries and decaying leaves are both bright. It is of refined appearance, and worthy of ranking with the most select of outdoor shrubs.—W. T.

## HARDY SHRUBS FOR FORCING.

The use of some of the more beautiful of the hardy flowering shrubs in the decoration of conservatories during the latter part of the winter and early in the spring will add much to their attractions. At that season of the year forced shrubs, with their deliciously fragrant flowers, are of great value in those gardens where the maintenance of a continual display of flowers is a necessity. There are so many kinds and varieties suitable for forcing that it is possible to obtain most charming and varied colour effects, which could not be secured at such an early season from any other plants that are available. With the help of flowering shrubs it is an easy matter to keep the conservatory and corridors gay with colour, until the plants commence to flower naturally out of doors.

When the plants arrive from the nursery they should be potted up, and the pots plunged to the rim in ashes in the open, for after they have been exposed to the elements for a short time they start readily into growth when subjected to artificial heat. Most shrubs enjoy a liberal amount of root room, but when they are required for decorative purposes in the mansion it is often necessary to place them in fairly small pots for convenience of arrangement. It is essential, however, to success that the plants are well furnished with fibrous roots, and freely set with flower-buds.

In order to have them in bloom in the shortest possible time it is necessary to plunge the pots in a hotbed with a bottom heat of about 70 degrees, and to maintain in the structure a temperature of 65 degrees. Spray them with tepid water several times daily, and do not allow them to become dry at the roots. To have Azalea mollis in flower at Christmas it is necessary to start the plants in the manner described six or seven weeks before; but previous to the full expansion of the flowers it is desirable to remove them to a cooler house in which to open their flowers. They will then continue longer in perfection.

With the commencement of the New Year shrubs can easily be brought into bloom by starting them in some of the early fruit-houses. Several lilacs are of immense value for forcing, and of these Charles X., (a single blue variety), Marie Legraye (a large single white), and Madame Lemoine (a great favourite, with large, compact trusses of double white flowers), are some of the best. Azalea mollis and its varieties are always appreciated, one of the best of these being Anthony Koster, which has rich bright yellow flowers.

Of the cherries, the lovely blossoms of Cerasus pseudo-cerasus fl. pl., with large, pale rose flowers, and C. pseudo-cerasus J. H. Veitch, with brilliant rosy-pink flowers, are two of the most beautiful, and can be strongly recommended.

Prunus triloba has large, semi-double, rosy-pink flowers, and is very telling associated with white lilacs. Deutzia gracilis, and D. Lemoinei are both desirable. Pyrus floribunda, with rose-shaded flowers, is very popular; while P. Scheideckeri has semi-double flowers freely produced, and P. spectabilis, with large pink and white flowers, are especially suitable for forcing. There are some lovely varieties of philadelphus, and of these P. Lemoinei and P. Boule d'Argent are excellent forms, being neat in growth and profuse in flowering.

Several of the shrubby spiræas are very attractive, and the pretty S. confusa and S. arguta are especially so, and are very free flowering. Staphylea colchica presents a charming appearance, whether grown as a standard or dwarf bush, and its sweetly-scented, wax-like blossoms are always admired. Some of the viburnums are worthy of a place, and of these V. plicatum and V. opulus sterile are two of the most useful, and are especially free flowering. Magnolia conspicua and M. stellata (both pure white), and M. Soulangeana (with rosy-purple-tinted blossoms), are most handsome, but are not recommended for very early forcing. Wistaria sinensis is seen to advantage when grown in standard form, as its heads of bloom project over the dwarfer subjects in a very graceful and pleasing manner. The white form should also be grown.

Standard specimens of Hydrangea paniculata grandiflora, Laburnum Parkesi, and L. Watereri, with unusually fine racemes of blossom, are also highly effective when arranged among dwarf subjects, as they break the flatness of the arrangement. Xanthoceras sorbifolia is a beautiful shrub for the purpose, and produces its dense spikes of cream-white flowers with great freedom.

There are various other shrubs that can be utilised for forcing, including rhododendrons, some of which are very showy, but those mentioned include many of the best, and will be found sufficient to furnish a supply of blossom during the early months of the year, when they will be much appreciated.

Batsford Park Gardens.

## SUCCULENT PLANTS FOR GARDEN DECORATION.

One occasionally comes across a more or less representative collection of succulents growing in a greenhouse, but it is very rarely that one finds them used for garden decoration during summer. A collection so used, however, always attracts much attention, though possibly, if such use became common—which is very unlikely—the attraction of the uncommon, and, in many cases, weird and peculiar specimens would, to a great extent, wear off.

Very few kinds are hardy, but many may be safely grown out of doors from early in June to the end of September. The change from always seeing them in a greenhouse well repays the time and trouble involved in their transference, and it is possible to give them a far more decorative effect outside than can be obtained inside. Bearing in mind their dissimilarity to any other class of plants, the object should be to find a place in the garden in keeping with them; and, further, to get away from a stereotyped style of bed. A place suggestive of a rockery is suitable.

We have used a site where the bed can be mounded up in the form of a cone, and this was situated at one end of a subtropical garden. This seems to have answered admirably.

In most cases the plants were turned out of their pots, and we find they grow faster thus treated. Others, with few roots, are plunged in their pots below the rims, great care being taken to prevent them from becoming wet or sodden. Preparations must be made by giving ample drainage when potting, and mixing some old brick rubbish with the potting compost, which should consist of loam, peat, and sand. A piece of glass arranged to throw off excessive rains from rare specimens is sometimes necessary.

No attempt was made in our case to completely cover the soil with carpeting plants, though Sedum Sieboldi variegatum, Mesembryanthemum cordifolium variegatum, M. mutabile, and Crassula manifolia were freely used. A few stones were placed here and there, and, in some instances, shingle sprinkled around the plants gave a very natural appearance. About 300 plants were used in furnishing the bed.

Agave Americana is an ideal plant for giving a high and bold, yet not stiff effect. A. Victoria Regina always appeals, and reminds one strongly of a variegated Globe artichoke. Aloe arborescens is useful among the bolder section, and the partridge-breasted form is well named, and flowers freely. Sempervivums are indispensable for giving boldness and character to the group. S. arboreum and the variegated form are grand plants, as also is S. cuneatum, which sometimes grows with one huge rosette, others branching out in quaint candelabra fashion. Echeverias in variety are, perhaps, the most beautiful of all from a foliage point of view. Some of the best are: E. metallica, E. m. crispa, E. grandiflora, E. macrantha, a distinct type with green leaves, margined with reddish-brown; E. cærulescens, and E. pulverulenta, a compact-growing species, with silvery foliage, that contrasts finely with the lovely bronzy-red leaves of metallica. E. Hoveyi is a beautiful plant, with greyish-green leaves. E. Lenoides is another silvery-grey plant, which is very effective, and one must not forget old E. secunda and E. s. glauca. The echinocacti are commonly known by names which suggest themselves as the Hedgehog or Pincushion cactus; E. Grusoni simply compels attention, but keeps intruders at bay.

Many of the cereus are very useful, standing up like sentinels among their fellows. C. marginatus, C. flagelliformis cristata, C. columbrinus hirsuta, C. peruvianus, C. macrogonus, C. chilensis bevispinus, and C. atropurpurea are among the best of a large number. Euphorbia natalensis is a very tall and striking plant. Pilocereus senilis (Old Man cactus) is one of the first to be noticed, and brought forth the question from an observant youngster of four years—"Mamma, is that Father Christmas?" The numerous mamillarias are mostly quaint and interesting. M. nivea, M. Nicholsoni, M. centricircle, and M. rufocrocea are among the best. Mesembryanthemum tigrinum is quite distinct from the better-known trailing varieties, and is very suggestive of Tiger's Claws, hence its name.

A collection would not be complete without a few gasterias, the leaves of which are tongue-shaped; G. spinalis, G. glabra, and G. nigra maculata are good. Stapelias, especially when in bloom, always attract as curiosities, owing to a most disagreeable odour which they exhale, and they are, as a consequence, known as the Carrion Flowers. Opuntias, usually recognised by the abundance of spines, are interesting, and when in flower very beautiful. Phyllocactus are glorious when in bloom. P. Ptersdorfi and P. phyllanthoides var. German Empress, are among the best. Rochea falcata must on no account be left out, the lovely heads of scarlet blooms lasting a quite long time. This plant is worth growing in quantity for greenhouse or room decoration. A few haworthias, kleinias, rhipsalis, dasylirions, pereskias, and ceropegias would complete a representative collection, while many of the yuccas may form a useful addition, if necessary.

Duffryn Gardens, Cardiff.

**There is no Better Present** for a gardening friend than a practical book on some branch of Horticulture, and to aid in making a selection we refer you to our publisher's announcement on page vi. Better still, send a postcard for a complete catalogue; it will be posted, by return, with pleasure.

# POT CULTURE OF PEARS AND APPLES.

Of these fruits, possibly the pears are grown to a greater extent than the apples in pots or in tubs. It is quite an easy matter to understand the reason of this in some instances—viz., in districts where really high-class pears are not so easy to produce as in more favoured localities. If I had to give my choice, I should certainly recommend the pear in preference. Both are, however, very much improved in many districts when so grown.

## Why some grow them in Pots.

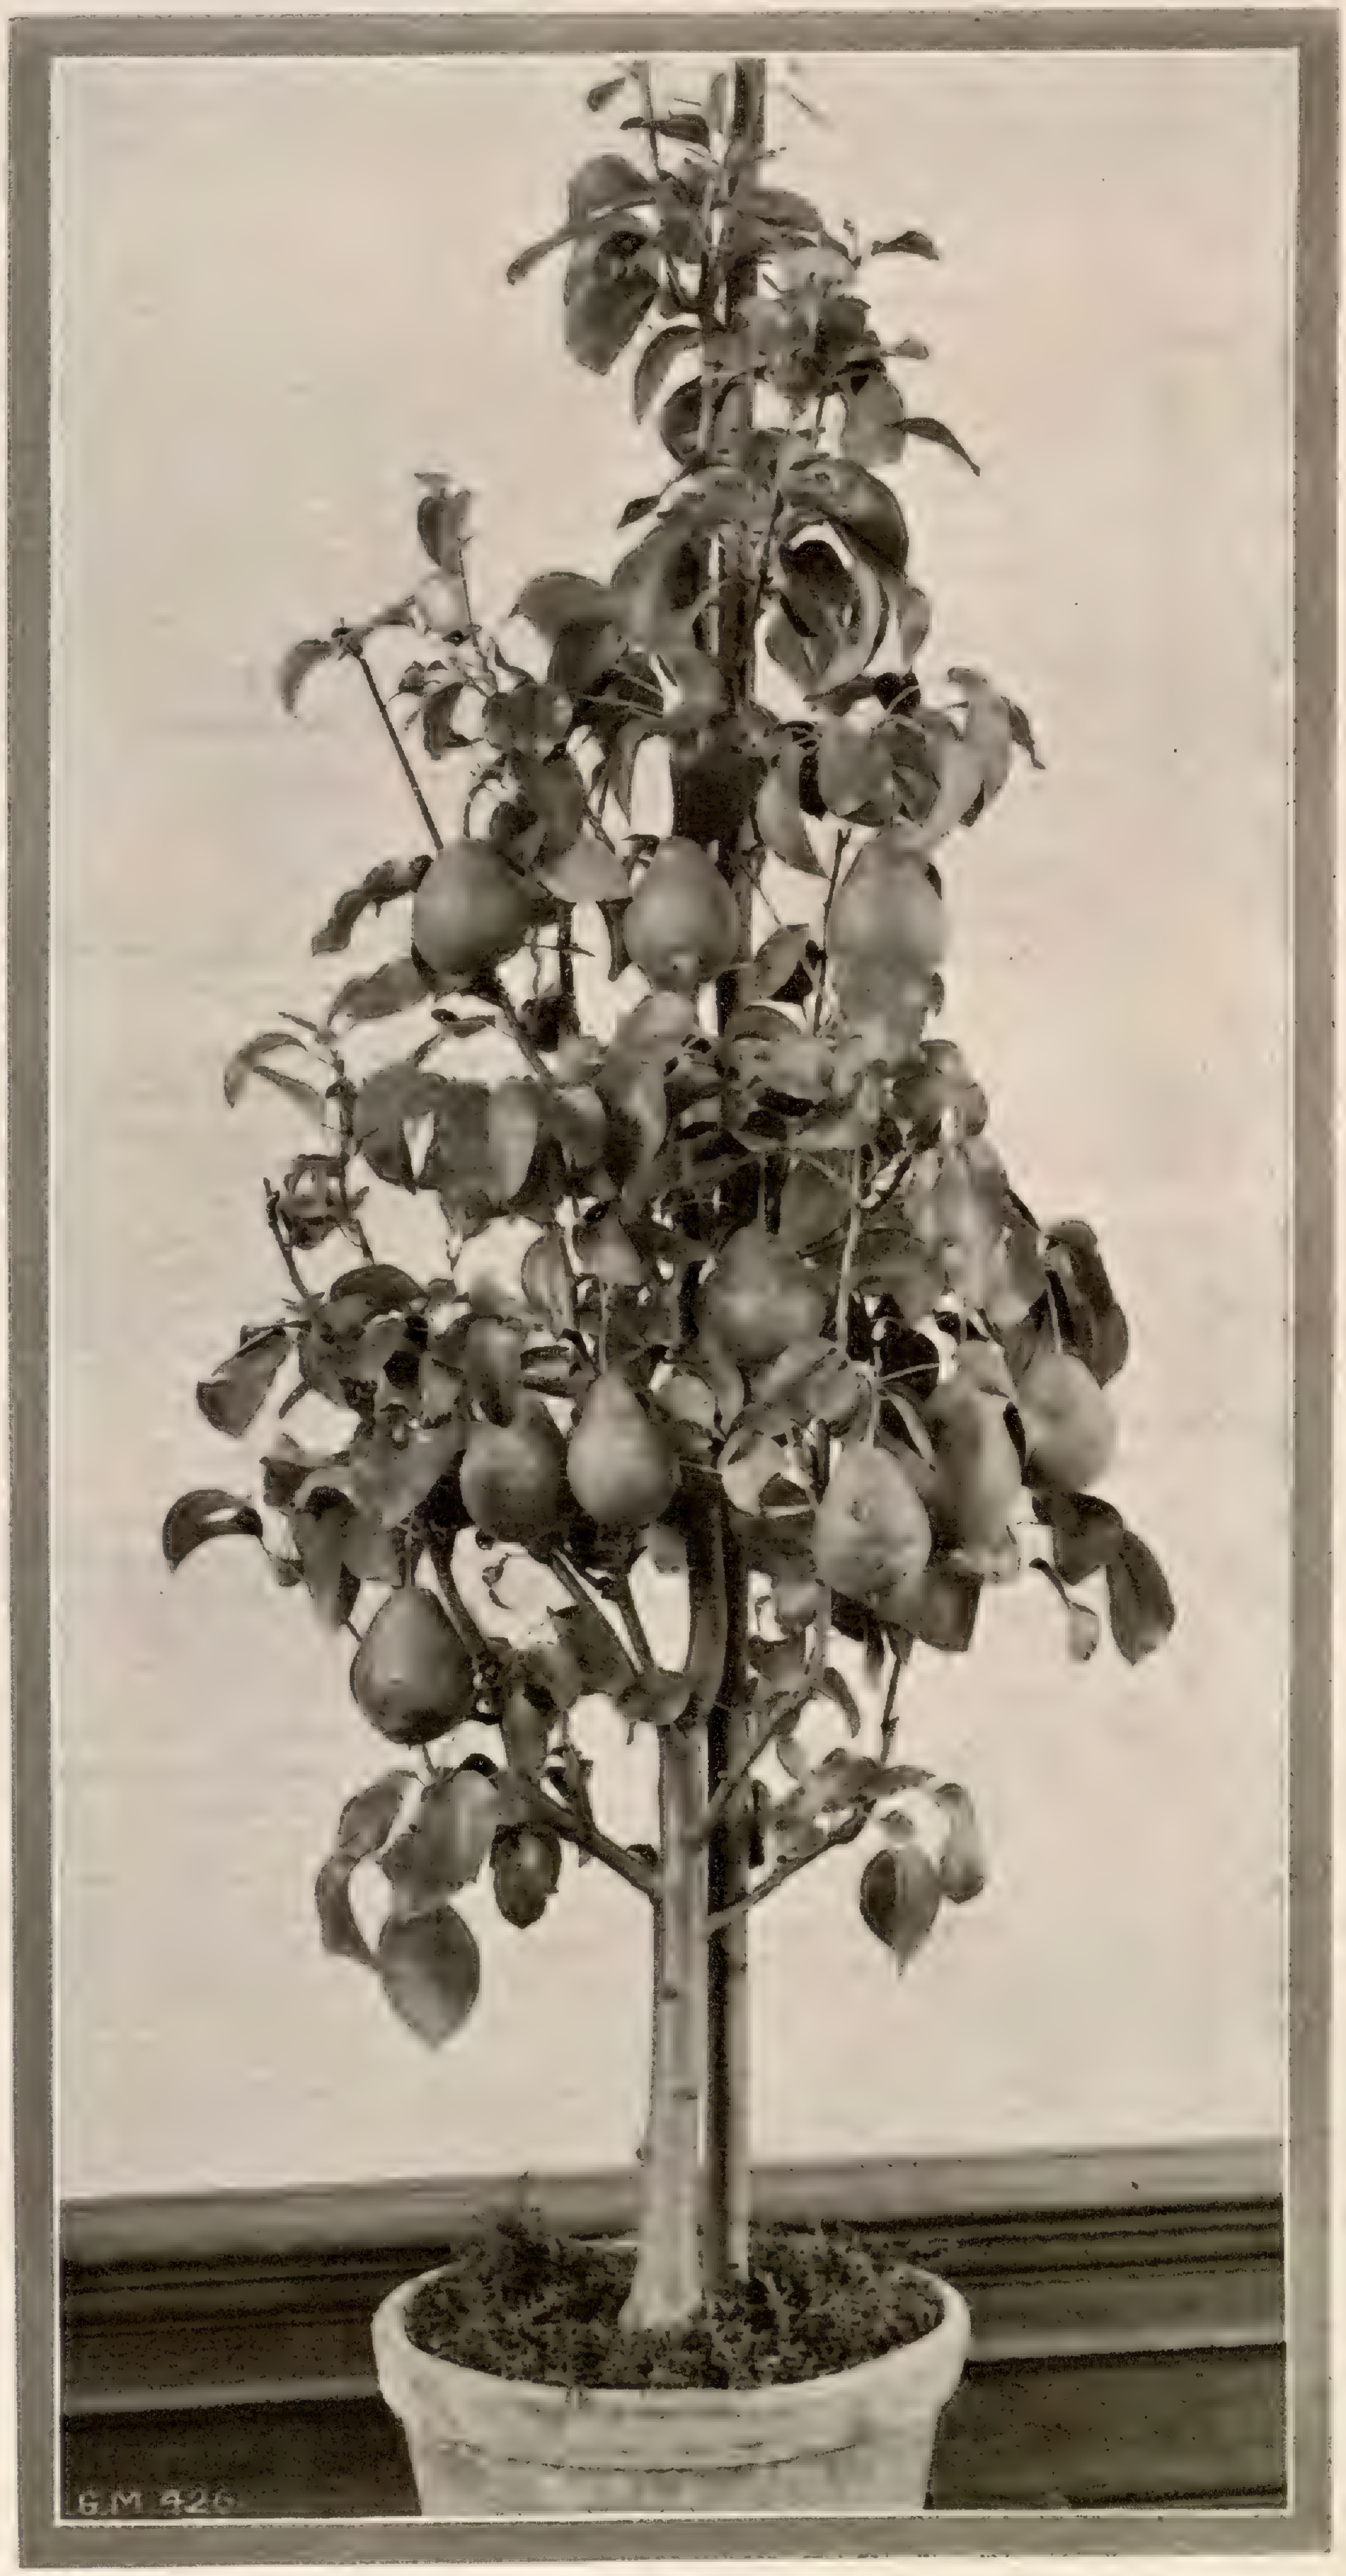
It is in this way that the very fine fruits are produced that one sees in collections of fruits at the best-known horticultural shows during the earlier part of the autumnal season. At Shrewsbury, as a case in point, many such are to be seen in the best exhibits. There I have noted on several occasions such pears as Doyenne du Comice, Souvenir du Congrès, Triomphe de Vienne, and Williams' Bon Chretien; and of apples such as Ribston Pippin, Cox's Orange Pippin, and Washington, which are recognised as dessert kinds (at least, the two first-named are at all times, and the latter when grown in pots or against a wall). But I take exception to such apples as Emperor Alexander and Gascoigne's Scarlet being shown as dessert fruits, even when they are grown in pots; this is misleading to the general public. Admittedly they are often remarkably well-grown fruits, and in every way attractive in appearance; and also very serviceable, because the same fruits will do duty several times over. Sometimes one also sees the stewing pear shown in pots, but surely this is not in any sense necessary.

## Their Culture.

Given a house with abundant means of ventilation, with the maximum of light, and no shade imparted from other plants, it is a comparatively easy matter to produce very fine fruits, and good crops also. Forcing, however, is not advisable, as forcing is generally understood. It has to be done with extreme caution. Every tree should be allowed to start of its own accord; and if, by a little coaxing afterwards, it can be induced to flower a fortnight or so in advance of the outside trees, that is all that should be aimed at. When the fruits are set and fairly well on the move, then a little encouragement may be given; but what should be aimed at, above all, is to see that the trees in pots do not become too cold at night. In other words, avoid the sudden chills that at times occur outside, and known by us all as spring frosts. It will be found that the fruits will, when thus treated, swell away freely, and will arrive at their full size quite early in the season. Then place the trees in the open, and in a warm position, where every advantage can be taken of the warmth from the summer sun. This will impart the colour that is so desirable, and what, in other words, is known as a perfect finish. Of course, every care must be taken of these fruits when put outside, as the birds will at once mark them as being desirable food. Thin-mesh netting strained over the trees is the best means to adopt; and, if possible, fix up a framework, so that easy means of access is at once available for watering and other purposes.

## Varieties to Grow.

I have already alluded to some of these in prefacing my remarks as to why some kinds are grown. All of the pears so named may be grown in pots with success, but I only recommend Doyenne du Comice and Triomphe de Vienne of those so named; but, in addition, I recommend Durondeau, Marie Louise, Emile d'Heyst, and Fondante de Thirriott. This makes half a dozen excellent kinds for any cultivator to make a start with. When cultivated in pots, Pitmaston Duchess is much improved in flavour. Of apples in pots I should only grow for private consumption Ribston and Cox's Orange Pippins. The best fruits I have ever tasted of the last-named were from pot-grown trees. The flesh was so sweet and the texture so granulated as to indicate perfect ripening. These fruits, too, be it noted, will keep sound and good when outside-grown fruits are passing off.



PEAR FONDANTE DE THIRRIOTT.

A finely fruited tree, exhibited by Messrs. G. Bunyard and Co., Maidstone, at a recent R.H.S. meeting.

Jas. Hudson, V.M.H.

Gunnersbury House Gardens.

## DESSERT APPLES FOR THE NORTH COUNTRY.

Following upon the list of dessert apples already recorded for culture in the open, it may be advisable to name a few others which should have a place wherever sufficient wall space exists, against which such could be trained, as the assistance thus afforded, apart from overhead covering, will usually be found sufficient to insure regular crops of very superior fruit.

### Ribston Pippin.

This popular variety is regarded by connoisseurs as the beau ideal of the apple family—a fact that few, perhaps, would be inclined to dispute when the produce is from a healthy tree, flourishing in a suitable soil and climate. Too often, however, the specimens produced are quite the reverse of this; lack of juice and flavour, and a tough and more or less wizened skin are most in evidence. This from trees growing entirely in the open, but given a wall having a south or west aspect, large, highly-coloured, and luscious fruits become almost a certainty.

### Cox's Orange Pippin.

This is more reliable than the foregoing, both for continuous cropping and for quality of its fruits, when grown in bush or pyramid form, and in favourable seasons faults of any kind are almost absent. To obtain it at its best the aid of a wall or other very similar support, and a sunny position, are requisite.

### Langley Pippin.

This being one of the newer apples, its merits and cropping propensities as a spreading tree in the open are as yet but slightly tested. Against a wall it crops very freely, and the fruits are very handsome, though not large, but sufficiently so for dessert. It ripens early in September, and the russet-coloured fruits make a welcome change from other early varieties which, for the most part, are more or less flushed with red.

### American Mother.

The exquisite form and high colour of this render it at once a favourite, while some are disposed to class it with the very richest-flavoured varieties. To be this, however, a good soil and a warm, sunny situation are essential. In the open it bears freely alternate seasons, the off ones being very light indeed. In bright, warm summers the fruits attain full colour in any position, but if the reverse of this, both appearances and flavour are deficient. This variety well repays for the wall space it would occupy, if only for the beauty displayed by the fruits upon the branches.

### Adams' Pearmain.

This is very distinct in form, and once fully recognised could hardly be mistaken for any other variety; its broad base and even slope to a much-contracted apex make it very conspicuous. Being one of the very best late-keeping apples, it requires to hang late, thereby well maturing upon the tree, when plumpness and the retention of its fine flavour is assured. I have known this apple thrive and crop with great freedom in the open, but much finer fruits are produced under still more genial conditions.

### Margil.

A small and rather angular-shaped fruit, firm in texture, juicy, and of exquisite flavour. The plant is slender in growth, and requires but slight pruning, as the fruit spurs are produced mainly towards the points of the branches.

### Paroquet.

When better known this variety will be much sought after, more especially by those who prize late-ripening apples. The tree bears freely when trained against a wall, for which purpose its moderate growth makes it most suitable. The fruits are slightly conical in shape, very even in outline, and become a brilliant scarlet late in autumn, and continue thus until May.

### Other Varieties.

Mabbot's Pearmain, Rosemary Russet, Pineapple Russet, Braddick's Nonpariel, Dr. Harvey, Brandy Pippin, and several of the newer varieties introduced in quite recent years, all prove very useful and highly interesting growing against a wall or other structure, while such as those requiring to remain long upon the trees are easily protected from the ravages of birds in such a position. J. Day.

Galloway House Gardens, Wigtonshire.

## GOOSEBERRIES.

Without doubt, the gooseberry is the most useful of all our bush fruits. It is the first in season, for often, after a warm spring, fruit in a green state may be gathered from bushes growing in sheltered places early in May, and from that time onwards until late in August its fruit may be had in a fresh state. The gooseberry is not so particular as to soil as the currant, for it will grow and thrive well in that of a light gravelly nature; in fact, the heaviest crops of finest berries that ever came under my observation were grown on a piece of poor thin gravelly soil that had been reclaimed from the wild forest.

Lancashire and the North are credited with growing the finest gooseberries, but I have never seen in any county north of the Trent such fine berries, and so abundant a crop as is grown in the neighbourhood of Chelwood Common, in Sussex. The varieties grown are by no means numerous, for some of the largest growers content themselves with not more than two or three varieties, and there is one which is regarded as of special merit; that is "Leveller." I visited one plantation last summer when the owner was gathering the fruit, and, though I had seen many large plantations in various parts of the kingdom, never before had I seen a crop like his. The bushes were not large, and, though some of them were about sixteen years old, not one would be more than three feet through. The whole secret of success was thorough cultivation, close pruning, and a sharp lookout that the birds did not destroy the buds during winter and spring. Whenever a bullfinch made its appearance it was shot, and the cultivator could reckon on almost every bud left at pruning time being saved to produce a cluster of flowers. In stating that the trees were closely pruned, it should be mentioned that very little growth is made. Few bushes made shoots long enough for a good cutting, but the fruits, though thinned in the early part of the season to provide green gooseberries, hung in such abundance as to somewhat resemble a large swarm of bees; they touched each other all over the bushes, like berries in a bunch of grapes. We weighed many of the largest berries, and found they ran from eighteen to twenty to the pound. Such fruit, when carefully packed, realised good prices in the market, and though there was such an abundance, the returns were from 6d. to 10d. per pound, according to the quality.

Gathering and packing are important operations, and these receive special attention by competent persons. The fruits are gathered into trays and taken to the packing shed, graded, and each pound weighed separately. Boxes are prepared by placing a layer of bracken fronds (which grow plentifully in the neighbourhood) over the bottom and round the sides, and as each pound is placed in the box a few fern fronds are added to keep the fruits in position. This process is repeated until the box is filled; each box contains a dozen pounds. Some tons of this variety are sent from this small village each August to the London markets, thus creating quite a trade in the district.

Private growers cannot confine themselves to one or two varieties, as they must have both early and late kinds, and some for dessert and others for culinary use. Neither can gardeners keep a man specially to protect their crops from the ravages of the birds during winter. Private gardens, too, are usually surrounded by shrubberies, which harbour birds of every description, so that the cultivator is labouring under great disadvantages, nevertheless some contrive to produce wonderful results considering the drawbacks. There are undoubtedly far finer flavoured gooseberries than Leveller, though none, to my knowledge, will realise such high prices.

In selecting shoots for cuttings, choose well-ripened ones from fifteen to eighteen inches in length. Be careful to remove every bud for at least a foot from the bottom, then insert in rows in a well-prepared piece of land. When the cuttings are well rooted, which they will be by the following autumn, they should be transplanted, unless they were given in the first instance ample room to grow for a couple of years. A small stake should be put to each plant to keep the stem perpendicular. The gooseberry is a bad plant to throw up suckers, therefore, if any buds are found below the soil, they should be removed when transplanting takes place. If intended for bushes the shoots should be shortened to within two or three eyes the first season, to induce them to push ample growth and form a good head. When grown as cordons as many shoots should be selected as are required, all others being removed close to the base. If it is desired to form a cordon having several stems. Two shoots only should be selected, and these should be brought down to a horizontal position, and young shoots taken up from them, about nine inches apart. To form a single cordon only one shoot should be left, and these, when planted against a wire trellis, soon fill their allotted space. When grown in this way, the fruit can be readily protected from birds, and, as there is only a single line, there is full exposure to the sun.

Gooseberries become highly flavoured when fully ripe, provided there is ample foliage to cause a good flow of sap. It is not always the large-growing varieties that are the best flavoured, for what could be better than Early Sulphur, Warrington, Langley Gage, Langley Beauty, Golden Gem, or Green Gage? Some prefer large varieties, such as Leveller and Gunner, and where such are in request there is no reason, as cordons take up so little room, why a collection should not be grown. A fence a hundred yards long would take as many triple cordons or three times the number of single ones. Whichever mode is adopted, it should always be borne in mind that the secret of success is to protect the buds during winter and spring from the ravages of birds. It is impossible to grow heavy crops and have shapely bushes when half the buds are destroyed. Liberal treatment is always essential, and on light, dry soils manure cannot be too bountifully applied to the land. The foliage must also be kept clean, and free from all pests. H. C. Prinsep.

## OLD FRUIT TREES ON WALLS.

Experienced cultivators never allow trees n walls to become overcrowded with long purs on which flowers appear in large numers but few fruits. I am referring to pears iore especially than to any other kinds. 3ut one often sees such specimens on walls; hey are pruned every year, surface dressed vith manure, and otherwise attended to, ut are not remunerative. I have seen nany trees growing several feet above the ops of rather low walls with great clusters f spurred-back branches varying in length rom 9in. to 18in. Now, of course, such a ondition obtains through wrong treatment while the trees were in a young state, nainly, though it is a fact that well-managed trees have come under the charge f incompetent persons, and then they are eglected, and have become unsightly obects in a very short time.

I have had to deal with such specimens nyself, and have removed them from walls o more open quarters, training the main ranches to the wires supporting other espalier-trained specimens. The roots found ow down in an almost dust-dry medium, ere pruned, and the long spurs were everely thinned out, only a few shorter purs bearing fruit buds being retained. he trees soon presented a better appearnce, and fruited satisfactorily after a parse showing of blossom.

It often happens that when a pear tree is most smothered with blossom very few uits set. This is mainly owing to two uses—over-dryness of soil round the roots nd lack of leaves which support the owers. A tree bearing a rather thin prinkling of flowers, with a fair number of aves developing, will have a better crop fruit than one laden with flowers, possessing few leaves, and dry at the roots at he same time.

It does not matter how well-managed a ear tree may be; if it is very freely owered much thinning of blooms will be ecessary if a satisfactory crop of pears is be secured. There is no time better than he present for lifting entirely, or partly, eglected trees which are growing near alls. G. B.

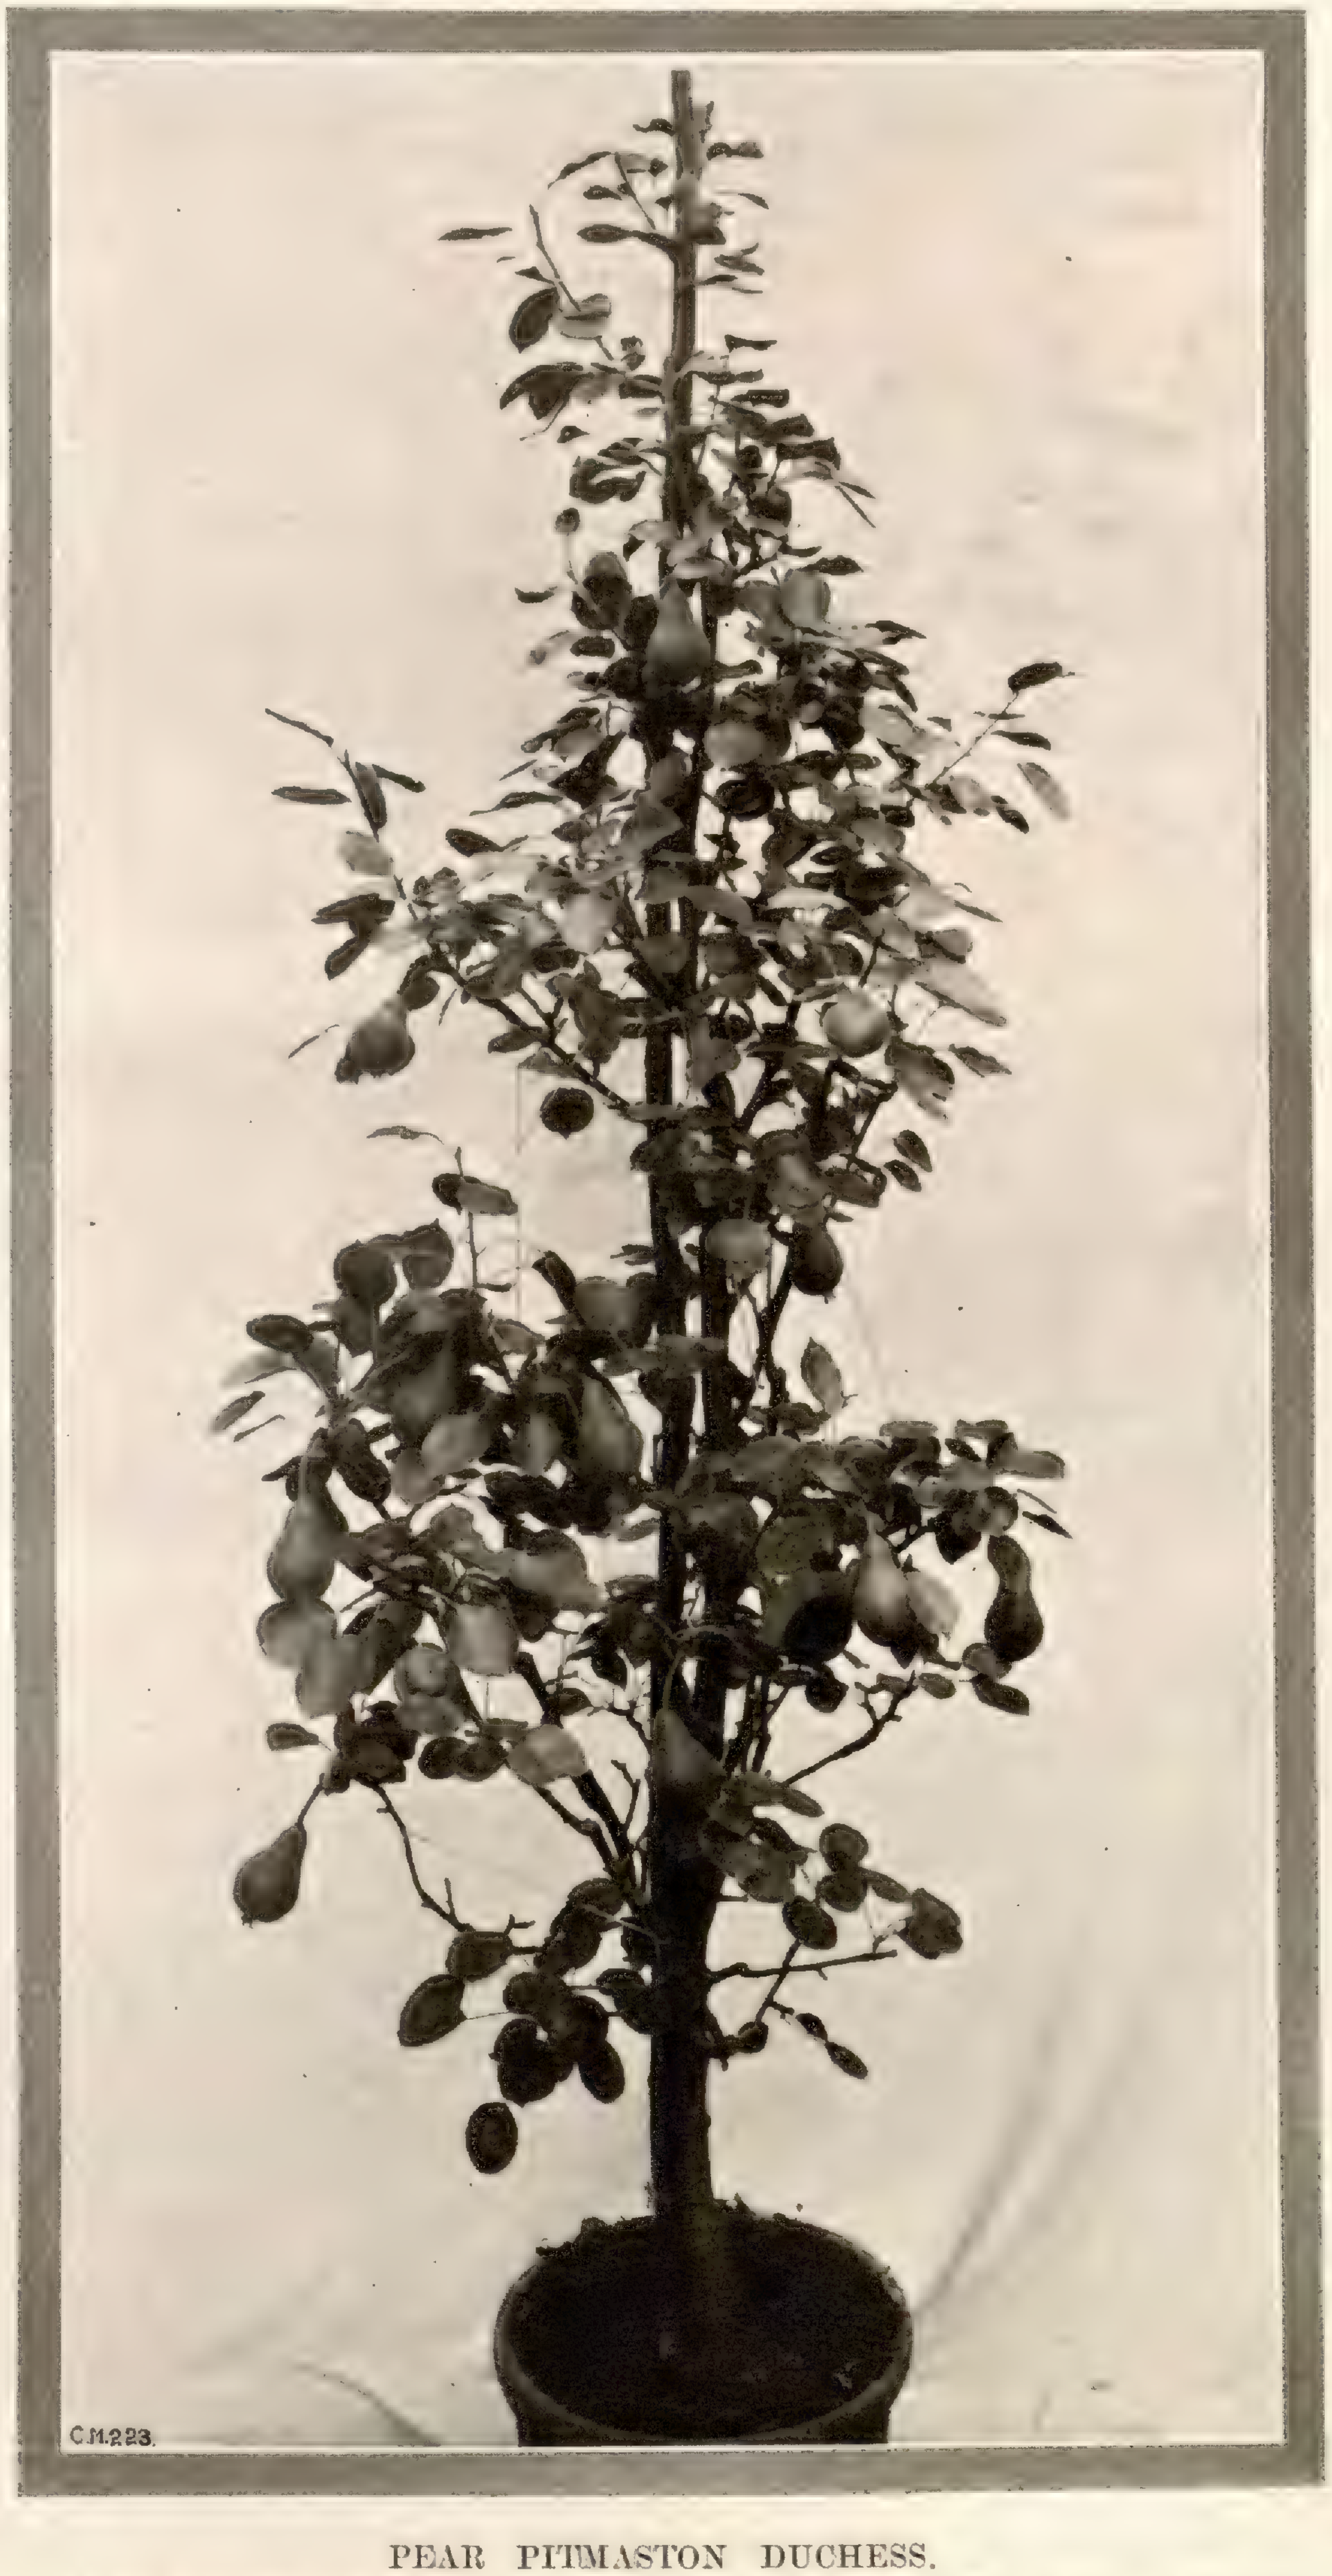
## BEGONIA IMPERIALIS.

There is a small group of begonias ith fine foliage, consisting of the Mexican egonia imperialis and two distinct forms ereof. One scarcely knows whether to write them in the past tense or not, but they are rtainly now far less plentiful than they ere twenty years ago. At the time of the egonia Conference in 1893 Mr. Watson, of ew, included B. imperialis in his selection the fifty best begonias, a position it was en at least fully entitled to. Compared th B. Rex, it may be described as of weak owth, the broad oblique leaves being from ur to six inches across, and so thickly vered with hairs as to present a quite velty appearance. The colour is brownish, th irregularly-shaped bands of bright een along the principal veins. This species s first introduced into Europe in 1859, and s given a second-class certificate by the yal Horticultural Society in the spring of 62. There is a very beautiful variety— aragdina, in which the entire velvety leaf of a vivid green, and a form known as to Forster, which is very distinct and ually charming. The last-named, which has ves of the same velvety appearance as the ers, has the principal portion of the leaf a bright silvery-green, while the spaces beeen the principal veins, except for some le distance on either side of the midrib, occupied by brownish blotches. S.W.

## EUCRYPHIAS.

In your valuable paper (page 839), your correspondent, "W. D.," gives some practical hints on the cultivation of these beautiful shrubs, but I am surprised to find him stating that eucryphias dislike root disturbance. I thought this old belief was quite forgotten. I have pointed out on more than one occasion that eucryphias are as easy to move as almost any other shrub; we move many annually without ever losing a specimen, or in any way stopping growth, and we have some dozens, in different positions, all of which flowered extra well this season. We find that seedling plants do very much better than those from layers; they grow better and quicker, and flower at a very early stage. It is a pity that erroneous ideas should be spread abroad, as they very often deter people from planting one of the best August-flowering shrubs we have in the country. As a general rule Eucryphia pinnatifolia sets seed very well; these germinate readily, and make quite useful plants in about three years. W. A. Cook.

Leonardslee Gardens, Horsham.



PEAR PITMASTON DUCHESS.

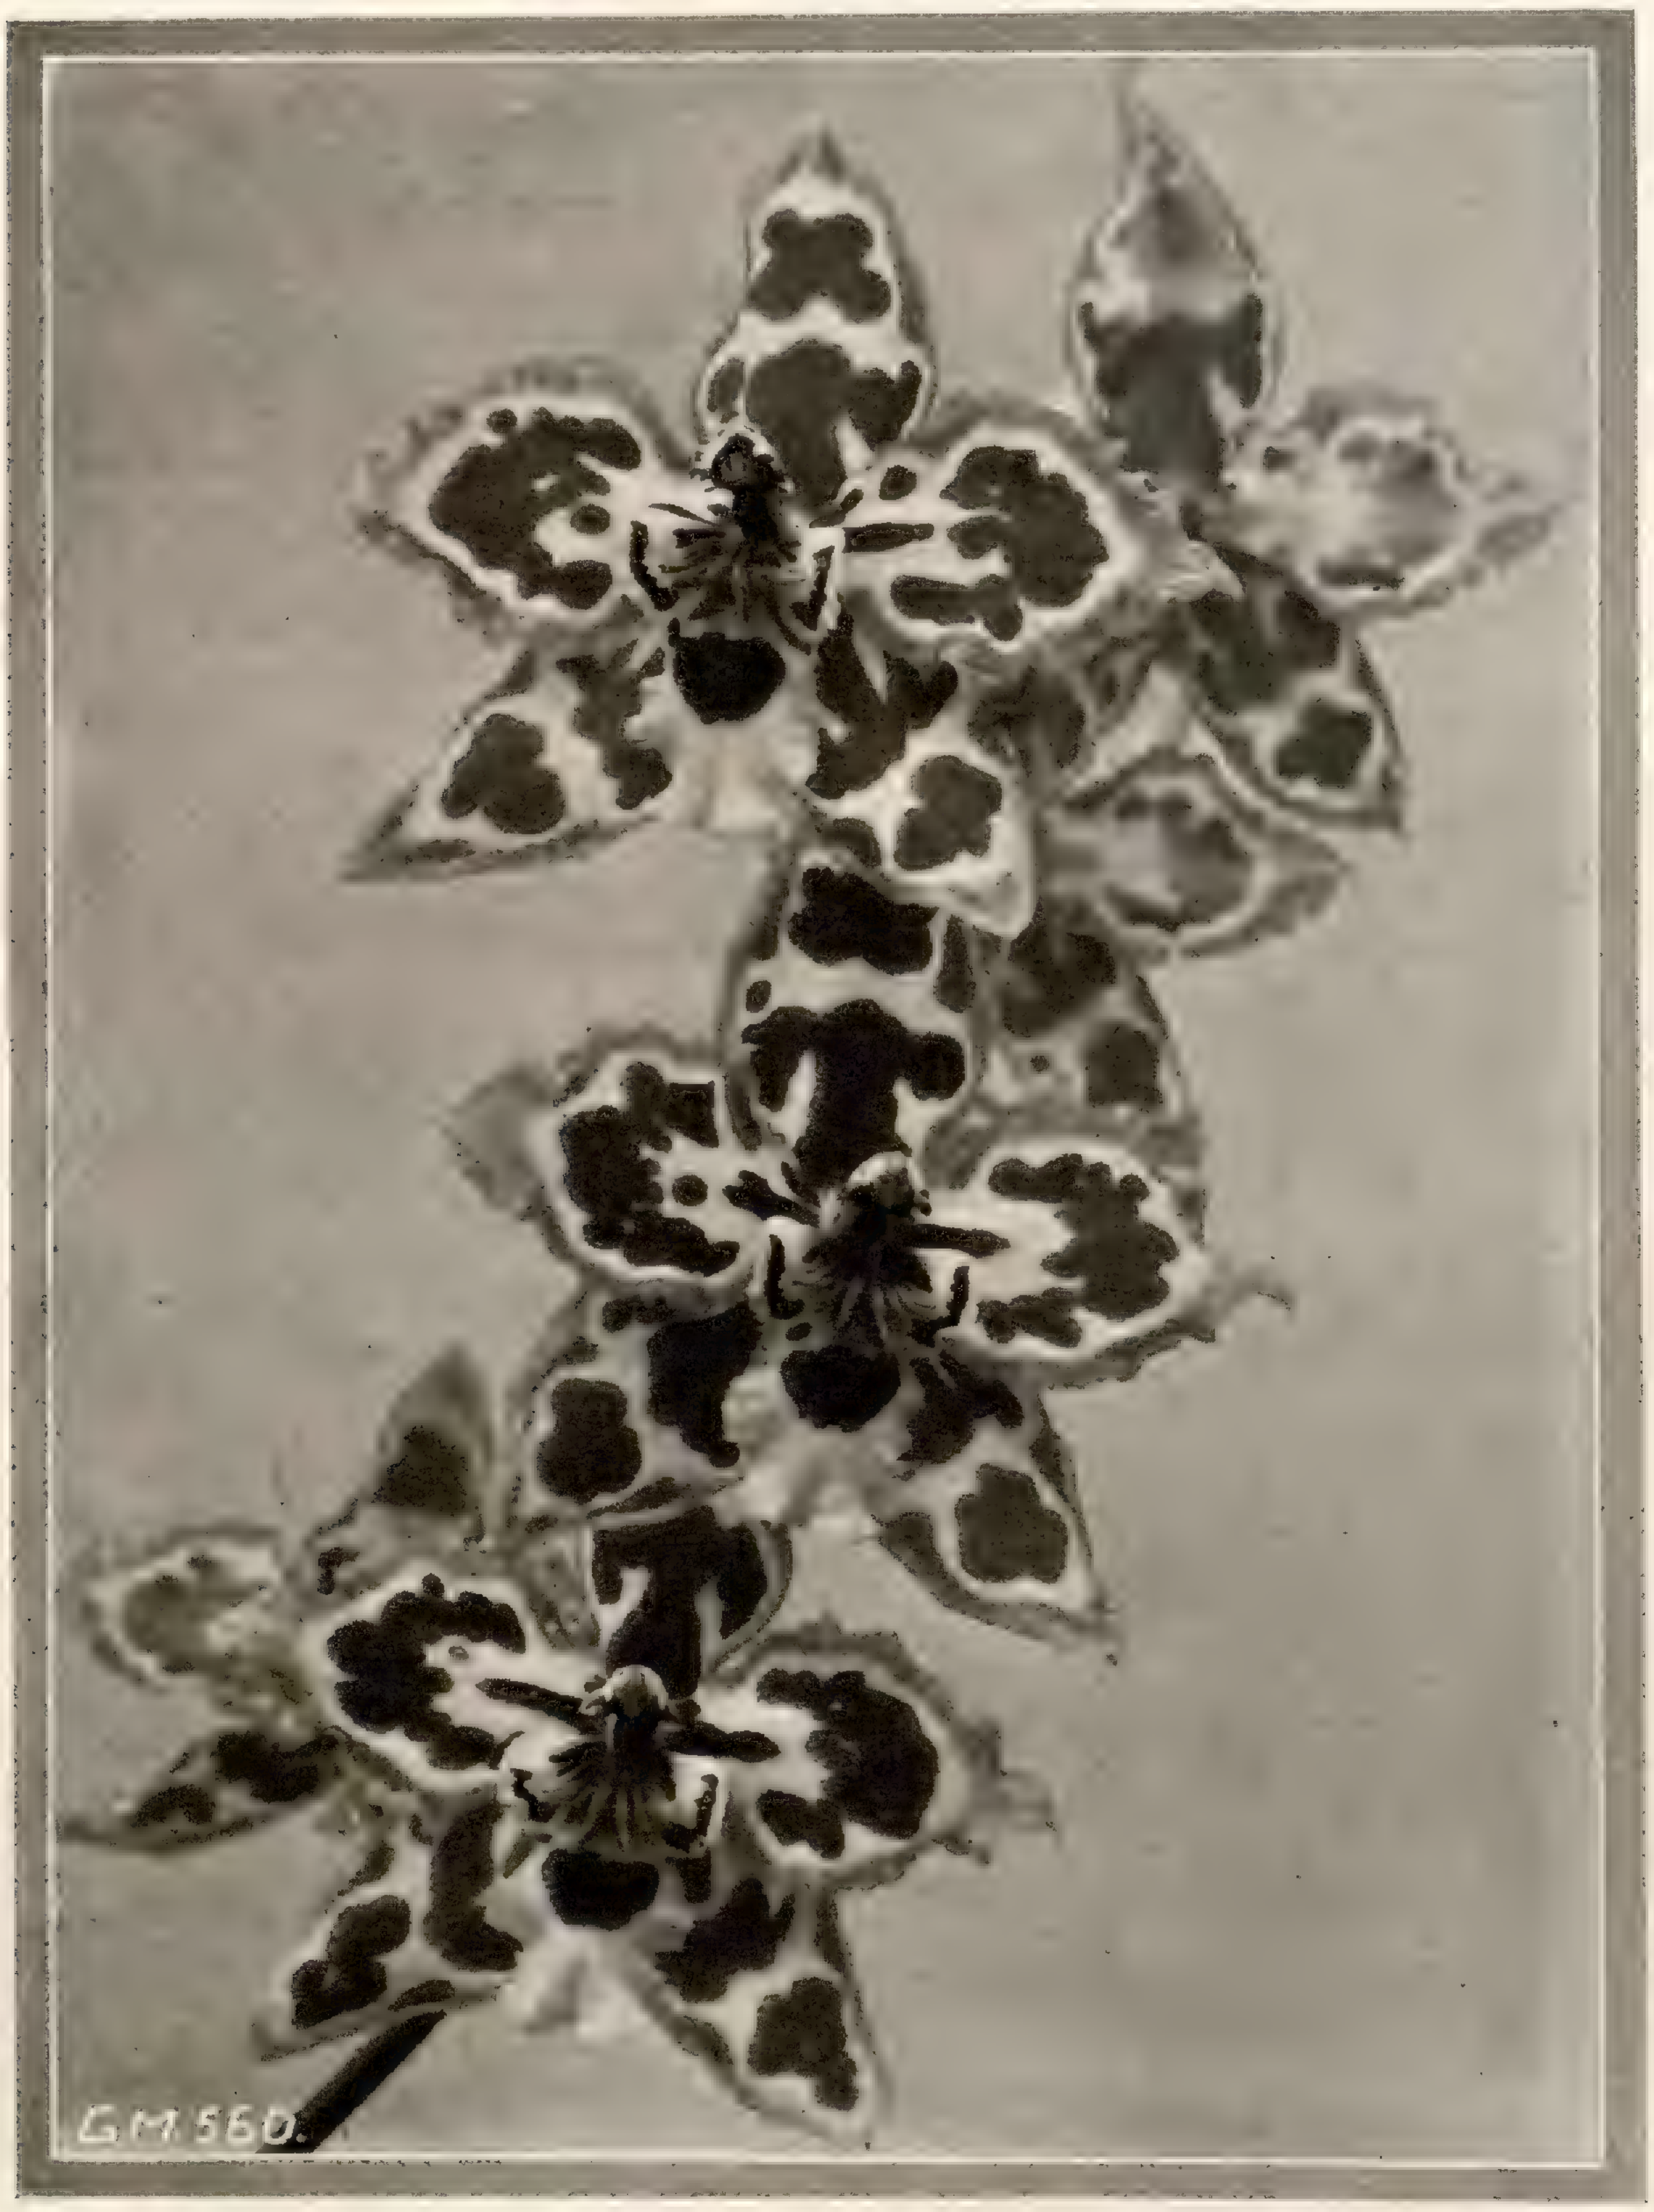
A well-cropped tree, grown by Messrs. T. Rivers and Son, Sawbridgeworth.

# NEW PLANTS, FLOWERS, AND FRUITS.

◆

### ODONTIODA LATONA, FOWLER'S VAR.

A very beautiful orchid with flowers of odontoglossum size. The shapely and attractive blooms have a pale blush ground colour, the margins are rosy-red, while over the central areas are large blotches of rich crimson. The parents of this fine hybrid are Odontioda Bradshawæ and Odontoglossum crispo-Harryanum. F.C.C., R.H.S., December 3. J. Gurney Fowler, Esq. (gardener, Mr. J. Davis), Glebelands, South Woodford.



ODONTIODA LATONA, FOWLER'S VAR.

Flowers blush, rose-red, and crimson. F.C.C., R.H.S., December 3.
J. Gurney Fowler, Esq., The Glebelands, South Woodford.

### LÆLIO-CATTLEYA GOLDEN ORIOLE VAR. RUBY.

Another beautiful orchid with brilliant colouring that is much appreciated during the dull season of the year. The flowers are of medium size, and several are produced on an elongated spike. The colour is bright ruby-red, with a ground colour of golden yellow showing through as veinings, and much more prominent in the sepals than the petals. F.C.C., R.H.S., December 3. Lieut.-Colonel Sir George Holford, Westonbirt, Tetbury, Gloucester.

### CYPRIPEDIUM EURYBIADES.

This hybrid between C. euryades and C. alcibiades bears most resemblance to the first-named parent, but is more shapely. The large, bold flowers have a broad white dorsal sepal with a green base, and an abundance of dark purple spots. The petals and lip are yellowish, heavily shaded with purple-brown. A.M., R.H.S., December 3. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking.

### CYPRIPEDIUM VIKING.

A very striking hybrid derived from C. Buchanianum and C. illustre. The bright purple median band on the white dorsal sepal gives evidence of descent from C. Druryi. The broad petals and rounded lip are shaded with purple-brown over yellowish-green. A.M., R.H.S., December 3. Lieut.-Colonel Sir George Holford.

### SOPHRO-LÆLIO-CATTLEYA CARNA.

A neat plant that carried a large, showy, flattish flower of great beauty. The sepals and petals are rose-coloured, tinted with crimson, the lip of somewhat richer shade with a yellow throat and base. A.M., R.H.S., December 3. Messrs. Charlesworth and Co., Haywards Heath.

### PRUNUS MIQUELIANA.

Though not a new species, this is one little grown in gardens, and yet in sheltered positions it deserves cultivation. It makes a low, twiggy bush, and, in Sussex, blossoms freely in November and December. The pure white flowers are produced in little clusters of two, three, or four along the slender growth, and only a very severe frost spoils them. Each bloom is about three-quarters of an inch across, and composed of a dozen or fifteen narrow petals. See "G.M." of December 7, p. 933, for illustration. A.M., R.H.S., December 3. Colonel S. R. Clarke, C.B. (gardener, Mr. Conn). Borde Hill, Cuckfield, Sussex.

### ASPLENIUM DIVARICATUM ELEGANS.

A very elegant fern with finely divided but not plumose fronds. As shown it is about a foot high, and the regularity with which the fronds are produced all round the centre makes it a capital table plant. The fronds are light green, asd the stems are blackish. A.M., R.H.S., December 3. Messrs. J. J. Parker and Co., Whetstone.

### CARNATIONS.

Mrs. A. F. Dutton.—A large-flowered rose-pink variety of great beauty; it is a sport from White Perfection, and has the good qualities of its parent. A.M., R.H.S., December 3; F.C.C., P.F.C.S., December 4. Mr. A. F. Dutton, Iver, Bucks.

Bonfire.—A very bright scarlet perpetual variety, fringed, fine stem and calyx, but a trifle small. A.M., R.H.S., December 3. Messrs. Wells and Co., Merstham.

Mary Allwood.—Already described and figured in these columns. F.C.C., P.F.C.S., December 4. Messrs. Allwood Bros., Haywards Heath.

Baroness de Brienen.—A fine salmon-pink variety, already described and figured in our columns. F.C.C., P.F.C.S., December 4. Messrs. Stuart Low and Co., Enfield.

Snowstorm. A beautiful white variety that we have previously described and figured. F.C.C., P.F.C.S., December 4. Mr. W. Lawrenson, Yarm-on-Tees.

### CHRYSANTHEMUMS.

Miss A. Brooker.—Described on p. 940. A.M., R.H.S., December 4. Messrs. W. Wells and Co., Merstham, and Messrs. J. Veitch and Sons, Chelsea.

Eric Wild.—Described on p. 940. A.M., R.H.S., December 4. Messrs. W. Wells and Co., Merstham.

Mrs. Wingfield Miller.—A single variety, of good size and rich violet-rose colouring. A narrow white zone round the disk adds to the effectiveness of the variety. The flowers are a trifle cup-shaped, and so, while the variety will appeal to some, it will fail to please those who like a flat bloom. A.M., R.H.S., December 3. Messrs. W. Wells and Co., Merstham.

### APPLES.

Winter Banana.—A finely-flavoured dessert variety popular in many parts of Canada. The fruits are of fair size and rounded; yellow, flushed with red. A.M., R.H.S., December 3. The Agent-General for British Columbia.

Steyne Seedling.—A late dessert variety of first-rate quality. It bears considerable resemblance to Cox's Orange Pippin, and is probably a seedling from that well-known variety. A.M., R.H.S., December 3. Lady Thornycroft, Steyne, Bembridge, Isle of Wight.

Crawley Beauty.—A very fine culinary apple that will keep well to March. It is a local seedling, flowers very late, and hangs long on the tree if not gathered. The fruits are of good size, rounded, bright crimson, with red splashes on the green, shaded side. Solid, juicy, of capital flavour, and a very free and regular cropper. A.M., R.H.S., December 3. Messrs. J. Cheal and Sons, Crawley.

## GEUMS.

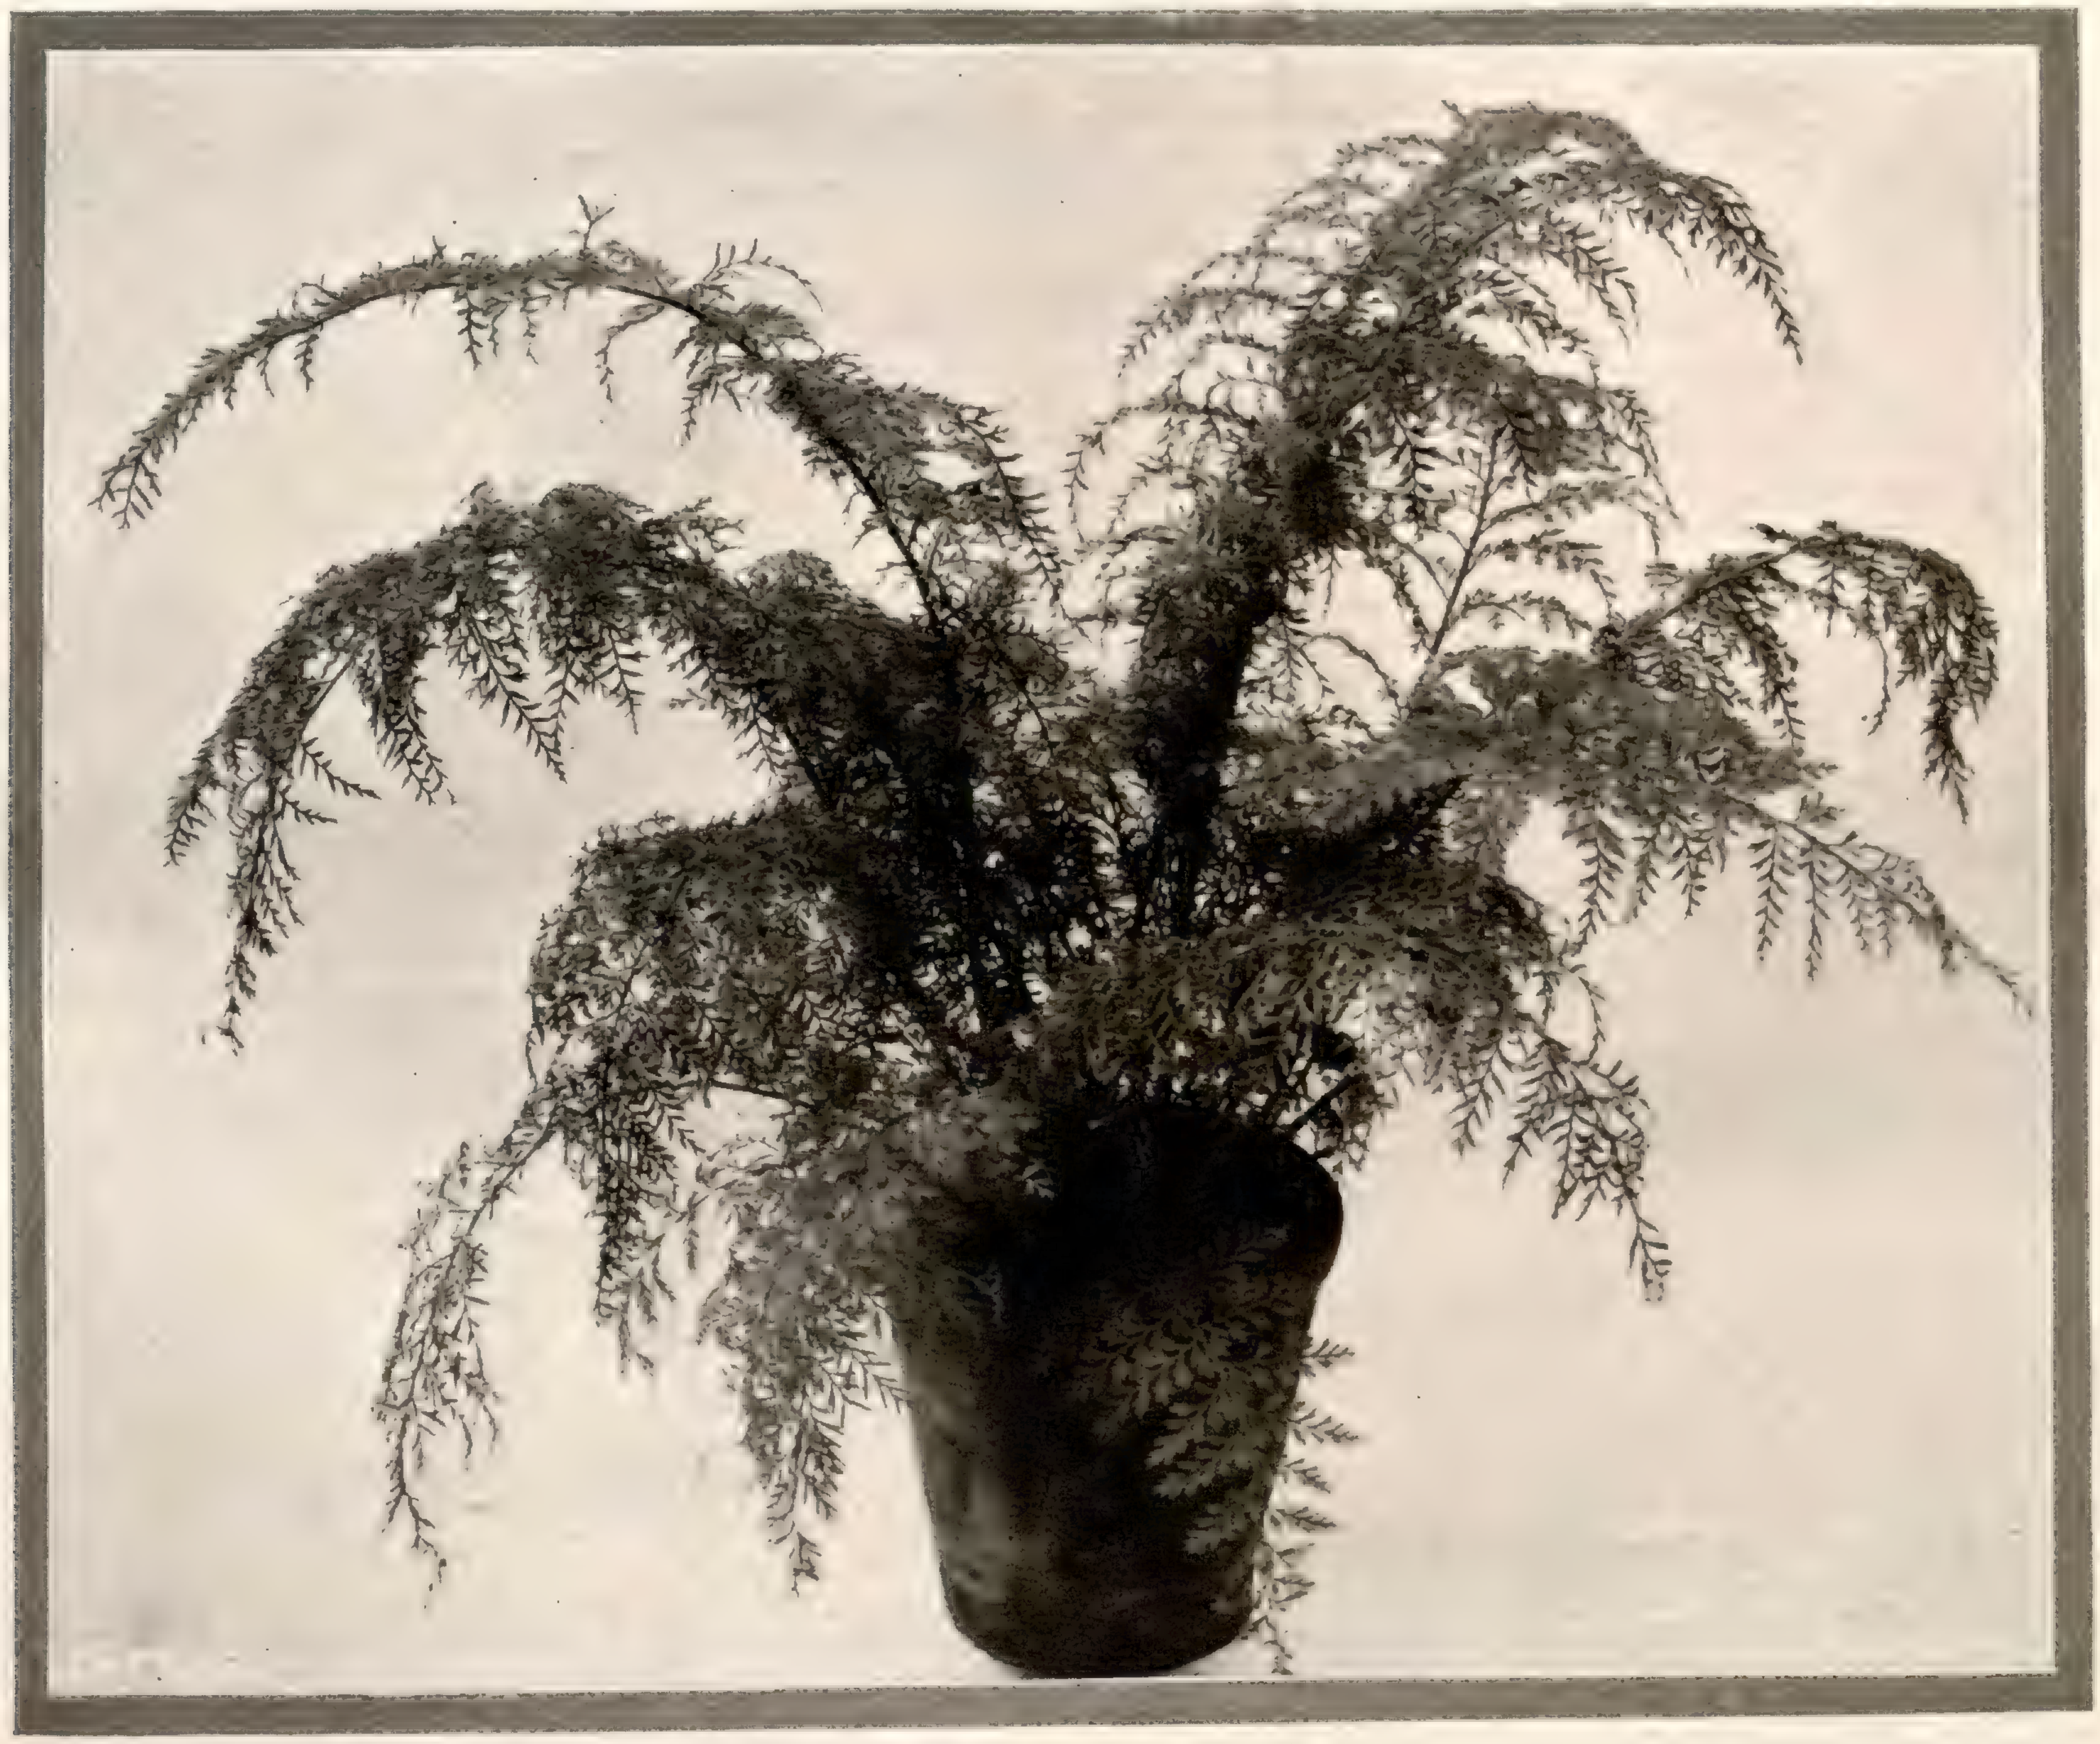
The geums includes a considerable number of species and varieties, all of which are of the easiest culture, succeeding in ordinary garden soil, and producing their gaily-coloured flowers over a more or less extended season. The positions wherein they lend themselves for decoration is either the rock garden, or in borders or beds devoted to perennials; they produce the best effect when planted in broad masses of each kind, and, being perfectly hardy, they may remain undisturbed for several years. After the third season some decrease in size of the flowers takes place in G. Heldreichi and G. coccineum and their varieties, so that it is advisable to replant these after every second year. Geums are readily propagated by division of the crowns, which may be safely carried out at planting time, in autumn or spring. They are also readily raised from seed, sown in nursery beds in April and May, or earlier under glass, and if transplanted when large enough to handle, strong plants are obtained by autumn.

Geums come practically true from seed, and the variety Mrs. Bradshaw being no exception. G. montanum is a handsome Alpine species, robust in growth, the foliage resting on the ground, and forming tufts from which arise stout stems, some nine inches in height, carrying large golden-yellow flowers; these are succeeded by seeds having a feathery attachment, after the manner of Anemone pulsatilla, which invests them with a certain beauty after the flowers fade. G. aurantiacum is a most attractive hybrid between the last-named and G. Heldreichi; the flowers are coppery-orange colour, on slender stems a foot high.

Geum Heldreichi resembles, and is said to be a form of, G. montanum; in habit of growth this is so, but the flowers are very large and coloured soft orange. In the variety splendens the flowers are of a shade of reddish-orange, on stems fifteen inches in height, and the variety magnificum attains a height of eighteen inches, with orange-coloured flowers that have generally two rows of petals, the others previously named being single.

Geum coccineum is one of the commonest, its bright crimson flowers being produced all through the summer and autumn. It succeeds under most indifferent conditions, and, being hardy and a vigorous grower, it has earned a full share of popular favour. This latter characteristic has all the appearance of having been transferred to its variety Mrs. Bradshaw, owing to the duplicating of the segments and their elegant frilling, which gives this variety the appearance of a perfectly double flower of more than ordinary attractiveness. The flowers are very large, rich crimson, and borne profusely during summer and autumn. G. miniatum is a slender-branched kind, allied to G. chiloense. The flowers are rich orange.

THOS. SMITH.



ASPLENIUM DIVARICATUM ELEGANS.

A graceful fern, with light green, black-stemmed fronds. A.M., R.H.S., December 3. Messrs. J. J. Parker and Co., Whetstone.

## OVERCROWDING HERBACEOUS BORDERS.

A herbaceous border, well arranged as regards the disposition of both the growth and the colour of the flowers, forms one of the most attractive features of a garden. There are now so many beautiful varieties of the different kinds that a border, judiciously treated, may look well for the greater part of a whole year.

Usually, one finds the different kinds of plants indiscriminately mixed so that many with a weak habit are smothered by the stronger, and, as a result, the border presents a weedy appearance. Every plant grown in a border should have ample space for development, and if more specimens of the smaller subjects were planted together at suitable intervals a bolder and yet more pleasing effect would be secured.

The formal, sloping bank of plants on a broad border finds favour with many cultivators, but greater variety should in my opinion be introduced. There are many kinds of dwarf growth that may be planted to form a groundwork to taller ones; the latter being disposed well apart so that they do not unduly interfere with the well-being of their dwarf neighbours. The latter need not be wholly confined to the front part of the border, neither should the tall ones be limited to the back portion.

G. B.

## THE ROSE SEASON OF 1912.

By the end of October we may consider the rose season finished with, so far as their blooming is concerned. But it was the severe snap early in that month which put such a sudden stoppage to growth this year. I have not in any season had roses more full of an extra late lot of flowers than was the case previous to that frost. From my annual notes I see that in 1894 we had just such an autumn after a very erratic season. It was in May of that year that we had the severe frost which played havoc with the extra early growth then existing.

But eighteen years ago we had not such a wonderful collection of late-flowering varieties. The hybrid tea class or section had not then indicated the remarkable developments which have been made within the past fifteen years. To mention a few of the best will show how much better off we are for varieties that are good in the autumn, and have proved themselves of immense value during such erratic and widely different seasons as those of last year and the present.

Taking the hybrid teas alphabetically reference must first be made to Antoine Rivoire, A. R. Goodwin, Betty, Chateau de Clos Vougeot, Duchess of Wellington, Ecarlate, Edu Meyer, General MacArthur, George C. Waud, Jacques Vincent, Joseph Hill, Killarney, Lady Ashtown, Lady Battersea, La Tosca, Lyon Rose, Madame Abel Chatenay, Madame Jules Grolez, Madame Ravary, Marquise de Sinety, Mrs. Aaron Ward, Mrs. Arthur Munt, Mrs. A. R. Waddell, Mrs. Harold Brocklebank, Mrs. Theodore Roosevelt, Pharisaer, Souvenir de Maria de Zayas, Theresa Bevan, and Theresa. If any reader wants really good decorative roses all through the season, and more especially in the autumn, he can scarcely do better than select from this list and the few to follow from the tea-scented and hybrid perpetual sections.

Some teas that have proved themselves exceptionally useful, and introduced since 1894, are Corallina, Enchantress, Harry Kirk, Lady Roberts, Molly Sharman Crawford, Peace, Madame Antoine Mari, and Souvenir de Pierre Notting. From the H.P.'s I would give preference to Ben Cant, Commandeur Jules Gravereaux, Frau Karl Druschki, Gloire de Chedane Guinoisseau, Hugh Dickson, and Rouge Angevine.

I did not intend to make any list of roses at the outset of these notes, but on reference thereto, I find them so frequently mentioned as extra good each autumn since their introduction that I felt compelled to name them now the planting season is upon us. The year 1912 has been one of the worst for mildew I have known. This refers only to gardens where no preventive measures were taken, and I am pleased to be able to write that this direful disease was of little or no trouble, even during such a mildew-producing season, where early and persistent measures had been adopted. The use of these, at very little cost and trouble compared to the pleasurable results, together with the elimination of varieties that have proved more than usually subject to mildew, has made this disease of far less terror than previously.

Some striking cases of this came before me during the past season. Many little gardens near me contain a considerable number of roses, and it was very noticeable how the mildew upon one or two (and these in exactly the same position) disfigured and quite spoilt both plant and flower, while the plants in others were quite healthy. Enquiries and observation proved that in every case of mildew the preventive measures had been omitted or not applied early enough.

It stands to reason that if our spraying or syringing is to make the foliage immune from the attack and spread of mildew—as it undoubtedly does—it is wise to keep it up; otherwise how can the young growing foliage be protected And it is this that is most severely attacked, as well as the earliest. I have rather harped upon this point for some time now, and am pleased to find so many of our most successful growers are of the same conviction.

I must hark back once more to 1894, when the class for hybrid teas alone, was, I believe, first started. It was for twelve varieties only, and seeing there were, at that date, no more than ten "exhibition" hybrid teas in the National Rose Society's official list, it did not surprise me to find it very indifferent. I think we may safely say that half of the largest class—viz., 72 varieties from all classes or sections—are now made up from the hybrid teas. And yet at that time many were of opinion there was no future before this section.

A. Piper.

## SOME POTTING REQUISITES

We all know how much more work we can get through in a given time if we have everything ready to our hand, and this is particularly true of potting work in the garden, where so many different things are required for doing the work really well. In an article on "Potting Composts," which appeared in the Gardeners' Magazine of June 4, 1910, I dealt with the materials which were most commonly wanted in making the various potting composts for different kinds of plants, and it seems to me these remarks might be usefully supplemented by a few notes on some other matters which simplify and expedite the work, especially when any considerable quantity has to be done. Amateurs who have not a great quantity of potting to do often use the most makeshift arrangements, and put up with all sorts of inconvenience, resulting in much discomfort and more or less unsatisfactory work. How far anyone will agree with the suggestions made will depend in part upon the amount of potting work he or his gardener has to do.

Having provided oneself with at least the most necessary materials for making potting composts, perhaps before having done this, the great essential is a supply of various sizes of pots adequate to anticipated future needs, always keeping those of the same size together, which is no small convenience in all potting work. For striking cuttings and growing young seedling plants, thumbs, with an inside diameter at the top of one or two inches, are very useful, though not so indispensable as a collection of small and large sixties, with a similar diameter of three to four inches, as these are the sizes of pots ordinarily used for rearing bedding-out plants. Forty-eights, with a diameter of four and a-half to five inches, can be used for flowering small plants as well as for an intermediate shift of larger plants, but they are not so generally useful as sixties and thirty-twos. The latter, together with the slightly larger twenty-fours, with inside diameters of about six and seven inches respectively, are the pots for flowering pelargoniums and numberless other plants of medium size, both in the open and under glass. It should always be borne in mind that plants of a given size need larger pots when grown in the open than under glass, not only because evaporation is so much more active, but to keep them from being blown over in a moderate wind. Before investing in the larger eight, ten, or twelve-inch pots, one should have some idea in mind as to the use to which it is intended to put them. In addition to a good supply of pots, it is very desirable to have a number of seed pans, both for sowing seeds and pricking them out, as well as for striking cuttings in quantity of such plants as violas, lobelias, and pentstemons. Shallow pans are the best for sowing most seeds, especially those which will soon be pricked out, but the deeper ones are necessary for pricking out seedlings and striking cuttings. The supply of pans for pricking out seedlings may be eked out by the use of shallow boxes, such as those in which many bedding plants are offered for sale.

Having considered the compost and the pots, the next question is the potting bench or table. Professionals, of course, have a potting shed and a massive bench, with every convenience at hand. Certainly some sort of cover is necessary for keeping composts from becoming wet after they have been made up, but those who have no such convenience may do a great deal with a stout table against a wall—in a corner by preference—with a shelter over it, or a movable protection of some sort, to keep the compost dry. If the table is not sufficiently substantial to stand the strain of firm potting, in addition to its other load, a stool some two or more feet high, should be handily placed by its side for the purpose. There is room in this matter for the ingenuity of the amateur, not only for making himself comfortable at his work, but for providing himself with the conveniences that are necessary for efficient potting. A shelf near the table or bench is almost indispensable for holding various small things which are constantly needed, among which should be included two or three different types of rammers, one very effective kind being made out of the handle of an old broom or spade, rounded at one end, and chisel-shaped at the other. Different sizes of round flat pieces of wood with a handle in the centre are also very useful for pressing the soil when sowing seeds, though this may be done with the base of another pan. Labels, too, in at least two sizes, should always be ready to hand, and an indelible pencil should be kept in the box with them. A small assortment of flower sticks of such sizes as are often wanted when potting plants should be included among these small things.

Trifling as it may seem, boxes of graded potsherds are one of the greatest conveniences and time-saving accessories at the potting bench. One size should be suitable for thumbs and sixties, another size for the general run of pot plants, while, if large plants are grown in pots, a stock of larger pieces should also be kept handy. Near akin to this there should always be some peat or fibrous turf for putting over the drainage, while a store of quarter-inch bones is useful for the same pupose, as well as for mixing with the soil of hard-wooded plants, and those which will occupy the pots for a lengthened period.

Alger Petts.

**Eupatorium petiolare.**—Most of the eupatoriums are of value for the supply of cut flowers, especially during the winter months. The blossoms of all of them last well in water. One that I like very much is that which was distributed under the name of Eupatorium petiolare, but which is now known as E. Purpusi monticola. It has an upright, freely-branched habit, and the flower heads, like little daisies, are pinkish at first, but become white after expansion. —T.

## EVERGREEN SHRUBS WITH SHOWY FLOWERS.

One is often appealed to for a selection of evergreen shrubs with showy flowers, the height being limited to six feet or thereabouts. Where rhododendrons and their allies thrive it is an easy matter to compile a long list of suitable subjects, but where these are not available the choice is far more limited than it is by the uninitiated considered to be. The chief subjects that, outside of rhododendrons and plants of that nature, can be confidently recommended for the purpose are: Berberis aquifolium and its several varieties, whose golden flowers are not only very showy in the spring, but in autumn the leaves acquire a more or less bronzy or reddish tint. B. Darwini is one of the most handsome evergreen shrubs we have, the rich orange blossoms being borne in the greatest profusion during the month of May, while in some cases a fair crop is borne again during early autumn. This will considerably exceed the height of six feet, but it may be readily kept down to about that height. B. stenophylla, which vies with B. Darwini in beauty, has deep golden-yellow flowers. Lastly among barberries comes B. Wallichiana, a pretty and distinct species. This is a spiny shrub, which, clothed with very dark green leathery leaves, has flowers of a much lighter yellow than any of the preceding.

Choisya ternata, also known as the Mexican Orange Flower, is a shrub with the reputation of being somewhat tender, but it is really as hardy as the common laurel. The white flowers borne in clusters late in spring or early in summer have a very pleasing fragrance.

Given a warm, dry situation, there are several forms of Cistus or Sun rose that can be depended upon to produce a charming effect. Among them may be especially mentioned C. laurifolius, with large, white flowers; C. ladaniferus, in which the blooms are white with a purple blotch at the base of each petal; C. cyprius, somewhat in the same way, and C. villosus, also known as C. undulatus, whose blossoms are of a reddish-purple colour. Their near allies, the helianthemums (rock roses) are beautiful, free-flowering evergreens, but from their lowly stature they must be regarded rather as subjects for the rockwork or sunny bank than for the open border.

Daphnes are not numerous, the principal ones that come under this heading being D. Blagayana, a small, spreading shrub with ivory-white flowers, the still smaller-growing D. cneorum, whose fragrant blossoms are of a delightful rose-pink shade, and D. neapolitana or Fioniana, a little upright-growing shrub, with clusters of pretty, rosy-purple coloured flowers.

The Rose of Sharon (Hypericum calycinum) is a pretty, dwarf evergreen for the edging of groups, clothing of banks, or even under trees. Considering its lowly stature the flowers are large, rich golden-yellow in colour, and borne in great profusion during the summer months. The lavender (Lavendula spica) is another well-known subject, whose blossoms are from their delightful fragrance admired by everyone, while the peculiar greyish tone of the foliage singles it out for notice at all seasons.

Of privets the most showy, from a floral point of view, is Ligustrum sinense floribundum, but this must be regarded as more of a sub-evergreen. L. japonicum, with dark green, leathery leaves, bears a profusion of upright panicles of creamy-white flowers towards the end of the summer. This is strictly an evergreen.

The New Zealand Olearia Haasti forms a somewhat box-like shrub, which about the end of July or in August is absolutely covered with clusters of small white daisy-like blooms. Ulex europæa flore plena (Double-flowered Furze) is a remarkably showy shrub, its brilliant golden-yellow flowers being borne in great profusion. Like the typical kind, it will hold its own even on dry, stony soils, indeed it is not seen at its best in rich soil.

The laurestinus (Viburnum tinus) is a well-known and valuable evergreen, not the least of its attractive features being the fact that, given a mild winter, its clusters of pretty, whitish flowers are borne throughout the entire season. The comparatively new Viburnum rhytidophyllum has large clusters of creamy flowers during the spring and often in the autumn months. The blossoms are certainly less showy than some of the others, but at the same time, they impart a distinct appearance to a specimen, while the bright-coloured berries and peculiar rugose leaves all command attention. The periwinkles (Vinca major and minor) are very pretty, but of a low, creeping nature, that they are suited rather as an edging to taller-growing subjects than in any other position.

In particularly favoured districts the choice is less limited, for beside those mentioned above may be noted the Chilian Berberidopsis corallina with drooping berberis-like flowers of a bright crimson colour; Carpenteria californica, with willow-like leaves and white flowers; camellias of sorts, which are hardier than many consider them to be; Desfontainea spinosa, which in foliage mimics a holly, but has tubular-shaped, scarlet and gold flowers; Fabiana imbricata, a heath-like shrub with pure white, tubular-shaped blossoms; Grevillea rosmarinifolia, and G. sulphurea, the two hardiest of the grevilleas; olearias of sorts, more tender than Olearia Haasti; Ozothamnus rosmarinifolius, with long shoots studded with small white flowers; and Tricuspidaria lanceolata, which is also known as Tricuspidaria hexapetala, T. dependens, and Crinodendron Hookerianum. This has bright red, globular flowers of a pendulous nature, suggesting cherries hanging on long stalks, and remarkable for their distinctness and beauty.

The different garden varieties of veronica are, in many districts, especially near the sea, delightful flowering evergreens, but in some localities they are very liable to be injured during the winter. The New Zealand Veronica Traversi is much hardier than the garden varieties of V. speciosa, and is largely grown as a hardy shrub over a considerable portion of the country. Good examples of this dense-growing and free-flowering species may often be seen in London and suburban gardens. S. W.

---

## ALLAMANDA NERIIFOLIA.

Many people would like to grow an allamanda, so as to enjoy its rich yellow flowers, which have such a delicate fragrance, but are prevented from doing so by the lack of a tropical house. This is because the species generally seen are such stove kinds as A. Hendersoni, A. Schotti, etc., which not only require heat, but also a deal of headroom. Whilst the shrubby species, A. neriifolia, may be grown well in a warm greenhouse, it does not require an extravagant amount of room. The flowers are not so large as those of the other species, but they possess all their charm of form, colour, and fragrance, and are freely produced. The foliage is much smaller, and, as the specific name implies, is suggestive of that of the Oleander, or Nerium, as it is often called. CECIL AUBREY.

---

## FILBERTS AND COBS.

Filberts and cobnuts are well worth attention as a garden crop, and, provided they are planted in a suitable soil and position, invariably prove remunerative. Experience goes to show that when grown in exceedingly rich soil, over-exuberance is produced at the expense of fertility; while, on the other hand, good crops are the order of the day when they are given, or are planted in, sandy loam, with only a small quantity of manure. Where the natural soil is very light and porous it is permissible to add manure in liberal quantities at the time of preparation, and this may be supplemented by mulching when the trees are in full bearing.

It is necessary to say a word as to clayey loams, which often rest upon pure clay, and in such cases special preparation should be made by placing a quantity of brick-bats, clinkers, cinders, etc., at a depth of two feet. This layer of drainage material should be at least eight inches in thickness, and further, if builders' rubble can be procured, it may be incorporated with the soil on its being filled in about the roots. Planting may be carried out at any time from October to February, and young trees or bushes with a clean stem of two and a-half feet should be selected. Care must be taken that they are not planted deeper than they were in their nursery quarters, the line of demarcation being plainly seen. They should be arranged at least ten feet apart, and an important point is to thoroughly solidify the soil around the roots, also to give a support until established, to prevent them being swayed by the wind. The time and labour involved in training and pruning the nut bushes will be well repaid, and the correct method is to train out about a dozen of the best growths eighteen inches apart, securing them to a wooden hoop fastened to a stake. This will lay the foundation of well-balanced specimens, while the thin disposition of the branches allows the free entry of sun and light.

Subsequently, growths that show signs of over-luxuriance, as also those which tend to crowd the central parts of the trees, should be removed, not forgetting that the small spray or lateral growths are responsible for the fruit, and should only be shortened to avoid density. A word as to the fertilisation of the female blossoms, which appear at a later date than the male flowers. In view of the fact that the nut plant is monœcious, it is very necessary that a sufficient quantity of the latter are left to supply pollen when the threadlike styles of the minute female flowers are protruded for its reception in early spring.

One often sees nuts being harvested long before they are properly matured, which results in shrivelling; in fact, they are rendered comparatively worthless. The proper time is clearly indicated by their dropping freely from the trees, and, with respect to varieties, some exceptionally fine kinds have been raised and placed in commerce in recent years. Amongst cobs Merveille de Bollwyller and Bergere are tremendous croppers, while the old Kentish Cob is of great merit. In filberts, Prolific, Red Exhibition and White ditto are fine indeed.

WALTER H. AGGETT.

---

**Peristrophe speciosa.**—Though the flowers of this acanthaceous plant, which are magenta-purple, are not among the popular colours of the present day, it is for all that a very useful subject for flowering in the warm greenhouse, where it will maintain a succession of blossoms throughout the winter months. It is of very easy culture.—S. W.

# WORK FOR THE WEEK.

## THE ORCHID HOUSES.

ZYGOPETALUMS.—Most of these plants are now growing freely, and must receive water at the roots whenever the compost becomes dry. Z. Mackayi, perhaps the best-known species, produces its strong flower-spikes at this season, and must not be allowed to suffer from want of water. When flowering is over, the plants may be repotted should they require it. Owing to the large quantities of water they require when in full growth, it will probably be advisable to repot them, as the thick fleshy roots resent a sour and decomposed compost. The majority of the species are free-rooting and easily grown, and require a fair amount of pot room, with a good depth of compost and ample drainage. A suitable potting compost is the kind advised for green-leaved cypripediums. Z. Mackayi, Z. crinitum, Z. Lindeni, Z. Clayi, Z. Protheroeianum, and several others, grow well in a warm shady corner of the warm intermediate house, elevated at this season of the year near to the glass to receive as much light as possible. Z. Maxillare and Z. m. Gauteri will thrive under the same conditions, but instead of being grown in a pot, are found to thrive best on the pieces of tree fern they are usually imported upon. The rare Z. Balli, now in flower, requires a course of treatment identical with Z. Mackayi. Z. Gautieri is now at rest, and should be suspended from the root in the same house, and be kept moderately moist at all times. The intermediate house is also the best place to grow such bigeneric hybrids as Zygo-colax Veitchi Z.-c. Wiganianum, Z.-c. Amesianum, and Z.-c. Charlesworthi. Zygopetalum rostratum and Z. Roeblingianum should be grown in the warm, moist, plant stove, whilst Z. Burkei requires cool house treatment. The miniatures, Z. citrinum (Promenæa), Z. Rollisoni, and Z. stapeliodes also thrive when suspended from the roof of the cool house.

MILTONIA VEXILLARIA.—Plants of this and of M. Bleuana, now in full growth, should be in a light position, close up to the glass in the intermediate house. They should have water afforded them whenever they become dry, but care must be taken that they do not receive it in excess, as there is great danger of the plants losing their roots, the leaves turning black, and the whole plant decaying. Examine them from time to time and liberate any leaves which adhere to each other, and any sheaths at the base of the half-made bulbs, which prevent the new roots entering the compost may be removed.

CLEANING PLANTS AND HOUSES.—This work should be pushed on, and it is advisable to examine every plant, and wash the houses both inside and out. When doing this work every care should be taken to thoroughly cleanse the laps of the glass from all dirt and slimy matter. This not only admits more light, but allows atmospheric moisture that condenses to easily pass away between the panes of glass, and so prevent drip. During this cleaning we get to know exactly the condition of every plant, and, should any want repotting shortly they should be set on one side.—J. T. BARKER, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

PRIMULAS.—Probably at the present season the primulas are the most popular plants we have in bloom. They remind me of the lovely sweet peas, which have no respect for persons, for, whatever may be the status of the cultivator, they yield a bountiful harvest of their beautiful flowers in return for the labour bestowed on them. Primulas delight in a warm buoyant atmosphere with a fair amount of moisture. The roots being very fine, the plants are consequently good feeders, and need liquid manure for their sustenance. This should be given twice weekly, and sheep or deer droppings or fowls' manure, collected and placed in a tub makes a splendid liquid, as also does a bushel of soot placed in a bag and immersed in a tub of water. It is a safe proceeding for most plants to allow the tub to stand full of water for a fortnight before using, the liquid may then safely be used without further dilution, provided when one canful is taken out another of clean, soft water is added, whereby the tub will always be full. In the use of liquid manure, we presume the tub is always standing outside. Therefore the cans containing the liquid manure must be stood in a warm mushroom house, or in the house in which it is to be used, to bring it to the same temperature as the house. There are many varieties available for conservatory decoration, and, although differing greatly in habit and appearance, possess much beauty. We have Primula sinensis in its double and single forms. Then there are the Stellate, or Star primulas, which of late have been greatly improved; and we now have almost every colour imaginable.

PRIMULA OBCONICA, which also has been greatly improved, ranks next in merit. Groups consisting of separate colours are strikingly beautiful. It is unfortunate that this primula has the reputation of being poisonous to some who touch their leaves, and in case certain individuals who have handled them have had a bad attack of eczema, I must, however, say, in favour of the plant, that such cases have been few and far between. Primula Kewensis is another good form, its spikes of yellow, sweetly-scented flowers giving us the colour we so much need at this season.

CLARKIAS.—Although generally classed as half-hardy annuals, clarkias are splendid subjects for conservatory decoration. Seeds should be sown now in gentle heat, and when the plants are up they should be placed on a shelf near the light and encouraged to grow steadily. When large enough to handle they should be put into 3in. pots, and as the plants develop they should be shifted on until eventually they reach 24's. Clarkias like a rich compost, and must be grown cool with plenty of light and air. They should not be pinched, but allowed to grow naturally. The best varieties for pot culture are Sutton's Delicate Pink, Double Salmon, and Firefly.—LEWIS SMITH, Cadland Gardens.

## HARDY FRUITS.

THE APRICOT.—The pruning of apricot trees should be carried out at the earliest opportunity to allow ample time for the cuts to heal over before the sap commences to rise. Early pruning minimises to a certain extent the danger of gumming; further, if pruning is delayed severe weather may occur which may defer the work till the flower buds are swelling and ready to burst. The pruning of apricots is carried out on similar lines as that of the plum, and as the varieties of the latter vary considerably in their habit of growth and bud formation, so I find it with apricots; certain sorts make a compact growth, freely studded with short-jointed spurs; these may be pruned reasonably close back. Others, notably Large Early Montgamet, must be allowed more latitude, and not be pruned too close back, or a crop will not be realised. Healthy, established trees of free-flowering habit are liable to form masses of spurs which, if allowed to remain, flower so freely that a heavy strain is put upon the trees, with the general result that the embryo fruits fail to swell satisfactorily; it is therefore essential in cases of this description to substantially reduce the number of spurs, leaving, so far as possible, such spurs as are in close proximity to the wall. To take the place of faulty branches young growths from the base of the trees should be laid in. Young trees which have not filled their allotted wall space should have their centres kept well open until the wings are fully developed, it is then a comparatively easy matter to fill up the middle portion of the tree. When the operations of pruning, cleansing, and refastening the trees are completed, clear up all prunings and the remains of the summer mulch. If the trees are in need of a top-dressing, remove the soil to a depth of three or four inches, and apply some good rich loam and lime rubble, and to this may be added bone flour, if the trees are in an exhausted conditon. As the apricot is liable to loss of branches in the summer, it is advisable to keep a reserve stock of young trees to replace any losses which may occur.

THE PLUM.—As previously mentioned, the pruning, training, etc., of the plum is similar to that of the apricot, and should succeed that of last-named. Fan-training is the usual method practised, and to form a shapely, well-balanced tree the branches must be equally distributed over the wall space, and overcrowding must be strictly avoided. The lateral growth on young extension shoots may be slightly shortened back, say, to within two inches of the main growth. With some varieties it is not advisable to cut back too hard, otherwise, in many instances, no further growth takes place, and the branches are devoid of fruit spurs. When planted in congenial soil, growth may be too vigorous, and, although the young shoots may be left a reasonable length, a certain amount of shortening back must take place, both to encourage lateral growth at the lower portion of the shoot, and also to preserve the balance of growth on both wings of the tree. — W. MESSENGER, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

DIGGING AND TRENCHING.—The time has arrived when these operations should be pushed forward with all possible expedition. Whenever the weather and ground is favourable, advantage should be taken of the opportunity for proceeding with the work. When done early the soil will be greatly improved by the atmospheric influences to which it will be exposed throughout the winter. A portion of the ground should be trenched each year wherever possible, particularly for peas, beans, onions, and cauliflowers, relying on the deep-worked celery ground for the tap-rooting subjects, as parsnips, carrots, and beet. This latter area can, as the celery is cleared, be deeply dug over often through the winter to well pulverise it. During the later digging a dressing of soot, old lime rubble, and burnt garden refuse should be liberally applied, particularly on heavy soils.

TOMATOES.—The more forward of the young seedlings will now require shifting into 48-sized pots. The weaker plants in thumbs can safely be left without being repotted till the new year. Use a nice compost of two parts turfy loam, one part of leaf-soil and a dash of coarse grit. After repotting replace them on a shelf near the glass, where they will have the assistance of a temperature of 55 degrees or thereabouts; after watering in, keep on the dry side for a few weeks. Plants ripening their fruits should receive much the same treatment; once a week will be found quite often enough for applying water.

CUCUMBERS that are now fruiting must be cropped very lightly at this season to maintain healthy-bearing wood continuously. The air must contain a certain amount of humidity, the glass be kept quite clean to admit every ray of light possible, and the temperature be maintained between 60 and 65 degrees at all times.

MINT AND TARRAGON. — Introduce batches of these herbs at intervals into the forcing house or warm pits. Boxes are preferable for mint, where only small quantities are required, otherwise made-up beds are the most desirable. Mustard and cress should be sown at intervals according to requirements. Endive, seakale, chicory, and rhubarb should be introduced somewhat liberally into the forcing quarters for the approaching festive season and the New Year. It may also be very advisable to take up a quantity of the more forward-looking broccoli plants and place them in pits, or even fruit houses, for the time being, to have a good supply later on.—GEORGE ELLWOOD, Swanmore Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

## Royal Horticultural Society.

SCIENTIFIC COMMITTEE.—December 3.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Sir Harry Veitch, Messrs. A. Worsley, G. Wilson, J. O'Brien, J. Fraser, J. T. Bennett-Poë, C. E. Shea, A. W. Sutton, W. Hales, J. Odell, R. H. Pearson, and F. J. Chittenden (hon. secretary).

PRUNUS MIQUELIANA.—Mr. G. Wilson drew attention to this beautiful shrub which flowers in the open in December in Sussex and elsewhere. (See GARDENERS' MAGAZINE, December 7, 1912.) Its appearance suggests a garden origin, for the flowers are semi-double.

FERN IN BOTTLE.—Mr. J. Fraser showed a specimen of a fern, Cystopteris fragilis, growing in a bottle, in which it was found in a garden. Though this fern usually loses its leaves in July, the present specimen was still green.

ORANGE-FRUITED HOLLY.—Mr. E. A. Bowles showed orange fruits from a holly in his garden. The tree is probably identical with that referred to in Dallimore's "Holly, Yew, and Box," under the name Ilex aquifolium fructa-aurantiaco. It is there suggested that this is a seedling from the yellow-fruited variety, and the tree in Mr. Bowles's garden is apparently of similar origin.

LÆLIA PUMILA × LÆLIO-CATTLEYA OPHIR (LÆLIA XANTHINA × CATTLEYA AUREA).—Mr. G. Wilson said this hybrid with cream-white sepals and petals and purple labellum was raised by Mr. R. G. Thwaites, of Streatham Hill, and was shown by him in support of his hypothesis that white flowers are produced by a mixture of red, blue, and yellow.

The committee will not meet on December 17, there being no show on that day.

## National Dahlia Society.

The annual general meeting of this society was held in an "upper room" at the Hotel Windsor, Westminster, S.W., at four o'clock on Tuesday, December 10. The President, Mr. George Gordon, V.M.H., occupied the chair, and there were less than a score of members, chiefly officers and committee, present.

After the reading of minutes, etc., the Report of the Committee for 1912 was presented as follows:

The Society held one large exhibition at the Crystal Palace on Tuesday and Wednesday, September 17 and 18, 1912, and this proved to be successful, a large number of amateur exhibitors being present than in the previous year.

Your Committee offered a gold, a silver-gilt, and a silver medal for competition at the Royal International Horticultural Exhibition held at Chelsea, in May, 1912. There were two competitors, and Messrs. J. Stredwick and Son secured the gold medal.

Three joint committee meetings, consisting of members of the Royal Horticultural Society and the National Dahlia Society, were held at the Royal Horticultural Hall, for the purpose of making awards to new seedling dahlias. A large number of varieties were presented, and several certificates granted.

Continuing the policy adopted last season, a Conference on Dahlias was held at Carr's Restaurant, 264, Strand, on March 8, 1912, when papers were read by Mr. George Davidson on "The Cultivation of Cactus Dahlias in a Town Garden," and by Mr. J. B. Riding on "Collarette, Pæony-flowered, and Decorative Dahlias." The conference was well attended, and a useful discussion followed the papers.

Your Committee, believing the Society should continue to give attention to all types of the dahlia, and especially to dahlias suitable for garden decoration, recommend an exhibition, a conference, joint meetings of the R.H.S. and the Dahlia Society to consider new varieties, and a Year Book for the ensuing year.

It is with deep regret that we have to record the early demise of Mr. F. W. Seal, who has been for many years an ardent supporter of the Society, and who was well known as an exhibitor and raiser of new varieties.

The thanks of the Society are largely due to the Crystal Palace Company, the readers of papers at the conference, to the judges, and all others who have so kindly assisted in the work, and to the horticultural press for its willing and ready assistance.

The President moved the adoption of the report and financial statement (the latter subject to audit), said the society had not made the progress it should have done, and he hoped that every officer and member would wake up and recognise their responsibilities, so that the membership might increase largely in the future. He advocated the claims of dahlias suitable for garden decoration because, while he had a great love for all exhibition flowers, he felt that unless the dahlia held a high position in the garden it failed in its usefulness. The society should appeal to all tastes in respect to dahlias, and so enlarge its membership, and also its usefulness; but to tie itself down to any particular type, or confine its attention to exhibition flowers only, would be fatal. He urged that the regular issue of a Year Book was not only expedient, but necessary, as being some return for membership in the case of non-exhibiting members. He referred to the offer of a 75-guinea challenge cup by Mr. R. Cory, for a display of dahlias for garden decoration by traders, and a possible 25-guinea cup for amateur exhibits on similar lines, and he hoped that the society would be able to so arrange matters as to accept this generous offer. Mr. Wyatt seconded the proposal formally, and expressed a hope for better times for the society.

Mr. J. S. Brunton moved thanks to officers and committee. Mr. George Gordon, V.M.H., was re-elected president, Mr. Joseph Cheal was re-elected chairman of committee; Mr. John Green as treasurer; Mr. J. S. Brunton was added to the list of vice-presidents; and Mr. J. B. Riding was unanimously elected hon. secretary in place of Mr. Hawes, who has been felt compelled to resign owing to pressure of business; and Mr. J. Harrison Dick was elected auditor of accounts. New members of committee elected were: Messrs. J. S. Brunton, H. Shoesmith, A. H. Farmer, E. F. Hawes, Vasey, W. G. Valentine. Mr. Caselton was appointed show superintendent at the Crystal Palace.

It was decided that in future the society's accounts be closed each year on October 31. The meeting closed with thanks to the president.

## Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 3rd inst. Mr. Massie, the president, was in the chair, and there was an attendance of 80 members.

The meeting was an "open" one, and was devoted to a discussion on the following questions: (1) Is galvanised wire and wire netting injurious to fruit trees? (2) In judging leeks "as grown for market," in what order should their relative merits be considered? (3) What are the advantages of sterilising soil? (4) Has the grass herbage any influence in intensifying the colour of the fruit in orchard-grown apples? (5) What causes luminosity when a light is applied to the inflorescence of Dictamnus fraxinella? (6) How is multiplicity in the flower spikes in the bulbs of some varieties of hyacinth brought about? (7) What is the "English" elm? and (8) What is a spray?

No one had observed any injury to fruit trees from the use of galvanised wire or wire netting. It was pointed out that market leeks could not be judged from the same standpoint as those produced by the private grower. The primary consideration should be weight, but freshness should be considered. The question of blanching did not count, as it would not pay the growers to put so much labour on the crop. The third question gave rise to considerable discussion, but beyond statements of the facts which have been published regarding sterilisation no new points were brought out. The influence of grass herbage on the heightening of the colour of orchard-grown fruit also gave rise to some discussion, but no definite conclusion was arrived at. The possibility of the formation of dew being facilitated by the grass covering, and of this having some effect on the fruit was suggested, as was also the fact that in a moist climate like that of Ireland apples coloured well, and that the moisture might have something to do with it. Their earlier ripening on grass land was attributed to the drier condition of the soil at the roots of the trees. It was agreed, however, that, from all points of view, it was inadvisable to have a grass covering over the roots of fruit trees. A note was read detailing some experiments by Sir Edward Thorpe in connection with the luminosity produced from Dictamnus fraxinella, from which it appeared that the glands with which the inflorescence is covered are really exceedingly brittle ducts, which are filled with an essential oil, and that when, for example, a burning match is brought into contact with them they take fire; the essential oil is ejected, and the flame is enlarged and made more luminous by its combustion. No satisfactory explanation could be given as to the production of more than one flower spike (which had been fairly common last season in such varieties as Gertrude, Grand Maitre, and Maximus, in hyacinths, but the opinion was expressed that the previous season had probably something to do with it. It was pointed out that besides the true English elm (Ulmus campestris) there was another small-leaved species, largely imported from Germany, which was being distributed through British and American nurserymen as the small-leaved elm, and that this had led to some confusion, the true English elm also being called the "small-leaved" elm in nurseries. Much diversity of opinion was expressed as to the correct definition of the term "spray" (as used in show schedules), but no satisfactory solution was arrived at.

It was stated that the profits on the recent chrysanthemum show was approximately £35, and it was agreed to hold a three-days' show in 1913, the dates to be November 12, 13, and 14. Mr. David King was nominated as president for 1913.

The annual business meeting will be held on January 14, 1913.

## Smithfield Show.

In general aspect the big exhibition held at the Agricultural Hall, Islington, from December 9 to 13, was very little different from those of former years. There were the bullocks, sheep, and pigs in their usual places, and the exhibits of implements, machinery, and all manner of farm requisites occupied just as much space as they have hitherto done, whilst in the Gallery the elaborate stands of the leading seedsmen appeared at first glance to contain just the same displays of roots and vegetables as last year.

On closer inspection, however, one soon found that there were a good many new things to be seen, and in many ways the exhibits revealed in a marked degree the great advance that has been and is still being made in the improvement of both farm and garden crops.

It has to a large extent been an unfavourable season for roots and vegetables, but, nevertheless, there was an abundance of produce of excellent quality. From the gardeners' point of view the potatoes constituted one of the principal features to be seen, and they are always seen in large quantities at Smithfield. There is not the feverish excitement that prevailed during the short-lived potato boom of a few years since, but there is much interest in the latest introductions, and during the whole course of the exhibition farmers and gardeners could be seen criticising and discussing the merits of the varieties upon the many stands.

The newest varieties of potatoes on the very attractive stand arranged by Messrs. Sutton and Sons, Reading, were Edinburgh Castle and Dover Castle, both of which are oval potatoes of fine appearance, the last-named being a lemon-coloured, and the former a white-skinned variety. Messrs. Sutton also showed Ailsa Craig onions, good mushrooms, tomatoes, and splendid turnips and mangolds, the front of the stand being nicely decorated with finely-flowered cyclamen.

Chief among many excellent potatoes staged by Messrs. E. Webb and Sons, Wordsley, were Stourbridge Glory, a long kidney with straw-coloured skin and very shallow eyes. Wordsley Pride, New Guardian, and Goldfinder, all of which possess individuality and merit.

Messrs. J. Carter and Co.'s exhibit was as attractive as ever, but probably the feature of greatest interest was the seed germinator, which was shown in full working order. This ingenious machine is really like an incubator. It has the merit of promoting germination at express speed, and the high percentage of fertility in the seeds handled by Messrs. Carter was demonstrated by the evenness with which the samples in the machine were germinating. Messrs. Harrison and Sons, Leicester, had, as usual, some good onions on their stand; and they also showed a fine kidney potato named Morning Star. Messrs. J. K. King and Sons, Coggeshall, had some splendidly-grown sugar beet and a grand lot of potatoes. Beauty of Essex was one that appealed to us, and Rentpayer was evidently named in consequence of its heavy cropping qualities.

Mr. A. J. Sole, Peterborough, showed several of the best-known varieties of potatoes; and Sir J. Llewelyn, Factor, Eldorado, and Dalmeny Beauty were just a few among the really good samples shown. A very distinct and fine-looking novelty in potatoes was Arran Chief, shown by Messrs. Kent and Brydon, Darlington. It is a round potato, with a beautiful skin. Other good varieties were The Brydon, Dalhousie Seedling, and Darlington. Mr. A. Findlay, of Auchtermuchty, exhibited on this occasion what he considers is the masterpiece of his long series of introductions. This is a late, long-keeping potato of real kidney shape and character. It is as distinctive as an ashleaf, and, being late, is a decided acquisition.

Messrs. Fidler and Son, Reading, who showed potatoes only, had a pile of King George V., which is a good serviceable kidney of splendid quality. It is a second early, rough-skinned, and shallow in eye. Dreadnought, another variety of the firm's own raising, is a good maincrop potato.

Messrs. Dicksons, Lim., Chester, showed both apples and potatoes, and also young forest trees. Messrs. Horne and Sons, Cliffe, Rochester, showed some excellent apples; as also did the King's Acre Nurseries, Lim., Hereford. The last-named firm had a fine lot of Rival, Charles Ross, Golden Spire, Bramley's Seedling, and other standard varieties. Messrs. W. Seabrook and Sons, Chelmsford, showed some excellent fruit, the colour in many of the dessert apples being very fine.

## Horticultural Club.

On Tuesday, the 4th inst., after the usual monthly dinner of this club, at which Sir Harry Veitch presided, and a large number of members and friends, including many ladies, were present, Mr. Arthur W. Sutton, V.M.H., F.L.S., gave a most interesting lecture entitled, "My Desert Camping Tour to Mount Sinai," illustrated by a hundred splendid photographs taken by him en route, and beautifully coloured.

Mr. Sutton, who takes a particular interest in the evidence afforded in favour of the accuracy of Biblical records by the actual localities to which they refer, explained at the outset that he was heavily handicapped in this direction by the shortness of the time at his disposal, and the difficulty he felt, on referring to the views he displayed, in not dwelling at too great a length on the many interesting points in this particular connection which, moreover, he felt were hardly adapted to a general audience. He commenced with a map of the region which he had traversed circuitously for some 200 miles in company with Dr. Mackinnon, the well-known medical missionary of the Edinburgh Mission in Damascus. The first visit made was to the traditional spot where the passage of the Red Sea was effected under apparently miraculous conditions by the Israelites. It would appear, however, that there are three places assigned to this, one of which, to the north, where the water is very narrow and shallow, is considered by some travellers as the most likely, as an exceptional state of tide and wind might have greatly facilitated the passage on practically normal lines; while the other two involve the traversing of deep water and a much greater distance, which only a colossal miraculous interposition could have rendered possible. The views of the desert were splendid, apparently limitless streaks of barren sand without a trace of vegetation, alternating with views of brilliantly green oases of palms, sometimes, thanks to a local supply of water and the generally warm climate, of such luxuriant growth as to be traversable with difficulty.

The general temperature varied, however, from 100 degrees in the shade during the day to very near the freezing point at night. The pervading conditions of sand and the consequent limitation to camels for transport of both travellers and their impedimenta, rendered the whole journey a most difficult one, camel riding being so uncomfortable as to compel frequent descents for a rest. Walking being in its turn equally exhausting, recourse to the camel's back for variety's sake involved no particular charm, and this, with short intervals of rest on the dry, heated plain, day after day, did but little to recommend the Sinai desert as a popular resort.

In time, however, Mount Hebron, and its associated hills of barren growth of brilliant red, interspersed with black and other coloured outcrops, everywhere devoid of even a blade of grass, began to indicate an approach to Mount Sinai, and here, of course, the Biblical records were brought home to the traveller most vividly by the character of the surroundings of these heights which are regarded as the scene of the most stupendous events. The intervening stretches of sand were here dotted with small bushes, and even one minute flower was discovered by the lecturer. At Sinai there is a monastery, at which both travellers and their cook, guide, and camel drivers had a well-earned and welcome rest prior to the return journey to Suez.

A very hearty vote of thanks to Mr. Sutton concluded a most interesting and instructive meeting.

## Beckenham Horticultural Society.

The lecture given before the above society by Mr. C. T. Watts, B.Sc., on "Lime and its Uses," was of great value. The lecturer strongly advised gardeners to attend a simple course of practical instruction in chemistry, so as to learn the nature and action of chemical compounds, whether for insecticides or fungicides, or for manurial purposes. Lime, he said, consisted of calcium and oxygen, and was also known to the chemist as a "base"; it is not easily altered by heat, and will stand 2,000 degrees Cent., while it melts at 3,000 degrees Cent., such heat being obtained only by the electric furnace. Sourness in soil was due to acidity, but lime neutralised this, and turned the acid into a salt. A good way to find whether the soil contained much lime was to pour hydrochloric acid on a small quantity of soil in a vessel, and the presence of lime would be notified by effervescence. It was of interest to learn the many uses lime is put to; it is used in the making of mortar and cement, in the manufacture of glass, and in preserving eggs by means of "waterglass," which seals the shell against air and decay. In the purification of gas we have a useful product in gas lime; in the manufacture of leather lime is used to clean hair off hides; and in the making of insecticides lime is used, while in horticulture and agriculture its value is well known.

## Bournemouth Gardeners' Association.

DECEMBER 3.

On the above date Walter Child Clark, Esq., F.R.H.S., of Michelgrove House, Bournemouth, gave a very interesting lecture on "Thirty-five Years amongst Roses" to a large attendance of members and the public.

There was added interest in this meeting, owing to the fact that many old and new varieties of roses were shown on the screen in their natural colours by Dr. George G. Hamilton. This gentleman has advanced very far in colour photography, and recently gave a lecture on the subject, and showed some beautiful coloured photographs at Vincent Square, Westminster.

At the Bournemouth meeting, Dr. Hamilton showed charming photographs in colours of Fremontia californica, Oriental poppies, kniphofias, rockeries, herbaceous borders, and cattleyas.

Mr. Clark said he commenced the cultivation of roses near Liverpool, thirty-five years ago, by growing six plants in pots, all teas. He then had some houses built, and planted roses in beds. At the end of June, after the first lot of flowers had appeared, the roof lights were taken off, and the plants fully exposed to the weather until the end of November when the lights were replaced. He came to Bournemouth about eleven years ago, and, as he did not wish to destroy the numerous pine trees in his garden, he trained many climbing varieties to their trunks and formed beds in various positions, the total numbering nearly seventy.

The lecturer dealt in detail with reference to many old and new varieties, and strongly recommended growers to give their trees two dressings in winter as a preventive of mildew, rust, and other diseases of the leaf. He also referred to the greatly improved methods of exhibiting roses in these days, and said it was a great advantage to would-be cultivators to be able to see, at exhibitions, the foliage as well as the flowers. He had found that those varieties possessing thick, smooth, glossy leaves were the least liable to the attacks of mildew.

A free discussion followed on budding roses, lifting, and transplanting old standards, training, and pruning. Numerous questions were ably answered by Mr. Clark, to whom, Dr. Hamilton, and the president (J. H. Ralph Smythe, Esq., J.P.), very hearty votes of thanks were passed. Begonias, ferns, calanthes, and primulas were exhibited by Messrs. Heath, Pearce, Evans, and Povey, and a lovely bowl of December roses by Mr. Clark.

## Reading Gardeners' Association.

There was an excellent attendance of members at the Abbey Hall on Monday evening. The President occupied the chair, and Mr. H. Costin, of the University College Fruit Station, Shinfield, gave an excellent address on "Small Fruits."

The lecturer first dealt with the preparation of soil for small fruits generally, advising double digging as a minimum preparation unless the site had previously been well prepared for the growing of some other crop. In the process of preparation in the case of heavy soils, as much road grit or opening material should be worked into the under layer in order to assist aeration and the percolation of water. He advised that stable and farm manure, particularly where the supply was limited, be kept as near the surface as possible, if not actually applied as a top dressing or mulch after planting, or a good deal of the manurial value might be wasted in the drainage long before the roots reached it. Heavy soils should be prepared early in the autumn or in spring while in a moderately dry condition.

Strawberries, raspberries, loganberries, currants, and gooseberries were respectively treated on, Mr. Costin giving his experience on the most important points in their cultivation. The life history of the more important pests was given and remedies calculated to control them named.

The discussion that followed was one of the best of the session, numerous questions being put to Mr. Costin with reference to methods of planting raspberries, the use of basic slag on light and heavy soils, the pruning of gooseberries, the applications of insecticides, etc. Mr Costin, who is to be congratulated on the way he emerged from the criticism in this, his maiden effort, received a hearty vote of thanks.

A fine exhibit of vegetables was staged by Mr. H. G. Cox, of Messrs. Sutton and Sons, and was of great educational value, the numerous enquiries relative to the growing of onions, beet, carrots, parsnips, etc., being readily replied to by Mr. Cox.

## GARDENING ENGAGEMENT.

Mr. H. T. Martin, for some years head gardener at Warren Wood, Hatfield, has been appointed head gardener to the Princess Frederick Leopold of Prussia, at Potsdam, Germany.

**Kleinia Galpini.**—This pretty South African composite was introduced about twenty years ago; but, despite its desirable qualities, it has always been an uncommon plant. It first flowered at Kew, and has been noted there many times since. It forms a freely-branched specimen that will reach a height of eighteen inches or thereabouts. The stems, as well as the pretty glaucous leaves, are of a succulent character. The flowers, which are borne in dense heads, about an inch across, are of a bright orange colour, and, being freely produced, a well-flowered specimen is very effective. It is a plant of easy propagation and culture, if care is taken to guard against an excess of moisture, especially during the summer months. The temperature of a greenhouse is essential to its well doing.—K.

## PERPETUAL CARNATIONS.

The following is the text of the paper on "Perpetual Carnations," read by Mr. J. Gardner at the Carnation Conference held under the auspices of the Perpetual Carnation Society on the 4th inst.:

The perpetual-flowering carnation, as we now know it, is essentially a modern plant, and is fast gaining the position of the premier winter-flowering subject for the production of cut blooms, for it is during the dull days of the year that it is most appreciated and valued. Its popularity is chiefly due to its especial beauty and utility for decorative purposes in a cut state, and to the persistent manner in which it has been so artistically displayed at exhibitions by nurserymen and others, who appreciate and know its manifold charms.

### Value for Decorations.

When used in a cut state for the purpose of adorning reception rooms, dinner tables, etc., the carnation is unsurpassed by any other flower, and but few blooms of other plants continue in a fresh condition when cut and placed in water for so long a period. These qualities alone are sufficient to render it popular, without taking into account its easy cultivation, for I maintain that when its requirements are understood, it is not a difficult plant to grow. For this reason I would especially recommend it to amateurs, as I feel sure that no plant would give better returns, and be conducive of greater pleasure.

It is truly called perpetual, for the same plants can be had in bloom for twelve months, and if they are well managed good flowers will be produced during the whole time, which fact alone ought to gain for the perpetual carnation a prominent position in gardens where the production of cut flowers in quantity is a necessity. As regards its improvement, I will say little, as the fact is self-evident to all who have followed it for a few years that there is every probability of its improvement continuing until the perpetual-flowering carnation becomes a model of all that is perfect and beautiful. Not only do modern varieties produce superior blossoms, but in many cases the habit of growth and the constitution of the plants are distinctly in advance of the old-time favourites.

Cross fertilisation for the purpose of obtaining new varieties would require a paper in itself, so I do not intend to discuss the matter here; but those who are engaged in it know the amount of patience and attention required, and the very small percentage of seedlings that are of any merit as improvements on the old varieties. A matter that might be taken into consideration is the production of varieties with sweet scent; for, although a bloom may be perfect in shape, and the plants possess every good characteristic, if the flowers are scentless they are destitute of a most delightful charm. Whether they possess smooth-edged petals like May Day, or serrated edges like Baroness de Brienen, is really not an important matter, as there is room for both types, each appealing to different tastes.

### Commencing their Culture.

When commencing to grow perpetual carnations, it is essential to devote a suitable house to them, for I believe there are more failures through attempting to grow them under unfavourable conditions than from any other cause. It is impossible to grow carnations well in an indifferent greenhouse among a miscellaneous collection of plants, for carnations love light and air, and it is necessary to provide these essentials if one is to excel in their cultivation. A good style of house for the private grower is a span roof one, provided with a centre stage, and a stage all round next to the outside. The house should face to the south so as to obtain the maximum amount of sunshine during the winter, and be fitted with a 4in. flow pipe under the outside stages, with the returns conducted under the centre stage to maintain the requisite temperature in winter. The stages should be covered with fine shingle, or small cinders with the ashes sifted out. Both top and bottom ventilators must be made to open outwards to the fullest extent.

The best way to make a start is to procure some strong plants in small pots, from a nurseryman who makes a speciality of the section. These can be obtained early in March, and if correctly treated will make fine bushy plants that will commence to flower in October. In subsequent years, with the exception of purchasing any novelties that are required, it is preferable to raise one's own stock. The best time to commence this work is during the latter part of December, and from then until March the process may continue. Cuttings rooted after March are not forward enough to make good plants to bloom early in the following winter.

It may be worth mentioning that we obtain good results by propagating in August, taking the cuttings from plants growing in the open garden. The growths are generally firm and well matured at that season of the year, and we have found them make better plants than those rooted in the winter. By propagating in August, strong plants in 60's are obtained by October; these are kept in a cool house during the winter, and after the turn of the year are potted on, and grow away rapidly.

### Propagation.

The method of propagation I advocate is intended for private growers who only require a few hundred plants, as market growers, who produce many thousands, have their own special methods. When taking cuttings, it is essential to obtain them from plants that are vigorous and free from disease, so as to ensure the continuance of a healthy stock. Those from the centre part of the stem are the best; they should be removed when about 3in. long, and prepared in the usual way. It is most important to take really good cuttings, as weak, thin growths fail to make good plants. We obtain good results by inserting them singly in small thumb pots filled with a fine compost consisting of loam, leaf-soil, and silver sand in equal parts. Plunge the pots in fibre in a propagating frame, with a bottom heat of 60 degrees and a overhead temperature of 55 degrees. Give them a thorough watering in with a can to which a fine rose is fitted, and keep the frame fairly close until they are rooted. Just admit a little air in the morning for an hour or two, and at the same time dry the glass to remove condensed moisture.

It is desirable to shade the cuttings lightly from bright sunshine, and give a gentle spray with the syringe if required. Under such conditions they root readily in from three weeks to a month, when they should be gradually exposed to more air. Of course, this treatment varies a little according to circumstances. Shift the young plants on into 60's, using more loam and less sand in the compost, but make sure that they are moist at the root before being potted, and grow them on in a temperature of from 50 degrees to 55 degrees.

Some growers prefer to root their cuttings

→ Spraying ←
The question to-day is not "**Shall we Spray,**" as every gardener knows he **must** Spray, but "What machine or syringe shall I spray with?" All the world answers, Use **only** the **reliable** tested "FOUR OAKS"

which have won **30** Gold & Silver Medals, many in open competition with other makes. The machine illustrated is the Four Oaks Gold Medal Knapsack Sprayer, **45/-**. No rubber valves. Complete Catalogue of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers—**THE FOUR OAKS SPRAYING MACHINE CO., No. 3 G, SUTTON COLDFIELD.**

in sand only, and by this means more can be propagated in a given space. When this method is followed, the frame has a 3in. layer of firm, moist sand in the bottom, and the cuttings are inserted in that until rooted; but taking into account the fact that they have to be put into very small pots before they can be moved into the 60 size, it is doubtful if there is any advantage. When they are rooted in pots they can be shifted on without the roots being disturbed at all, and in consequence there is practically no check to growth. When the young plants are 5in. or 6in. high, pinch out the tops to induce them to produce side shoots, and form a bushy habit. They may also be stopped again later, but not after the end of June.

### Repotting and Watering.

The next move will be into 48's. For this potting, a compost consisting of three parts good fibrous loam, one part flaky leaf-soil, with the addition of sufficient silver sand and broken charcoal to keep the compost sweet and open is recommended. Add a 32-sized pot full of some approved carnation manure to each bushel of the compost, and mix well together. When preparing the loam pull it to pieces by hand, as this enables heavy lumps to be removed, and also permits the operator to pick out any wireworm that may be in the soil. Pot firmly, but take care not to place the plants too deeply—they should be the same depth in the soil as before; deep potting is sometimes the cause of stem rot. Provide temporary support when required, and grow the plants on in the same house until the end of April, when they can be removed to a cold frame. Ventilate with care at first, but later on admit more air; finally remove the lights entirely, except during heavy rains.

Watering must always be carefully performed, especially after potting; allow the soil to become moderately dry, and then afford sufficient water to thoroughly moisten the whole of the compost. When nicely rooted, move the plants on into 24's, in which they will be allowed to flower, and use a similar compost as recommended before, only in a rather coarser condition.

When well established, stand them out in the open on a bed of ashes, so that they may enjoy the maximum amount of light and air; but it is advisable to erect a framework over them, on which to place lights in case of wet weather. The plants must receive support as required, and for this purpose the patent wire supports have superseded the old method of staking and tying. They enable the flowers to be cut more easily, and when affixed save a good deal of subsequent labour.

During bright weather the plants derive much benefit from being sprayed about twice a day, and this helps to keep insect pests in check, besides encouraging growth. Do not permit green fly to gain a footing, but upon the first sign of it spray the affected growths with quassia extract. As the plants become well rooted, weak soot water can be given with advantage at alternate waterings, and it may also be occasionally sprayed on the foliage.

(To be Continued.)

---

**The Specific Name of the Common Hydrangea.**—A few years ago I thought there was no doubt whatever as to the correct specific name of the hydrangea, for we were told by different authorities that it was named in honour of Queen Hortense, and should consequently be Hortensia. In recently correcting an acquaintance, however, I had a rude awakening, for I was referred to the last edition of the hand list of trees and shrubs at Kew, where, sure enough, it was given as Hortensis, with Hortensia as a synonome. This list was published in 1902, and in that of Tender Dicotyledons issued two years previously Hortensia was adhered to, and also in the first Tree and Shrub list of 1894. Such confusion makes one lose faith in our botanical authorities, with whom it seems to be a case of pay your money and take your choice.—W.

---

# ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

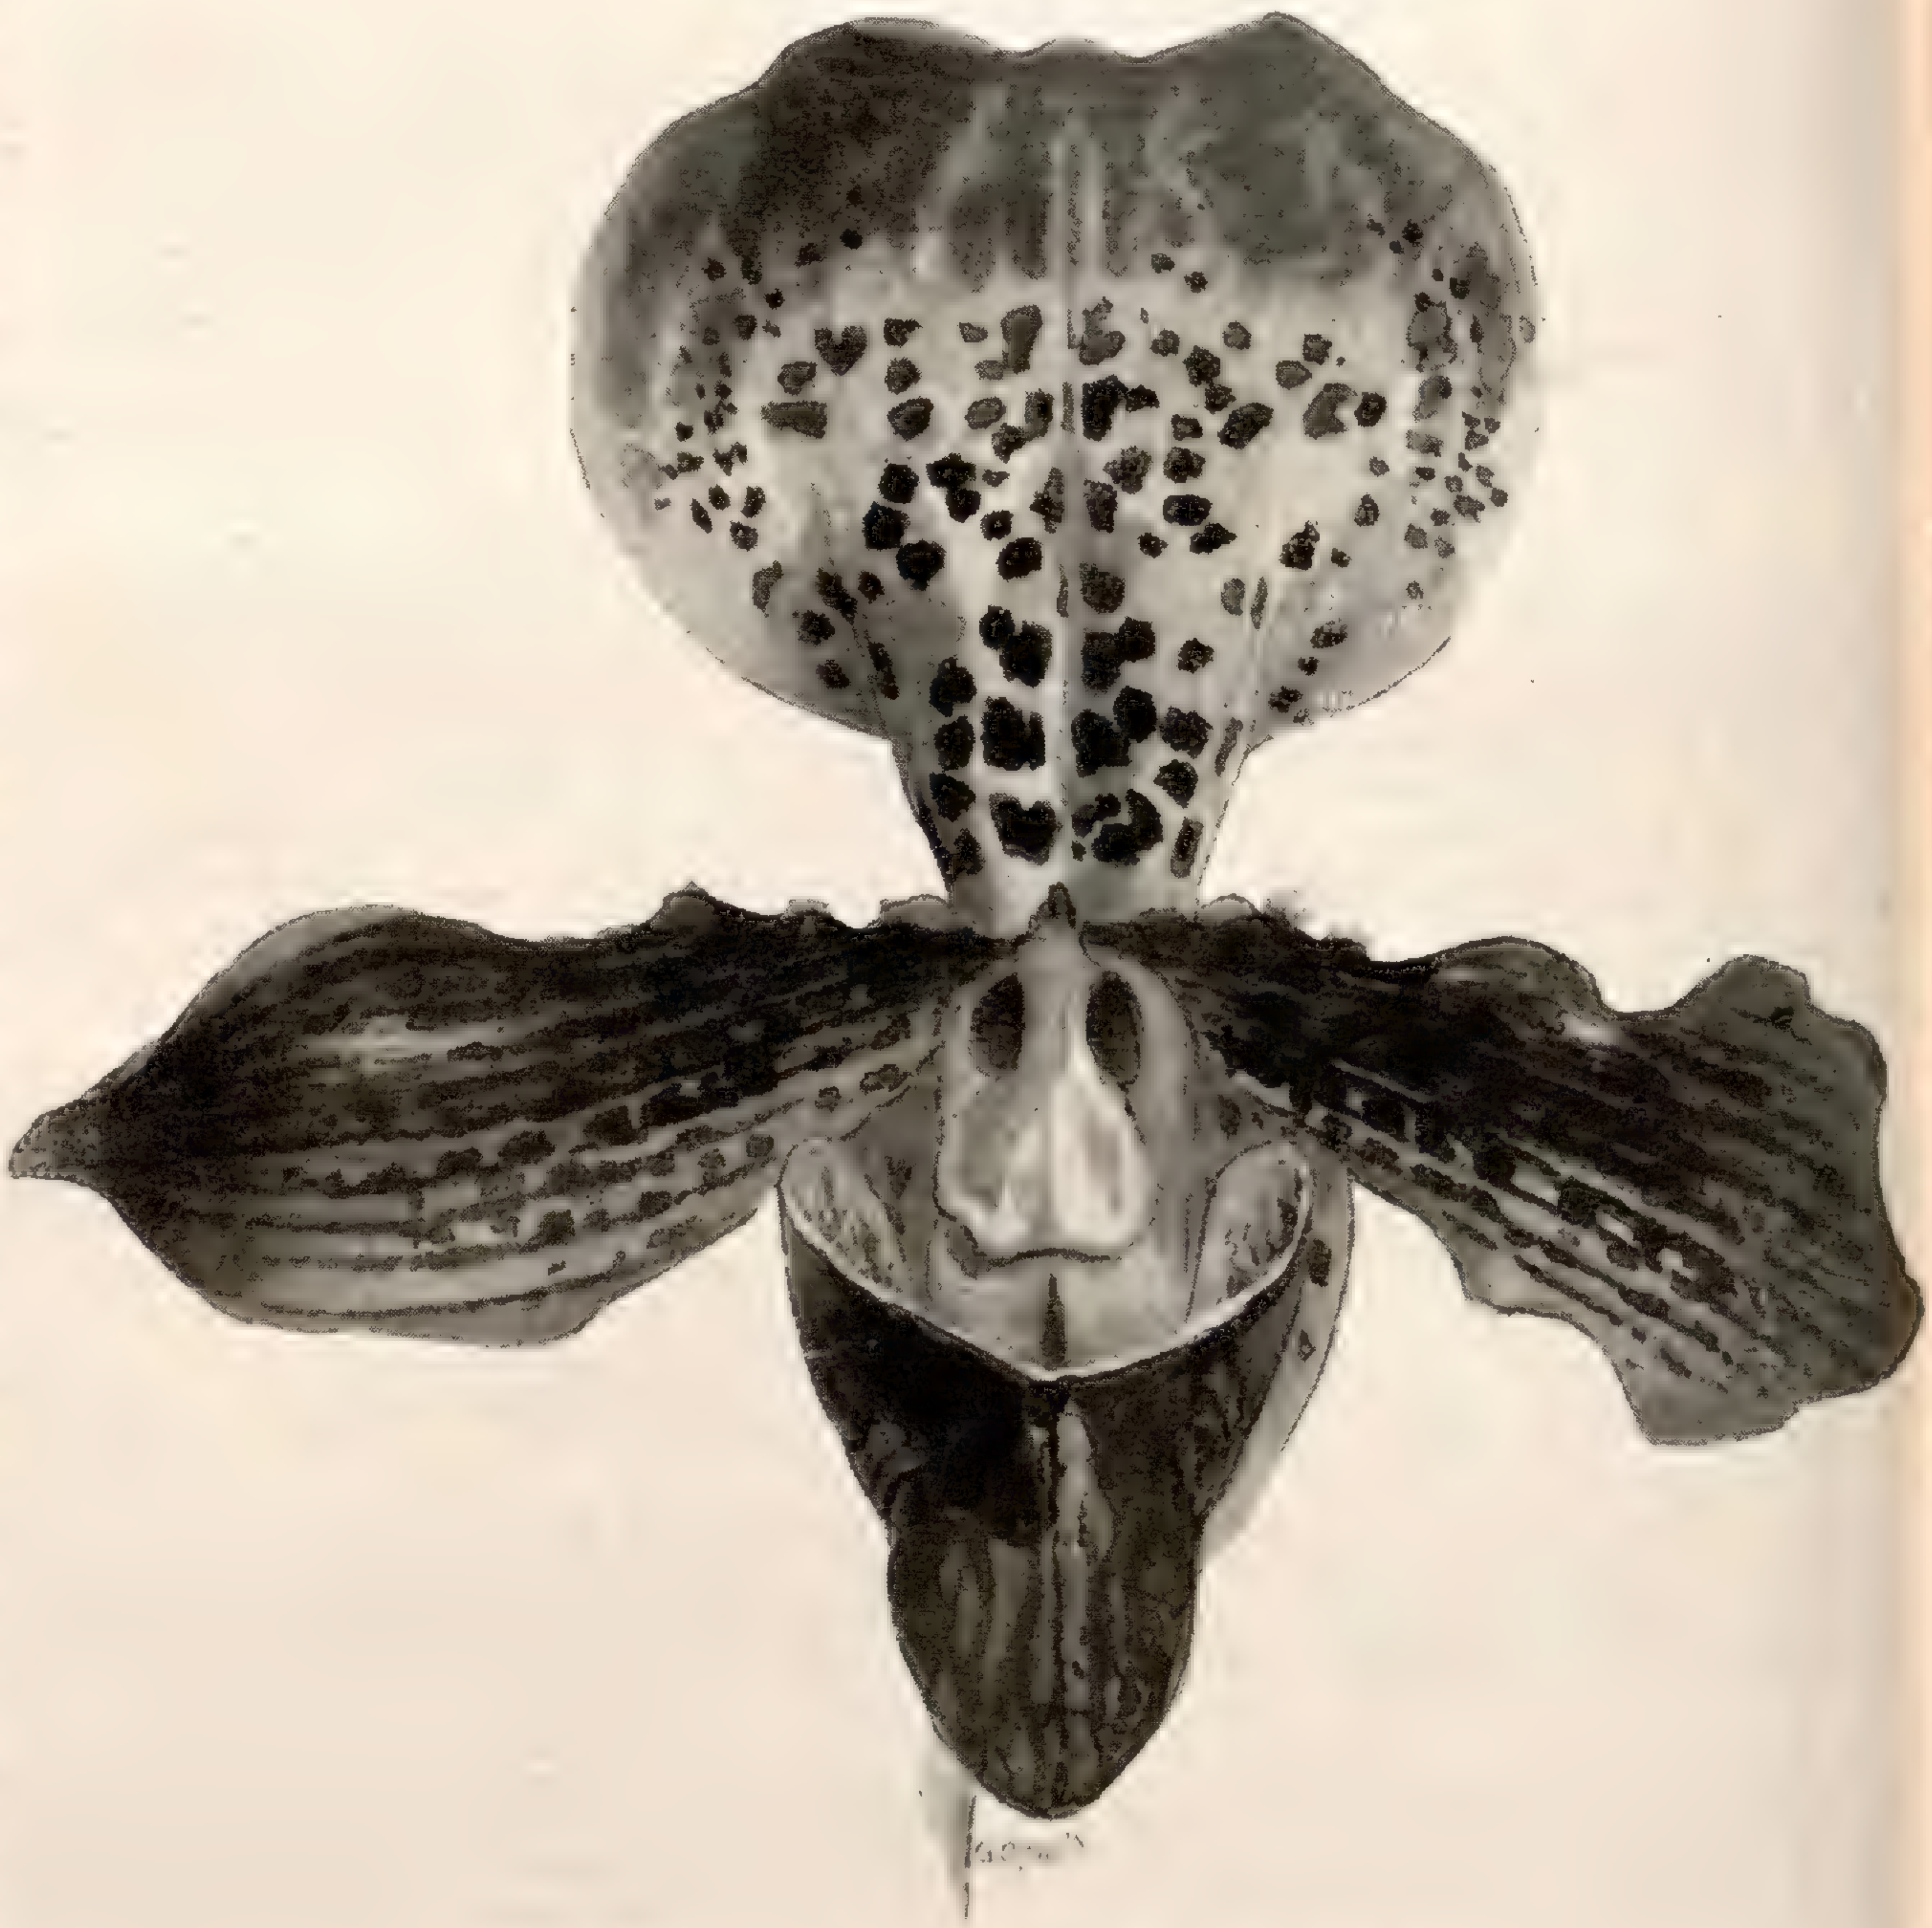
Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

---

CYPRIPEDIUM EURYADES.—N. E. J., Ipswich: I am just beginning to take an interest in winter-flowering cypripediums, and I gather from your reports of the R.H.S. and other meetings that C. Euryades is a fairly popular hybrid, and new varieties of it are frequently raised. I shall be glad if you will kindly tell a new reader how C. Euryades was raised.—S. Euryades is really a variety of C. Hera. C. Hera first flowered in 1892, and was raised by Messrs. Jas. Veitch and Sons, by crossing the fine old C. Boxalli with the hybrid C. Leeanum. About a year after C. Hera appeared, the varietal form named C. Euryades flowered, and, as a general rule, by the use of the finest forms of C. Leeanum, as parents most of the late seedlings have resembled C. Euryades more than the original C. Hera, hence the latter name is rarely used. The dorsal sepal is generally white, with a green base, spotted with purple, and sometimes blush-tinted; occasionally there is a medium purple band. The petals and lip are yellowish-green, shaded with brown, and usually brightly polished. The accompanying illustration represents a fairly good form of the hybrid, but in the very best varieties the dorsal sepal has been broadened and smoothed out right down to the base, instead of being pinched in at the base and having reflexing margins.



CYPRIPEDIUM HERA VAR. EURYADES.

CROWN GALL DISEASE IN ROSES.—W. R. G., Sevenoaks: Have you ever published an account of the Crown Gall Disease that attacks roses and some other plants? If you have, and will kindly give me the date of the issue I shall be very greatly obliged.—We published an illustrated account of the Crown Gall Disease on p. 959 of the GARDENERS' MAGAZINE of December 3, 1910.

GLADIOLUS COLVILLEI AND ITS VARIETIES.—O. B., Alfreton: Will you be good enough to tell me which are the best varieties of the early-flowering Gladiolus Colvillei for cultivation in pots, and when should they be potted?—Corms of these early-flowering gladioli should be obtained at once, and potted; use pots 4½ or 6in. in diameter, and place from six to twelve corms in each pot, according to size. A good compost consists of two parts good turfy loam, one part of leaf-soil, and a good sprinkling of sand. During the process of potting place a little sand under each corm. Good varieties are G. Colvillei, The Bride, Queen of Holland, Ne Plus Ultra, Pink Perfection, and Crimson Queen.

SOWING ASPARAGUS.—T. E., Tavistock: Please tell me the best time to sow asparagus seeds and the best method of sowing, as I am anxious to obtain crowns for planting new beds in 1914. Some of our beds are very old, and seem to have suffered from inattention, consequently we propose to purchase some planting crowns this coming spring, and make two new beds. Each following year we hope to make two new beds, and dig up two old ones, until we have an entirely new set.—The best time to sow asparagus seeds is in early April in

To W. H. AND L. COLLINGRIDGE,
148 AND 149, ALDERSGATE STREET, LONDON, E.C.

I request you to send me the GARDENERS' MAGAZINE by post every week until countermanded, and I enclose________ for________ months in advance.

Name____________________

Address____________________

Date____________

1 Year, **10/6** post free; 6 months, **5/6** post free; 3 months, **3/-** post free; to Foreign Countries, **14/-** per annum.

* * If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

thoroughly good and well-worked soil. Sow in shallow drills drawn a foot apart, and thin the seedlings early to one foot apart. If time and circumstances permit, the seedlings should be left until they have flowered and fruited, and those that fruit heavily should be rejected for permanent planting, as plants that fruit rarely or sparsely generally give the best yield of heads for cutting.

TEA-SCENTED AND HYBRID TEA ROSES.—H. W., Southwell: I shall be greatly obliged if you will, through the columns of your valuable paper, give me the names of about three dozen first-class hybrid tea and tea-scented roses, and also a few pillar roses.—Assuming that you require roses for garden decoration rather than for exhibition purposes, we give the following list of suitable varieties: H.T. roses: Antoine Rivoire, Camoens, Caroline Testout, Clara Watson, Dorothy Page Roberts, Duchess of Wellington, Ecarlate, Florence Pemberton, General McArthur, Grace Darling, Gustav Grunerwald, Irish Elegance (single), Joseph Hill, Jonkheer T. L. Mock, Kaiserin Augusta Victoria, Lady Ashtown, Mdme. Abel Chatenay, Mdme. Jules Grolez, Mdme. Leon Pain, Mdme. Melanie Soupert, Mdme. Ravary, Mrs. E. G. Hill, Mrs. Theodore Roosevelt, Pharisaer, Prince de Bulgarie, and Richmond. Tea Roses: Anna Olivier, Corallina, Mdme. Antoine Mari, Mdme. Jules Gravereaux, Harry Kirk, and Sulphurea. Roses for Pillars: American Pillar, Blush Rambler, Dorothy Perkins, Hiawatha, Mdme. Alfred Carriere, Gruss an Teplitz, Gustave Regis, and White Dorothy.

APPLE FARMING IN ONTARIO.—S. S., Worcester: Can you tell me where I can obtain information regarding apple cultivation in Ontario, as I feel inclined to start fruit farming in that province?—If you communicate with the Ontario Department of Agriculture, Fruit Branch, Toronto, Ontario, Canada, asking for bulletins on fruit culture in the province, we believe you will promptly receive the information you desire.

### NAMES OF PLANTS.

S. E. T., Chippenham.—Plumbago rosea.

C. D. W., Hertford.—1, Linum trigynum; 2, Plumbago rosea; 3, Centropogon Lucyanus; 5, Selaginella apoda.

L. E. W., Melton Mowbray.—1, Oncidium cheirophorum; 2, Masdevallia tovarensis; 3, Calanthe Veitchi—very poor colour.

F. E. B., Morton.—1, Abies Nordmanniana; 2, Ceterach officinalis; 3, Adiantum tenerum; 4, Cotoneaster horizontalis; 5, Hippeastrum aulicum.

R. C. H., Maldon.—1, Sequoia sempervirens; 2, Cupressus macrocarpa; 3, Selaginella Emileana; 4, Dracæna congesta; 5, D. Godseffiana; 6, not recognised, send when in flower.

### NAMES OF FRUITS.

F. B., Matlock.—A fine specimen of Bismarck.

S. F. E., Chichester.—1, Ribston Pippin; 2, Court Pendu Plât; 3, not recognised.

C. A., Minehead,—1, Dumelow's Seedling; 2, Egremont Russett; 3, King of the Pippins; 4, a very small fruit, probably Claygate Pearmain.

**PUBLISHING MANAGER,**
**148-9, Aldersgate Street,**
**London, E.C.,**
**who will give the matter immediate attention.**

## NOTES OF OBSERVATION.

◆

**Correa cardinalis.**—The Australian fuchsias, as the correas are popularly termed, are a very pretty class of evergreen shrubs, and need the protection of a greenhouse in this country. The flowers, which are borne in great profusion, are tubular, and of a drooping fuchsia-like character. They will often bloom throughout the winter months. Some of them are rather dull in colour, the brightest of all being that at the head of this note.—K.

**Forms of Vitis inconstans.**—One cannot fail to be struck in the autumn with the great variation in the leaf tints of this vine, which is far better known as Ampelopsis Veitchi. The very strong-growing form does not as a rule colour nearly as well as the more slender type, which takes possession of a wall by covering it with a network of slender shoots clothed with small foliage. The comparatively new Ampelopisis Lowi also colours well.—T.

**Plant Groups at Shows.**—I do not think the building up of group of plants to a great height, as seen during the present autumn, is an improvement on the arrangements of past years, say, ten to twenty years ago. I will only refer to one group, which was awarded a first prize by the judges, the owner being thus encouraged to build, it may be, still higher groups in the future. The leaves of the central palm were about 15ft. or 17ft. from the ground; the pot being raised about 10ft. to 12ft., and at this height small pot plants were grouped on a stand, and its side wings supported by other pot plants down to the ground level almost. The only part of this group, to my mind, that was attractive, was the base, which was beautifully filled with smaller plants. The base, with a graceful palm and a few other light plants in the centre, but with the pots resting on, or near the floor, would have made the most pleasing group.—G. B.

## FORTHCOMING ENGAGEMENTS.

MONDAY, December 16.—National Chrysanthemum Society's Executive Committee, 7 p.m., at Carr's Restaurant, Strand.

TUESDAY, December 17.—Royal Horticultural Society; Committee will meet at 12 o'clock, but there will be no general exhibition of plants and flowers.

National Rose Society: Annual Meeting at the Crown Room, Holborn Restaurant, corner of Kingsway, W.C., at 3 p.m.; to be followed by a Conversazione from 4.30 to 6 p.m.

THURSDAY, December 19.—Linnean Society.

WEDNESDAY, December 25.—Christmas Day.

THURSDAY, December 26.—Bank Holiday.

NEWS FROM HEADQUARTERS.

EFFICIENCY.

The continued prosperity and progression of the British Empire depend on the efficiency of all departments and individuals on whom the responsibility resolves. The diplomacy of ambassadors and the integrity of over-sea consuls is as important as the maintenance of a strong fleet, capable of immediate mobilisation, or a powerful army ready to take the field at a moment's notice. It is only by possessing departments and individuals of the highest efficiency that our heritage can be upheld.

In business, similar conditions are essential, and only those houses who adapt their systems to modern requirements can hope for continued prosperity. The up-to-date firm must be willing to scrap existing plant and methods immediately they have decided that they no longer spell complete efficiency.

We were the pioneers of "Tested Seeds," and during each decade our experts have been constantly working to introduce new methods of testing, selection, grading, and hybridisation, until at the present time, nearly 100 years after our business was established, we possess machinery, apparatus, trial grounds, and facilities which are second to none. Come and see them whenever you can spare the time.

Every department is trained to a high standard of efficiency, controlled by men of proved ability and discernment. Our resources are at your command and we undertake to cater for every horticultural necessity, from supplying one packet of Virginia Stock to 50,000 bushels of peas, and from filling a window box to laying out a thousand-acre golf course.

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
RAYNES PARK, LONDON, S.W.

## Situations Wanted.

COLONEL STEWART RICHARDSON highly recommends JOHN E. DAVIS, who has been with him for the past ten years, as Head Gardener; highest credentials as to capabilities and integrity; leaving through estates being sold. Address, JOHN E. DAVIS, Ballathie Gardens, Stanley, Perthshire.

GARDENER (good Single-handed or Head where two are kept); thoroughly experienced in Kitchen and Flower Garden, also Lawns; 12 years' experience; 5½ present situation; age 26; can be highly recommended; married when suited. F. BARRETT, Ellisfield Manor Gardens, Basingstoke.

GARDENER (Head Working, where four or five are kept). Mr. J. PROWSE, late head gardener (20 years) to the Right Hon. Lord Burnham, can highly recommend W. MANN to any Lady or Gentleman requiring a thoroughly competent man as above; age 32; married; abstainer. W. MANN, St. Hilary Gardens, Cowbridge, Glam.

GARDENER (Head Working), and Wife, experienced Laundress, seeks SITUATION; 30 years' experience in all-round gardening; 12 years in present situation as above; no family; good references. Box 70, Office of this Paper.

GARDENER, good Single-handed, or Second; married; age 28; good experience in Vines, Melons, Cucumbers, Chrysanthemums, and general routine; excellent references from previous places. W. GREEN, The Gardens, Goldicote, near Stratford-on-Avon, Worcestershire.

GARDENER, age 17½, seeks SITUATION as Under Gardener; three years' experience, Inside and Out; good reference. G. DARBY, High Street, Witham, Essex.

GARDENER (Head Working); aged 38; nineteen years' all-round experience with plant and fruit houses, lawns and kitchen garden; good references. W. BOULTON, 92, Sumatra Road, West Hampstead, London, N.W.

GARDENER (Head) seeks SITUATION, where one or two are kept, 14 years' experience in all branches, Inside and Out, in large establishments; excellent ref.; highly recommended. H. PAYNE, 59 Thorpe End, Melton Mowbray.

GARDENER (Head Working), highly recommended by present employer (H. E. Reid, Esq.); capable and trustworthy; 13 years head in present place; thoroughly experienced in Fruit, Flowers, and Vegetables; age 47; one boy, 15; life abstainer; leaving for a change. G. MARLOW, The Oaks Gardens, Walton Heath, Surrey.

**Read what our Advertisers write re "Gardeners' Magazine."**

November 27th.

Dear Sir,

I beg to say that my son has secured a situation through your paper; thanking you very much for the trouble you have taken,

I am, etc.,

B. L.

**The "GARDENERS' MAGAZINE" is the gardener's friend. Read it and recommend it to your friends.**

GARDENER (Single-handed or good Kitchen Gardener, or Pleasure Ground Man); age 28; married; eight years' experience in good places; good references. A. NEWTON, Knossington, near Oakham.

GARDENER (Head of two, or good Single-handed); single; age 25; good experience in Vines, Cucumbers, Chrysanthemums, and general routine; excellent references from previous places; leaving through no fault. J. STEPTOE, 59, Burlington Road, New Malden, Surrey. No circulars.

MR. DAVIS, Ballathie Gardens, highly recommends HENRY PITMAN as Inside Foreman; thoroughly capable, conscientious, and very reliable; age 24; leaving through estates being sold. Address, HENRY PITMAN, Ballathie Gardens, Stanley, Perthshire.

MANURES

FOR GARDEN AND FARM CROPS

*By W. DYKE.*

*Edited by T. W. SANDERS, F.L.S., Editor of "AMATEUR GARDENING."*

A book for which Gardeners—amateur and professional—have been waiting, and one which will fill a gap in many a garden lover's library. Mr. Dyke is an authority and treats his subject in a lucid and simple style that will without doubt convince the reader of its great importance. What he has to say on manures and fertilisers is the outcome of profound study, and long and practical experience. From this work you may learn why manures are needed, and obtain practical information in regard to the food of plants, the constituents and properties of natural and artificial manures and their application, with the object of increasing the quantity and quality of plants, flowers, and all garden and farm crops.

*116 Pages. Illustrated. Paper Boards 1/- net, by post 1/2. Cloth 1/6 net, by post, 1/8.*

ORDER FORM.

To the Publishers, 148 & 149, Aldersgate Street, London, E.C.

Please send me a copy of "MANURES FOR GARDEN AND FARM CROPS," by post, for which I enclose remittance of 1/2 (Cloth 1/8).

IT IS WORTH WHILE TO PLANT A PERENNIAL GARDEN.
It will be a saving in pocket and a Perennial Delight, as one season succeeds the other.
It is a garden of which you can make a *hobby*, which can hardly be said of the bedding system. Plant it with Kelway Artistic Colour Borders. Now is the time to plan them. Kelway's will save you all the trouble connected with them if you will send particulars as to area, position, soil, etc., to
KELWAY and SON, The Royal Horticulturists, LANGPORT.

"I am sending you two photos, one of my border. As regards the border, planted about the middle of April, a friend of mine, who is a great amateur gardener, saw it in August, and said that he would not have believed that it had only been planted four months. He thought that at least the plants had been there three years. I myself have never seen better plants sent out by any other firm."

---

KELWAY'S PÆONIES.
NOW IS THE TIME TO PLANT Pæonies. No garden is complete without the new Pæonies. Kelway recommend the following collection (E) as being representative of their celebrated varieties. They will give great satisfaction, and be a credit to any garden.

COLLECTION OF PÆONIES.—Agenoria, Amalthea, Czarina, Duc de Wellington, Formosa, Lottie Collins, Nycletius, Princess Maude, Splendida, Tessa, The Lancaster, Zephyrus.

36s. the dozen; good plants, true to name. Immediate delivery. Carriage and packing free for remittance with order (mentioning this advertisement).

From Mrs. ——, Vienna, Austria.
"I received some very fine Pæonies from you a few years ago that have since bloomed and been the admiration of everyone."

KELWAY AND SON, The Royal Horticulturists,
LANGPORT, SOMERSET.

---

WEEKS'S DUPLEX UPRIGHT TUBULAR BOILERS, for full advertisement see page viii.

THE GARDENERS' MAGAZINE

# NOTE OF THE WEEK.

## Lime.

Since the absence or presence of lime in the soil is often a determining factor as regards the successful growth or failure of the plants located therein, a little consideration of what it really is should be of interest. As a rule, its presence is beneficial, and in many cases essential, but there are many plants, such as rhododendrons and others, on which it practically acts as a poison, the reason of such sympathy and antipathy being quite unknown. Lime occurs geologically in several forms and many formations, such as the chalk and limestone, which cover enormous areas and are of great thickness, and found to consist almost entirely of lime (calcium) in combination with carbonic acid gas, thus forming carbonate of lime. In the chalk we find the deposit to consist entirely of the skeletons of mostly microscopic organisms which once lived in deep ocean water, whence we must assume they derived the lime which was built up into their shells or skeletons. This belief is justified by the fact that pure lime is so thoroughly soluble in water that a considerable quantity may be present in it without any detriment to its transparency, though immediately it becomes associated with carbonic acid gas, equally transparent and equally capable of permeating the water, it assumes a solid form. This we can prove by taking a vessel of clear lime water and blowing into it by means of a tube, thus introducing the carbonic acid gas which we exhale with every breath. The water at once becomes turbid and milky, and in a short time a deposit of carbonate of lime is seen at the bottom. In the formation of the chalk this association of the two elements must have been effected by the minute organisms aforesaid, the carbonic acid doubtless having been produced by vital action on the same principle as with ourselves. When, in this connection, we consider the thickness and extent of the chalk formation with which we are familiar along our southern coasts from Kent to Devon, and, passing beneath London, reappears a long way inland, and is hundreds of feet in thickness, and we are forced to attribute this immense mass to the slow deposition, at the bottom of a deep ocean, of the remains of microscopic organisms, the mind becomes paralysed in the attempt to compute the time required for the process. Still more are we incapable of grasping the extent of the changes involved in, and the time necessary for, the subsequent elevation of most of this mass from the depths of a deep ocean to some hundreds of feet in the upper air, and to remain there so long that probably a considerable part of it has been again dissolved and carried down to the ocean to be used again in like fashion. That it is so re-used is proved by the fact that new chalk formations on practically precisely similar lines are being deposited to-day in the ocean depths. The other great limestone deposits which crop up all over the world have more or less diverse origins and composition, but in most of them the evidence of organic origin is obvious in the shape of shells or skeletons, microscopic or large, though in many the process of change known as metamorphosis, due to immense pressure, heat, and molecular action, has obliterated all traces of such. Thus it is with many of the marbles, all of which are limestones proper. The pure white kinds are pure carbonate of lime in a crystalline form, the veined and coloured ones owe their tints to infiltration of iron and other oxides. In Asiatic Turkey there are ranges of mountains of considerable height of pure white marble from base to summit and of unknown depth, and, although a very varied and curious vegetation finds a footing in the hollows, to mount them on horseback is like climbing an enormous mass of pure loaf sugar. An incomprehensible fact in this connection is that every here and there in these hills, like plums in a pudding, pockets of some thousands of tons each of pure Corundum (emery) occur, as black as ink and quite sharply defined in the surrounding white. Owing to its solubility, lime formations exposed to the weather are constantly being eaten away, and thus, although the general contour of a chalk country, like the Weald of Kent, is superficially one of gentle undulation, immense caves are often formed by underground streams, and these are frequently rendered very beautiful by the stalactites and stalagmites formed within them by lime-laden droppings from the roofs, the stalactite being the overhead pendant spike-like formation, and the stalagmite the conical projection formed beneath where the drops fall. These, in course of time, connect together, forming columns and curtains and other curious associations of great beauty. Limestone formations also arise on the surface where hot springs, lime-laden, emerge, as in New Zealand, and these also form very curious and beautiful accumulations, devoid, of course, of any organic traces, and in this way showing us how other limestone strata may have originated indirectly from what may be termed organic limestone ones.

MR. C. E. SHEA.

---

**Mr. Charles E. Shea,** whose portrait we have the pleasure of giving in this issue, is so well-known to our readers for the splendid services he has rendered in the cause of horticulture that there is no occasion to refer otherwise than briefly to the work he has accomplished in the course of the well-directed efforts he has made for the advancement of horticulture. For many years Mr. Shea devoted a considerable proportion of his leisure to chrysanthemums, and both as a cultivator and raiser he achieved a high degree of success, placing himself in the forefront of the large body of amateurs who gave attention to the Golden Flower. Concurrently with his work in connection with chrysanthemums, Mr. Shea evinced a warm interest in roses, and for some years he exhibited with much success in the amateurs' classes at the leading exhibitions. Not only did Mr. Shea cultivate and exhibit with much success both chrysanthemums and roses, but he devoted some share of his attention to the management of the two leading societies associated with these flowers, and, possessing administrative abilities of a high order, he soon obtained a prominent position in the respective executives. In due course he became president of the National Chrysanthemum Society, and so admirably did he perform the duties associated with the position that the National Rose Society, on the death of Dean Hole, unanimously elected him as his successor. At that time a rule to the effect that the president should not remain in office more than two consecutive years was adopted, and consequently, at the end of the second year of his occupancy of the presidential chair, Mr. Shea returned to his position among the vice-presidents. His excellent work was not, however, forgotten, and, when a vacancy occurred in the presidency this year, by the retirement of the Rev. J. H. Pemberton, a strong desire was felt by the members of Council and others that Mr. Shea should be invited to accept office as president a second time. Practical expression was given to this desire, and, as shown by our report, he was unanimously elected president, and in the interest of both Mr. Shea and the National Rose Society, we trust his second period of office may be not less successful than the first.

**Disbudded Orchids.**—Hitherto it has been the rule of the Royal Horticultural Society's Orchid Committee to ignore a plant which carried a disbudded spike when such plant was submitted for award, but, feeling that this rule might prove some hardship, and that the members should be allowed to use their judgment as to whether disbudding had unfairly enlarged or improved the flowers presented, the committee carried the following resolution at its meeting of December 17, on the motion of Mr. de Barri Crawshay and Mr. J. O'Brien: "Awards will not be recommended to any plants, the natural size and character of the flowers of which have been, in the opinion of the committee, improved through disbudding or dressing."

**Horticultural Representation on Scottish College Board.**—A movement, originating with the members of the Scottish Horticultural Association, to have a direct representative of horticulture on the board of the Edinburgh and East of Scotland College of Agriculture, has been laid before the governors of the latter by a letter from Mr. A. D. Richardson, secretary of the Scottish Horticultural Association, and is to be considered at the next meeting. It appears that co-option is the only means by which such a member could be appointed to the governing body, but horticulturists in general will agree that it is highly advisable that some one, representing either the Royal Caledonian Horticultural Society or the Scottish Horticultural Association should be on the College Board, which, through its highly competent staff, carries out courses of instruction, conduct an experimental garden, and in other ways further horticultural education. The governing body is now to receive from the Board of Agriculture a loan of £1,000 without interest to replace an overdraft on capital account incurred in connection with the Liberton Experimental Garden.

**Popularity of Garden Roses.**—The high degree of popularity that is now enjoyed by roses of special value for beautifying the garden was evidenced in no uncertain manner at the meeting of the Muswell Hill Horticultural Society the other evening, when Mr. George Gordon, V.M.H., gave a lecture on "Garden Roses," illustrated by lantern slides. The meeting, over which Alderman Cooper, Deputy Mayor of Hornsey, presided, was held in the Wesleyan Church Hall, and this building, which seats 500 persons, was so well filled that the audience must have numbered considerably over 400, and, judging from the discussion that followed the lecture, the liveliest interest was evinced in the subject.

**National Chrysanthemum Society.**—A long special meeting of this Society's Floral Committee was held at Essex Hall on Monday, December 16, to settle various matters that had arisen in the work of this committee during the present season. It was decided to grant special market certificates and commendations during the 1913 session, and judgment is to be recorded by pointing. For this particular purpose the general scale of points will be: Colour, 20; form, 20; fulness, 10; petal, 10; stem, 10; foliage, 10; habit of plant, 20; total, 100. For single varieties the code is slightly different: Form, 20; colour, 20; petal, 10; eye, 10; stem, 10; foliage, 10; habit of plant, 20; total, 100. This method of procedure was adopted unanimously. Another piece of business, also adopted unanimously, was a motion that the Floral Committee should not in future recognise a varietal name in which the raiser's or distributor's surname is used as a prefix. Yet one other matter was carried, and eventually accepted by the General Committee, and this was a proposal to charge a fee of one shilling for every variety entered for the consideration of the Floral Committee. About 250 varieties were considered this season, and very many were utter rubbish; the new regulation will probably impose a necessary check, and if it does not, then possibly a higher fee may be charged in subsequent years.

**Additional Public Park for Paisley.**—The late Sir William Dunn, Bart., late M.P. for the burgh, has left some valuable bequests to the town of Paisley. The principal amount is for charitable purposes, but his trustees are authorised to expend a sum of not more than £5,000 in the provision of a public park for the west end of the burgh—a part in which Sir William Dunn had special interests. Some legal difficulty has arisen with regard to the several wills made by the testator, but all these make the same provisions for the public legacies. The bequests were intimated by the Provost of Paisley at a meeting of the Town Council, and much pleasure was expressed by the members—a gratification shared in by the inhabitants, especially by those in the part of the town in which the park will be situated.

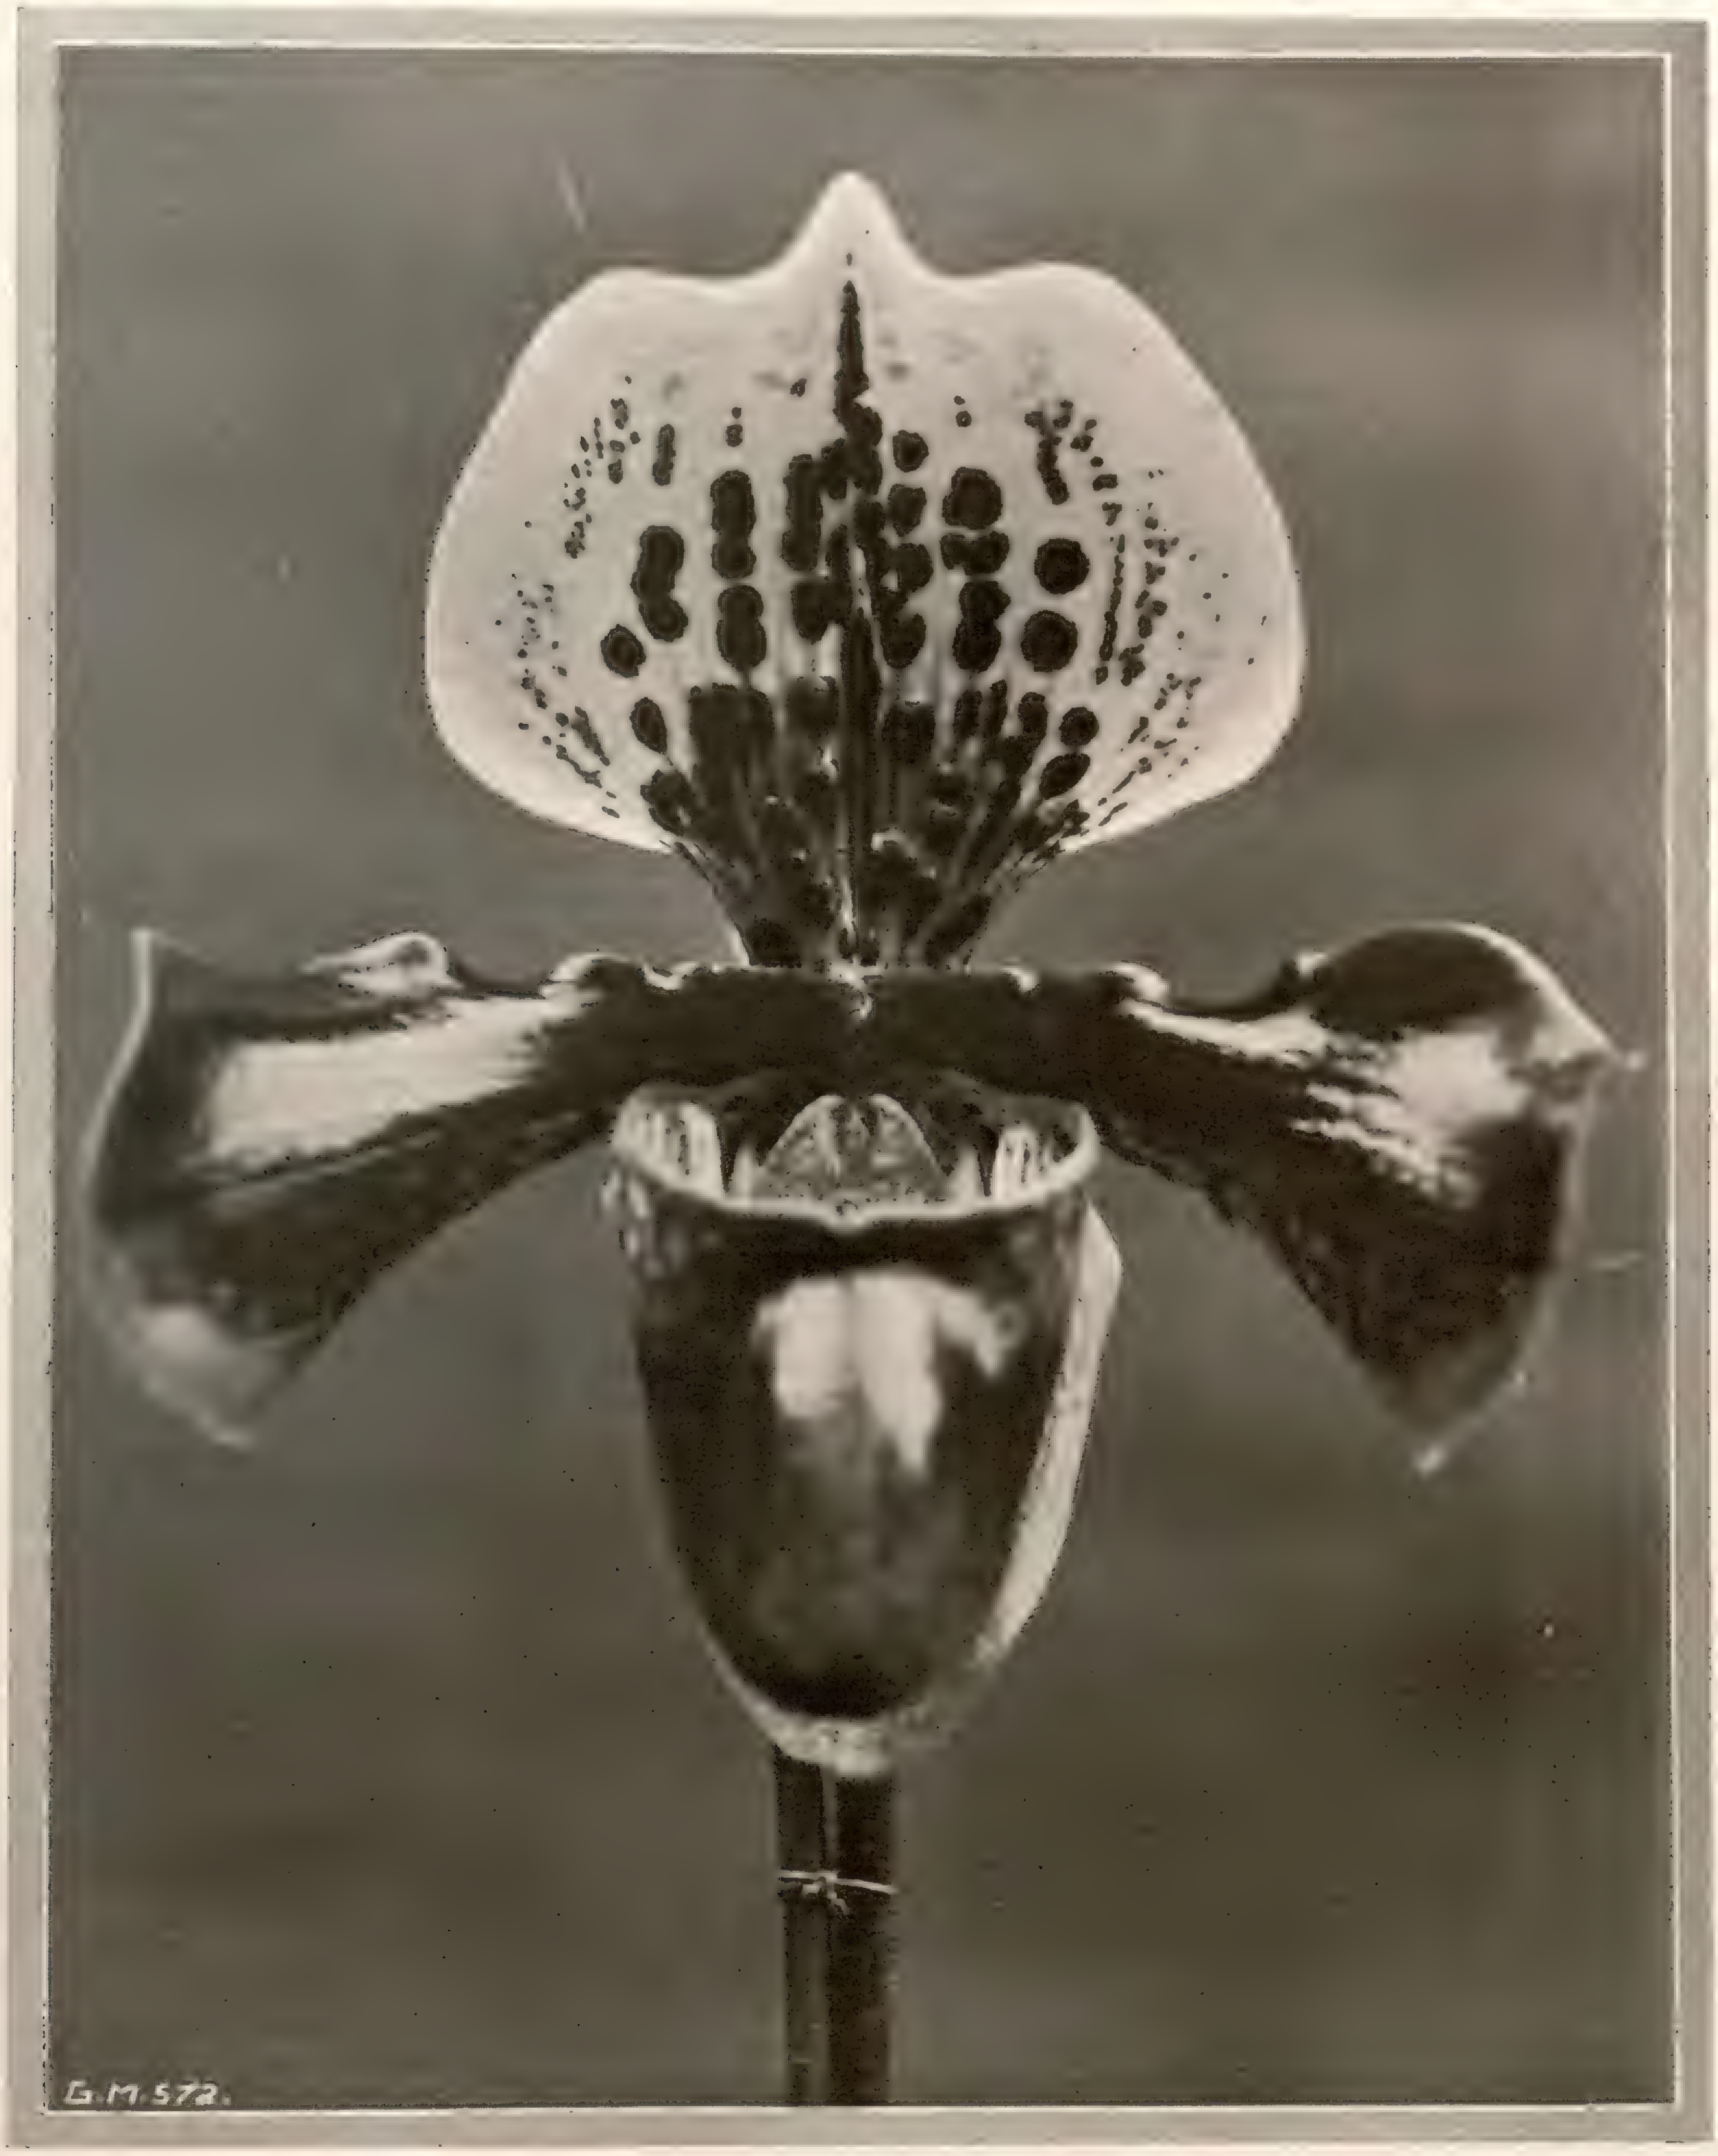
**Hedychium coronarium as a Source of Paper.**—Many of our readers will be familiar with Hedychium coronarium, a strong-growing member of the Ginger family, and one that produces large spikes of white fragrant flowers in a warm house, such as the Lily House at Kew. It appears that this species has become naturalised in Brazil, where, in some places, it grows spontaneously, spreads rapidly, and produces a dense jungle-like growth that completely ousts other vegetation. Experiments proved that the pulped stems had some value for paper-making, and later experiments by Messrs. Clayton, Beadle and Stevens, as recorded in the "Kew Bulletin," show that the paper so produced is of exceptionally good quality, for if the pith cells are retained in the paper, "they give it parchment-like properties to an extraordinary degree. They also render the paper ink-bearing without the addition of any sizing material."

**A New Monograph of the Ivy.**—Dr. F. Tobler has published an important monograph of the genus Hedera ("Die Gattung Hedera," Gustav Fischer, Jena). The author, we learn from "Nature," describes two new species of ivy (Hedera himalaica and H. japonica), making six species in all, which are well illustrated by reproductions from photographs. Besides detailed descriptions of the morphology of the genus, the work includes an interesting chapter on the biology and physiology of the ivy, followed by chapters on the history of the genus and the culture of the species as garden plants.

**The Perpetual-Flowering Carnation Society,** recognising the support which it receives from the provinces, and alive to the interests of its provincial members, has decided to hold its next spring show in the Midlands. Leamington, geographically the centre of England, has been chosen as a suitable venue for the event, and the show, for which arrangements are already well in hand, will be held on April 10 and 11, 1913. Schedules may be obtained from the hon. secretary, Mr. T. A. Weston, Floradale, Orpington. The society's London show of 1913 will be held at the Royal Horticultural Hall, on December 3.

**Feeding Value of Potato Haulm.**—We learn from the "Journal" of the Board of Agriculture that in the experiments conducted by Völtz, at the Institute of Fermentation Industries, Berlin, potato haulm harvested early in October was dried partially in the field, and later in drying kilns, and then chopped and fed to two sheep. The analysis of the dried tops was as follows: Water, 19.83 per cent.; crude protein, 10.13 per cent.; carbohydrates, 28.71 per cent.; crude fat, 3.58 per cent.; crude fibre, 27.03 per cent.; ash, 10.72 per cent. The following were the coefficients of digestibility: Crude protein, 61.2 per cent.; crude fat, 41.7 per cent.; crude fibre, 56.4 per cent.; carbohydrates, 76.9 per cent. The tops were found to have a greater digestibility when mixed with meadow hay. The tops were, it is stated, eaten with avidity by the animals, and no bad effects resulted, but nothing is said as to whether such food was beneficial to them.

**The "Botanical Magazine"** for 1912 is dedicated to Mr. John Medley Wood, A.L.S., "whose devotion to their interests, during the many years that he has held charge of the Durban Botanic Gardens, has been of signal benefit alike to horticulture and to botany." The issue for December opens with a double-page illustration of Pinus flexilis, a somewhat rare species from Colorado, and worth growing for its distinct appearance. This is followed by Primula Juliæ, a Transcaucasian species, with purple, yellow-throated flowers, and a species readily propagated by means of seeds or its stolon-like growths: Akania Hilli, a small Australian tree, with elegant pinnate leaves and panicles of white flowers—it recently flowered at Kew in the Mexican House, for the first time, after having been in cultivation there for forty years; Lissochilus Andersoni, a moisture-loving, tropical, terrestrial orchid from West Africa, with greenish-yellow sepals and petals and a purple-lined lip, and Rosa omeiensis, found in Szechuan about a quarter of a century ago, but more recently collected by Mr. E. H. Wilson, and introduced to cultivation by Messrs. J. Veitch and Sons. It is a hardy rose, with elegant, much-divided foliage, white flowers about an inch across, very spiny stems, and bright red, yellow-stalked fruits.



CYPRIPEDIUM DEMETER.

A very fine hybrid obtained by crossing Cypripedium G. F. Moore with C. Earl of Tankerville. The colouring is white, purple spots, purple, brown, and green, and the flowers have a brightly polished appearance. F.C.C., R.H.S., December 17. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

**Forestry at Cambridge.**—The Forestry Committee of the Cambridge University report that the course of instruction during the past year by the Reader and Lecturer has been supplemented by excursions to woods and plantations in Cambridgeshire and the adjoining counties. The average attendance has been fourteen during each term. The training of probationers for the Indian Forest Service began at Cambridge in the Michaelmas Term, 1911, when two of the five probationers selected in that year by the India Office entered on their studies at the Forestry School. During the past year the collection of specimens illustrative of timbers, forest botany, and diseases of trees has been largely increased. The two most important collections received each comprising about 100 specimens of North American woods, accurately named, were presented by the Director of the Forest Products Laboratory, Madison, Wisconsin, and by Professor Record, of the Yale University Forestry School. The University is also indebted to various Conservators of the Indian Forest Service for an exceptionally fine series of planks of the commoner Indian timbers. The provision of a forestry building containing laboratory, workshop, and museum accommodation for teaching and research is regarded as urgent. A site on the Downing Ground has been allotted by the University, and plans for the building have been approved. The building will be begun as soon as £5,500 is collected. Of this sum, £4,500 is now in hand. The Treasury has granted to the Forestry Committee, through the Board of Agriculture and Fisheries, a sum not exceeding £500 per annum for investigating the structure of timber. The committee have drawn up a scheme for research, and they propose to make a beginning with home-grown pine and spruce, and later to investigate foreign timbers of the same class

## SOME YELLOW AND BRONZE CATTLEYAS AND LÆLIO-CATTLEYAS.

In a previous note I referred to some of the most desirable of the purple or mauve coloured autumn-flowering hybrids of the Cattleya, Lælia, and Laelio-cattleya families; but what appears to me a greater development still is the number of yellow and bronze-tinted hybrids that have been introduced during the last few years. No one could fail to admire the striking contrast these afforded by comparison with the typically coloured cattleyas at the autumn show of the Royal Horticultural Society. In Sir George Holford's, Messrs. Charlesworth and Co.'s, and Messrs. Sander and Sons' groups there were many hybrids and secondary hybrids displaying yellow colouring, and giving brightness to each arrangement.

When we consider how few species have yellow colouring, there is all the greater reason for appreciating the good work of the hybridist in this direction. To name the principal species used in their production is not at all a difficult matter. These are Cattleya Dowiana, C. Druiana aurea, C. granulosa, C. Schofieldiana, C. Forbesi, and C. bicolor; while among the Lælias we have L. flava, L. cinnabarina, L. Cowani, and L. tenebrosa. Here we have practically the whole of the material from which this good work has been produced.

As the cattleyas afford very little foundation for this section of bronze and yellow flowers, there is a large field open for the hybridist in intercrossing the secondary and future generations. Among the best of those already in commerce may be included C. Aliciæ (bicolor and Hardyana). This is very variable, but the better forms have a pleasing range of tints that are always attractive and useful. C. Cardea (Iris and Fabia) possessing a strong strain of aurea from its ancestors, and remarkable for its good form, but it is variable in colour. C. Iris (bicolor and aurea) is one of the most attractive and useful of its class; it varies considerably, but being a good growing plant, when it is seen strong and in its superior forms, it is difficult to beat. It has proved one of the most successful among the hybrids as a parent, and its influence in secondary hybrids has been remarkable. C. Rhoda (Iris and Hardyana) is one of the finest of the more recent introductions; its bronzy flowers are most attractive, and those with the more distinctive yellow petals and sepals may be considered even more desirable. The rich crimson labellum in all these hybrids is a particularly desirable characteristic. C. Venus (Iris and aurea) has a distinctive bronzy-yellow tint in nearly all the plants, and is a most desirable kind.

The Lælio-cattleyas are naturally richer in bronze and yellow flowers, as the lælia parents available are more numerous. The primary crosses are too well known to require a reference here, but I must add that, where plants are required for decorative and cut flower purposes, there are none more useful than the primary crosses from Lælia Cowani, L. cinnabarina, L. flava, and L. tenebrosa. In this connection, however, my remark is not confined to those kinds which flower during the winter months.

In L.-c. Aureole (L.-c. Luminosa and C. Iris) we have a most attractive and desirable addition; flowers of medium size, variable to some extent in colour, but exceedingly useful. L.-c. Golden Oriol (L.-c. Charlesworthi and C. aurea) we have one of the most beautiful of the yellow-petalled hybrids, possessing a good constitution and clear colouring. It should prove one of the most useful for future developments. L.-c. Hera (L.-c. Issy and C. Hardyana) gives a distinct bronzy shade in the sepals and petals. L.-c. Iverna (L.-c. callistoglossa and L. tenebrosa) is good, and where the plants are strong they are very free flowering, and produce several blooms on long spikes. It varies in its season of flowering, but is always serviceable for cut flowers. L.-c. Lusitania (C. Iris and L.-c. Phryne) is worthy of every consideration. The constitution of C. Warscewiczi has been conveyed through the last-named parent. L.-c. Mikado (L.-c. Golden Fleece and L. cinnabarina), as seen in Sir G. Holford's group on November 5 last, at the R.H.S. Hall, is one of the most desirable of the more recent introductions, being not only decorative, but one of the most beautiful of the deep yellow-flowered hybrids yet introduced. L.-c. Neleus (L.-c. Iris and L.-c. Ophir) is one of the useful decorative kinds, with medium-sized flowers. L.-c. Olenus (L.-c. Bletchleyensis and C. Dowiana Rosita) is one of the largest of the section, variable, but forms with traces of yellow or bronze are among the finest of the autumn-flowering kinds. L.-c. Orion (L.-c. Haroldiana and C. Dowiana Rosita) is fine, especially where the Walton Grange variety of L. tenebrosa has been used in producing the first-named parent. It gives flowers with golden-yellow sepals and petals, and although not distinctly a late winter-flowering plant, we may have it as late as the end of October.

L.-c. Phœbus (L.-c. Cappei and L.-c. Iris) is not large, but useful for decorative effect. L.-c. Prospero (L.-c. Charlesworthi and C. Trianiæ), especially the variety L.-c. P. aurifera, produces distinctly yellow-bronze flowers of average size, and the plants possess a good constitution and free-flowering characteristics. L.-c. Sylvia (L.-c. Phœbe and L.-c. Ascania) is certainly one of the finest. The soft yellow of the sepals and petals, and the ground colour of the lip, are the same shade, while the dark purple front lobe renders it a most desirable addition.

Oakwood Gardens. H. J. CHAPMAN.

## SMILAX.

Smilax sprays containing leaves with browned points or edges are useless for decorative purposes in the dwelling-room. Such defects are, mostly, the result of bad management. If the plants are grown in shallow, narrow borders near hot-water pipes, very careful watering is necessary, or checks to growth and consequent yellow leaves or those with brown points are sure to be plentiful. Then there is also the danger from red spider. Usually these plants are kept dry, or nearly so, at the roots during the winter months; and if the soil is in close proximity to the pipes red spider will soon become troublesome. In a cool border the roots may be kept rather dry, but in one liable to be dried by the hot-water pipes they should not be allowed to suffer through lack of water.

As the sprays are so useful for various kinds of house decoration at all times of the year, but especially in the winter season, everything should be done to preserve the freshness of the leaves.

The plants usually do well grown on a wall facing north, north-east, or north-west; but the finest batch I have as yet seen was grown on a wall facing west, behind several rows of tall palms. Each spray was entwined round thin strings 4in. apart, and nearly 1ft. from the back wall. They received syringings when the palms did; and, being at a nice distance from the wall, were not very liable to attack from red spider, as would have been the case if grown in touch with it, on account of the wall becoming dry at times owing to its aspect. GEO. GARNER.

## SEASONABLE ROSE NOTES.

Up to the time of penning these few notes we have enjoyed a good and open planting season. In some cases, excessive wet has been a drawback, and I would be chary about planting upon any wet ground. When the soil clogs to boots, tools, or sets down too tightly, it will often be wiser to delay the planting. At present the ground is warmer than usual for the time of year. I would even wait until early spring rather than plant upon ground that is altogether too wet for the operation to be done satisfactorily. The use of broad boards is a great help upon some soils, and I feel they are not made sufficient use of. It is true that we want the soil firm about the roots, but it is not well to bind the whole down by heavy traffic and wheelbarrows of manure. More care in the spreading out of roots will be repaid in all cases.

Where the ground has not been prepared no time should be lost. I would do it now and wait for planting until the most favourable time at the end of January or February; it is better when the ground can have a little time to sink a bit. Upon no account will I ever trench or dig when the ground is hard frozen or covered with snow, having had so many unsatisfactory results that we can attribute to nothing but this.

If any protection is contemplated, the material should be made ready for use without further delay. Not only is there much less of this done now, but with the hardier class of roses now grown it is by no means so necessary, nor was it so essential before as many apparently deemed. I am strongly against anything of a wet or moisture-absorbing material as a protective agent, and would not place a quantity of rotted manure around the base of my plants. Rather would I draw up some of the surrounding earth well over the base of all dwarfs. This will keep away frost from the most vital part, and have a tendency to cast off all extra moisture; and I feel convinced from my own observations that our roses will stand many more degrees of frost if dry, than when the surroundings are wet, and this is why well-rotted manure is not placed around the plants here.

With earth around the base and a few branches of some twiggy trees or shrubs stuck among the rose growth or firmly stuck into the ground upon the most exposed side of the beds an efficient protection is afforded. Loose litter of any kind does not afford protection for long; it is either blown away or becomes a wet and undesirable mass around the bottom of the plants. Twigs and branches retain their position, do not retain moisture, and allow of free ventilation that cannot be the case when litter is secured around the plants. Given a little easily applied protection in this way is all that our roses can need.

No pot roses should be left in the open now; a very little shelter will answer their purpose, and we do not find frozen wood reply so satisfactorily to forcing. All should be carefully looked over, and any repotting done now. They can be brought from cool quarters to more heat in batches of convenient size, as needed, and will prolong the supply of cut flowers.

If pot plants for specimens are wanted, few are more useful than the Ramblers and Climbing Polyanthas as standards or pyramids; while for compact, showy plants, I would keep to the dwarf polyanthas as far as possible. Six with large individual blossoms that do well with me are Pharisaer, Mrs. Aaron Ward, Molly Sharman Crawford, Killarney, White Killarney, and Dr. O'Donel Browne.

ROSARIAN.

# PACKING APPLES FOR MARKET.

In our issue of the 14th inst. we referred at some length to the importance of fruit growers adopting more modern methods of packing apples for market than those which are regarded with favour by the majority of those who are engaged in the fruit industry. As we endeavoured to show, sieve and half-sieve and other baskets still enjoy a high degree of popularity for the conveyance of apples from the place of production to the markets, although far inferior to plain boxes of a moderate degree of strength for the purpose. Their inferiority consists in the difficulty, if not impossibility, of so packing the fruits as to prevent movement in course of transit, and thereby avoiding the injury caused by friction. We need not dwell at any length on the fact that apples which are packed in baskets that are not provided with closely-fitting lids suffer considerable damage in the course of a comparatively short railway journey, but it should be mentioned because of the importance of constantly keeping this point in view. When apples, or indeed any other fruits, are damaged in transit they are not only less attractive, but they quickly begin to show signs of decay, and are therefore of much less value to the consumer. On the other hand, apples properly packed in boxes can be sent long distances by railway and other means of conveyance without suffering appreciable injury. We have put the matter to a practical test on more than one occasion, and have found that the boxed fruit keep so much longer as to be worth at least 50 per cent. more than similar fruit packed in baskets.

It follows therefore that if undamaged fruits are worth fifty per cent. more to the consumer, the latter will assess the value according to the length of time over which the supplies remain in good condition, and that if the boxed fruit will remain sound longer than that packed in baskets, he will willingly give a higher price for his supplies. As duly recorded in these pages, the authorities of the Wye College have, during the past three years, been giving special attention to the packing of apples for transit, and the demonstrations of the usefulness of boxes, both at Wye College and the exhibition held in Maidstone in October last, have had a highly beneficial effect in creating additional interest in the subject. With reference to the exhibition, we have just been reading in a report that "sixpence for a non-returnable box is a severe handicap on profits, especially when time has to be paid for in grading and packing, but a real good, reliable, sound article will fetch its price in time." There is really no justification for the assumption that sixpence for a non-returnable box is a severe handicap on profits. The consumer who appreciates fruit that reaches him in a sound state without having been handled in the course of transit will readily pay an additional sixpence for the 40lb. or so of fruit that the box will contain, and the grower will have no occasion to trouble about returned empties, which, by the way, the railway companies do not return free, and usually suffer more or less from rough usage on the return journey. The inside measurement of the boxes that have been brought into prominence by the Wye authorities measure 20 inches in length, 11 inches in width, and 10 inches in depth, and contain, when properly packed, about 40lb. of apples. A box of this size will be found the most convenient for the majority of households.

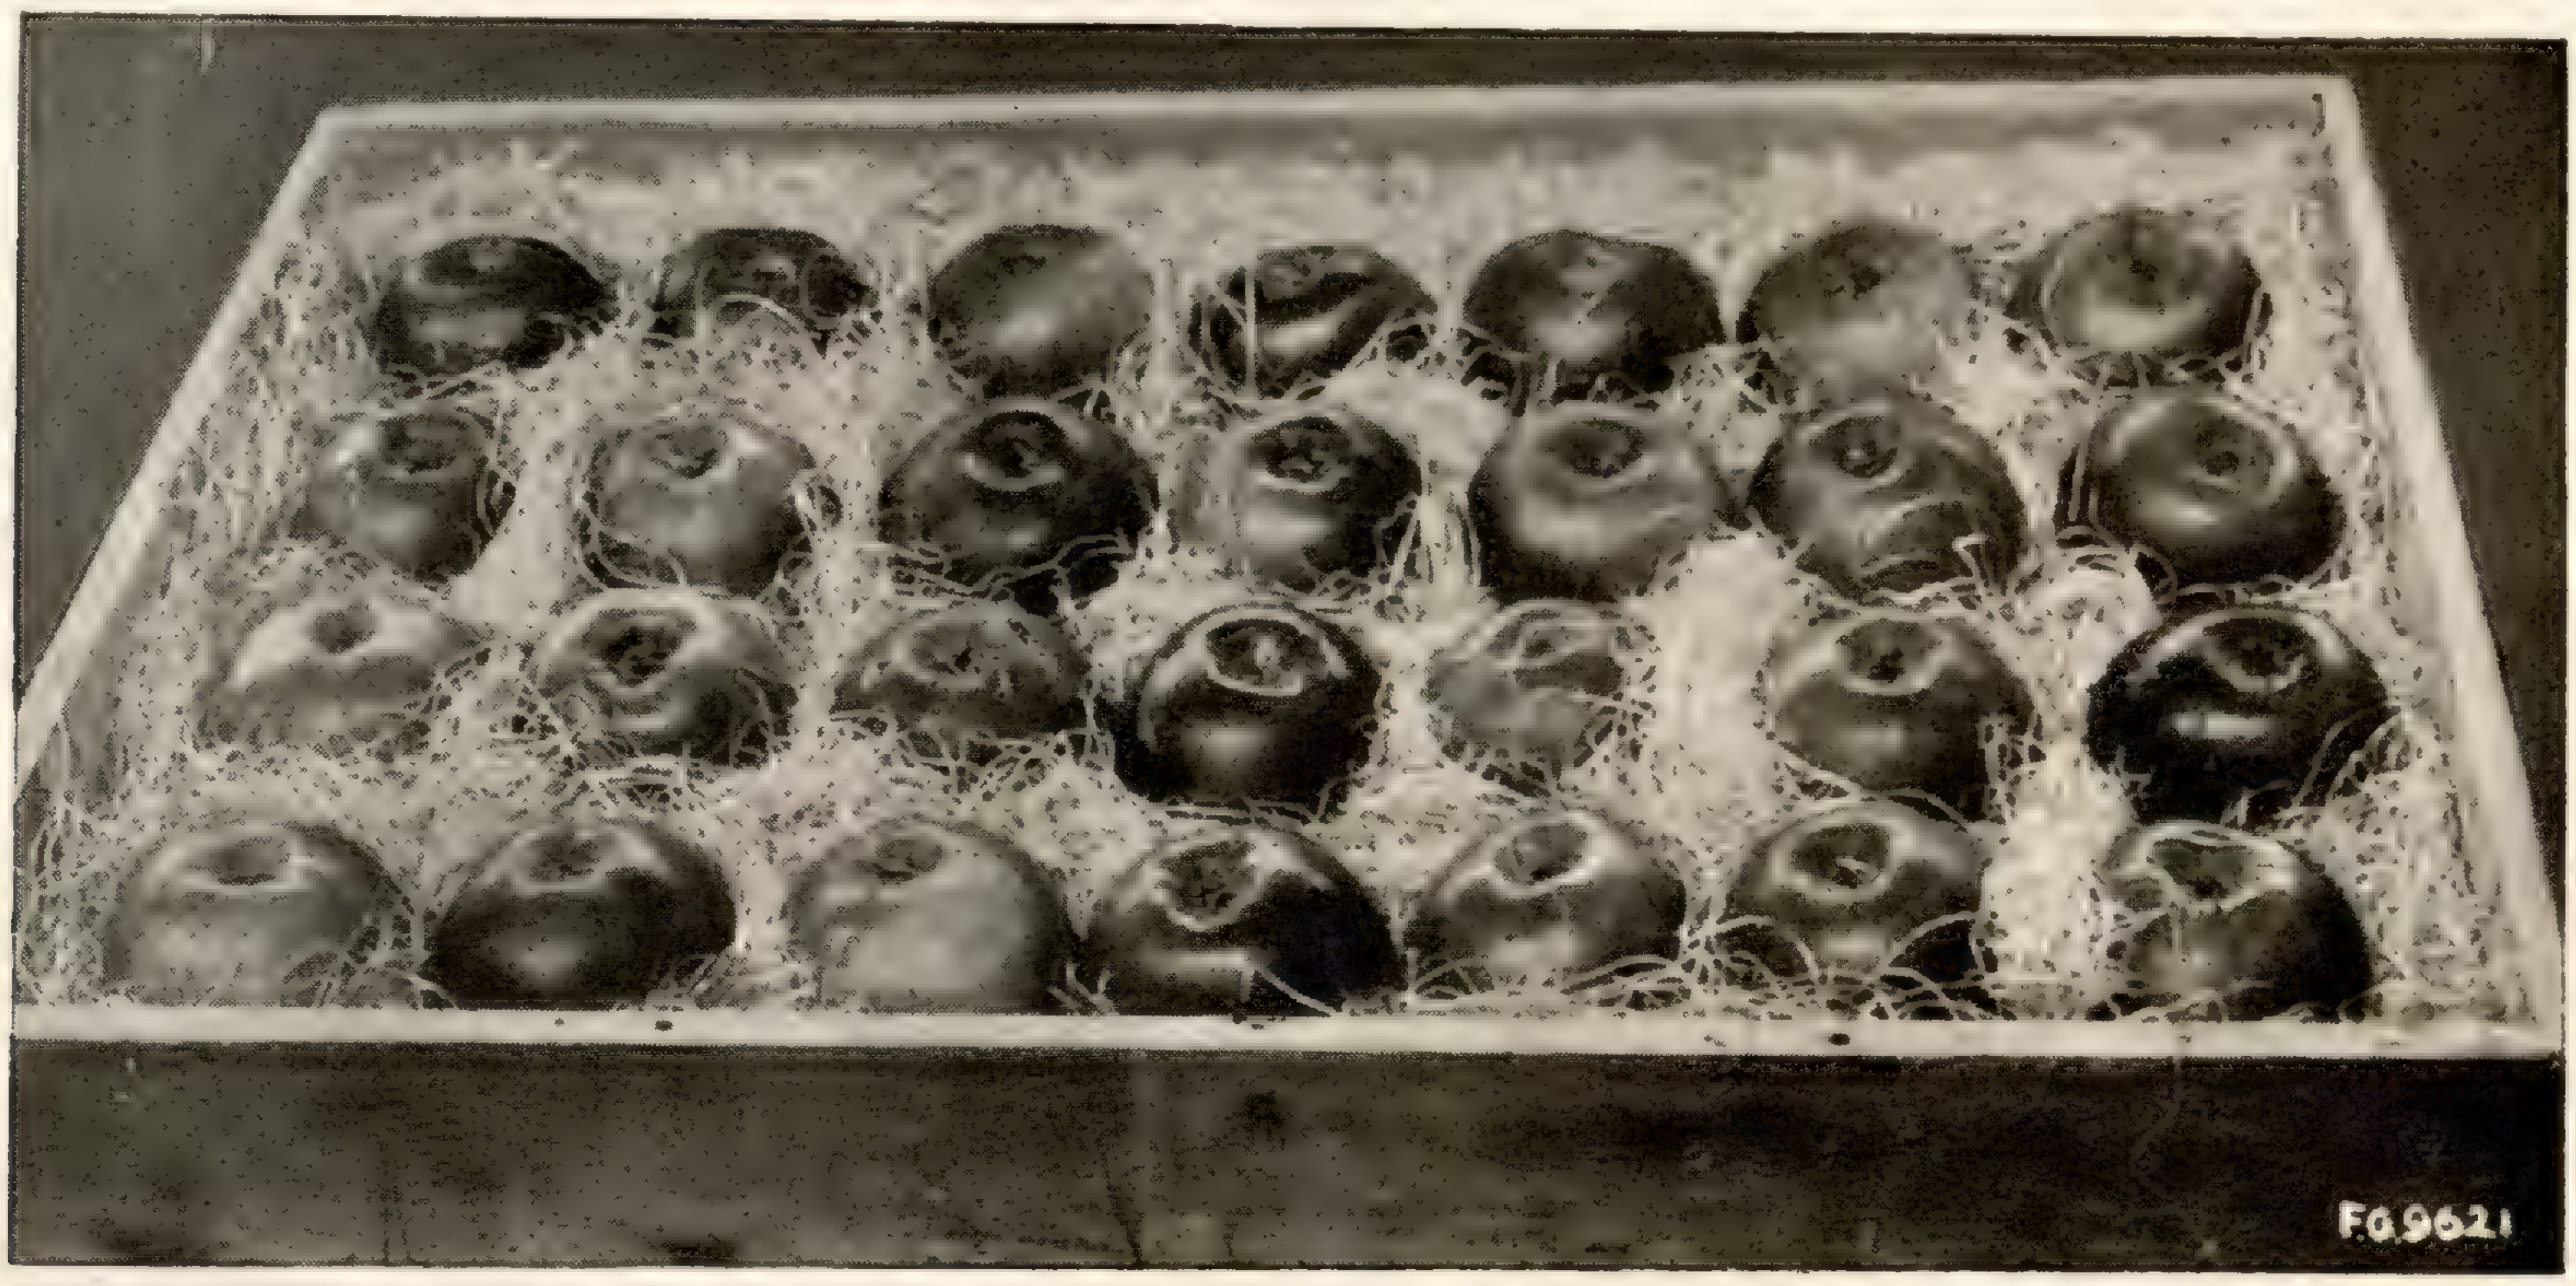
The packing and marketing of apples in Ontario have reached a high degree of development within recent years, and the bulletin recently issued by the Department of Agriculture for the Province on "Apple Orcharding" contains much useful information on the marketing of apples. It is stated by the writer of the bulletin that "Some of our apples are graded and packed in the orchard and shipped direct to market. The majority are roughly graded, packed in barrels, and sent to the storehouse where they are re-packed. The chief package is the barrel, which, for some years to come, will be the standard for our ordinary grades of such varieties as Greening, Baldwin, Russet, Stark, and Ben Davis." Barrels are superior to baskets, inasmuch as when the packing is done with care and the press judiciously used, the fruit can be conveyed long distances without injury. Proceeding, the writer states: "The box package, so much admired, is the standard for western growers, and where we come into competition with them it is likely that we shall have to adopt their style of packing for our fancy fruit. Undoubtedly apples present a much more beautiful appearance when properly packed in boxes, and it is quite certain they hold up longer and show fewer bruises. Our fancy grades should all be boxed, especially the early and tender kinds, such as Fameuse and McIntosh, and the better grades of Spy, King, etc.

"The packing of fruit in boxes by the Ontario growers is greatly on the increase. Local markets in Ontario and Quebec are using more boxes than before. The western markets are asking for their fancy fruit in this package, and if our growers are to participate in these markets for high-priced goods they must ship the greater percentage, if not all, of No. 1 fancy fruit in boxes. The demand for boxed fruit in Great Britain is increasing also, but that country, together with other European importers, will continue to take the bulk of their fruit in barrels. Box-packed apples may meet with poor returns at first, but once introduced to the trade, they should, and undoubtedly will, give better net prices to the grower. Any failure may be attributed largely to low quality and poor packing.

"All summer and early autumn apples should be sold in Canadian markets in boxes. The fruit carries better and finds a readier market, especially in the west. In the local markets, and to some extent in the western markets, there is a good demand for summer apples, such as Astrachan and Duchess, put up in baskets. The fancy and No. 1 grade of apples will always bring better prices in boxes and baskets than in the barrel. The fruit being soft suffers far less from bruising in the smaller package.

"The standard box is 10 inches deep, 11 inches wide, and 20 inches long, inside measurement. It should be made of good clear spruce lumber, the ends ⅞in. thick, sides ⅜, top ¼in.; cleats ⅜in. thick and ⅞in. wide. Good cleats will be a saving of both time and patience. Pine should not be used as the wood taints the fruit. In most cases the boxes are bought set up. Where they are to be shipped a long distance it will be a great saving in freight to buy them in the flat. It is not an expensive operation to nail them together, and they occupy much less space in the fruit house. Too many nails should not be used and only as many as are absolutely necessary to put the box strongly together. If the sides, tops, and bottoms are in two pieces, four nails in each end will be enough. If they are in one piece, three are all that will be necessary. The tops and bottoms should be nailed with the cleats. Inch and three-quarter gummed box nails for the sides and two-inch nails for the tops and bottoms will hold much better than ordinary nails. Before using, the cleats should be soaked for a couple of hours in water to avoid splitting.

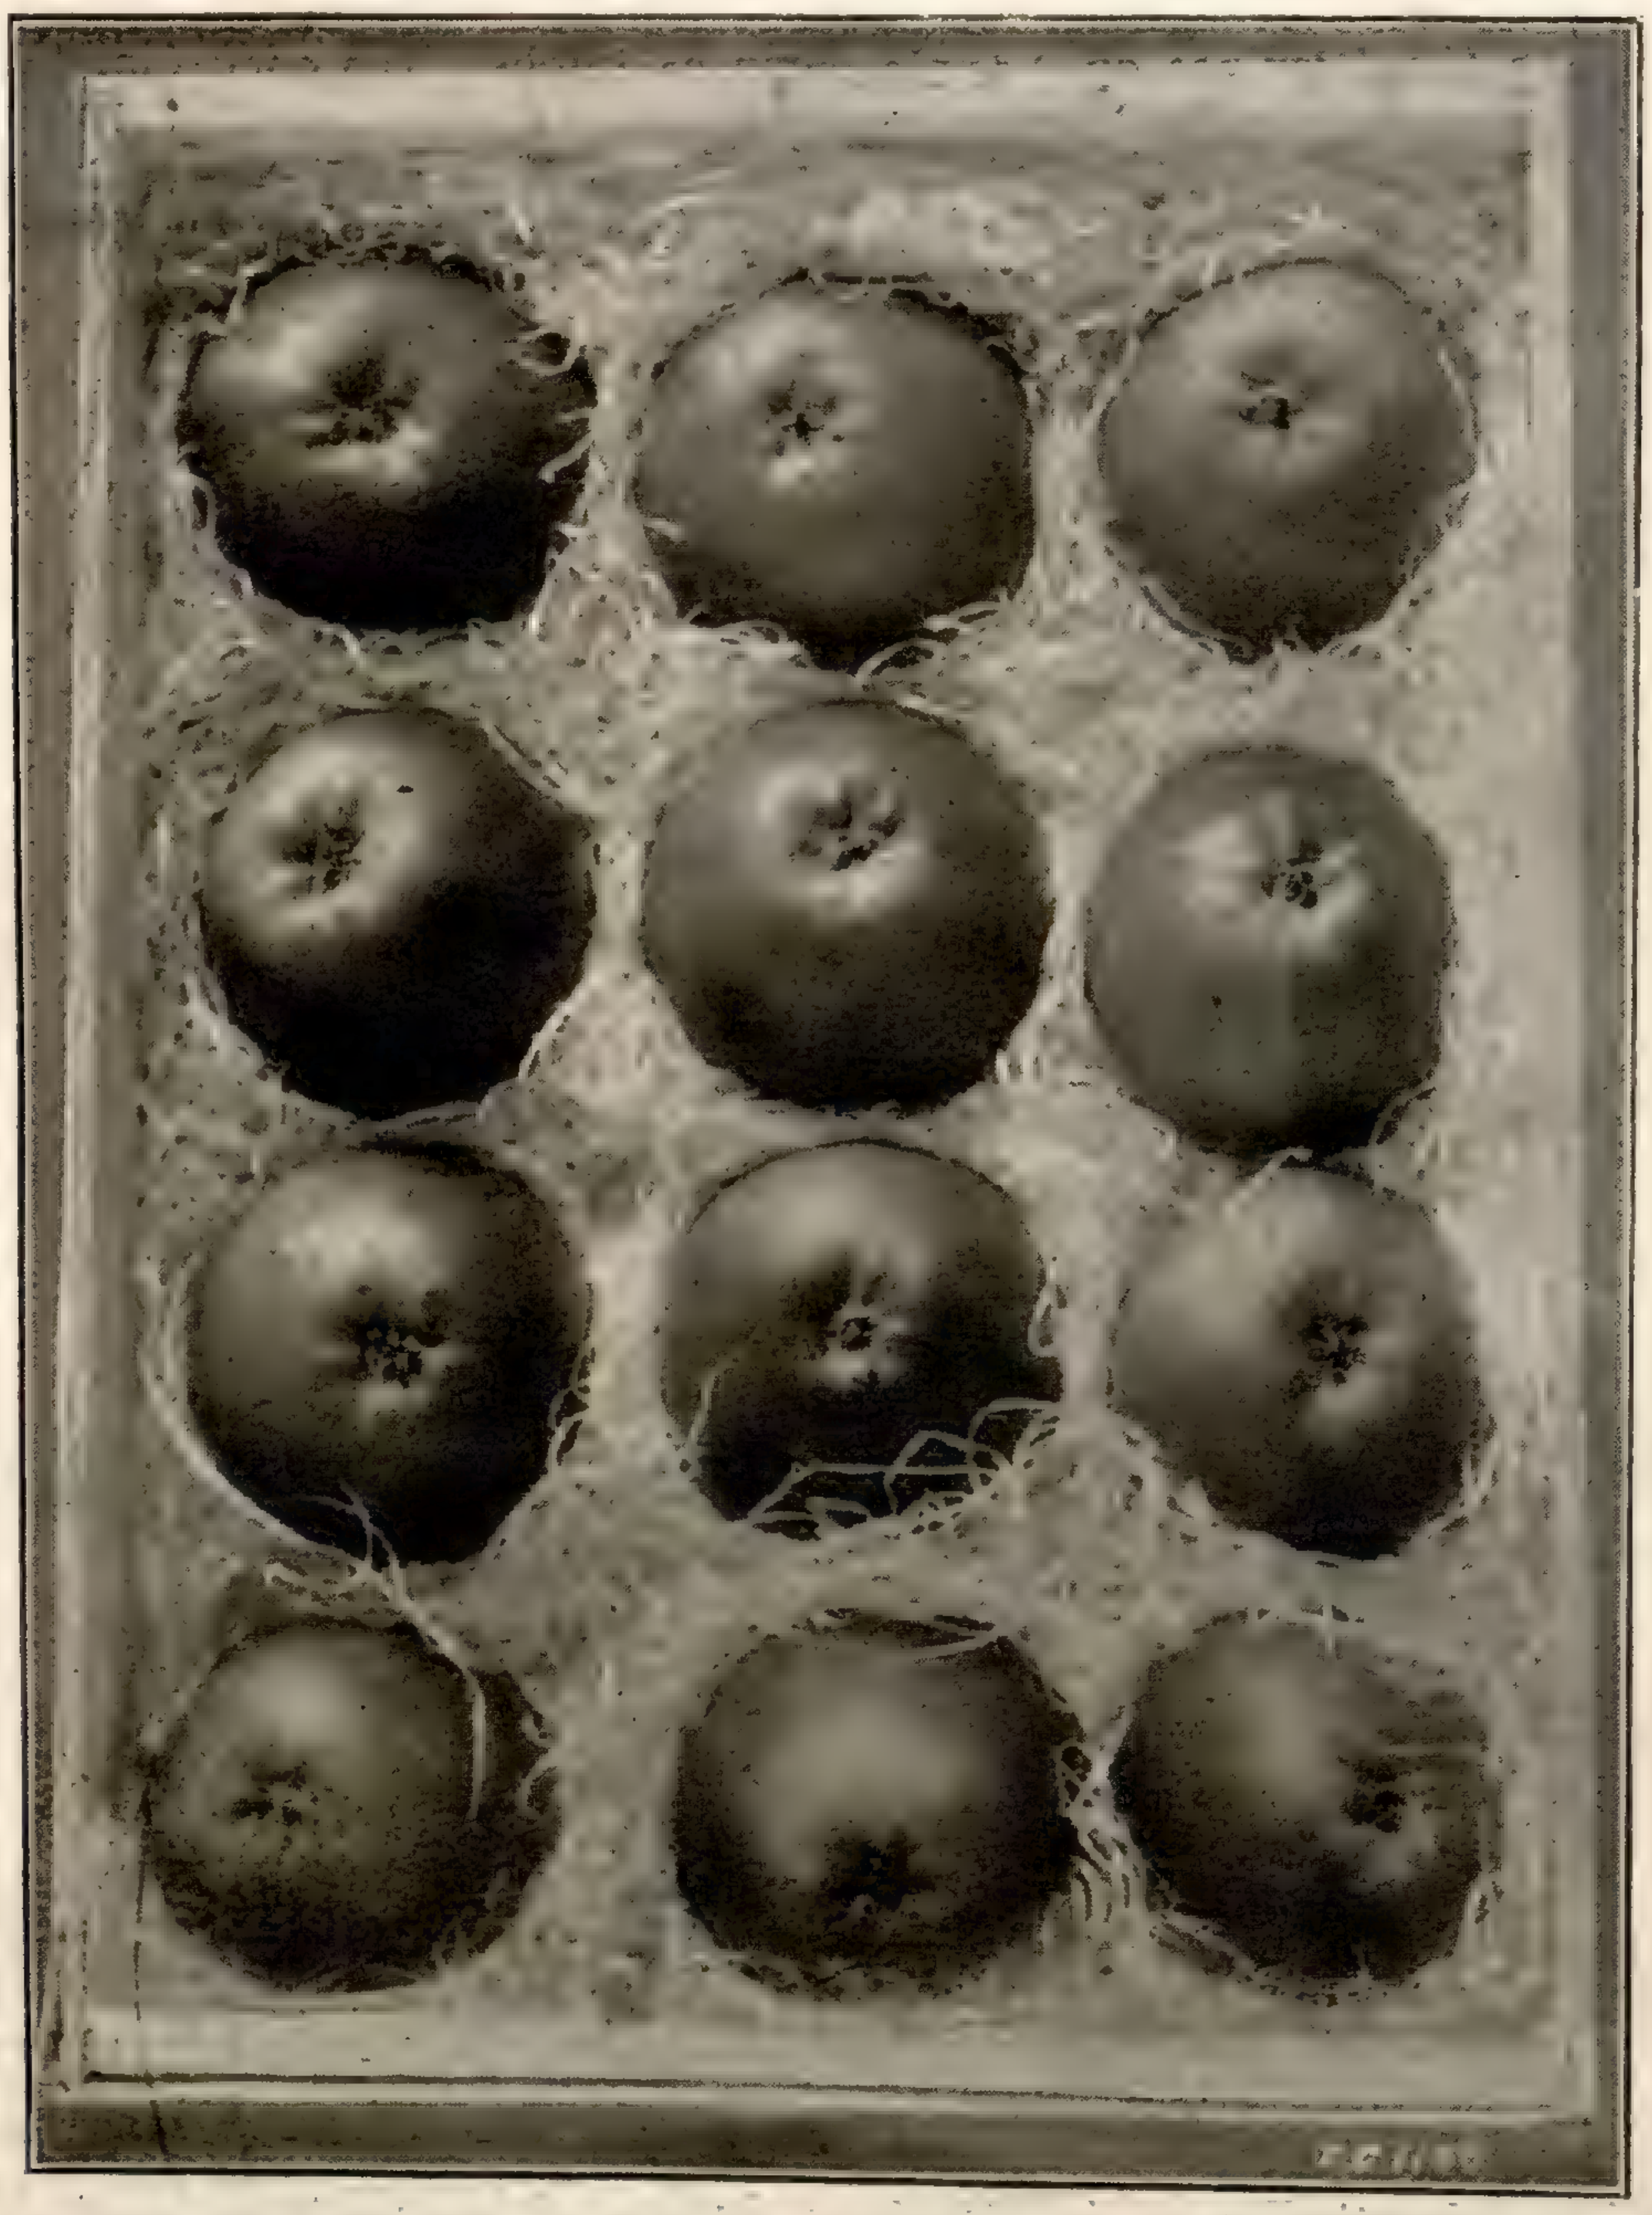
"A great many make-shifts can be used for packing tables. They must be so arranged that the stand for the box is close to the fruit so as to facilitate speed for packing. The small portable tables made on the principle of the folding cot with a position on each side for a box are useful for the individual grower. In large packing houses long stationary tables built of heavier material are best. The surface of a table for two should be about three feet wide and not more than five feet long, as anything larger would not allow two packers to reach all points of it without unnecessary stretching. The table should be high enough to



CULINARY APPLES PACKED IN A SINGLE LAYER.

allow a packer to work with comfort, avoiding back bending in all cases. Three feet is about right. The covering should be of strong canvas allowed to hang rather loosely. The edges of the table should be padded to prevent bruising of the fruit. Care should be taken to have the table cleared of fruit six or eight times a day, otherwise the fruit will be considerably bruised by continual handling.

"To make a success of box packing a great deal of time and patience at the start is necessary. Some growers have not suceeded sufficiently to make it worth while changing from the barrel pack. This is to be regretted, and it is safe to say, had they persevered very good results would have been shown. The most important point in box packing is to aim for the same standard of quality that has obtained for the western growers their markets and high prices. We have the flavour in Ontario, so our next concern is to have well-coloured, clean fruit. The apples should be graded closely, according to size. This not only facilitates packing, but also improves the appearance of the box when opened. Box packing requires considerable practice and skill to reduce the cost to a minimum.



CHOICE DESSERT APPLES PACKED IN A SINGLE LAYER.

"High-grade fruit should be wrapped; use a light Manilla paper. Much of the paper at present in use is too thin, and where the apples sweat it presents afterwards a very untidy appearance. No time is lost by wrapping, for while the packer is reaching for the apple with one hand he picks up the paper with the other. Then, too, a wrapped apple remains in place and the shifting so troublesome in unwrapped apples is overcome. The boxes should be paper lined as it insures keeping dirt and odours away from the fruit, and adds to the attractiveness of the package. Pads are sometimes used in the tops and bottoms of the boxes. The thick patent pads made with excelsior filling are clumsy and occupy too much space. Single and double corrugated cardboard or heavy soft cardboard or paper will answer the purpose, especially for export, and will prevent a good deal of bruising.

"The two ways of packing most used are the diagonal and square methods. The diagonal is preferable for the reason that it causes less bruising. One apple fits in between two in the form of a triangle and allows more pressure to be applied diagonally across the box instead of having to jam them as in the square pack."

In packing apples that are not wrapped in paper, the Canadian growers proceed in such manner that the bottom of the box, when being packed, is the top when opened; but if the fruits are wrapped the box is top side up, and the last layer is the face. If there are to be four tiers in the box, and a wrapped diagonal pack is used, the first tier is started with two apples across the second tier, two or three across the third, four, etc. This method of packing is to ensure the fourth tier or face opening up with an apple in each corner. If the fruits are not wrapped the face is started by placing an apple in each corner, the second tier is then started with two fruits.

We give three illustrations of the English methods of packing apples. In two of the boxes the fruits are packed in single layers, a method which is especially adapted to the requirements of those who make a speciality of supplying small quantities of the choice kinds. This method of packing is also a very good one for private gardens where culinary and dessert apples have to be sent in comparatively small quantities to the town houses, or as presents to friends resident at a distance. For commercial purposes it is preferable to pack the culinary apples and the commoner dessert fruits in boxes of a depth that will allow of about four layers or tiers in each box, as the cost of packing will then be considerably less.

It will be of interest to mention in this connection that the Inspection and Sale Act, which was passed a few years since by the Canadian Legislature, renders it necessary for the market growers in the Dominion to exercise considerable care in the packing of apples. Among other things it is enacted that—

> Every person who, by himself or through the agency of another person, packs fruit in a closed package, intended for sale, shall cause the package to be marked in a plain and indelible manner, in letters not less than half an inch in length, before it is taken from the premises where it is packed,—
>
> (a) with the initials of his Christian names, and his full surname and address, or, in the case of a firm or corporation, with the firm or corporate name and address;
> (b) with the name of the variety or varieties; and
> (c) with the designation of the grade of fruit, which shall include one of the following four marks, viz.: Fancy, No. 1, No. 2, No. 3.
>
> 2. Such mark may be accompanied by any other designation of grade or brand, if that designation or brand is not inconsistent with, or marked more conspicuously than, the one of the said four marks which is used on the said package.
>
> No person shall sell, or offer, expose, or have in his possession for sale, any fruit packed,—
>
> (a) in a closed package, and intended for sale, unless such package is marked as required by the provisions of this Act;
> (b) in a closed package, upon which package is marked any designation which represents such fruit as of
>   (i) Fancy quality, unless such fruit consists of well-grown specimens of one for the variety, of normal shape, free least normal size and of good colour for the variety, of normal shape, free from worm holes, bruises, scab, and other defects and properly packed.
>   (ii) No. 1 quality, unless such fruit consists of well-grown specimens of one variety, sound, of not less than medium size, and of good colour for the variety, of normal shape, and not less than 90 per centum free from scab, worm holes, bruises, and other defects, and properly packed.
>   (iii) No. 2 quality, unless such fruit includes no culls, and consists of specimens of not less than nearly medium size for the variety, and not less than 80 per centum free from worm holes and such other defects as cause material waste, and properly packed.
> (c) in any package in which the faced or shown surface gives a false representation of the contents of such package; and it shall be considered a false representation when more than 15 per centum of such fruit is substantially smaller in size than, or inferior in grade to, or different in variety from, the faced or shown surface of such package.
>
> When apples are packed in Canada for export or for sale by the box, they shall be packed in good and strong boxes of seasoned wood, the inside dimensions of which shall not be less than ten inches in depth, eleven inches in width, and twenty inches in length, representing as nearly as possible 2,200 cubic inches.

---

**New Canadian Homesteads.**—During the first six months of 1912 homestead entries for the four western provinces of Canada, recorded by the officials of the Interior Department, numbered 18,524, as against 19,657 for the same period in 1911, a decrease of 1,133. These homesteads represent an area of 3 million acres which has been given away free of charge to new arrivals. For Manitoba the entries totalled 1,710 as against 1,459 in 1911, and for British Columbia they increased from 124 to 138. Both Saskatchewan and Alberta show decreases. The entries for Saskatchewan for the six months stood at 9,340 as against 10,409 for the first half of 1911; while the Alberta entries fell from 7,585 to 7,336. During the month of June 3,988 homesteads were entered by applicants whose countries of origin were as follows: Canada, 1,276; British Isles, 662; United States, 1,087; all other countries, 973.

## BLACK CURRANTS.

Bush fruits play an important part in all gardens both large and small, therefore it is well to consider the best means of keeping up an adequate supply. There are but few kitchen gardens that are equal in size to the requirements of the establishments they are intended to serve, and in these days, when a great portion of the space is taken up with herbaceous borders and the like, bush fruits have to be planted in the most unfavourable positions, such as under the shade of fruit trees, the consequence being the fruit produced is both small in quantity and inferior in quality to what it would be grown under more favourable conditions. There has been a great improvement in the various kinds of bush fruits of late years, but even with these superior varieties it is impossible to produce the finest results unless the conditions under which they are grown are favourable. There is a vast difference between growing bush fruits in an open field where there is ample room and a free circulation of air, than in a limited space in the kitchen garden, where they have to be crowded together.

If we take the black currant as an example, we shall find that in many instances the plants, after being planted four or five years, are so overcrowded that they have become one thicket of spindly shoots. Such bushes cannot produce either fine samples or fruit of good quality. There are now some very fine varieties of the black currant, which, if well grown, will produce fruit as large as an ordinary-sized black cherry, but there is an art in growing even so common a fruit as this. Old worn-out bushes are of but little or no use, and should be destroyed to make room for younger ones. It is from the stout growths on young trees that the finest crops are obtained, and these should not be closer together than a foot, otherwise the light and air cannot circulate freely amongst them to plump up the fruit buds. The wood which produces the best fruit is stout and short-jointed, the leaves should be large, with plump buds at their base. The season is now at hand when it is advisable to look over the plantations and see whether it is not possible to make some improvement. Where there are already such varieties as Boskoop Giant, Goliath, Coronation, Victoria, and Lee's Prolific grown, cuttings should be taken off them; but where none but the older varieties are in cultivation it would be well to procure young plants, which can be had for a few pence each. In selecting cuttings it is well to choose those from fifteen to eighteen inches in length, taking them off with a heel of the old wood attached. Do not remove any of the eyes, as the best shoots are those produced near the ground. The cuttings should be inserted in well-prepared ground in rows about two feet apart, allowing a foot between each cutting in the rows. This will give ample room to keep them free from weeds, and for the growths made to develop freely. The top of the cutting should be removed in order to induce several buds to push. The following autumn all growths made should be cut back to within about three buds of their base, and when the growths from these are three or four inches long, all but the best placed ones should be removed. If the plants have been well looked after in the way of watering in dry weather, and kept free from weeds, they should be strong, and have eight or ten shoots each.

The best time for transplanting black currants is as soon as the leaves are off, and if planted early they will become established before Christmas, and so produce a full crop of fruit the following year. Black currants do not last long on some soils even with the best cultivation, therefore it is advisable to root a few cuttings each year to keep up a stock of young plants, and as soon as there are any signs of exhaustion dig up the old ones and make a fresh plantation. If this is followed up, and a clean stock of cuttings taken, we should not hear much of the black currant bud mite. As the finest fruit is produced from the stout growths on young bushes, such shoots should be selected, removing all others. If pruning is done in the summer after the fruit is cleared off, this will allow the light and air to circulate freely in the centre of the trees, and so induce the young shoots to complete their development. It may be necessary to look over the bushes in winter just to remove the superfluous shoots, but, as a rule, if pruning is done judiciously in the summer, there will not be many growths to remove. There is an advantage in having young bushes, for they can be planted closer together than if they are intended to be allowed to remain for several years. Black currants prefer a deep, rich, well-tilled soil of close texture to that of a light, sandy nature. In that of the latter class fresh plantations should be made about every four years.

H. C. PRINSEP.

A SMALL CASE OF DESSERT APPLES.

---

**Gooseberry Caterpillar.**—Where this pest has been troublesome during the past season it will be advisable to take the precaution of removing two or three inches of the surface soil, together with any leaves or rubbish there may be under the bushes, as it is here the pests are found during the winter. A dusting of fresh lime around the bushes, previous to adding fresh soil, will prove beneficial. The infested soil and rubbish should, if possible, be burnt; or, failing this, be deeply buried out of the way.

---

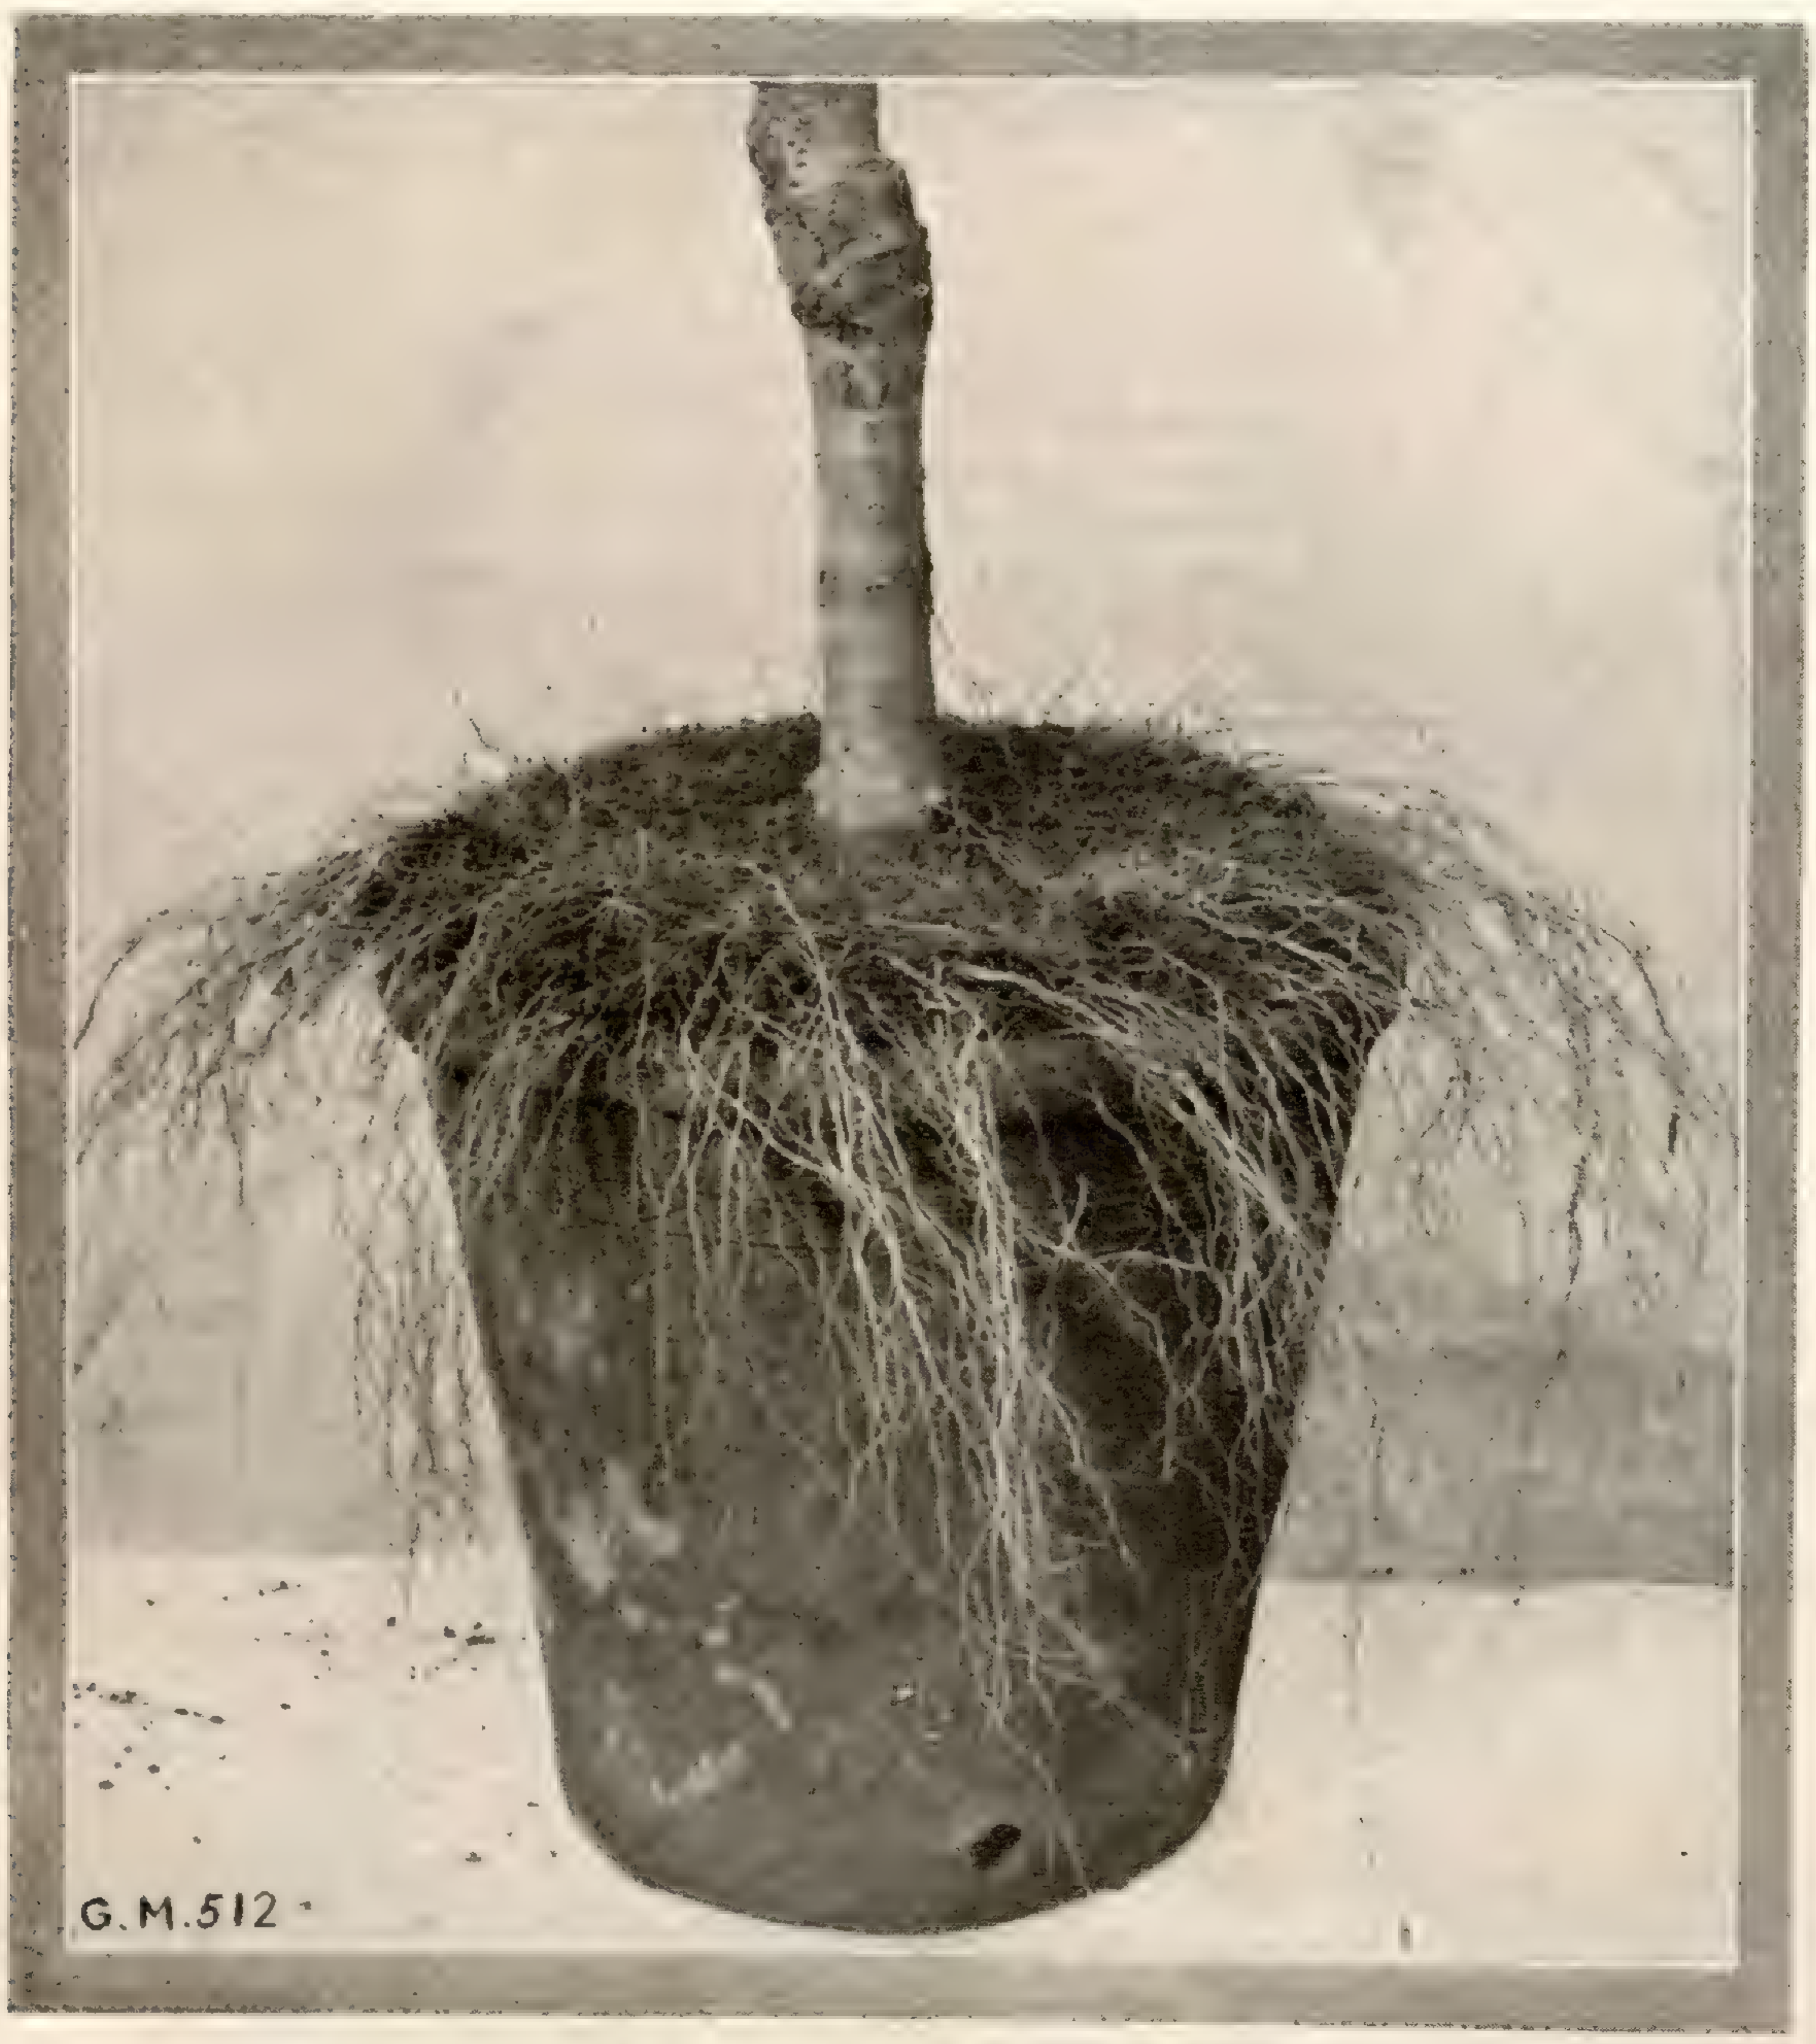
## FRUIT TREES IN POTS.

Too much importance cannot well be placed upon the selection of the very best possible soil for pot fruit trees. It is well known that good fruits of all kinds are produced upon the best land under ordinary cultivation, and it is equally as essential that the choice of the best loam should be made for fruit culture in pots. At the present time we are very fortunate here in being able to obtain some of the best loam we have ever handled for pot fruit tree culture. It should be the top spit of an old pasture, cut not more, at the most, than four inches in thickness. This should, if possible, have been stacked some six months or so prior to its being broken up for mixing and potting. A calcareous loam is most essential—i.e., one that has a good proportion of lime in its composition, and is full of fibre, which in the breaking up handles tough and firm, not close, soft, and spongy. It is not always possible to obtain this without the mixing of two kinds, and this we have repeatedly had to do ourselves. Such a loam as one would select as being the ideal soil for making a vine border is not far short of being the best to choose.

### Preparing the Soil.

There is frequently good loam to be found within easy reach upon the lands and purviews of an estate, but which, strange to say, is forbidden to the gardener to make use of for this object, and he has to go farther afield to obtain the needful soil for his fruit trees, not only in pots, but in the open as well. There should not be any waste in the soil when it has been obtained at, possibly, some considerable cost, and every handful should be made use of. This I like to be enabled to do for our pot fruit trees.

Unless there is evidence of the presence of an abundance of lime in the soil it is always advisable to add some lime rubble or old mortar in mixing or preparing the soil for potting purposes. We always add some ourselves, and look around to secure some old lime rubble from the debris when housebreaking is in process. This does not deteriorate by being stored, and it is always valuable in many ways in the potting-yard. This is broken down, so to speak, and is passed through a sieve of about half-inch mesh, the coarser rubble is laid aside to place upon the drainage, if this happens to be short. Some well-decomposed manure is added; for this we prefer such as one would use for the making up of a mushroom bed, but in a somewhat drier condition.



CHERRY TREE IN POT AS LIFTED FROM THE PLUNGE BED.

With such a soil of good quality it is not necessary to use any artificial ingredient at this stage. Should the soil, however, be not all that one could wish, a light addition of Clay's Fertilizer is most useful, but use it with caution, otherwise the object in view will be defeated. After the loam has been broken down to, say, the size of ducks' eggs—some will be smaller, of course—it is ready for mixing up, and some two or three turnings should then be given. After this is done the heap should be covered up as a safeguard against an excess of rain. We usually mix our soil early in September at the latest; it is then ready for potting operations by the end of the month, or by the first week in October, when we commence to do the potting. This we prefer to do under cover, as it is in every way preferable to working in the open.

### Pots and Potting.

It is well to have some pots in reserve at the start, so that the potting can proceed without delay. New pots should be well soaked before they are used; they will absorb a considerable quantity of water. The old pots, as the trees are turned out of them, should be well cleansed, and then aired for a time. Clean pots are, in my opinion, most essential. The crocks used for drainage should also be cleansed. Quite the average amount of drainage should be used, and a handful or two of coarse lime rubble will do no harm. Some rough pieces of turfy loam should then be beaten down firmly over the drainage.

Only under most exceptional circumstances should any trees stand over from year to year without being repotted. We have potted the same trees of peaches, nectarines, cherries, and plums every year, in nearly every case, for fully fourteen years past, and with the best results. It is a mistaken notion to think that potting cannot be thus done with advantage every year. Young fruiting trees are usually prepared by the nurserymen, who grow them in 10-inch pots, or thereabouts. I prefer to purchase trees in pots of this size rather than larger ones. It is better to grow them on under the somewhat altered conditions than to purchase in larger pots. These trees should be secured late in September in order to be able to pot them afresh in October. If purchased a month or so later than this, it will be better to let them stand over one season, supposing that they have not been repotted. When trees are purchased early, in 10-inch pots, it may be possible to put some of the most promising into 11-inch pots the same season. Experience must decide this in every case, and rather than err in using the larger pots, I would keep to the same size in which they have been received.

### Preparing the Trees for Repotting.

In this case, as in that of all the rest of the stock in pots, it is a question of reducing the ball so as to allow of a fair amount of soil as equally as possible all round, and both under and on the surface as well. A very good guide is to reduce sufficiently to allow the hands being passed easily down around the ball. In order to do this we use a claw-like scratcher, with two claws from two to three inches long; this, with the handle need not be more than one foot in length. It is an extremely useful little tool, and one that is easy to manipulate with a little practice. A sharp knife will be found useful for removing some of the coarser roots. Two or three rammers of varying thickness are advisable for ramming the soil down "firmly," and equally all around the roots. Guard against any hollow places being left during potting. When finished there should be about one inch, or a trifle less room, left for watering. I have emphasised "firmly," for this is most essential. Sometimes a pot gets broken during the ramming, but this only indicates that the potter is doing his work well. We have not a dozen trees at the present time in pots of more than fourteen inches diameter, although we are forcing some of the same trees now as we did fourteen years back, and they are in a robust state of health and bear abundantly.

### Notes on the Two Illustrations.

The two illustrations in this week's issue on this subject were from photographs taken by Mr. George Gordon, V.M.H., at Gunnersbury House Gardens in October last. The first is given to show the importance of plunging the trees after the fruit has been picked and the trees hardened off (of this more in next week's issue). This speaks volumes in favour of the system of plunging. Although comparatively little woody growth is then made, the fruit buds for another season are being developed, and this keeps the roots active. The second of these illustrations shows the same tree knocked out of its pot and prepared for repotting by the reduction of the ball of soil sufficiently to permit of its being repotted in the same size of pot. A glance at the former will indicate the amount of roots, and what I think may fairly be termed "fruit-bearing" roots. These, in the second illustration, are seen all carefully preserved, and will mingle in the potting with the other roots; a few roots were cut away at the base, and scarcely anything further needed to be done in this instance. The tree in question was one of the cherries that was staged in the non-competitive group at the recent Royal International Horticultural Exhibition held at Chelsea. It was also one of the group of cherries staged at the Temple Show some twelve years back. It is about fifteen years old.

### After Potting.

I much prefer to place the trees back under glass immediately they are potted. It is better than leaving them outside at that season of the year. Soon after potting one good watering is given, and enough is supplied to permeate the soil. Afterwards but little attention is needed, save that we keep the trees syringed every fine day. I attach considerable importance to this item of procedure. On one occasion I well remember, during a fine, dry, warm autumn, that the wood in some cases shrivelled in October; this taught me a lesson. The cherries we showed last May were syringed all the way through from repotting in October, 1911, until the flowering in February last.

JAS. HUDSON, V.M.H.
Gunnersbury House Gardens.

## CULTIVATION OF THE MIXED BORDER.

It is sometimes assumed that the mixed border, being planted mainly with hardy perennials, involves less work than was necessary for the same piece of ground in the old days when it was completely replanted every summer with bedding-out plants. However plausible this theory may seem to the uninitiated, few who have had experience of both will feel inclined to support it. When a border was planted ribbon-fashion with geraniums, calceolarias, and lobelias, at the end of May, there was little more to do to it until October, unless it needed watering in a dry summer. But the mixed border reminds one of woman's work, namely, that it is never done. The plants in the border are of such diverse character that when one kind does not need attention another kind does, while what is known as the problem of the mixed border—its maintenance in a moderate degree of order, with a fair display of blossom from April to October—is always demanding solution, and that very frequently in some new and unexpected form. Of the several aspects in which this feature of the modern garden is presented to us, the one it is proposed to deal with here is, perhaps, the most important, as it is the foundation of all, and that is, the cultivation of the soil, for it is only by practising the highest cultivation of which the circumstances permit that successional displays can be maintained throughout a lengthened season.

In old-fashioned country gardens it is still the practice to put on a man once or twice a year, usually in spring and autumn, to "do up" the borders, this being understood to consist in a general tidying up and digging or loosening the surface of the soil amongst the clumps of plants. For the purposes of general cultivation, a spade should never touch the mixed border, for it can only be used in a general way at the expense of the bulbs and the smaller and more delicate plants, while the roots of even the largest and strongest clumps of perennials will sustain damage, which will give them a check for the season if it is done in spring. No border can be wholly satisfactory unless once in seven years at least every plant and bulb is taken up in November, and the whole border dug two or three spits deep, some of the raw soil of the lowest spit being taken up and wheeled away to keep the border from getting too high, and as much good rotted manure incorporated with the soil as can conveniently be dug in, together with some lasting material, like bone-meal or basic slag, at the rate of ten to fifteen pounds to forty square yards. This is, of course, a most laborious business, especially when the spaces between the plants are filled with bulbs. The latter add no small part to the time taken by the work, whether they are taken up in summer or autumn. They suffer by being taken up in November, and it damages some of the perennials to take the bulbs up in June. The best solution of the difficulty is, perhaps, taking up the bulbs at the latter part of May and laying them in somewhere to ripen.

Apart from this great septennial operation there is the cultivation of the soil during the intervening months and years to be considered. To begin with the early spring. Apart from tidying up, it is not advisable to do anything to the soil until the spring-flowering bulbs are all showing. As soon as practicable, the whole of the surface should be lightly turned over with a trowel, or, if this was done in the autumn, loosened with a small handfork, at the same time working in a little superphosphate (5lb. to 40 sq. yards), and, if the soil is a light one, sulphate of potash as well at half this rate. This loosening of the surface will serve the double purpose of aerating the soil and preventing the conduction of moisture from below to be evaporated. Many of the perennials are very thirsty subjects, and we need to conserve all the moisture we can to carry them through the summer. This surface working should be repeated after every considerable shower—a piece of routine which can be disposed of very quickly after the first loosening of the surface in the early spring.

But, however much we may husband the water content of the soil, it will begin to get pretty dry before May is out, in a normal season. As soon as the growth of most of the bulbs can be cleared away the whole border should receive a liberal mulch of manure, preferably from a spent hotbed, the surface having previously been loosened and left as rough as possible. From this time surface cultivation must cease, but the mulch will prevent the soil running together again to any extent, and if the mulch is pretty thick, where it is not too visible, water may be poured on it, and will run straight in without causing the surface of the soil to cake. This treatment will carry us on till the autumn, by which time most of the mulch will have become reduced to the condition of leaf-mould if it was well-rotted stuff to start with. This should now be lightly turned in with a trowel, the working of the soil to the depth of half an inch or so not interfering with any of the bulbs if done carefully. At the same time bone-meal, or steamed bone-flour, should be applied at the rate of 5 or 6lb. to 40 sq. yards, or basic slag if the soil is a heavy one or of a rich, black character, the material, in any event, being lightly turned in with the mulch to be slowly rendered available for the plants in the coming spring.

POT CHERRY TREE PREPARED FOR REPOTTING.

Some plants will need dividing and replanting every autumn, sometimes a whole group of plants, and advantage can then be taken of such circumstances to dig up the plot thus occupied, taking out some of the impoverished soil and working in some well-rotted manure. Michaelmas daisies, most of the sunflowers, heleniums, Rudbeckia Golden Glow, and some others, will generally be the better for it, and in this way, not only those subjects replanted, but others in immediate proximity will have a renewed food supply. This is the time, too, to redress the balance between different subjects in the borders, to prevent some of the weaker ones being crowded out altogether. The summer is the time to settle the details of this important operation, and failure to attend to this means the rapid degeneration of the border into a piece of wild gardening.

In the spring, when clumps of narcissus and tulips are seen to be getting crowded, they should be marked for removal, and they can be replanted in the autumn among the newly-planted perennials. Some keep the positions of bulbs always marked by short sticks, but this is rather a large order when a border is really well filled. The practice is certainly a commendable one, and it facilitates the piecemeal renovation of the border in the autumn.

**Alger Petts.**

## OLD TERRACE STEPS AT POWIS CASTLE.

Where gardens are terraced, and especially where the terraces are fairly deep owing to the sharp slope of the site, steps are very necessary for ascent and descent. Much money has been lavished on terrace walls, balustrading, and steps; and while in many cases the construction of these has been quite in keeping with the architecture of the house, there are many instances where the design and material have neither associated well with the dwelling or harmonise with the garden surroundings. In recent years it has become the fashion to make rough-flagged pathways in certain parts of the garden, and allow small-growing plants to grow between the stones. Wide steps, too, are often so arranged that even here vegetation may find a place, while it is a growing practice to allow small openings in retaining and terrace walls, wherein aubrietias, moss pinks, dianthuses, antirrhinums, etc., may be grown. Sometimes this intimate association of vegetation and bold architecture is incongruous, and in other cases the association is pleasing. On the face of things it does seem absurd to spend large sums of money in building and material, and then at once proceed to cover up the beauty of the design by means of vegetation; in such cases the money would have been better spent in the garden, and the architectural features have been simple and strong.

The accompanying illustration represents a quaint combination of lowly plants and bold terrace steps at Powis Castle, Welshpool, the residence of the Earl of Powis. A glance at the picture will show that the climate is fairly moist as ferns grow freely on the steps, and have as companions veronicas, ranunculuses, antirrhinums, thyme, and toad-flax, and possibly other things also. This is not a case of careless neglect, but one of "studied negligence." The beautiful work on the top of the terrace wall is open to view, but the wall itself is amply clothed with fruit trees, and the border and path show that the general upkeep of the place is good. K.

## NOTES ON ALPINE FLOWERS.

### Erodium amanum.

The smaller Heronsbills are charming flowers, and deserve the utmost love and care of the alpine cultivator. I imagine they would be more highly thought of were they more difficult to cultivate, and we had to concoct and dispense to them complicated mixtures of certain soils, chips, and the other ingredients so dear to the faddist in the growing of alpine plants. But they are, as a whole, free from the least breath of suspicion (that is to say, if they have reasonable care, which they don't always receive), and the only one readily procurable which may be written down as really "dorty" is E. Reichardi, and that cannot be said of it everywhere. Now, I think that Erodium amanum, which is one of the most charming of the lot, is not to be overlooked, although as yet one which is little known. For a nice sunny spot on the rockery, either in a chink or on a level place with plenty of stones about it, this Heronsbill is a charming plant. Some three or four inches high, with beautiful grey foliage and dainty white flowers borne for months in succession, E. amanum has surely a future before it. May I just add a word in favour of the Erodiums as a whole? They want to be much tetter known, with their dainty loveliness.

### Geranium Traversi.

Every time I think of Geranium Traversi I am almost beside myself with vexation. It is one of the alpines to fall in love with at first sight, and once seen and grown is never to be forgotten. Hardly anybody can see the delightful silvery Geranium argenteum without feeling resolved that one must have it for our "very own." It is a gem, but Geranium Traversi is a more precious one still. We may best describe the rose-coloured form of it as a glorified G. argenteum, fashioned as the final handiwork of the Master Craftsman in the Cranesbill creation. I know of no more beautiful flower in the race. Its delightful silvery leaves and large rose or white flowers place it in the galaxy of the finest alpine flowers of earth. Taller than G. argenteum, it is yet not too tall for the alpine garden, and as we see it on some knoll open to the sun on some bright day, we realise and acclaim its commanding, yet gentle, beauty.

But the trouble is that it is, like so many other ethereal flowers, hardly suited for the rough-and-tumble ways of our climate in all parts of the three kingdoms. Rain, and snow, and sleet; frost and fog; gentle breezes and bitter winds—all and more are contained in these winters of ours, and they appear to play havoc with this plant from the Antipodes. Happily this is not so everywhere, and in places where the winter is mild and not too fickle in its moods there is room for the hope of succeeding with this exquisite Cranesbill. S. Arnott.

## WINTER GARDENS.

The more gardens are loved for their beauty, and appreciated for the opportunities they afford of healthful recreation, the more will the desire for lovely winter walks and nooks be fostered. It is so easy, and yet so rare, to plant beds and borders, rockeries and banks, slopes and valleys, so that with the passing of autumn leaves new attractions are revealed, and the coming of winter hastens other blossoms into bloom. Because there are few flowers that can be enjoyed out of doors in December and January, it is necessary to make the very fullest possible use of these: yet they are not the only adornments awaiting the hand of the artist-gardener. Where one man will tolerate sickly turf under trees, another will have an expanse of primrose roots, freshly green, or a low shrubbery of ever-pleasing Berberis aquifolium.

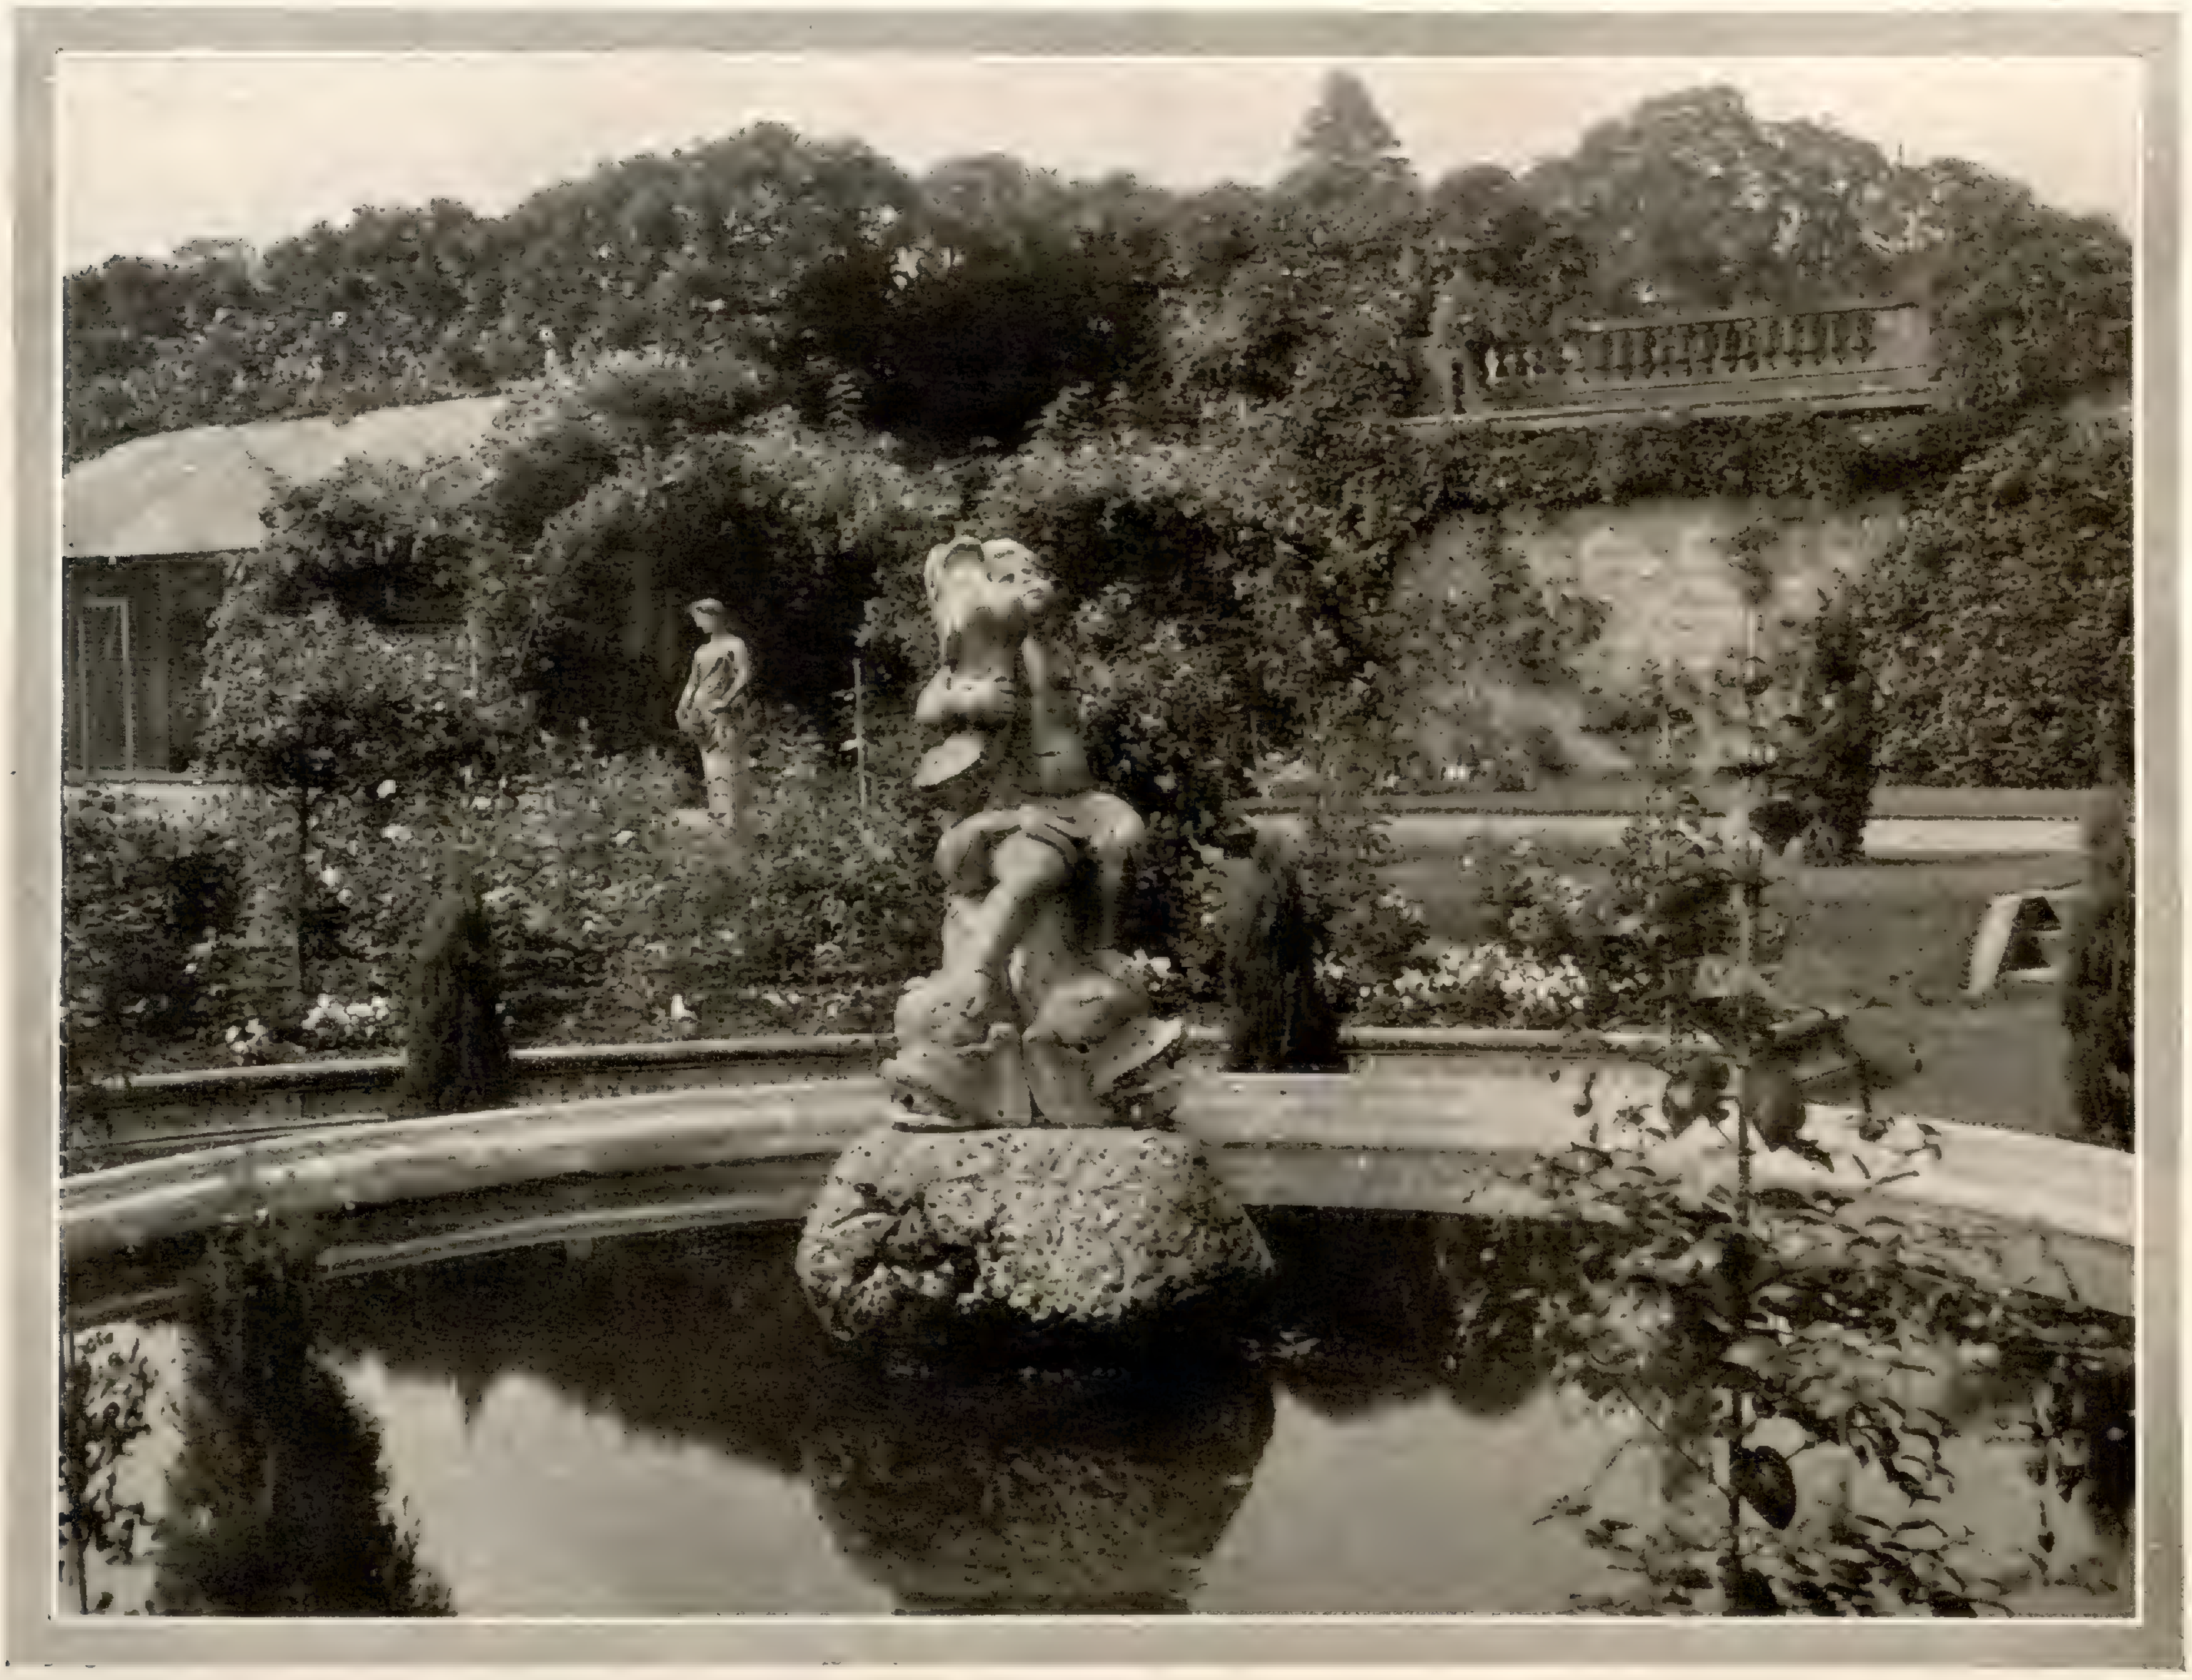
The whole planning of a garden should be arranged with a view to its effect when the year shall wane. It is an error to keep evergreen trees and shrubs in only one or two portions of the grounds. Belts of fine specimens, as distinct from hedges of one variety, are, of course, admirable here and there, but the scattering of specimens in all directions is also advisable. The rosery, a barren spot from November to June, should show pot shrubs sunk in the beds, a line of golden euonymus or of golden privet, since the place is no doubt sheltered, will permanently improve the scene if located behind white or crimson roses, far from the yellow varieties. As the rosery is generally screened off from the north, fine-leaved silver ivy can be used on a bright pea-green trellis, with red roses.

The rock garden often owes much of its winter fairness to the fact that so many alpines have permanent foliage; it is preeminently among the stones that the autumn, winter, and spring crocuses should be planted in profusion. No gardener who has not used Crocus Imperati thus has any idea of the glorious violet mass it will show from a distance.

Instead of growing Christmas roses under ugly handlights, as when cut blooms in perfection are required, let an abrupt slope of rich soil be given up to them, and behind the bank may tower up tamarisk, to make a screen, and bracken fern also. The feathery branches of the former, and the long-enduring autumn-coloured fronds of the latter, can be skilfully bent over, their ends tied to sticks, so as to form considerable protectors to the snowy blossoms of the hellebores. Against the house, in those narrow borders that have been gay with bedding plants, large pots of Tussilago fragrans, the Winter Heliotrope, should be sunk. There will then be delicate flowers, glossy leaves, and fragrance there. The pots can be kept at other seasons sunk in the shadiest places.

Rugosa roses and snowberry bushes well combined, make a screen of considerable charm during winter. They may have just in front, or on either side, borders in which summer's most tender bedding subjects have luxuriated. The edge to the border, if of London Pride, will be sightly at all times.

A remarkable display was made in one terrace garden, of formal style, by using different mossy saxifrages to form edgings, and mark out the patterns, by means of lines, in all the beds. M. H.



FOUNTAIN IN ROSE GARDEN AT HILLINGDON COURT.

[Photo: H. N. King.

## WATER IN THE ROSE GARDEN.

Where the soil is somewhat light, and there is gravel below it, most readers know full well that the rose garden will need an abundance of water and good feeding during a dry season. But this brief note has no reference to the direct supply of moisture to roses grouped more or less informally in a rose garden more or less formally designed. The idea now is to draw attention to the association of water and roses in an ornamental sense. In many instances the formal design of beds in the rose garden demands a formal pool of water. At Hillingdon Court, the residence of Lord Hillingdon, at Uxbridge, there is a circular pool in the rose garden, as illustrated, with a bold fountain. At Kew, the Dorothy Perkins roses hanging over the wall around the pond in front of the Palm House, attract far more attention than the roses in beds, and the water has not a little to do with this attractiveness. It is more than likely the near future will see roses and ornamental water more frequently associated in gardens than at present. Even on the sharply sloping banks of the stream, the trailing roses of the Wichuraiana group are quite at home. Circumstances must always be duly considered, but when rose gardens are being planned the desirability of including water in the design should be carefully considered, remembering the beautiful reflections, the cooling effect, and the peacefulness of placid water in summer time.

# CHRISTMAS FLOWERS IN THE GREENHOUSE AT KEW.

Flowers of various kinds are always in demand during the Christmas season, and complaints are by no means infrequent of the limited number at that time available. Still, a walk through the greenhouse at Kew reveals the fact that the choice is greater than one might think, for the following all combine to render an effective floral display.

## Begonias.

Of these there are among the true species B. Haageana, with massive drooping clusters of blush-coloured flowers; B. metallica, an old and well-known kind, with handsome bronzy leafage and smaller clusters of flowers than B. Haageana, but of much the same tint, and B. polyantha, a freely-branched, bushy growing plant, with small pink flowers.

Garden varieties include Gloire de Lorraine, both in pots and suspended baskets, and the larger and richer-coloured variety The King, as well as the white or pale blush tinted Turnford Hall. Others are B. Luzerna, a tall grower, with olive-green leaves and large clusters of pink flowers; B. Corbeille de Feu, a dwarf bushy plant, whose small bright red flowers are borne in great profusion; B. Gloire de Sceaux, handsome bronzy leaves and large pink flowers; B. semperflorens gigantea, an almost continuous flowering kind, with deep rose coloured blossoms; B. carminata, a pretty hybrid between B. coccinea and B. Dregei, now past its best; with B. Winter Cheer, a bright-coloured Socotrana hybrid.

## Hard-wooded Plants.

These contribute their share to the floral display, among them being Indian azaleas, Erica hyemalis, the pretty mauve-tinted and exceedingly floriferous Erica melanthera; the Bottle Brush Flower (Callistemon salignus), which is nearly always called Metrosideros floribunda; Crowea saligna, with its profusion of rich pink flowers; Polygala myrtifolia grandiflora, whose carmine-rose flowers mimic those of a leguminous plant; Barosma lanceolata, with a profusion of tiny white flowers; Tetratheca thymifolia, a little dense bush, thickly laden with deep lilac-mauve blossoms; and Phylica capensis, whose small white flowers are collected in terminal heads.

## Other Flowers.

Such well-known flowers as chrysanthemums, carnations, cyclamen, zonal pelargoniums, narcissi, Roman hyacinths, stocks, and primulas, are freely represented, while a batch of small plants of bouvardia is very bright and cheerful. Of the several varieties composing it, the rich scarlet-flowered President Cleveland stands out from its fellows as the finest in its colour. The large camellias planted out in one of the beds are also unfolding their earliest blossoms.

## Uncommon Plants.

Less common subjects, worthy of note, include Buddleia asiatica, with long, taperings spikes of creamy-white flowers centred with yellow; Buddleia officinalis, a mauve flower, also with a yellow eye; Salvia splendens pyramidalis, a good form of this showy autumn-flowering salvia; Impatiens Oliveri, a large growing member of the genus, whose mauve-coloured flowers are borne practically throughout the year; Sparmannia africana, so distinct from anything else, and much admired at this season; Tibouchina semi-decandra, whose salver-shaped, rich purple blossoms have been borne for the last three months, and still continue; Crassula lactea, a sturdy succulent, with loose clusters of starry white flowers; Statice brassicifolia, whose pleasing blue blossoms are now in many cases past their best; and Plumbago rosea, with good spikes of rosy-red flowers, a tone of colour unrepresented among its many associates.

The bright and pleasing effect produced by a number of small bushes of Aucuba japonica vera, absolutely laden with scarlet berries, also claims recognition, and so does the beauty of Centropogon Lucyanus when grown as a basket plant. In this way, the clusters of curved, tubular-shaped flowers of a carmine tint are seen to considerable advantage. Of the climbing plants the most notable just now are Abutilon Boule de Neige, white; A. Golden Fleece, yellow; and that distinct species, A. insigne, whose widely-expanded flowers are reddish, with deeper veins. Lantana salviæfolia is also a delightful climber for the greenhouse, being thickly studded with its rounded clusters of lilac flowers. This is the same kind as that which is so generally bedded out during the summer as Lantana delicatissima. K.

---

# THE HOLLY FOR CHRISTMAS DECORATIONS.

Although many kinds of evergreens are used for decorative purposes at Christmas time, the holly is mostly in demand, and for a very long period it has been associated with the festive season. Early writers united in attributing its use to scenes of a joyous nature, whilst some other evergreens, more especially the yew, were referred to in connection with depressing conditions. Shakespeare appears to have followed the usual rule, for in "As You Like It," he says:

> "Heigh ho! sing heigh ho! unto the Green Holly;
> Most friendship is feigning, most loving mere folly:
> Then, heigh ho! the Holly,
> This life is most jolly!"

To the yew, he refers in "Titus Andronicus," as follows:

> "But straight they told me they would bind me here
> Unto the body of a dismal yew."

The earliest use of the holly for Christmas decorations appears to have taken place during the early years of the Christian era, for it was the custom of the Romans to use the branches in connection with the festival of the Saturnalia, which occurred about the same time of the year; and early Christians are thought to have used similar decorations in connection with their festivities, in order that they might not appear too conspicuous. That being the case, it is more than likely that the Romans introduced the custom to the British Isles, and there is plenty of proof that it has been used continuously for many centuries. That it was in use during the reign of Henry VI. is evidenced by the fact that it is freely mentioned in a carol which was written at that time. According to that carol, the proper place for the holly was the hall, while the ivy was relegated to the porch, for the lines occur:

> "Holy stond in the Halle, fayre to behold;
> Ivy stond without the dore; she ys full sore cold."

While, however, it has always been considered the right and proper thing for holly to be used for Christmas decorations, various restrictions were placed upon its use. Thus the superstitious would not upon any consideration introduce holly branches into the house before Christmas Eve, else they would be subjected to all sorts of disasters during the ensuing year. Neither would the judicious housewife remove the holly before Shrove Tuesday, on which day she would use it to fry pancakes over. Were anything else done with the Christmas holly she would be liable to various pains and injuries for a year.

These are not the only superstitious ideas connected with the holly, for one wise person has decreed that Candlemas Eve is the correct time to remove holly from a house, and if any is left after that time, the womenfolk who have neglected the work will be visited by ghosts and goblins for an indefinite period. It is also fatal to a husband's supremacy in the household if he allows holly with spineless leaves to be taken into the house at Christmas.

There is an old Border tale to the effect that if a maiden gathers nine holly leaves on a Friday night at midnight and ties them in a three-cornered handkerchief with nine knots, and places them under her pillow she will dream of her future husband. Another means is open to her of attaining the same object, for if she places three pails of water on her bedroom floor and pins three holly leaves to her night-dress, immediately over her heart, before retiring to bed on Christmas Eve, she will be aroused from sleep to see the form of her future husband glide through the room.

Whatever the superstitions are which attach themselves to it, the holly occupies a very important position in the commercial world, for very large quantities change hands about Christmas time, and growers and market salesmen make it a considerable source of profit. The fact of some trees producing berries freely and others failing to bear any is often a source of bewilderment to owners. But when the matter is carefully considered, there is a very good reason for it. It is very seldom that flowers containing perfect male and female organs are produced by the same tree, and usually the flowers on one tree have perfect male and rudimentary female organs, while on other trees the reverse is the case. Good fruiting years do not always occur, and even when fruits are most common, fertile seeds may not be abundant, especially when the fruit-bearing trees are some distance from the nearest male.

Anyone who contemplates planting hollies for the production of berries for Christmas decoration cannot do better than rely entirely upon the common kind, for it is much better suited for the purpose than the majority of the garden varieties, many of which never bear a fruit, and those which do, often fruit less freely than the type. Plants should be selected and planted at the rate of one male bush to ten or twelve female bushes to ensure the most satisfactory crop. A good place to plant hollies for the purpose is a thin plantation. Most kinds of soil suit the holly, but that which suits the oak is peculiarly adapted for holly.

Quite recently a fine lot of well-grown and well-fruited bushes, which had originated as natural seedlings, were noted in a thin oak wood in Berkshire, while the New Forest is a well-known place for well-developed trees. As a contrast to the red-fruited tree, that with yellow fruits might be grown, while for gardens the female form of the American Ilex opaca is well worth planting, for it fruits freely, its fruits art very brightly coloured, and the bush is neat in appearance. Several of the variegated kinds are sometimes considered in connection with the production of berries, but the varieties with large leaves command little respect for indoor decoration.

Kew. W. DALLIMORE.

# THE POSSIBILITIES OF A SCHOOL GARDEN.—V.

## Its Influence on Character.

It may seem like stretching the possibilities of a school garden to urge that it can have any influence in the above direction, but do not let us make any mistake in thinking that education begins and ends with the acquirement of so much knowledge. It is something more, for education also means the building up and moulding of character; and in this particular, perhaps, the future of the nation's manhood and womanhood is more in the hands of the elementary school teacher than anybody else. There can be no doubt that the school garden can, and does, have an influence on the character of the boy, for it teaches moral lessons in self-respect, self-control, self-reliance, patience, and unselfishness; and, besides, it brings out faculties of inventiveness and resource. School gardeners learn to respect other people's property through the mere fact that they have property of their own, in the shape of the plots and the crops growing on them.

Let me take the points I have mentioned one by one. The self-respecting boy in the school would never tolerate an untidy plot. His aim is to have it equal to or better than his father's garden at home; and more than once I have seen lads flush crimson and hang their heads in shame when they have admitted in low tones that their gardens were a disgrace to them. And I have seen the same lads hold up their heads in self-respect when I have paid a later visit, and congratulated them on the improvement in their plots. School gardening teaches habits of tidiness and order. The lad who is untidy in other ways is just the same in the garden; but his fault is more plainly seen. There he has to stand the criticism of the teacher, the inspector, and his fellow-pupils himself. This not infrequently prompts him to mend his ways in the garden, which is the first step towards improvement in other directions.

In regard to self-control, let me quote an extract from a letter recently received from a highly successful teacher of school gardening. He writes: "With the school garden we are aided in the problem of instilling into the minds of our pupils the value of self-control. The scholar in the garden sees the ripe strawberry, plum, or other fruit, but he controls his longing, and for the honour of himself and the school he does not yield to temptation. Of course we are occasionally troubled with 'finger blight,' but when this occurs we have a good opportunity of showing that the offender has lost his self-control." It is scarcely necessary to add a word to this testimony of a school teacher, who writes from practical experience.

In the garden the boy must exercise the virtue of patience. He puts the seeds into the ground, but has to wait for the germination of the same and the development of the plant. He has his losses and disappointments; and, to use the words of that well-known member of Parliament, Mr. Charles Bathurst, in a recent speech, "Gardening, to my mind, brings boys very closely to their Creator, and everyone who takes an active part in it realises that he has an unseen assistant in the task to which he puts his hand." Every word of this is true, and that contact with Nature which the boy has in the garden can hardly fail to be useful in teaching lessons of patience.

Where do sympathy and unselfishness come in? In many school garden classes there are boys who are strong and healthy, and boys also who are weakly and puny; but in the garden you find the strong helping the weak. Not long ago a boy was composing the story of his gardening lesson, and, looking over his shoulder, I read the following words: "I got on with my digging, and when I had finished my plot I went and helped Arthur Jones, because he is lame." This was not written in a spirit of boastfulness or self-praise, but was a mere statement of fact, and it displayed fellow-feeling and practical sympathy with the other boy, who was less able to perform the task. Just as adult gardeners, as a rule, are generous in sharing surplus plants with their neighbours, one sees the same thing on school plots, though the giver frequently knows that he is in competition with the receiver for a prize or some other award.

The school garden makes the boy self-reliant, because he gets into the way of taking initiative, and depending on himself. This is particularly noticeable when boys in their second year's course are given somewhat a free hand, and are not entirely dependent on the instructions of the teacher. Frequently I see boys at playtime walk almost unconsciously to the tool shed, take down some implement, and use it on the garden plot without being instructed, and entirely on their own initiative. That they prefer this to playing is obvious; it shows a fondness for the garden, and, further, a confidence in themselves in doing work that they knew wanted doing. Years ago no teacher would have thought of sending several boys out of school to perform a task without supervision; but since the establishment of gardens it is quite a common thing to see three or four boys working steadily away at some task or other, with no master in attendance. They feel the responsibility of having confidence placed in them; they are somebody; they are doing something "on their own"; and, in short, that faculty of self-reliance is appealed to with good effect.

The garden boy at school, like his father in the garden at home, is inventive; if he wants a thing he makes it; he gets into a habit of contriving, and that pocket-knife of his is used to better use than whittling away a piece of stick to no purpose. Very often the boy's contrivances are of a crude and rough-and-ready type; but they have the virtue of being his own. And if they serve the purpose, as they invariably do, that is the main point.

Lastly, one may consider the influence of the garden on the "dull boy" who everybody knows, and in respect of him the teacher referred to above writes as follows: "That dull boy in the school, how he worries the teacher! He has no self-reliance, and depends on anybody for help. But when he is put in charge of a garden plot he finds that his plants grow as well as those of his sharper school-fellows, and he discovers that he is capable of producing equally as good results. He then begins to have faith and confidence in himself, and there is no better method of encouraging such a lad than by giving him a garden plot."

There is abundant evidence to show that the school garden may be a useful factor in the education of a boy who is not much good at books and figures, but can use his hands. He may be low down in the class in school, but in the garden he comes up level with the brighter boys, can hold his own with them, and this gives him confidence. In fact, in the garden many a dull boy finds his vocation; and, realising that he excels somewhere, and is not altogether out of it, he is less tempted to get into that habit of thinking that because he is slow and dull, and cannot do things so well in the school, it is not worth while trying to do them at all.

H.

# PERPETUAL CARNATIONS.

(Continued from page 968.)

## Removal to Under Glass.

The plants should be housed at the end of August, and when placing them in their winter quarters remove any diseased leaves, also see that the pots are clean and free from weeds. It is important to give them all the air possible at this period, both by night and day, but when the outside conditions become cooler so regulate the ventilators and the hot water system as to maintain a minimum temperature of from 48 degrees to 50 degrees by night, with a rise of a few degrees in the day time. It is desirable to admit a little air throughout the night, when it can be done without lowering the temperature too much. It should be remembered that carnations must not be subjected to excessive fire heat; any attempt to force on the flowers will be disastrous, as it would create weak growth and flowers of poor quality and substance.

Occasionally light top-dressings of carnation manure are a great help to the opening buds, a really good manure produces large blooms of fine colour besides stimulating growth. During the winter, fertilisers should be applied sparingly, but after the turn of the year the plants will readily respond to judicious feeding. It is an advantage to spray between the pots during bright weather; but when it is damp and foggy endeavour to maintain a dry, buoyant atmosphere.

## Diseases.

Damp, close air in a carnation house is extremely hurtful, and one of the chief causes of disease. Keep the plants carefully disbudded, but in doing this remove the lateral buds gradually; to disbud too closely at one time is a check to growth, and sometimes causes the crown bud to turn blind. Give the plants a turn over several times during the winter, as this enables the cultivator to administer to their wants in various ways. Attention to apparently trifling details makes the difference between producing fine blooms of good quality and having to be satisfied with those which are second rate.

As regards rust, I have very little faith in any of the so-called remedies. Liquid applications to the foliage are not advisable during the winter; they only reach the developed spores, and do not materially check the disease. Much could be done to eradicate rust if growers would propagate from unaffected stock and maintain those conditions that are detrimental to its spreading. It is an advantage to cut off and burn any leaves that are attacked. Red spider ought not to trouble the grower if he pays attention to all cultural details. It can be destroyed, however, by spraying the plants with nicotine soap insecticide, applying it with force under the foliage. To prevent green fly, fumigate the house once a fortnight with nicotine compound. It is important to keep this pest in check, or it will do considerable damage to the young buds.

Another important point in the management of carnations is the way the flowers are cut. Plants often become very leggy when the flower stalks are only cut about half their length; but if the stems are removed close down, young growths are produced from near the base, which soon run up to flower, besides retaining the bushy habit of the plants.

## For Bedding.

As regards the use of perpetual-flowering carnations for bedding out, it may be said that they are likely to increase in popularity for this purpose as their value is more widely realised. They have already demonstrated their suitability for outdoor culture in many gardens, and we have had very encouraging results from them grown in this way. It is preferable to procure strong plants in 48's that are already set with flower buds. These should be hardened off before they are planted out at the end of May, when they will commence to flower at once, and continue to make a display of blossom until frost puts an end to growth in the autumn.

# WORK FOR THE WEEK.

## STOVE PLANTS.

GLOXINIAS.—A batch may now be placed in a warm house, selecting those corms that have been longest at rest. I do not advise shaking the corms out and repotting for early flowering, but prefer to prick over the surface soil with a pointed stick, and top-dress with sweet, rich compost. I find that new growth commences much quicker in the dull season under this treatment. Place the batch on a light shelf in a structure that is maintained at about 65 degrees, and water sparingly until new growth is well advanced. Examine at intervals the whole of the corms left in store, bring them out immediately they show signs of starting, and place on a shelf in an intermediate house until the time arrives for general repotting.

CYCLAMEN.—Although these flowers are not classed as stove plants, it is necessary to accord them a genial warmth from the time the seeds are sown until the plants are established in 60-sized pots. By the time these latter are well filled with roots, and each plant is carrying several stout leaves, the weather will allow of their transference to a heated pit, where they may remain until summer, when a cold frame will suit them well. I invariably sow the seeds early in the month of August, and as soon as the second leaf forms prick off the seedlings into pans of light, rich soil, afterwards putting them singly into thumb pots. To obtain the best results they should be grown on throughout the winter without a check, at the same time avoiding too much heat, or the leaf-stalks will become drawn and spindly. A shelf quite near the roof-glass will suit the young plants best. Allow a little top-ventilation when mild weather prevails.

CLOSING REMARKS.—We are now passing through the dullest time of the year, and until the days lengthen there is but little work in this department of a pressing nature, beyond keeping the plants and surroundings clean. With the advent of the New Year work will steadily increase.—H. T. MARTIN, Warren Wood Gardens.

## THE ORCHID HOUSES.

DENDROBIUMS.—As the deciduous and semi-deciduous dendrobiums are always a feature in good collections during the late winter and spring months, it is a wonder they are not more grown than at present. For some time they have appeared to lose favour with connoisseurs, but for amateurs and small growers they are indispensable. Besides the well-known species, such as D. Wardianum, D. crassinode, D. nobile, D. aureum, D. chrysanthum, D. Pierardi, D. tortile, D. transparens, D. crystallinum, D. lituiflorum, the lovely D. Devonianum, with D. superbum, and its varieties Burkei, Dearei, and Huttoni, and the late-flowering D. regium, there are many hybrids that are well worth growing, and in many cases these are improvements upon the species from which they were raised. Among them a few of the best for garden purposes may be enumerated, namely D. splendidissimum and its numerous varieties, D. micans, D. Cybele, D. Juno, D. melanodiscus, D. Venus, D. Dominianum, D. Chessingtonense, D. Thwaitesiæ, D. Wiganæ, D. Wiganianum, D. Melpomene, D. Ophir, D. Sibyl, D. Clio, and D. Kenneth. There is great variety in colour in an up-to-date collection of these interesting plants. Many of the plants, which have been resting, and have rested properly, will now be showing their flower buds, and when the buds are fairly developed, the plants may be given a slightly higher temperature, which will enable the flower to open more quickly, and be the means of prolonging the season of flowering.

EARLY FLOWERS. — Water must be afforded the plants with extreme care, as any undue disturbance will not only cause the new growths to break away prematurely, and thus prevent the flowers opening, but it will also damage the constitution of the plants. In pushing the earliest of these orchids into flower, it is the greatest mistake to unduly hurry them in the earlier stages. If the house in which they are placed is moist and warm, they may make sufficient progress without any water being afforded, but they must be examined from time to time, in order that the pseudo-bulbs may be prevented from shrivelling. I do not advocate syringing or spraying the plants which are developing their buds. D. Wardianum, D. crassinode, and all the hybrids which have been obtained from these species, have a tendency to produce new breaks from the base of the flowering growth, and require careful treatment, for if these growths are allowed to extend to any great length, the whole crop of flowers may be lost. Keep such plants in a moderately dry condition in the cool resting house, in order that the new growths may remain almost stationary for some time. When the flower buds have half-expanded, the plants may receive more genial treatment, and the flowers will develop vigorously and quickly. When the flowers are fully open, return the plants to cooler and more airy quarters, where they will last a considerable time in full beauty.

OTHER KINDS.—There are also a number of species, as D. Bensoniæ, D. albo-sanguineum, D. Parishi, D. rhodopterygium, D. nodatum, D. secundum, D. crepidatum, D. primulinum, D. aduncum, etc., that should be kept in a dry position in the cattleya house during their season of rest, and if their growths are properly matured they will require very little water at the roots, but they must not be allowed to shrivel or much harm will follow. Shrivelling from any cause is most detrimental to orchids, and is caused either by an insufficiency or an excess of water at the roots. Superabundance decays, and an insufficiency withers the roots of the plants.—J. T. BARKER, The West Hill Gardens.

## FRUITS UNDER GLASS.

PEACHES AND NECTARINES. — The early house that was closed up some few weeks ago will require a night temperature of from 40 to 45 degrees, allowing a day temperature of 40 to 50 degrees, and, with sun heat, it may be allowed to rise to 60 degrees. Give abundance of air when possible, but not in such a manner as to cause any cold draughts. The trees flower naturally outside when the temperature is low, consequently, when grown inside, they must not be subjected to a high temperature at this stage. Lightly syringe the trees on fine days, until the flowers begin to show colour, when it should be discontinued until the fruits have set. When the flowers are fully developed, keep a night temperature of 55 degrees, with a day temperature of about 60 degrees. Commence to disbud, very sparingly at first, removing the shoots that grow from the upper and lower parts of the branches. Keep a sharp look out for green or black fly, and fumigate immediately it is discovered.

EARLY VINES.—The buds of the vines in the earliest house are pushing into growth, and it will be necessary to gradually increase the night temperature to 60 degrees, with a day temperature of from 65 to 70 degrees. Admit air by means of the top ventilators on mild days, and keep the atmosphere fairly moist by damping down the paths and walls occasionally. Lightly syringe the rods with tepid water on fine days, at closing time; this operation, of course, must not be done if there is any likelihood of frost; the borders will not require water at the present time if they were thoroughly well soaked before the house was closed. Sufficient care and judgment must be exercised at this season of the year, so that water is not thrown on the borders in an indiscriminate manner, or they will become too wet, and the soil in all probability will become sour and stagnant, and under these conditions it is impossible for the roots to perform their proper functions. If the points of the rods were tied down to ensure an even "break," they should be now tied up in their proper places. As soon as this has been accomplished, commence to disbud, first of all by rubbing off the small growths, and lose no time in reducing them to two shoots on each spur, and finally one of these must be cut off when it can be seen which will produce the best bunch.

LATER VINES.—Close up another house to maintain a supply of ripe grapes in succession to the earliest crop; give the borders a good soaking with clean water, and proceed on the same lines as that recommended in a previous calendar. Ripe grapes hanging in the late houses should be carefully looked over, and all decayed berries removed at once. It is not a wise plan to allow ripe grapes to hang upon the vines far into the New Year, so preparations should be made forthwith to cut them and carefully place them in bottles in a cool room. It must be borne in mind that it is quite as essential that the late vines should have a proper period of rest, as the earlier forced ones, so everything should be done to attain this end. —HENRY R. FARMER, Cardiff Castle Gardens.

## THE FLOWER GARDEN.

SUMMER BEDDING PLANTS. — The various subjects that were rooted from cuttings in the autumn require very careful treatment during the winter months. Do not subject them to too high a temperature, but keep them close to the glass to promote sturdy growth. Pick off any decayed leaves, and water with great care. Plants like heliotropes and fuchsias, that were rooted several together in a pot, and are needed as standards, should be potted off into 60's, and grown in an intermediate temperature. Where a large number of bedding plants is required, a start should be made to propagate from the stock plants at once. Specimen plants being wintered in cool houses or pits should have sufficient water given them to prevent the soil from becoming dust-dry, but they must not be started into growth until February. Fumigate all bedding plants occasionally to keep down greenfly.

PERENNIAL ASTERS, or Michaelmas daisies as they are popularly called, should now have their tops removed and burned. These beautiful autumn flowers have been so greatly improved during recent years, and there are so many charming varieties, that especial care should be taken with their cultivation. When a border is devoted entirely to them it is beneficial to replant every year, after manuring the ground well and cultivating it deeply. With this object in view lift the plants and lay them in on a convenient piece of ground, so as to have the border in readiness to plant by the end of February. Three single crowns to each station are sufficient, as this will enable each stem to be staked out separately, and so show their beauty to advantage.

HIPPOPHÆ RHAMNOIDES, which is known as the Sea Buckthorn, is very effective during the autumn and winter, with its clusters of bright orange-coloured berries, and this year berries have been produced with unusual freedom. It is seen to advantage when planted in masses in a conspicuous position, but it is essential to include a few pollen-bearing (male) plants in addition to the female forms which carry the berries. The silvery-grey foliage is a source of attraction during the summer months.

SEASONABLE WORK.—Have all the shrubberies cleaned through, and remove all the leaves and decayed vegetation. The whole staff should be put on to this work, so that it may be completed speedily with the object of having the pleasure grounds smart and tidy before Christmas. Subsequently the digging of shrubberies and borders can be proceeded with during favourable weather. Repair and put in order all paths that need regravelling, and roll them well during damp weather. Have at hand material to protect tender subjects in case of frost. Prepare a supply of stakes, labels, and pegs for the coming season.—J. GARDNER, Batsford Park Gardens.

# RHODODENDRONS FOR PRESENT PLANTING.

The popularity of the various kinds of rhododendrons for garden and woodland planting has resulted in the family being one of the most valuable assets of the nurseryman, and several firms not only make a speciality of rhododendrons, but look on them as the mainstay of their businesses. In different parts of the country, however, the sorts cultivated vary to some considerable extent, and, although the kinds grown in the northern counties are quite suitable for culture in the mildest parts of the country, those which are most frequently seen in Cornish gardens would be of little use if planted out of doors in Derbyshire or Yorkshire. Therefore, when selecting plants, care must be taken to choose species and varieties that are suitable to the locality for which they are required.

Providing lime is not present in the soil in any appreciable quantity rhododendrons will thrive almost anywhere, for although they are popularly styled peat-loving plants, peat is not essential to their existence, for they thrive in both light and heavy loam to which no addition of peat has been made. The best position for rhododendrons is in a moist valley, where a little shade is provided from the midday sun, and where the ground is naturally well-drained but moist. They are also of use for planting as an undergrowth in a thin wood, whilst many are well suited for growing as specimens. The advantage of planting on undulating ground is very noticeable at flowering time, for then each plant can be seen separately, whereas when a large number of specimens occupy a wide tract of level ground, they are apt to interfere with each other, and the individual beauty of each one is not apparent. It is in such instances as this that standards are to be encouraged, for their tall stems allow the heads to stand clear of surrounding bushes; but too many standards are not desirable, for their appearance is less generally liked than naturally-grown bushes.

Rhododendrons may be planted any time between September and April, but it is advisable to obtain them before the latter date so that the roots may become settled in the new soil before growth commences, therefore people who contemplate planting should put the work in hand at the earliest possible date.

## Rhododendrons for Kind Climates.

The more tender kinds of rhododendrons which are suitable for the south-west counties of England and Wales, and for many parts of Ireland, and certain places about the West Coast of Scotland, are chiefly natives of the Himalayas, and hybrids from Himalayan species. Some are remarkable for their tall stature, as they grow into trees between 30 and 40ft. high, with goodly trunks. Others are conspicuous by their immense leaves, while the majority bear beautiful flowers. It is not so much winter cold from which they suffer as late spring frosts, for they start into growth early, and the young shoots fall a prey to frosty nights.

R. arboreum is the tallest-growing species, and many examples have been recorded between 20 and 35ft. in height. The trusses are shapely and compact, and they are made up of good-sized flowers, which vary to some considerable extent in colour. The best forms are a rich crimson; others are a paler shade of red, whilst there are varieties with pink and white flowers. Crossed with other species a set of showy hybrids has been obtained, but the majority are no more hardy than the parents.

R. Griffithianum, sometimes called R. Aucklandi, is another decorative kind suitable for the south. Forming a spreading bush, 12ft. or so high, it bears loose trusses of white flowers, which measure individually from 4 to 5in. across. Crossed with the blood-red R. Thomsoni, a number of very pretty hybrids have appeared, of which Gill's Triumph and Glory of Penjerrick, with red flowers, and Beauty of Tremough, with pink blooms, are worthy examples. There are also other hybrids, some of which claim a compact trussed kind for one parent. These bear enormous heads of flowers, as has been represented on several occasions by Dawn, a variety raised by the late Mr. Mangles.

R. barbatum is another species with bright red flowers. It may be easily detected amongst other kinds by reason of the stiff hairs on the petioles of the leaves. By crossing with R. Thompsoni, a hybrid with a compact truss of large, blood-red flowers was obtained. That is known as R. Shilsoni.

The blood-red flowers of R. Thomsoni are tubular, and 2 and 3in. long. They appear several together in loose trusses. Although often seen from 4 to 6ft. high, it sometimes attains a height of 15ft. R. campylocarpum is a choice species, growing from 5 to 8ft. high. Its principal characteristic is its canary-yellow flowers.

R. grande is a distinct large-growing Himalayan species with leaves from 9 to 12in. long and 3 to 4in. wide, silvery beneath, and green or greyish-green above. The cream-coloured flowers appear in large, shapely trusses, which are sometimes nearly 9in. in height, and the same in width. In some gardens plants may be observed 15ft. high, and as far through, which some years carry several hundred heads of bloom. R. Falconeri is quite as imposing, the leaves being even larger, for they are sometimes 15in. long, and more than 6in. wide. They are dark green above, and thickly covered on the under-surface with a dense reddish-brown felt. The white flowers are borne in large, shapely heads. R. Hodgsoni also has handsome foliage, but its purplish flowers are less showy than those of other kinds.

Quite different from any which have been mentioned is R. ciliatum. This grows into a compact bush, 4 to 6ft. high, and as far through. The leaves are very hairy, and the flowers white. When grown as a mass it is a most effective kind. Then there is R. glaucum, a bushy species, with small deep pink flowers, R. calophyllum, a tall-growing species, with white flowers, and several other kinds.

## Rhododendrons for General Cultivation.

Most of the hardier kinds of rhododendrons are of garden origin, for, with the exception of the common R. ponticum and a number of dwarf-growing species, the majority have been raised by the intercrossing of two or three very hardy species. The one which has exerted the most beneficial influence on these hybrids and varieties is the N. American R. catawbiense. This combines the qualities of a vigorous constitution, with good habit, handsome foliage, shapely heads of flowers, a late-flowering period, and extreme hardiness. Its flowers, however, offer no great range of colour, for they are generally a shade of lilac, therefore it was necessary to introduce other species for this purpose. One of the species used was R. arboreum, from which red was introduced. R. caucasicum has exerted its influence in the production of whites and pinks, while R. ponticum can be traced in purple-flowered kinds. Some of the earlier flowering hybrids have not descended from catawbiense, and are less generally useful than those which bloom from the middle of May onwards, for the flowers open at a time when frost is likely to occur; therefore, they may be crippled or destroyed before they have had a chance to show their best side. A case in point is R. Nobleana. This, although a beautiful and rich red, is rarely seen at its best, for the normal flowering time in the London district is late February and early March, and probably not more than one year in five do we see it in anything like good condition. Any variety, however, which exhibits the true catawbiense qualities, of late flowering, medium-sized, oval leaves, and conical trusses of flowers, may be depended on to give a good account of itself and to escape injury to flowers or shoots.

The following selection of varieties may be expected to grow and flower well: Album grandiflorum, white; Beauty of Bagshot, white with coloured eye; Broughtoni, red; Charlie Waterer, scarlet, light centre; Charles S. Sargent, scarlet; Countess of Clancarty, rosy-crimson; Cynthia, rosy-crimson; Everestianum, rosy-lilac; Doncaster, dwarf, scarlet; Frederick Waterer, bright crimson; Gower Waterer, white, flushed rose; John Waterer, crimson; Kate Waterer, rosy-crimson, yellow eye; Lady Clementina Mitford, peach; Lady Grey Egerton, pale lilac; Madame Carvalho, white, tinged blush; Michael Waterer, bright scarlet; Mrs. Anthony Waterer, white; Mrs. E. C. Stirling, white, tinged rose; Mrs. Holford, salmon-pink; Pink Pearl, pink; Prometheus, crimson; Purity, white, with yellow spots; Sappho, white, with dark spots; The Queen, white, tinged blush; The Warrior, rosy-crimson.

In addition to the groups already mentioned, there is a distinct set composed of hybrids with fragrant flowers. These are hybrids from the Chinese R. Fortunei. All are very floriferous, and the flowers are various shades of pink. A few good ones are Edith A. Boulton, Duke of York, Mrs. Thiselton-Dyer, and George Thiselton-Dyer.

The various hardy species which have not been generally used by the hybridist are also well worth consideration. R. racemosum is one of the most charming plants imaginable when covered with its small pinkish flowers. Unfortunately, it is seldom seen planted in large masses, which is the most effective arrangement. Then there are such showy and interesting sorts as R. cinnabarinum, Yunnanense, rubiginosum, punctatum, lepidotum, ferrugineum, and Smirnowi, all well-tried and hardy kinds, while among fifty or more new species, which have been introduced from China during the present century, we are bound to find many charming plants, although it is doubtful whether all will prove generally hardy.

The group represented by Smithi aureum and Broughtoni aureum is also worth consideration. This group is composed of hybrids raised between evergreen and deciduous species, and is sometimes called azaleodendron. The two kinds named have large heads of showy yellow flowers.

W. Dallimore.

---

**Reinwardtia trigyna.**—The rich yellow flowers of this member of the flax family (in fact, it is often known as Linum trigynum), are very bright and attractive in winter. It is a native of India, and is seen at its best in an intermediate temperature. The allied R. tetragyne has pale yellow blossoms.—W.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

# EXHIBITIONS AND MEETINGS.

◆

## Royal Horticultural Society.

There was no exhibition at the Royal Horticultural Hall on Tuesday, December 17, but the various committees met. The Fruit and Vegetable Committee had no work to do, and the Floral Committee had only the perpetual-flowering carnation Benora, white, faintly flaked with red, before it. This was shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, and gained an A.M. The Orchid Committee had a quite busy time, and granted two First-class Certificates and seven Awards of Merit. It also granted a Silver Lindley Medal to Mr. Dye, gardener to Lord Rothschild, Tring Park, Tring, for Phalænopsis intermedia Portea, which, after thirty-two years in cultivation at Tring, is this year carrying three spikes of bloom.

Messrs. Charlesworth and Co., Haywards Heath, exhibited Oncidioda cinnabarina (A.M.), a long-spiked, red hybrid between Cochlioda Noezliana and Oncidium monachicum; with this came Oncidium hybridum derived from O. tigrinum and O. lamelligerum, and bearing a good deal of likeness to the former; and a pretty little Restrepia striata. O. O. Wrigley, Esq., Bridge Hall, Bury, sent Cypripedium Mrs. Harry Bruce, a bold form of C. villosum origin. Mr. E. H. Davidson, Orchid Dene, Twyford, brought up a good form of Cattleya Maggie Raphael, a richly-coloured variety of Odontoglossum eximum named J. Lakin (A.M.), and Odontoglossum scintillans Orchid Dene var. (A.M.), a pretty purple and red-brown Rossi cross.

Cymbidium Gattonense, with a long spike of thirteen brown, green and white flowers, was exhibited by Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, who also sent a large specimen of Platyclinis uncata, and Eria Fletcheri, which was turned upside down so as to bring the inverted flowers into a position to be inspected. Francis Wellesley, Esq., Westfield, Woking, sent Cypripedium Sir William Chance (A.M.), a very attractive hybrid between C. Thompsonianum and C. Memoria Jerninghamæ; the white and purple dorsal sepal in this hybrid were very clear. Sophro-cattleya Westfieldiense (A.M.) with mauve sepals and petals, and a rosy-crimson lip, was another attraction from Westfield.

Very fine was Cypripedium Demeter (F.C.C.), obtained by crossing C. S. F. Moore with C. Earl of Tankerville. It has a white, dark purple-spotted, green-based dorsal sepal, and burnished purple and green edged petals and a purple-brown labellum; C. Artemis, a very pretty white and yellow-green hybrid from C. nitens and C. Farineanum was also shown. These two fine things were shown by Mr. H. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Tetbury, Gloucester. Messrs. Jas. Veitch and Sons, Chelsea, staged several good cypripediums, their C. Idina (A.M.), derived from C. insigne Harefield Hall and C. Countess of Carnarvon, being exceptionally bold and with a very broad white purple-spotted dorsal sepal possessed much beauty.

Mr. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, set up Odontoglossum Prince Albert, O. St. Mirin, richly coloured, and O. Phœbus, rich red with a few white and blush markings; Cattleya Tytius (A.M.) from the same collection was a bold flower with a splendid purple lip and yellow throat.

F. Menteith Ogilvie, Esq., The Shrubbery, Oxford, exhibited a particularly lovely orchid named Sophro-catt.-lælia Thisbe (F.C.C.), ruby-crimson, with deeper crimson lip, a beautiful hybrid between Cattleya Iris and Sophro-lælia Heatonense.

## National Chrysanthemum Society.

A considerable number of members of the Executive Committee met at Carr's Restaurant, Strand, W.C., on Monday evening, December 16. Mr. T. Bevan presided.

Income to date was given as £521 8s. 3d., and expenditure £437 3s. 7d., leaving a balance of £84 4s. 8d. The Floral Committee reported progress, and the matters referred to on another page were agreed upon. The annual dinner of the Floral Committee was fixed for February 17 next, at Carr's Restaurant. The Secretary reported that the society's shows would be held at the Crystal Palace in 1913, on October 1 and 2, and November 5, 6, and 7. It was agreed that a conference be held on December 10, 1913, and that an effort be made to arrange for a small exhibition at Essex Hall, Strand, on that date. Six new members were elected.

## National Rose Society.

A large number of members of this flourishing society gathered at the Holborn Restaurant, at three o'clock on Tuesday, December 17, at the thirty-sixth annual meeting.

The minutes of the previous annual meeting were taken as read. Ballot papers had to be signed on this occasion, and Dr. A. H. Williams and Mr. Arthur Turner were appointed scrutineers of the ballot. While the papers were being collected, Mr. Edward Mawley, V.M.H., the hon. secretary, read the annual report, and Mr. G. W. Cook dealt with financial matters.

### REPORT OF THE COUNCIL FOR THE YEAR 1912.

The Council, in submitting their report for the past year, congratulate the members on the continued satisfactory position of the society. The number of members is now more than double what it was five years ago. For the first time in its history four shows have been held during the year, and for the first time, one of those in Ireland. They also record with pleasure the presence at the Rose Conference and dinner of the largest number of foreign rosarians that have ever attended any function of the society.

The Southern Show was held at Southampton, on June 26, in celebration of the Jubilee of the Southampton Royal Horticultural Society. The season being an exceptionally early one, greatly favoured that exhibition, which, taking into consideration its extent and the general high quality of the blooms, must be regarded as having been the finest rose show ever held in the Southern Counties. The very complete arrangements for that exhibition were admirably carried out under the direction of the experienced secretary of the local society, Mr. C. S. Fuidge. The Metropolitan exhibition again took place, by the kind permission of the president and Council of the Royal Botanic Society, in their beautiful gardens in Regent's Park, the date of the show being July 9. This proved also a fine show, but was not quite so extensive as in some recent years.

Her Majesty Queen Alexandra, the society's Royal Patroness, after an absence of two years, once more honoured the society, and marked her continued interest in its doings by paying a visit to the exhibition, a compliment keenly appreciated by everyone present on that occasion. The attendance of members and visitors was larger than at any previous show held by the society. The provincial exhibition took place on July 19, in the Botanic Park, Belfast, this being the first time that the society has held a show in Ireland. As might have been anticipated, from the near proximity of three extensive rose nurseries, there was a fine display of blooms. This new venture proved a great success, and, but for the early character of the season, would no doubt have been better supported than it was by our leading rose growers in the South of England. To Mr. H. P. Pinkerton, the hon. secretary of the Irish Rose and Floral Society, great credit is due for the excellent arrangements made by him for that exhibition. One of the great surprises of the year was the large display of beautiful roses which were to be seen at the society's autumn show, after one of the coldest and wettest Augusts ever known. This exhibition took place in the Royal Horticultural Hall, Vincent Square, on September 12.

The society's rose conference was held at the Holborn Restaurant on May 20, when the President delivered an admirable address on the "Modern Development of the Rose." Many of the foreign rosarians present joined in the discussion which followed, greatly to the satisfaction and delight of the large number of members present on that occasion. The dinner which followed was attended by a still larger number of foreign rosarians and their friends. Indeed, at no previous period in its history has such a large gathering of foreign rosarians been entertained by the society.

Two new publications have been issued to the members during the year—in April, the "Rose Annual for 1912," and in November a new edition of the "Hints on Planting Roses." The Publications Committee have also been busy revising and amending future issues, and their untiring efforts on behalf of this important branch of the society's work again claim the warmest thanks of the council and of the members generally.

The number of societies in affiliation with the National Rose Society is now fifty-six, one of which is in Australia, and three others in New Zealand.

The council record, with regret, the death on her 87th birthday of Mrs. D'ombrain, a vice-patroness of the society, and the wife of the late Rev. H. H. D'ombrain, who was greatly dependent upon her help in his secretarial and other duties, especially during the later years of his life. The society has also lost during the year Mr. R. L. Garnett, a keen and successful amateur exhibitor at the society's northern exhibitions, and one who was much respected by all who knew him.

The receipts from all sources during the past year, including a balance from the previous year of £488 15s. 10d., amounted to £4,076 18s. 9d., and the expenditure to £3,634 6s. 7d., leaving a balance at the bankers of £442 12s. 2d. after £250 had been placed to the reserve fund. The reserve fund now stands at £1,500.

During the past twelve months 810 new members have joined the society. Allowing for the losses by death and resignation, the total number of members is now 5,504. Taking the year as a whole, two new members a day have, on an average, been added to the list of membership.

| | 1907 | 1908 | 1909 | 1910 | 1911 | 1912 |
|---|---|---|---|---|---|---|
| Number of Members ... | 2,484 | 3,150 | 3,797 | 4,584 | 5,125 | 5,504 |
| Net increase since previous year .... | 450 | 666 | 647 | 787 | 541 | 379 |

The first spring show the society has ever held will take place in the Royal Horticultural Hall, Vincent Square, on Thursday, May 1. The Metropolitan exhibition will be held in the Royal Botanic Gardens, Regent's Park, on Friday, July 4. The provincial show will take place at Gloucester, on Tuesday, July 15, in conjunction with the Gloucestershire Rose and Sweet Pea Society. The autumn exhibition will be held in the Royal Horticultural Hall on Thursday and Friday, September 11 and 12.

The "Rose Annual for 1913," which will contain, in addition to the usual helpful articles on rose culture, etc., a full report of the Rose Conference held at the Holborn Restaurant in May, will be issued to the members in March. In September will appear a new and revised edition of the "Official Catalogue of Roses," now in course of preparation, and early in December a new and amended edition of the "Enemies of the Rose."

To the donors of special prizes the Council after their grateful acknowledgments, and also to those hon. local secretaries who, by their zeal and activity, have assisted in promoting the interests of the society. They more particularly desire to mention the Rev. F. R. Burnside (Great Stambridge), Rev. R. Powley (Upton Scudamore), Mr. H. L. Wettern (Sanderstead), Dr. A. H. Williams (Harrow), and more especially Mr. R. E. West (Reigate), as having been the most successful in obtaining new members.

The Council feel they cannot close this report without tendering their warmest thanks to Miss Willmott, V.M.H., vice-patroness of the society, for her kind services during the past year.

SUMMARY OF RECEIPTS AND PAYMENTS FOR 1912.

| | | |

I have compared the foregoing statement with the books and vouchers, and hereby certify the same to be correct.

The cash balances and the securities representing the investment of the Reserve Fund of the Society have been verified by me.

CHARLES BRANNAN, Chartered Accountant.

GEORGE W. COOK, Hon. Treasurer.

The adoption of the report and financial statement was moved by the Rev. J. H. Pemberton, the retiring president. Mr. Pemberton emphasised the fact that the society had double the membership it had five years ago, and spoke of the great encouragement the society receives from Her Majesty Queen Alexandra. The society's conference and dinner to foreign rosarians in May last was, he considered, one of the best functions the society had held, because of the friendly feeling it encouraged among French and other Continental rosarians, and those of the United Kingdom. Financially the society was in a fine condition, and he was glad that out of an income of over £4,000, only £750 had been expended on prizes, while an equal sum had been expended on publications which did so much to keep distant and Colonial members in touch with the society. Besides, the publications were of immense value to the members. The exhibitions were splendid advertisements for the society, and a fine opportunity for the display of new as well as old roses. Next year, the society proposed to hold an early show in May, and he believed that this would further extend the cultivation of roses under glass; further, he considered the proposal to make the autumn show a two-day meeting a good one, as it would enable rose-lovers of all classes to see the blooms.

Mr. H. A. Darlington seconded the motion at some length, and made a kindly references to the services of Mrs. D'ombrain to the society, and he suggested that some day the writings of the late Rev. H. H. D'ombrain might be gathered together and published by way of a memorial to the society's first secretary. He suggested the society should consider the publication of a Rose Stud Book, which would be of great service to hybridists and raisers.

The motion was carried without any comment. On the motion of the Treasurer, it was unanimously agreed to offer Mr. Mawley an honorarium of £100, as a slight token of appreciation of his invaluable services.

Several alterations of rules were proposed by Mr. C. E. Shea, but they were all verbal ones, and served to bring certain rules into order in their relation to other rules; Mr. J. Green seconded his proposals, and they were carried nem. con.

Mr. Walter Stevens proposed, and the Rev. R. Powley seconded, "That a committee of five be elected for each show held by the society, to be known as show superintendents, and they will be held responsible for the proper staging of exhibits at the respective shows." In answer to a question by the Rev. F. Page Roberts, the President stated that already seven stewards were appointed for the summer show The motion was lost by a large number of votes.

Mr. W. Stevens further proposed, and it was seconded by Mr. Coney, that: "In the event of any complaint or objection being lodged by a competitor at the committee tent the matter be referred to the secretary, who, together with two or more members of the Council, shall have power to then and there decide any questions raised."

Mr. Stevens said that a box of flowers was moved at the summer show and not returned, and this was a contravention of the society's regulations. This motion was also lost, only six voting for it. The President pointed out that Regulation 10 covered the points raised in this motion.

Mr. H. P. Landon moved "that the thanks of the society be given to the officers and other members of the Council for their services during the year"; these thanks were heartily accorded, and Mr. Mawley briefly responded, and in doing so made pleasing reference to the work of president, treasurer, and Publications Committee. The President then declared the result of the ballot. Mr. Chas. E. Shea was elected president; Mr. G. W. Cook, treasurer; and Mr. Edward Mawley, hon. secretary. Most of the old members of Council were re-elected, and the newly-proposed members elected were: Colonel Kilbee-Stuart, Messrs. W. E. Harkness, Elisha J. Hicks, Stuart Hogg, H. P. Landon, and F. Slaughter.

Mr. Frank Cant moved that the Dean Hole Memorial medal be awarded to Mr. George Dickson, of Newtownards, for his great services to the rose cult as a raiser of new roses. He said there was no greater honour the society could confer, and he hoped the meeting would pass the motion. The Rev. F. Page Roberts very pleasantly and humorously seconded the motion, and it was carried unanimously and with great heartiness.

Mr. E. J. Holland moved thanks to the president in a very capable speech, and Mr. Pemberton suitably responded.

The remaining business was the induction of the new president, Mr. Chas. E. Shea, who has served one period of two years in that office previously, in succession to the late Dean Hole.

Following the business meeting came the conversazione, at which Dr. Hamilton displayed a splendid series of coloured lantern slides representing Bournemouth gardens. Music and refreshments added to the pleasantness of these later proceedings.

## National Hardy Plant Society.

The annual meeting of the National Hardy Plant Society was held at the Hotel Windsor on Thursday, th 12th inst., Mr. A. J. Macself in the chair. Sir John Llewelyn, Messrs. J. W. Barr, F. Bouskell, J. Collingridge, H. Hemsley, E. H. Jenkins, R. Morton, R. Pinches, A. Weston, and others were present. The annual report for the year was, on the proposition of Sir John Llewellyn, seconded by Mr. Barr, received and adopted, and ordered to be printed. The statement of accounts and balance-sheet, which showed a balance in hand of £15 odd, was adopted, on the proposition of Mr. Barr, seconded by Mr. Weston. The following officers were elected: Chairman of Council, Mr. Frank Bouskell; treasurer, Mr. R. Morton; hon. secretary, Mr. A. J. Macself.

The Council was then elected. Sir John Llewelyn asked the society to co-operate in a Primula Conference to be held on April, 1913. He pointed out the good work which had resulted from the last Conference, and that, with the many important additions in the Himalayan and China Sections, the work required bringing up to date. The Chairman welcomed the idea, and assured Sir John of the hearty co-operation of the society, and that he was authorised to state that Dr. MacWatt and other primula experts would be pleased to assist. A long discussion ensued as to publishing a quarterly journal. Ultimately it was decided to issue the Year Book for the present year, and to defer the question of the quarterly journal until the finances of the society warranted them. The question of holding a show was considered, and, on the proposition of Mr. Barr, seconded by Mr. Morton, it was decided to hold a show, if possible, between June 2 and 9, the secretary to approach the Royal Horticultural Society, details to be left to the Executive.

The meeting closed with a vote of thanks to the chairman.

## East Anglian Horticultural Club.

This flourishing club held its annual meeting at the Boar's Head Hotel, Norwich, on Wednesday, December 11, when a large gathering of members assembled.

From the carefully-prepared annual report presented on behalf of the committee by Mr. W. L. Wallis, secretary, it was gathered that the membership now stood at 365, the highest ever known, placing it well in the front rank of any other such club or association in the kingdom. Its finances are thoroughly sound, and there is a sturdy balance of £133 14s. 3d.

Essays and lectures have been given each month, and from the subsequent discussions have proved themselves of great educational merit. The monthly exhibitions have been a continued success, and proved a great feature of interest and friendly rivalry, and of educational merit also.

The committee thank those nursery growers and others who from time to time have made special displays of seasonable flowers, and also the generous donors who have provided special classes during the year. The highest number of points for the year have been secured by Mr. S. Hunt, gardener to Mrs. Willis, Southwell Lodge, Norwich, and he holds for the first year the silver challenge cup. Mr. W. Shoesmith wins the Harmer Challenge Cup for a series of special exhibits. Thanks are accorded to the officers, committee, and honorary members, for their kind services and help, and special thanks are given to Mr. John Willis for so kindly sending such an interesting monthly weather report.

At the subsequent election of officers the presidential chair was taken by Mr. F. Williams, gardener to Louis Tillett, Esq., Catton, according to rule, he having served as acting vice-president during the past year. Mr. John Clayton (Messrs. Daniel Bros., Lim.), was voted to the vice-presidency, and by a unanimous vote and with acclamation Mr. W. L. Wallis was re-elected secretary. The retiring committee were re-elected, with

Mr. Percy Holmes, Tuckswood, in place of Mr. W. Laws, who has gone to British Columbia. A list of proposed alterations to rules and exhibition classes, which had been dealt with by the committee, was adopted. The Secretary also read the proposed list of essays and lectures for 1913 session, which indicated practical subjects by well known local experts.

At this meeting some of the members made very good exhibits, special mention being due to the dendrobium, from Mr. W. Shoesmith, the vase of cut cypripediums from Mr. J. W. Chapman, The Gardens, Ashwellthorpe Hall; and the bunch of Alicante grapes put up by Mr. W. Marjoram, gardener to W. T. F. Jarrold, Esq., Thorpe St. Andrew.

The annual dinner is fixed for Wednesday, Jan. 15, at the Criterion Restaurant, Norwich.

### Croydon Gardeners' Association.

The attendance of members of this society at their headquarters, the Sunflower Temperance Hotel, George Street, on the 3rd inst., was very good. Each member had in mind a very interesting lecture delivered to them in October last by Mr. H. H. B. Shepherd, F.I.C., F.C.S., on the uses of artificial fertilisers. At that meeting Mr. Shepherd promised to answer any questions the members wished information upon if they would write him giving details, and he would furnish replies in similar form. A good list of questions had been forwarded to him, and this evening was set apart for the replies and further discussion.

In framing the questions, it was borne in mind that to advise the use of chemical fertilisers one has first to study local conditions. Generally speaking, the local soils are rich in lime, and this being one of the essentials of plant food, study must be made as to what other substances should be added to produce the even balance necessary.

After each written answer from Mr. Shepherd had been read the members entered into brisk debate on their experiences, and by this means a consensus of opinion was obtained which will benefit all who heard it.

The meeting unanimously accorded a hearty vote of thanks to Mr. Shepherd for his lucid remarks, and the hon. secretary was requested to write him to this effect.

Considerable interest was displayed in the exhibits shown on this occasion, and it was freely commented upon how the increase of these exhibits by members helps to improve cultural methods. Mr. O. Jeal and Mr. H. Bridges contributed collections of vegetables. Three vases of single chrysanthemums were shown by Mr. M. E. Mills. Mr. W. Coles brought a dish each of globe beet and potatoes, and Mr. Mann three dishes of dessert apples and one of pears, the colour in the apples being splendid.

### Dundee Horticultural Association.

The ordinary monthly meeting was held in the Technical College on the 6th inst. Mr. Wm. Christeson presided, while Mr. J. D. Aimer, Wellington Street, Dundee, gave a very interesting and fascinating lecture on "Mendelism." In the course of an excellent address Mr. Aimer gave a graphic outline of the principles on which Mendel based his theory, which is now fully recognised as "law" in plant-breeding. By the aid of lantern slides and sketches on the blackboard, the lecturer made perfectly plain the full significance of a good knowledge of Mendelism to plant and animal breeders who wished to attain the best results on scientific lines. The lecture was thoroughly enjoyed, and evoked numerous questions. The lecturer was cordially thanked.

**Exacum macranthum.** — This may be had in bloom at different seasons, but at no time are its rich tyrian purple blossoms more appreciated than they are during the dull weather so often experienced towards the end of the year. The yellow anthers stand out very conspicuous against the purple background.—K.

## THE FLOWERS OF APPLES

### As an Aid in Identifying Varieties.

Chief among the contributions to the current issue of the "Journal" of the Royal Horticultural Society is a highly interesting paper by Mr. E. A. Bunyard on the flowers of apples as an aid in identifying varieties. As the subject is one of considerable practical importance as well as of much interest, we give, with permission, the following summary of the paper:

A casual inspection of a number of different varieties of apples in flower reveals many differences even to the unpractised eye, and a closer inspection shows that the flower presents many characters which may be of great aid in determining, in difficult cases, the correct nomenclature of the variety.

It may be asked, "Why is this minute detail required; cannot we rely upon the fruit alone for purposes of identification?" There are cases, however, where it is extremely difficult to separate two similar varieties, and others occur in which, though fruits are practically identical, two varieties may present certain well-marked differences which are valuable from the cultural point of view. As an example of this we may cite the case of the existence of two forms of the apple Borovitsky (Duchess of Oldenburgh), which are practically alike in fruit and leaf characters, but whilst one form thrives only in the southern parts of Russia, the other will grow in much more northern latitudes. Any small detail therefore of the flower in which they differ would enable the distinction to be made without an actual experiment. Furthermore, the importance of full and accurate descriptions cannot be overrated. Quite apart from the interest of deciding cases of doubtful nomenclature, a very considerable practical issue is often involved. Pomology is largely a matter of tradition, knowledge being handed on from one generation to the next, and whilst this actual practical knowledge is of the first importance, and without it the merely book-learned would fail dismally, the converse also holds some truth. The traditional pomologist cannot afford to dispense with records. As an instance of this danger we may mention the curious error in regard to the apple Mère de Ménage. This apple was introduced into England in the early part of last century, and bears no resemblance whatever to the true Mère de Ménage of the Continent, from whence it was imported. An error in orthography probably started the mistake, which has persisted in this country for nearly a hundred years. The apple is probably a sort much grown in Flanders formerly as Mère des Pommes, and the similarity of names doubtless caused the confusion. Unfortunately, though a coloured plate of the Mère des Pommes exists as well as a description, the latter is not detailed enough to decide the point with absolute certainty.

This case establishes the point which we are trying to make—namely, that a reliance on tradition without records is a dangerous practice, and, further, that records should be ample and systematic.

The botanist will not undertake the naming of specimens from one part of a plant alone as a general rule, and the pomologist, whose material is often fully as difficult, should, for the purposes of accuracy, be able to refer to the most fully detailed records. That all advance in science is due to greater accuracy is a truism, and pomological science is no exception to this rule.

The special points considered in this paper are: Flowering season; size and shape of flowers; colour of flowers; sepals; styles and stamens, comparative lengths; styles, various forms.

In regard to these characters as a whole we may say that they are less subject to variation than any characters of the fruit, leaf, or wood. Conditions of cultivation have much less effect upon the flower than upon other parts of the tree, and in all cases the observations have been made over a series of three years, and the facts do not therefore relate to one season only, but have been twice confirmed.

The writer does not wish it to be thought that these characters are in any way new to pomology (except in so far as bud colour is concerned), as Duhamel du Monceau has used most of them in his descriptions, and Englebrecht in "Deutschlands Apfelsorten" uses the various forms of styles as dried in the fruit as recognition characters.

### Season of Flowering.

It is not necessary to go into detail as to the relative flowering periods, as this matter has lately been dealt with in reference to pollination ("Journal" R.H.S., vol. xxxvii., p. 350), but it will be remembered that very considerable differences occur between the different varieties, and the relative positions of early, mid, and late flowering kinds are on the whole well kept in varying seasons.

It may be well, however, to direct attention to certain varieties which may be termed successional flowering varieties, in which the flowers expand in succession, thus ensuring that a better chance is given of avoiding a frosty period than with those varieties the flowers of which are nearly all open at the same time. Such successional varieties are Worcester Pearmain, Cox's Orange Pippin, and Annie Elizabeth.

### Size and Shape of Flowers.

This is an obvious distinction, and not of very much value in discriminating between two similar varieties, as, generally speaking, the size of the flower is correlated with that of the fruit. The shapes, however, of the petals afford a much better ground. The shape of the expanded flower is characteristic, and may be described as cupped or flat. Those that are cupped do not, even at their maturity, lose this form, and representatives are Lady Sudeley and Lane's Prince Albert. Others open flat, or even in some cases the petal is forced back at less than a right angle to the axis of the flower stem. Examples of the flat type are Peasgood's Nonsuch and Gravenstein. The various petal forms are to be found in all sizes.

### Colour.

The colour of the expanded petal is very characteristic, and is generally confined to the outside, but there are certain varieties in which a general suffusion is common to both sides. Such, for instance, is Golden Spire.

The difference of colour is most prominent when the flower is in bud, and it forms an excellent recognition mark, and one to which we believe attention has not hitherto been drawn. The flower buds should be examined when about the size of a pea, and it will then be found that the colours are most distinct, ranging from a light yellowish pink (Rép. des Couleurs, Hydrangea Pink $T_3$) to the darkest carmine (Rouge Cramoisi, 114 $T_1$).

The value of this differentiating mark will be appreciated in the case of such easily

→ Syringes ←

Every gardener knows that the very best Syringes the world has ever seen, or can ever hope to see, are the "FOUR OAKS," which are the only Syringes ever awarded a Gold Medal.

The Gardeners' Ideal Syringe is No.1 Four Oaks Undentable, 1½ × 20in. 21/-; or with Angle Joint 27/- For Spraying.—No 9 Undentable Syringe, 1½ × 20 in. 12/6 or with Angle Joint, 18/-

Any "Four Oaks" Syringes willingly sent on approval to Head Gardeners

Complete Catalogues of Spraying and Limewashing Machines and Syringes of every description free on application to the Sole Manufacturers:— The FOUR OAKS SPRAYING MACHINE Co., No. 30, Sutton Coldfield.

confused apples as Pott's Seedling and Grenadier, and Lane's Prince Albert and Striped Beefing. In each case the first-named of the two pairs has very dark flowers, and the second light. A further case may be mentioned in that of Williams' Favourite and Worcester Pearmain, apples of the same season and of often similar appearance. The widely different colours of the buds will make identification easy.

### Calyx.

The size, shape, and woolliness are, of course, well observed in the fruit, and we need not discuss them here, except to say that the differences are more easily seen in the flowering stage.

### Relative Length of Pistil and Stamens.

This is a character of some value, and is, so far as our observation has gone, one of the most constant. It should be observed that the stamens usually attain their maximum size first, and are generally dehiscing when the pistil has reached its full length. Examples of these variations are as follows:—Styles longer than stamens: Lane's Prince Albert, Hormead's Pearmain, Gravenstein. Styles and stamens equal: Baumann's Red Winter Reinette, Mother, Lord Derby, Golden Spire. Styles shorter than stamens: Bramley's Seedling, Sturmer Pippin, Coronation.

### Various Style Forms.

Two well-defined forms exist. In different varieties of the same type the column may be longer or shorter, but it preserves on the whole a very constant length, and a measurement of fifty flowers, in which the average length of column before division was 6½mm., gave 5½mm. as the shortest, and 7mm. the longest.

The second type has the styles divided to the base, and the constancy of the form is even better maintained. The amount of pubescence is also a guide, though not so constant. In some varieties the whole pistil is quite glabrous, as in White Transparent, in others small hairs are present at the junction. In a third case the styles are hairy almost to their summits.

So far in the form in which they are divided to the base, we have not yet found a glabrous variety. It will be seen that, taking the two types, columnar and separate, we have two very clear-cut differentiating characters. Examples of their utility are shown in the following cases, in which two similar fruits are compared:—Styles divided to base: Cox's Orange Pippin, Forfar Pippin. Styles forming column: The Houblon, Norman's Pippin.

### Correlation.

The fascinating but dangerous task of searching for some broad and general correlation between these varying characters of apples is one at which we can only permit ourselves a hasty and hesitating glance. That large flowers indicate large fruit is frequently true, but exceptions exist. The largest flower we have noted is that of Nelson Codlin, an apple of medium size. Colour in flower and fruit seems to go more by contrary rule, as the finest coloured flowers are generally those of pale yellow or green varieties, as in Lord Derby, Forfar Pippin, and Golden Spire.

Lateness in flowering has on the whole a correspondence with lateness in the fruit, but by no means in all varieties.

The writer hopes that any departures from the facts stated above may be brought to his notice, as he has not had the opportunity of studying the possible effect of any markedly different environments upon them.

---

**Parsnips.**—These are far superior in flavour if left in the ground for the next eight weeks. If continuous frosts are expected, it is well to cover up a small portion with litter to prevent the ground being frozen hard. They will then be easy to dig as required; in open weather draw the litter off.—G. Ellwood.

## ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

---

FLOWERING EVERGREEN PLANTS FOR EDGINGS.—E. L. S., Saffron Walden: You will very greatly oblige me by suggesting a few subjects of perennial evergreen character that are suitable for the formation of edgings to flower borders. If the plants are also good flowering subjects, so much the better. By evergreen, I mean not deciduous. —Plants that are always presentable, of neat habit, and therefore suitable for edgings, and yet which flower well, are not numerous. Pinks, especially the variety Mrs. Sinkins, are especially good, while thrift, London Pride, arabis, violas (if planted early in the autumn), Saxifraga cæspitosa, S. hypnoides, S. muscosa, aubrietias, and either the green or yellow-leaved form of the Creeping Jenny (Lysimachia Nummuldria) may be used with success for edgings.

THE MORELLO CHERRY. — M. F., Cashel: The Morello cherry differs so largely from the sweet cherries that I have often wondered how it originated. Can you give any information upon this point? — The origin of the Morello cherry is "wrapped in mystery." It is a very old variety, and was mentioned by Parkinson in 1629. Dr. Hogg considers "The great bearing cherry of Master Miller," which Parkinson also refers to, as being identical with the Morello, a variety Switzer calls the Milan—"a reasonable great red cherry bearing plentifully, although it bee planted against a north wall, yet it will bee late ripe, but of indifferent, sweet, and good relish." This is about all we can tell you of the origin of one of our most useful fruits.

AUBERGINE OR EGG PLANT.—P. S., Harpenden: What is the best time to sow seeds of the Aubergine or Egg Plant. I should like to grow a few plants this coming year, and should like to have an idea of how to proceed.—Seeds should be sown in light soil, in a heated pit or stove, early in February, and the seedlings must be potted singly at an early date. Keep the young plants on a shelf near the glass in a quite warm house; pot again as necessary, and use rich substantial soil. Pots six inches in diameter should be large enough to fruit the plants in. An intermediate house will suffice in early summer, while an unheated pit will provide sufficient protection during the height of summer, provided the plants are well advanced. When the fruits have fully developed they may be either used for the table or the plants may add to the attractiveness of the conservatory.

AZOLLA CAROLINIANA.—C. H. T., Cranbrook: I enclose a few tiny plants of a very pretty little aquatic that is quite hardy and multiplies so rapidly here on still water that it becomes a nuisance. At the present moment it completely covers the pool, so that, from a little distance, no water is seen, but a surface that looks as solid and level as a pathway. What can be done to prevent the plant from spreading so rapidly, and what is its name?—The pretty miniature aquatic sent is Azolla caroliniana. In very still water it increases apace, but where there is considerable movement in the water it seems to increase less rapidly, while in running water it is soon carried away unless penned into a little bay by means of fine wire or a few strips of wood. Without doing damage to fish and to surrounding vegetation, we do not know of any means whereby Azolla caroliniana can be prevented from becoming a nuisance in still water, unless at regular intervals the stock is severely reduced by means of a skim-net.

HABROTHAMNUSES OR CESTRUMS.—G. H., Harrogate: Will you be good enough to let me know which are the best kinds of habrothamnus to grow as pillar plants in a warm conservatory?—The proper generic name for these plants is Cestrum, not Habrothamnus, though the latter title is still very popular in gardens. The best kinds to grow are C. aurantiacum, orange-yellow, summer-flowering; C. elegans, rosy-carmine, winter and spring-flowering; and C. Newelli, crimson, summer-flowering.

STAR ANISE.—M. A. R., Bristol: I have been given a few seeds of Star Anise; would it be possible to raise plants; and, if so, how should I proceed?—If the seeds are sound, they should be sown in moderate heat. Pot the seedlings singly when large enough, adding some peat to the soil. A warm greenhouse will suit them when once established. When you have a few plants a year or so old try one or two against a warm south wall. Your seeds may be either Illicium anisatum or I. verum.

MALMAISON AND PERPETUAL CARNATIONS.—Corunbian, Redruth: Will you kindly let me know if I am right in thinking that the treatment required for chrysanthemums will answer well for perpetual

NEWS FROM HEADQUARTERS.

WHAT THE SEED-BUYER OWES TO THE BIG SEED HOUSES.

When revelling in the delights of your garden, have you ever given a thought to what you owe to the big seed houses?

Did you know that a house like James Carter and Co. spends from £3,000 to £4,000 a year on arresting seed-degeneration, and on progressive researches?

In all cultivated plant life there is a perpetual tendency to revert to the original type. If, for example, you reproduce from seeds of your own growing, you will find your plants grow weaker and weaker each successive season.

That is exactly what would happen universally, but for the big seed houses. Only a visit to the great Exhibition Warehouse of James Carter and Co., at Raynes Park, can give you any adequate idea of the extraordinary measures taken—not merely to check the cultivated plant from running back to its original form, but to force it to a higher and yet higher form of development. Costly laboratories are maintained, where scientists pursue their horticultural researches all the year round, and the magnificent buildings are surrounded by extensive trial grounds where the plants undergo their final stage of examination.

After all, there is little difference between the development of plant life and the breeding of a racehorse. The parents of the seeds have to be selected with just as much regard to their strength, maturity, and fitness. The more thoroughly this great selective and cross-fertilising work is done the greater will be the reward. And it is precisely here that the seed-buyer gets value when coming to a big seed house.

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
RAYNES PARK, LONDON, S.W.

carnations, as regards potting, soil, and feeding? Will you also give me some information regarding the arrangement of Malmaison carnations?—The methods followed in the successful cultivation of perpetual-flowering carnations differ very considerably from those found necessary for chrysanthethemums. Both classes of flowers resent much artificial heat, they love good light and abundance of fresh air, and they both flower freely in autumn and early winter, if well managed, but there the similarity ends. We have published numerous articles dealing with the whole procedure for perpetual-flowering carnations during the present year, and, owing to the increased cultivation of these beautiful flowers and the many gardeners and amateurs who are newly devoting attention to them, we propose to deal with cultivation and varieties at some length during the coming year. Respecting Malmaison varieties, we have an illustrated article, from a clever grower, which we hope to publish in our second issue of the new year.

### NAMES OF PLANTS.

W. F., Witley.—1, Azara microphylla; 2, Zygopetalum Mackayi.

E. G. B., Bideford.—1, Escallonia macrantha; 2, Diospyros Kaki; 3, Abutilon insigne.

F. E. J., Chester.—1, Cypripedium Leeanum; 2, Selaginella amœna; 3, Cyperus papyrus.

### NAMES OF FRUITS.

S. C., Romsley.—Winter Greening.

J. T. T., Stowmarket.—1, Catshead; 2, Dumelow's Seedling; 3, not recognised.

E. G., Ottery St. Mary.—1, Cornish Aromatic; 2, probably Washington; 3, a seedling King of the Pippins; 4, not recognised, but evidently a good apple; can you tell us anything about it?

## OBITUARY.

### MR. J. D. ENYS.

We learn from the "Kew Bulletin" of the death of Mr. J. D. Enys, of Enys, Penryn, Cornwall. Mr. Enys died on November 7, at Leeds, where he had gone to undergo an operation. The gardens at Enys have been fully illustrated and described in the GARDENERS' MAGAZINE; they are remarkable for the many interesting Antipodean plants they contain, for the wonderful water gardening, masses of Primula japonica, the culture of Myosotidium nobile, the rhododendrons and gunneras. Mr. Enys resided in New Zealand for many years, and he was a valued correspondent of Kew.

**Horseradish.**—To secure good roots of horseradish a part of the plot should be taken up annually, the best roots being picked out and laid in soil for winter use. The ground should then be trenched and well cleaned, and good prepared thongs, not less than ten inches long, should be planted at once on the same site a foot apart, in rows eighteen inches asunder. — GEO. ELLWOOD.

## THE ROCK SOAPWORT.

Saponaria ocymoides is a most delightful rock plant, and one which, while in flower, is universally admired as it trails over the rocks, and is literally covered with its sheets of pink flowers. It reminds one of a vastly improved and trailing S. calabrica. It is an old garden plant, but not one to be seen every day, even in rock gardens, where it should have a good place. Its hardiness is doubtful in certain districts, but if its requirements are considered there is little fear of its loss in the greater part of the United Kingdom.

The typical S. ocymoides forms a low trailing mass of small green leaves, which for a considerable time in summer are generally covered, or, at least, almost completely veiled with pleasing pink flowers. There is a white variety, which however, becomes pink with age, and ought to be planted in stony soil and in a north aspect, so that it may retain its whiteness for a longer time. There is a deep pink variety called splendens, and a very handsome form, with more fleshy foliage and larger, brighter, flowers, is named splendidissima.

These soapworts like a hard, dry soil, with plenty of stones about it, and put in such a position that they will hang over rockwork or a stone edging. In wet winters there is some danger of losing them unless there is perfect drainage, and the finest plants in the garden of the writer are fully exposed to all winds and in poor, hard, dry, stony soil.

S. ocymoides is increased by means of seeds or cuttings, the latter being the method to be adopted for the choicer varieties. Seeds are cheap, and can be sown in shallow drills in the open in April or May in beds of sandy soil, or in pots or boxes under glass in March or April. Whenever the seedlings can be handled properly they should be transplanted about three inches apart, and put in their permanent quarters in the course of the summer. If left until late in autumn they may be destroyed in winter.

Cuttings, either of young shoots or of the older ones taken off with a heel, may be inserted in sandy soil under glass in summer, and are best wintered under glass, to be planted out in early summer. These saponarias, though not expensive, are worthy of full consideration from owners of worthy of full consideration. S. A.

**Jerusalem Artichokes.**—Leave the roots in the ground for seven or eight weeks if the soil is light, but on heavy ground take up and store without frozen soil being attached to them, and also without slugs being located upon them.—G. Ellwood.

# 20,000 Hectares of Land for Sale in the Argentine Republic.

Abundant pasture and water. The camp is very suitable for sheep-breeding. Very good climate. On this camp there are more than two millions Pine trees "Araucaria imbricata," and which measure more than one metre in diameter. The wood of these pine trees can be converted into timber as well as celulosa. This wood renders 48 per cent. of celulosa. In the Argentine Republic exist no celulosa mills. Argentina imported during 1911 not less than 24 millions kilos of celulosa. These pine trees produce a large quantity of first-class resin. The land can be inspected at any moment, and all the expenses from Buenos Aires to the camp are paid by the seller. Ask Esteban C. Ferrari, Corrientes 685, Buenos Aires, Argentine Republic, for further explanations and photos. The price for this fraction of land, with all it contains, is 170 francs per hectare, or, say, three millions four hundred thousand francs for the 20,000 hectares. Bear in mind that the price is stipulated in francs, and not in dollars, and that the area is 20,000 hectares, or, say, 200 square kilometres, and not acres. The Railway Line runs 40 kilometres distant from the land.

VOL. LV.—No. 3,087. SATURDAY, DECEMBER 28, 1912.

# THE GARDENERS' MAGAZINE

## NOTE OF THE WEEK.

### The Past Year.

The year which is now within a few days of its close may, in its relation to the garden, be regarded as remarkable for its variability, and be described as one of the most eventful of recent times. The great divergence in the climatic conditions that obtained afforded considerable pleasure at one time, and gave rise to much disappointment at others, to those who are keenly interested in the outdoor aspects of the garden, and resulted in some loss to those who are engaged in horticulture as a source of profit. In the opening days of spring the weather was warm and genial, and vegetation generally made good progress. Trees and shrubs remarkable for the beauty of their flowers bloomed so profusely as to produce wondrous displays of colour, and to contribute more liberally to the attractions of the garden than they had done for some years previously. Hardy fruits also yielded freely of their flowers, and in the fruit-growing counties the orchards of apples, cherries, pears, and plums produced in their season of blossoming a series of effects of surpassing beauty. The early promise of the orchards was not, however, fully realised, for a spell of cold weather towards the end of the period of flowering did considerable damage, and materially reduced the crops of certain kinds. Briefly stated, there was a fair crop of apples, a good crop of pears, a moderate crop of plums, and an abundance of nuts. The low temperature and the heavy rains that were experienced during the greater part of the summer were fairly favourable to many kinds of vegetables, and very different were the supplies in the markets and private gardens to those available in the summer of 1911. Potatoes were the most injuriously affected by the unfavourable weather, and the crop was disappointing both in yield and quality. Indeed, to find a less satisfactory crop of tubers it would be necessary to go back many years. Turning from this brief reference to the crops to the events of an eventful year, we find much that cannot have failed to afford immense satisfaction to those who are jealous of the traditions of British horticulture. For a long series of years a strong desire had been felt by all classes of horticulturists that an exhibition of an international character should be held in London for the purpose of demonstrating to the world the position of horticulture in this country, and of affording an opportunity for returning the generous hospitality that British horticulturists had received from their friends abroad. The organisation of an International Horticultural Exhibition worthy of the name is no light matter, involving, as it does, an immense amount of work and the expenditure of a large sum of money. Hence it was not until some three years since that it was felt so gigantic an undertaking could be entered upon with the full assurance of a complete success. No sooner was it decided to hold the exhibition this year than the preparatory work was commenced, and it was carried on with so much vigour that on the opening day the exhibition was so complete in its various details as to obtain for the members of the executive the warmest expression of praise from those who were in a position to fully appreciate the task that had been accomplished. As we so fully informed our readers at the time, the exhibition far surpassed in extent any horticultural exhibition previously held at home or abroad, and was remarkable for its interest and varied attractions. Science and practice were happily combined in the programme, and of special importance was the remarkably successful Conference on the education of gardeners, and the regulations relating to the diseases and insect enemies of plant life. The social functions were numerous, and the large number of foreign horticulturists who were invited to take part in the exhibition and conference returned home much impressed by what they had seen, and immensely gratified by the hospitality they had enjoyed. An episode which gave an immense amount of gratification to horticulturists of all classes, and, indeed, of all countries, was the knighthood conferred by the King on Sir Harry Veitch, V.M.H. Not only was this distinguished horticulturist the only member of the Board of Directors who had served on the committee of the International Exhibition held in 1866, but he had throughout the long period that had intervened taken a prominent part in all movements that had for their object the advancement of horticulture, and the welfare of gardeners. The exhibition, as now so well known, was remarkable for the evidence it afforded of the great popularity of orchids, on the one hand, and of hardy flowers on the other. One effect of the International Exhibition at Chelsea was the suspension of the Temple Show, which was much missed, but there was a consensus of opinion that the Council of the Royal Horticultural Society, who gave the most generous support, financially and otherwise, to the movement, had acted with their characteristic wisdom, and thereby contributed still further to the success achieved. The Royal Horticultural Society has, in

MR. H. T. MARTIN.

cordance with custom, pursued its work with vigour and success during the year. The great summer exhibition at Holland House was considerably above the average, the glorious displays of stove and greenhouse plants, roses, sweet peas, and hardy flowers being especially noteworthy; and the exhibition of hardy fruits in October was also of a highly satisfactory character. The interest in the fortnightly meetings have been fully maintained, and the attendance on several occasions was so large as to render it no easy matter to see the plants and flowers that had been so liberally contributed. Two additions were made by the society to its usual programme, one being the Daffodil Show, in April, which was the first exhibition of daffodils in London, and a gratifying success. The second was the exhibition of autumn-flowering orchids in November, and this was even more successful. Apart from the object-lesson it gave on the value of orchids flowering late in the year, it was of special interest as illustrating the possibility of successfully breaking away from straight lines in the arrangements of plants and flowers in the hall. The National Rose Society was not less active and successful than the Royal Horticultural Society, as evidenced by the report presented to the annual meeting a few days since. It held four exhibitions during the year, all of which were more or less successful, and, as in the case of the last-named society, it dealt with many novelties, the awards to new roses being more numerous than in any previous year. The National Sweet Pea Society held a highly successful show, and did much useful work in its trial grounds at Sutton Green and Burbage. Indeed, the value of the society's trials in connection with novelties cannot be over-estimated, and is so highly appreciated by growers and raisers, as a whole, that probably some other societies might with advantage in dealing with novelties follow the lines that have been laid down by this enterprising society. The National Chrysanthemum Society, the Perpetual-flowering Carnation Society, the National Carnation Society, the Hardy Plant Society, the National Dahlia Society, and the National Vegetable Society have all done excellent work in their respective spheres of activity, and thereby contributed appreciably to the advancement of horticulture. The last-named society made the mistake of holding its first provincial show within too short a distance of London, and, in the matter of finance, suffered accordingly. It appears to us that the initiation of a bolder policy is essential to the welfare of this society. At the great provincial centres, such as Shrewsbury, York, Wolverhampton, and Leicester, there have been no signs of a waning interest in the several societies and their work. Some may have taken less money for admission owing to unfavourable weather, but in all cases the decrease has been practically negligible, seeing that the leading societies are careful to keep a good balance in hand. With the smaller societies the case is different, and a considerable number are faced with a serious deficit. One of the most noteworthy events associated with provincial societies is the retirement of Messrs. Adnitt and Naunton from the joint secretaryship of the Shropshire Horticultural Society, a retirement that we much regret, as, indeed, do all who have had an opportunity of becoming acquainted with their work in connection with the Shrewsbury Floral Fête, which enjoys a world-wide fame, and is regarded as a model horticultural gathering for the provinces. Another matter of interest, whatever may be the views held with regard to it, has been the coming into force of the Insurance Act, which has compelled nearly all gardeners to join a friendly society. One result has been the addition of 500 members to the United Horticultural Provident and Benefit Society, but if gardeners had the proper understanding of these matters the number would have been 5,000.

**Mr. H. T. Martin,** who has recently been appointed head gardener to Princess Frederick Leopold of Prussia, at Klein Gliencike, Potsdam, and will enter on the duties associated therewith on January 6 next, has for many years occupied a leading position among practical horticulturists of this country, a position fully justified by his cultural skill and administrative ability. Mr. Martin, who is a Kentish man and the son of a gardener, commenced his gardening career away from home in a Kentish garden of repute, and after a service of three years, followed by a similar service in another garden in Kent, he came to London and entered a London nursery, where he remained twelve months with the object of obtaining a varied experience. Later on he obtained the position of foreman in the garden at Weston House, Shipston-on-Stour, the residence of the Countess of Camperdown, where fruit was grown with much success; and subsequently he was engaged as foreman by Mr. E. Beckett, V.M.H., in the Aldenham House gardens, where he remained some four years. While occupying the last-named position, Mr. Martin was appointed head gardener to the late Lord Leigh, at Stoneleigh Abbey, Warwickshire, with whom he remained until his death. During the nine years he had charge of the Stoneleigh Abbey gardens Mr. Martin specially distinguished himself in the cultivation of fruits and vegetables, and in all other respects fully maintained the traditions of these famous gardens. Some years have elapsed since Mr. Martin entered on the charge of the Warren Wood gardens, near Hatfield, and in the fulfilment of his duties has proved to demonstration his qualifications for the important position to which he has been appointed at Potsdam.

**The Gardeners' Magazine Almanack,** 1913.—With our next issue (January 4, 1913) we shall publish a Floral Almanack for the coming year, which will be printed in colours. The subjects of the illustration will be two of the most useful of the hybrid tea roses that are specially adapted for beautifying the garden. The almanack will also contain the dates of all the important exhibitions and meetings that have been arranged at the time of going to press, and will therefore present a happy combination of beauty and usefulness.

**Retirement of Messrs. Adnitt and Naunton.**—With reference to our announcement of the retirement of Messrs. Adnitt and Naunton from the secretaryship of the Shropshire Horticultural Society, Mr. H. N. Ellison, of West Bromwich, writes: "In common with other members of the trade I have read with much regret your announcement of the retirement of Messrs. Adnitt and Naunton from the positions they have so long occupied on the executive of the Shropshire Horticultural Society. They have worked with such untiring zeal, and shown such remarkable enthusiasm, that it has been a pleasure and privilege to meet them year after year at the Shrewsbury Floral Fête, which undoubtedly owes much of its remarkable success to their rare judgment, enterprise, and geniality. Most certainly the occasion should not be allowed to pass without giving the many horticultural friends of Messrs. Adnitt and Naunton the opportunity of showing their appreciation of the splendid work they have done for the advancement of horticulture. Personally, I shall consider it a great privilege to contribute to any testimonial that may be raised."

**National Chrysanthemum Society's Arrangements for** 1913.—The dates of the exhibitions and meetings that will be held by the National Chrysanthemum Society during 1913 are as follows: Executive Committee, September 22, October 27, November 17, December 15. Floral Committee, September 8 and 22, Essex Hall; October 1, Crystal Palace; October 13 and 27, Essex Hall; November 5, Crystal Palace; November 17 and 24, and December 10, Essex Hall. Exhibitions, October 1 and 2, and November 5, 6, and 7, Crystal Palace; December 10, Essex Hall. Conference, December 10, Essex Hall. Annual meeting, February 3.

**Forestry at Oxford.**—Sir William Schlich, F.R.S., recently offered £690 18s. to the Oxford University towards a fund for the permanent endowment of the professorship of forestry. This offer has been accepted. It is proposed, in connection with the Oxford School of Forestry, to appoint a qualified person to investigate diseases of trees, at a salary of £400 per annum, for two years, plus travelling expenses. The appointed officer will commence work about February 1, 1913.

**British Orchids.**—At a recent meeting of the Linnean Society, Mr. E. J. Bedford contributed notes on rare native orchids, and upon two species new to East Sussex. We learn from "Nature" that Mr. Bedford is engaged in obtaining a series of photographs of the British wild orchids, his intention being to secure photographs of every possible species in situ, as well as at closer quarters at home, when arranged against a plain background. During the season of 1911 he was fortunate enough to obtain two species not hitherto recorded for East Sussex. The first of these was the brown-veined orchid, Orchis purpurea, found in the Ouse district, near Lewes, in the month of May, by Mr. Herbert Jenner, of Lewes. This interesting find was the prelude of another of perhaps even greater interest, for in the month of June the author found a specimen of the rare lizard orchid, Orchis hircina, in the Cuckmere district, near Eastbourne. The author's collection of photographs at present consists of thirty-three species and varieties, out of a possible forty-four.

**Messrs. Dobbie and Co.'s Social Meeting,** which invariably gives rise to much pleasurable anticipation among those who have an opportunity of taking part in it, was held on the 20th inst., and proved, as usual, a splendid success. The Edinburgh meeting was held in the Oak Hall, Prince's Street, where a party of 200 employees and their friends were entertained. The same evening the staff and their friends, to the number of fifty, were entertained at Marks Tey, Mr. A. Ireland presiding.

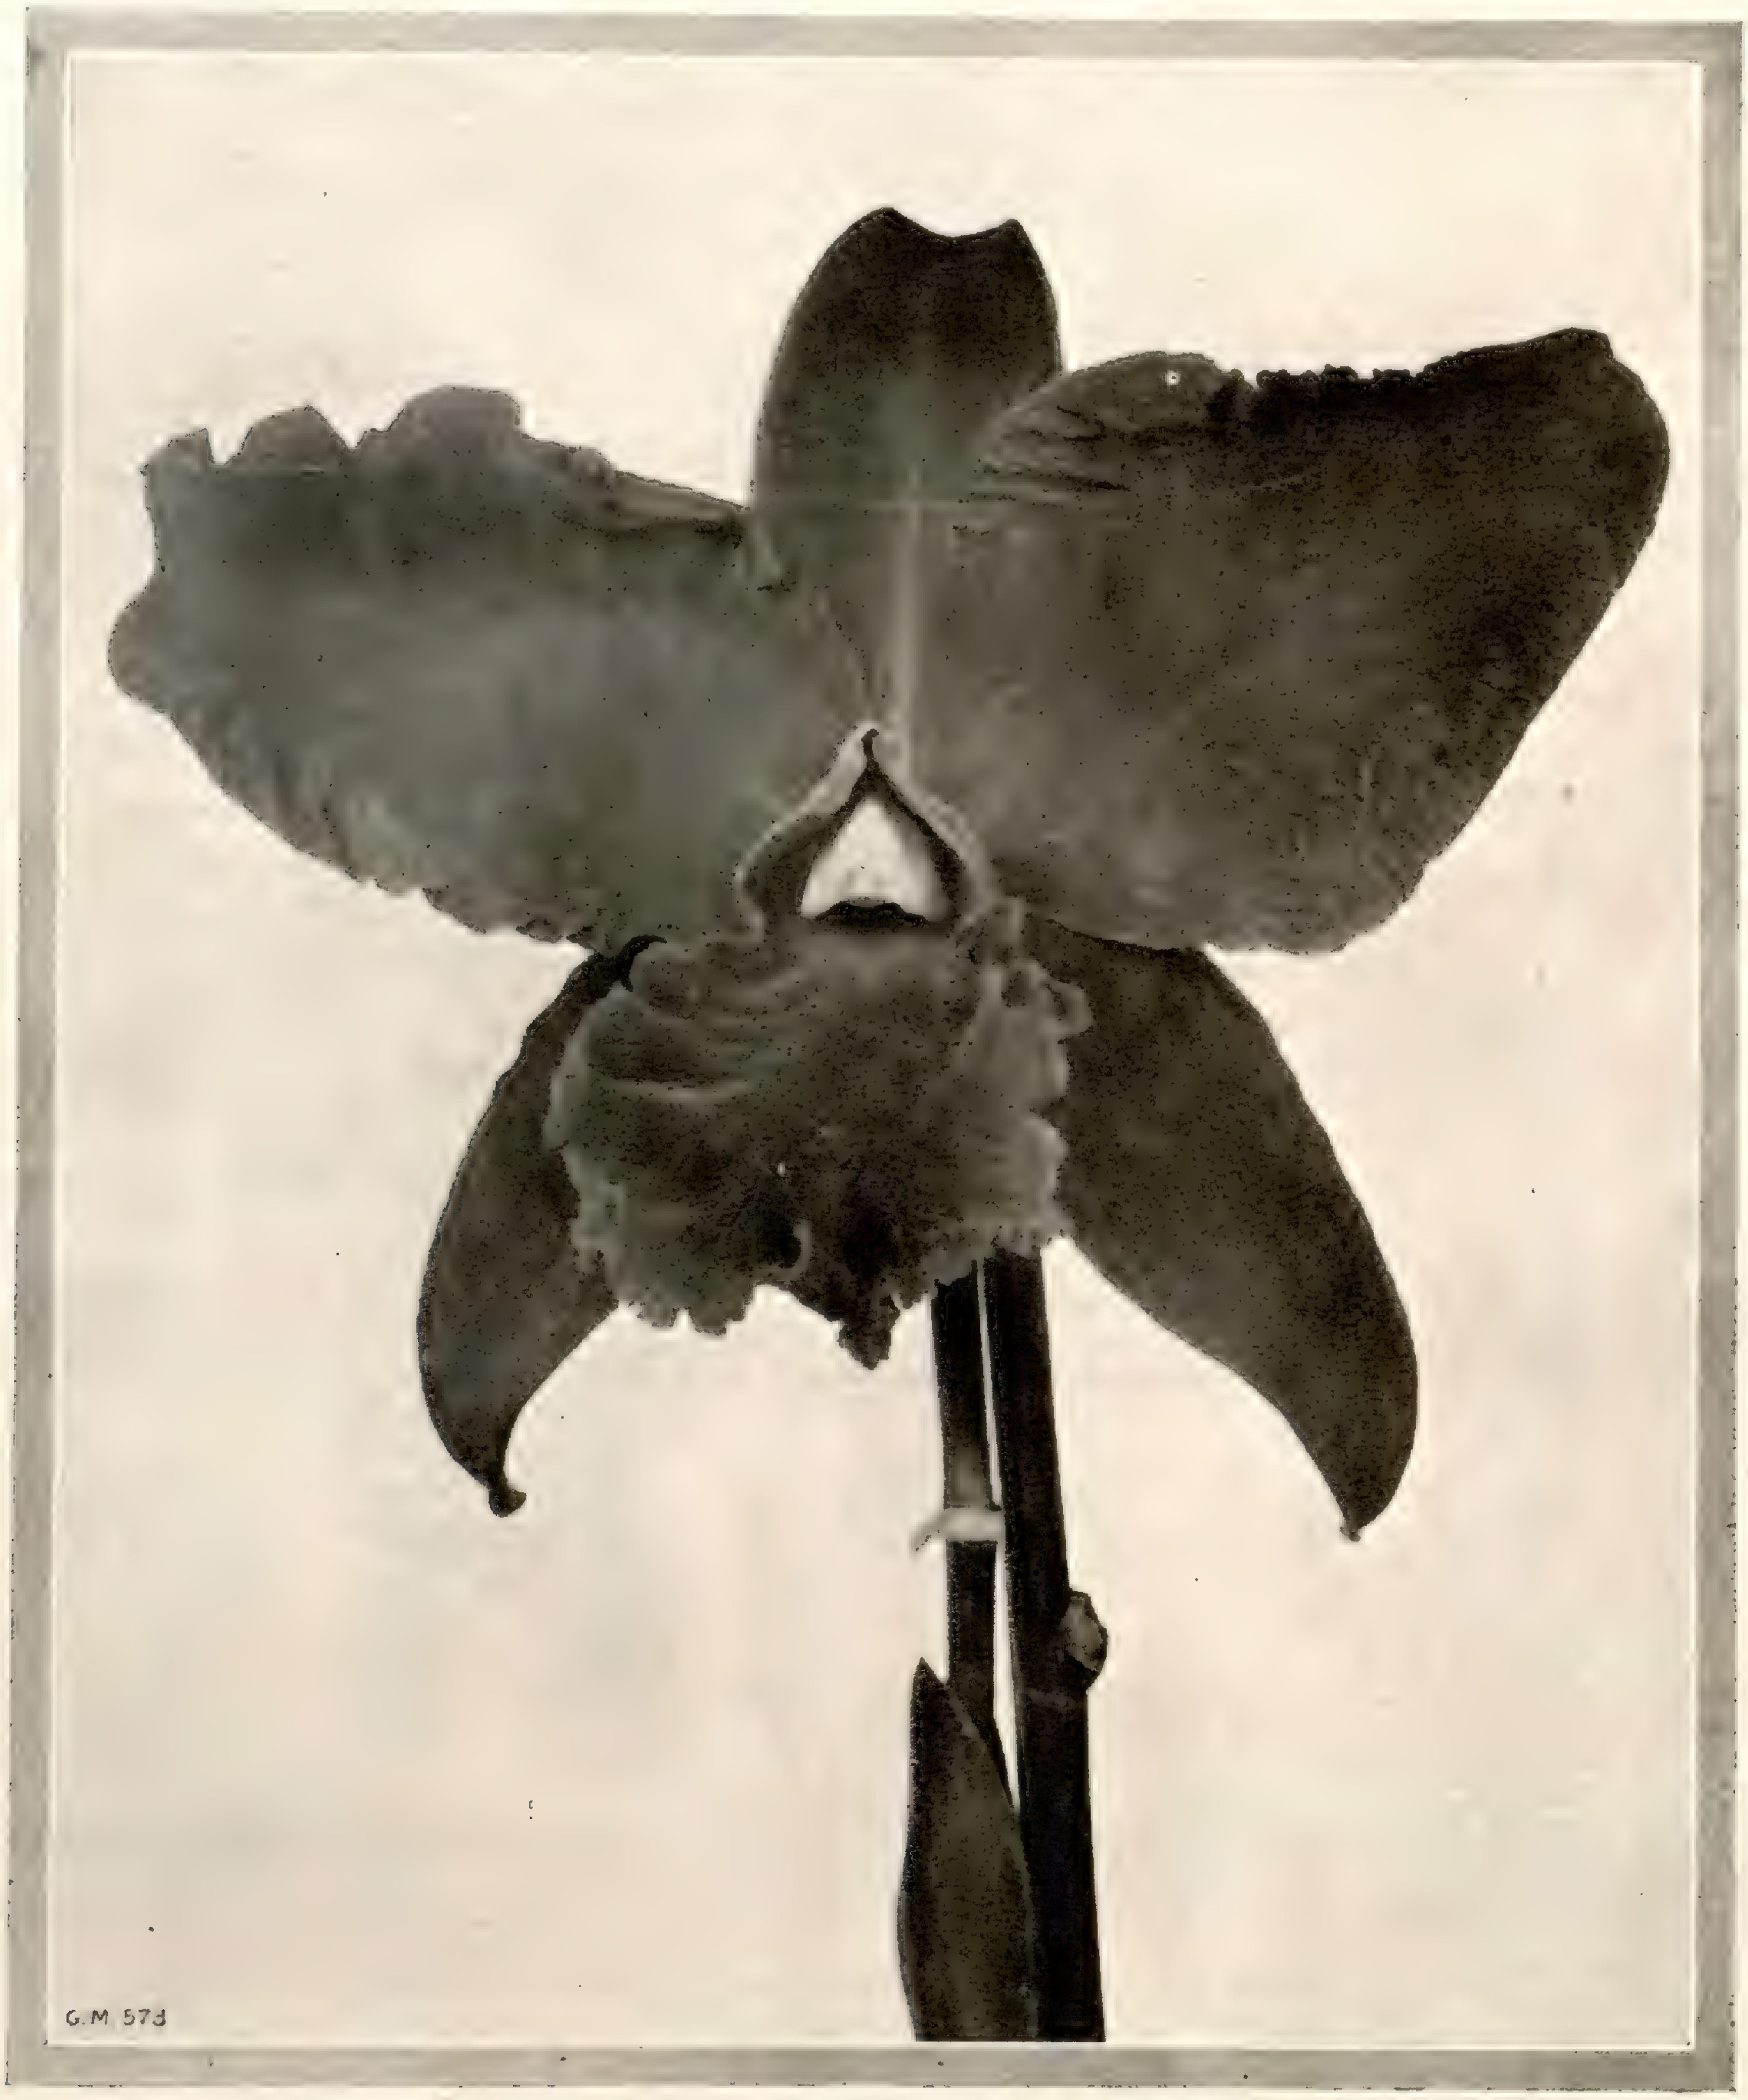
**Northern Counties Fruit Congress in** 1913.—The four northern counties will hold a Fruit Congress and Show at Kendal on September 24 and 25, 1913. The president is Lord Henry Bentinck, who will open the Congress; the treasurer is W. D. Crewdson, Esq. (High Sheriff); the chairman of the Executive Committee is F. W. Crewdson, Esq., Levens, Milnthorpe; and the joint secretaries are Alderman E. J. Abbott and Mr. Clarence Webb, Kendal. The Executive Committee is a thoroughly representative one, and includes many practical fruit growers. A ladies' hospitality committee has also been formed. At the first public meeting the dates determined upon were October 15 and 16, but, owing to representations made, and to meet the wishes of the damson growers, the dates were altered at the meeting of the Executive Committee to Wednesday and Thursday, September 24 and 25. The Executive also settled upon the following programme for the Congress: (1) Land Tenure and Fruit Culture; (2) Organisation of the Damson Industry; (3) Diseases of Potatoes; and (4) Winter Moths; with demonstrations of spraying machinery, fruit bottling, and pruning. It was originally thought that the large Market Hall would be suitable for the Congress, but, owing to the kind offices of Dr. Parker, chairman of the Kendal Education Committee, there are excellent prospects of the Museum, the large room, and the lecture theatre of the new technical schools being placed at the disposal of the Executive; in fact, it is hoped to open the technical schools with the Fruit Congress.

**Tree Planting in Canada.**—Twenty-five prizes, ranging from £10 to £120, are being offered by the Canadian Pacific Railway Company to encourage tree-planting by settlers who have bought or leased the company's land. The prizes will be awarded in the autumn of 1914 for plantations set out next spring or later. The chief points to be considered by the judges will be: Preparation of soil, 30 marks; cultivation and care of trees, 30 marks; growth and appearance of trees at time of judging, 30 marks; and bush fruits, shrubs, and flowers, 10 marks. A free supply of half the trees required, and free advice, are also offered by the company; while the other half of the trees will be furnished for £1 per 100 or £3 per 1,000 from their chief farm. Most of the prizes are for residents on the irrigation blocks, but eight of £10 each are reserved for settlers outside that area, and one of £120 is for the best plantation on any C.P.R. land south of Township 28, on the strip of Southern Alberta, 160 miles wide, next to the United States.

## NEW PLANTS.

### SOPHRO-LÆLIO-CATTLEYA THISBE.

For brilliant colouring it would be difficult to improve upon this beautiful hybrid, for, though the flowers are of but medium size, the splendid rich ruby-crimson of the sepals and petals, and the orange-crimson of the flattened lip attract attention at once. Probably, as it grows stronger, the spikes will carry several flowers, as the parents are Cattleya Iris and Sophro-lælia Heatonensis. F.C.C., R.H.S., December 17. F. Menteith Ogilvie, Esq. (gardener, Mr. W. Balmforth), The Shrubbery, Oxford.



SOPHRO-LÆLIO-CATTLEYA THISBE.

Flowers rich ruby-crimson with orange-crimson lip. F.C.C., R.H.S., December 17. F. Menteith Ogilvie, Esq., The Shrubbery, Oxford.

### SOPHRO-CATTLEYA WESTFIELDENSIS.

A strong-growing hybrid with fairly large flowers, in which the sepals and petals are deep mauve-purple, while the lip is rosy-crimson, veined with deep crimson. The parents are Cattleya labiata and Sophro-cattleya eximia. F.C.C., R.H.S., December 17. Francis Wellesley, Esq., Westfield, Woking.

### ONCIDIODA CINNABARINUM.

This is an interesting hybrid between Oncidium monachicum and Cochlioda Noezliana. The growth and inflorescence at once suggest the oncidium parent, as the arching spike, a yard or so long, with the flowers lightly set upon it, show the oncidium influence markedly. The medium-sized flowers have cinnabar-red sepals and petals, and a buff-coloured lip. A.M., R.H.S., December 17. Messrs. Charlesworth and Co., Hayward's Heath.

### CYPRIPEDIUM SIR WM. CHANCE.

Another fine cypripedium, and one of very distinct colouring and appearance. It has a very pure white, flattish dorsal sepal, with the base finely coloured with rich red-purple, this colour rising up the centre. The petals are purple-brown and yellow, and the lip green and brown. A.M., R.H.S., December 17. Francis Wellesley, Esq. (gardener, Mr. Hopkins), Westfield, Woking.

### CYPRIPEDIUM IDINA.

This hybrid seems to about hold the record for the breadth and roundness of its dorsal sepal, as that organ is especially fine and shapely. It is white, slightly concave, pale green at the base, and sprinkled with light mauve-purple spots. The petals and lip are green, shaded with brown. The influence of C. insigne Harefield Hall is most marked in C. Idina; the other parent is C. Countess of Carnarvon. A.M., R.H.S., December 17. Messrs. Jas. Veitch and Sons, Chelsea.

### CYPRIPEDIUM DEMETER.

A splendid hybrid, of large size and most effective. The parents are C. Earl of Tankerville and C. G. F. Moore. The large white dorsal sepal is broad, has a greenish base, and a large number of bold purple spots. The broad petals have a heavy shading of rich purple-brown, with edgings of bright green, and the lip is also purple-brown. One striking feature of the flower (figured on p. 973 of the GARDENERS' MAGAZINE) is the highly-polished or burnished appearance it presents. The base of the dorsal sepal is scarcely so broad as the connoisseur could wish, but that is the only criticism that can be offered. F.C.C., R.H.S., December 17. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

### ODONTOGLOSSUM SCINTILLANS ORCHID DENE VAR.

A small but pretty odontoglossum obtained by crossing O. Rossi with O. Wilckeanum. In habit and form of flower the hybrid bears a strong resemblance to O. Rossi. The flowers, borne on a small spike, are purplish, with dark red-brown spots and blotches; the lip is light purple, with a crimson basal area surrounded by a pink line; a yellow disk adds to the attractiveness of the flower. A.M., R.H.S., December 17. Mr. E. H. Davidson, Orchid Dene, Twyford.

### ODONTOGLOSSUM EXIMIUM VAR. J. LAKIN.

A bright form, with shapely flowers of good size and substance. The ground colour is blush, shaded with rose, and over this are numerous bars and blotches of deep chocolate-red. The white lip has red blotches and a yellow disk. A.M., R.H.S., December 17. Mr. E. H. Davidson, Orchid Dene, Twyford.

**Eucryphia pinnatifolia.** — This beautiful Chilian shrub, the subject of two or three recent notes in the GARDENERS' MAGAZINE, well merits all that has been said in its favour. In a visit paid to Coombe Wood Nursery at the end of the summer I was much impressed by its charming appearance. Several examples were then flowering freely, one specimen, about fifteen feet high, being a mass of blossoms. Apart from its beauty, this was of great interest as being one of the original plants raised from seed sent home by Richard Pearce, of tuberous begonia fame, by whom it was first introduced. —T.

## THE PAST CHRYSANTHEMUM SEASON.

The leader on this subject in a recent issue of the GARDENERS' MAGAZINE is interesting. My experience of shows in the South and the North induces me to say that the entries in the large bloom classes were not so numerous as usual, but that the shows were quite up to the average because greater interest was taken in other classes that go to make an exhibition. I think no one will deny that the cause of fewer exhibits in the Japanese classes is traceable to the fact that so many of the at one time regular exhibitors have ceased to be interested in this aspect of competitions at the chrysanthemum shows. It would not be difficult to name at least a dozen prominent growers who are now absent from the ranks of regular exhibitors, but it would be exceedingly difficult to name those who have taken their place or appear at all likely to do so. Such a fact as this is surely a reason for fewer exhibits. I noticed, also, that the competition in the Japanese classes was less keen, and that there was a much greater difference in the blooms in the first and second stands than was the case some years since.

Vase classes are not only fewer, but less well supported than formerly. There is no gainsaying the fact that vase classes reduced variety; instead of two or three dozen varieties being staged as in classes on boards vase classes require at the most a dozen, with perhaps one exception, Edinburgh—where fifteen is the maximum. Such a diminution of varieties cannot fail to reduce the interest in the Japanese section. I think perhaps the quality of new varieties of Japanese is of a higher standard than during the last five years. Such varieties as Queen Mary, His Majesty, W. Turner, and Thomas Lunt are great advances.

Where prizes were offered for a given number of blooms, say, twelve, of Japanese variety, arranged in one vase, with any kind of natural foliage, the effect produced was of the best, well illustrating the value of large Japanese blooms for hall decoration. Such a class is of infinitely more value than that for eighteen flowers arranged in a given space with foliage cut or growing.

To me it was very deplorable to see the poor quality manifest in the incurved section. I did not come across a single stand of a truly representative character. Many of the blooms show far too much of the Japanese character to be in any way typical of a true Chinese flower. In one instance I saw a bloom of G. F. Evans 8½in. in diameter, with florets resembling those in a typical Japanese incurved bloom! Mrs. J. Hygate is another of what I term a malformed flower, neither correctly a Japanese or an incurved specimen. I am aware also that cultivation has much to do with such undesirable blooms. In the hands of an expert such irregularities would be toned down. I fear that there is not a bright future in store for the incurved section, as they are not even appreciated for decoration, voted too formal, and I am equally positive they have few admirers in their present condition on the formal show board.

In the decorative section I noted stronger competition in the classes for undisbudded flowers, in sprays than in exhibits stipulating for so many flowers from disbudded plants. The former so much better displays the true character of the variety in a profusion of blossom which gives truly a more pleasing decorative effect. In groups of plants I noted this fact equally with cut blooms, especially in the case of single-flowered varieties. At no show that I visited could any comparison be made in this respect with the exhibits at Windsor. There the finest varieties were presented in a truly decorative manner, and, consequently, found many admirers. At Hull and at Norwich, too, classes were provided for both sections in vases; it was plain to be seen the preponderance was with the naturally-grown exhibits.

I think those societies who recognise the decorative aspect of the chrysanthemum as applied to dinner-table decoration, vases, and baskets with natural foliage, will score, especially if handsome prizes are given with a view of stimulating competition. It is not merely that increased competition will result, but such exhibits are more interesting to the general public, who are the means of rendering a show a financial success or otherwise.

When considering the financial aspect of societies, especially in maintaining the interest of the subscribers as apart from the ordinary visitor who attends, perhaps, quite casually, carnations could be made more use of, as they are a source of attraction to those who do not care wholly for chrysanthemums. Such visitors have to be considered, and many of them are apt to say, "Oh! it is no use going to that show; there is nothing else to see but chrysanthemums, and I don't care for them." Carnations, especially during the winter, are universal favourites, and help much to brighten up even a chrysanthemum show.

E. MOLYNEUX.

## LILIUM BROWNI.

We are continually told that Lilium Browni is a native of China, and on that point I would like to ask, Is that really so? By Lilium Browni, I do not mean any of the nearly allied forms which have been sent here from China within recent years, but the Lilium Browni which was grown in Europe when China and Japan were comparatively unknown lands. It is reported to have been named after Brown, a nurseryman of Windsor, somewhen about 1830, and has since then been grown by the Dutch. The lily principally cultivated by the Japanese and often sent to this country as Lilium Browni is L. japonicum Colchesteri or L. odorum, as it is often called.

That I am not alone in speaking thus of Lilium Browni is shown by the following extract from the "Book of Lilies" in the present-day gardening series. After saying that the habitat of L. Browni was not known with certainty till 1888, when Henry chanced upon it growing wild in some of the gorges of the Yangtse-Kiang, the writer goes on to say:

> "The lily usually grown in gardens as L. Browni is derived from the Dutch and Japanese nurserymen, who cultivate it in large quantities. Whether it was ever identical with the typical plant or whether, as sometimes happens, its characteristics have undergone some change under cultivation, is not clear; but it is evident that the Browni of gardens is not in all respects the same as the typical plant of Western China."

To this I may say that I have known L. Browni of the Dutch for nearly fifty years without it varying in the least, and cannot understand why this should not be regarded as the typical L. Browni. S. W.

**Escallonia exoniensis.**—This escallonia is of hybrid origin, but the parentage is, I believe, unknown. It flowers from the latter part of the summer well on to the end of the year, there being some clusters of flowers on it the week before Christmas. In August and early in September the flowers are particularly attractive to the showy butterflies of the Vanessa section.—W.

## ASTILBES IN POTS.

Under the generic name of astilbe is now included the plant so long popular in gardens and known generally as spiræa or Hoteia japonica. Well within the memory of many of us it stood out practically alone in its class, but now, thanks to more recent introductions, and the use that has been made of some of them by the hybridist, we have now a great many varieties, differing in habit, colour of the flower, and other particulars from each other.

The first great advance was the introduction of Spiræa astilboides, which was distributed by the late Mr. William Bull, of Chelsea, in 1884. It is altogether a larger and a bolder growing plant than A. japonica, while the inflorescence is of a creamy-white, and less feathery than in the older kind. This was followed in 1891 by Spiræa astilboides floribunda, announced by the Belgian nurseryman by whom it was distributed as having accidentally appeared as a seedling from S. astilboides, and apparently the result of the flower having been fertilised with the pollen of S. japonica growing in close proximity. This hybrid theory is probably the correct one, as S. astilboides floribunda is about midway between the two. It quickly became popular for pot culture and forcing purposes, and large numbers are still sent annually from Holland and Belgium.

This was after a time followed by others, of which astilboides longifolia, Lord Salisbury, and Gladstone are perhaps the best. New forms are, however continually being brought forward, one of the latest examples of which is that here figured—Avalanche, which was given an Award of Merit at the last Holland Park Show. It is a bold-growing variety, with stout, reddish stems, dark green, much serrated leaves, and white flowers. This was said to be the result of a cross between Astilbe chinensis and Spiræa compacta multiflora. At the mention of this last name, one may be pardoned a slight digression, for there was a very old variety of S. japonica with golden-veined leaves, which was given a First Class Certificate by the Royal Horticultural Society as long ago as 1869. This variety had the inflorescence arranged in a close, compact manner, exactly as in compacta multiflora, hence there is no doubt that this last-named resulted from the golden-veined form reverting to the normal green-leaved type. At all events, compacta multiflora was brought forward in the latter part of the eighties.

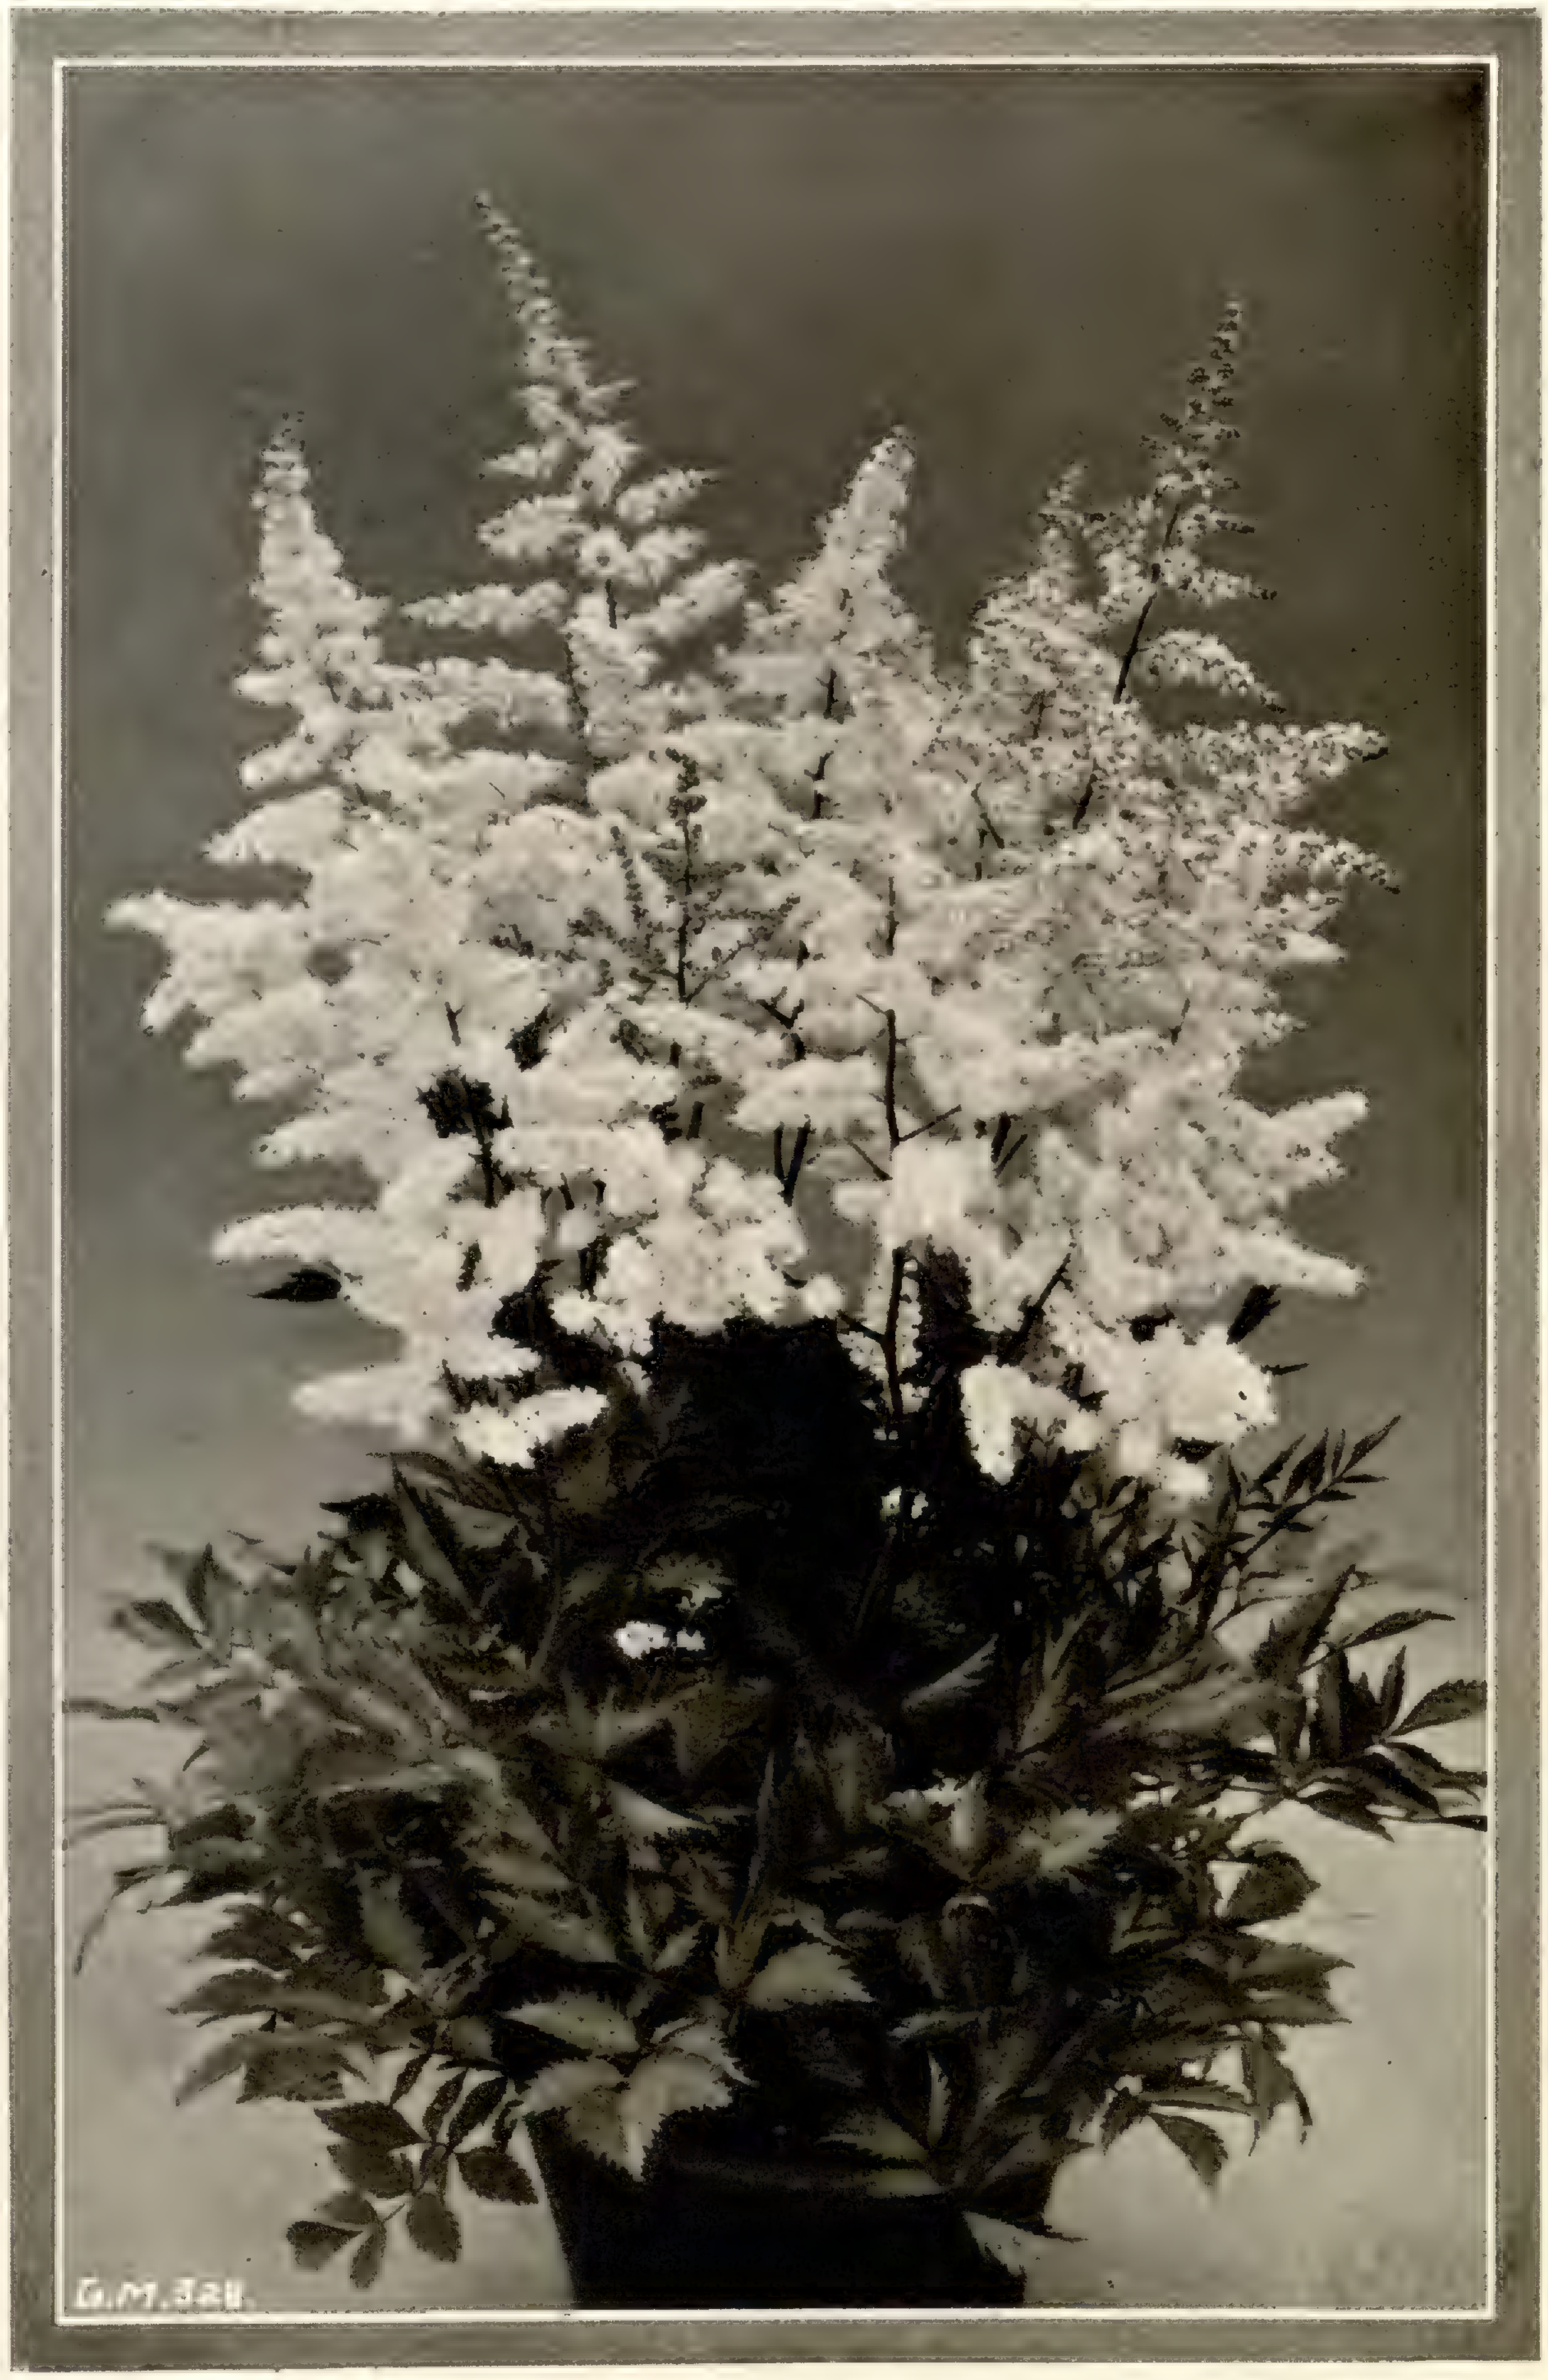
Two pink-flowered varieties, Queen Alexandra and Peach Blossom, created quite a furore because of the colour of their blossoms when they were first exhibited a few years ago. As the raisers were quickly able to offer them in quantity these pretty varieties were soon widely distributed, and are now almost as cheap as the older kinds. These have a good deal of the habit of Astilbe japonica, but now, with the introduction of the taller-growing A. chinensis, A. Davidi, A. grandis, and others, there is a larger race of these hybrid astilbes, usually of some shade of pink or rose, with, in a few cases, a lilac suffusion. They are exceedingly pretty, but are not so amenable to forcing as Queen Alexandra and Peach Blossom; in fact, they are more suited for planting out in a moist spot than for growing in pots.

Without these there is a wide choice available for pot culture, and of the best immense numbers are sent to this country every autumn from Holland. The price at which they are sometimes disposed of makes one wonder what the profit of the original growers can be.

The cultural requirements of these astilbes, or spiræas as they are so generally called, are so simple that little need be said on the matter. The clumps should, on receipt, be potted, and plunged out of doors till they are ready to be taken under cover, the time of which will depend upon when the flowers are required. In potting them it must be borne in mind that, as the leaves and flowers develop, they are very thirsty subjects, so that ample space must be left for a good supply of water. Owing to their cheapness, some obtain a fresh supply every year, but where they are kept over, two batches should be grown, so that they are forced only in alternate years.

They all stand hard forcing if it is required, or they may be brought on gradually. The pink kinds are of a far better colour when allowed to come on slowly and have plenty of light and air.

Some of the more popular astilbes (spiræas) are retarded in quite a wholesale manner, so that in this way it is possible to have flowers all the year round. Flowering examples of the ordinary japonica in the autumn months would at one time have been looked upon as a nine days' wonder, now they may at that season be often seen on the costermongers' barrows in the streets of London. No particular cultural requirements are necessary in the case of these retarded clumps, except to pot them when thawed, and allow them to come on very gradually at first. W. T.



ASTILBE AVALANCHE.

**Rhus cotinoides.**—Many of the sumachs are remarkable for the rich autumnal tints of their foliage, in which respect this species is second to none. The leaves are simple, as in the better-known Burning Bush, Wig Plant, Smoke Tree, or Venetian Sumach (Rhus cotinus), but R. cotinoides is altogether of larger growth. It is a native of the Southern United States, and has been known to botanists for a long time. K.

## SOILS FOR FERNS.

In the cultivation of ferns it is, of course, essential, as with other plants, that as far as possible the most congenial soil should be chosen, and this, of course, is best ascertained by a study of the soils in which under wild conditions they flourish best.

As a general rule, we shall find them, so far as regards the terrestrial species, as distinct from those which affect crevices on rocks and walls, in greatest luxuriance in an open, loose, leafy soil, with an admixture of rocky débris, such as we find in glens and woodlands. In such places the Lady Fern, Male Ferns, Broad Buckler Ferns, polystichums, and hartstongues grow in abundance, its long creeping rhizomes, peculiar to this lastrea among our native species, forming dense mats in the very mud itself.

Under glen conditions the spleenwort family is not thoroughly at home, though Asplenium trichomanes and A. adiantum nigrum may here and there find a habitat where rocks protrude enough to afford congenial chinks. All the members of this genus—A. trichomanes, A. adiantum nigrum, A. ruta murarum, Ceterach officinarum, A. lanceolatum, etc.—are, indeed, true rock or wall ferns, requiring thoroughly well-drained positions; thus we consequently find them, as a rule, assume their greatest size; while, as smaller-growing species associated with them, we find rampant colonies of the oak fern, beech fern, and common polypody where the rocky substratum comes to the surface and gives them a congenial foothold.

Where extra moist conditions prevail, Osmunda regalis, the Royal fern, if out of the reach of the vandal, may assume the aspect of a coppice man-high or higher; while here and there, in better-drained but still moist conditions, the mountain lastrea and the hard fern will thrive together, always provided that no lime is immediately present. In absolutely boggy ground the marsh buckler fern will in elevated sites, and some of them often in places where one wonders how they obtain sufficient water for their needs. Their roots, however, penetrate very deeply into the crevices they occupy; and their fronds, moreover, are so constituted that, though in times of drought they may shrivel up, they are capable of resuming their verdure when rain recurs.

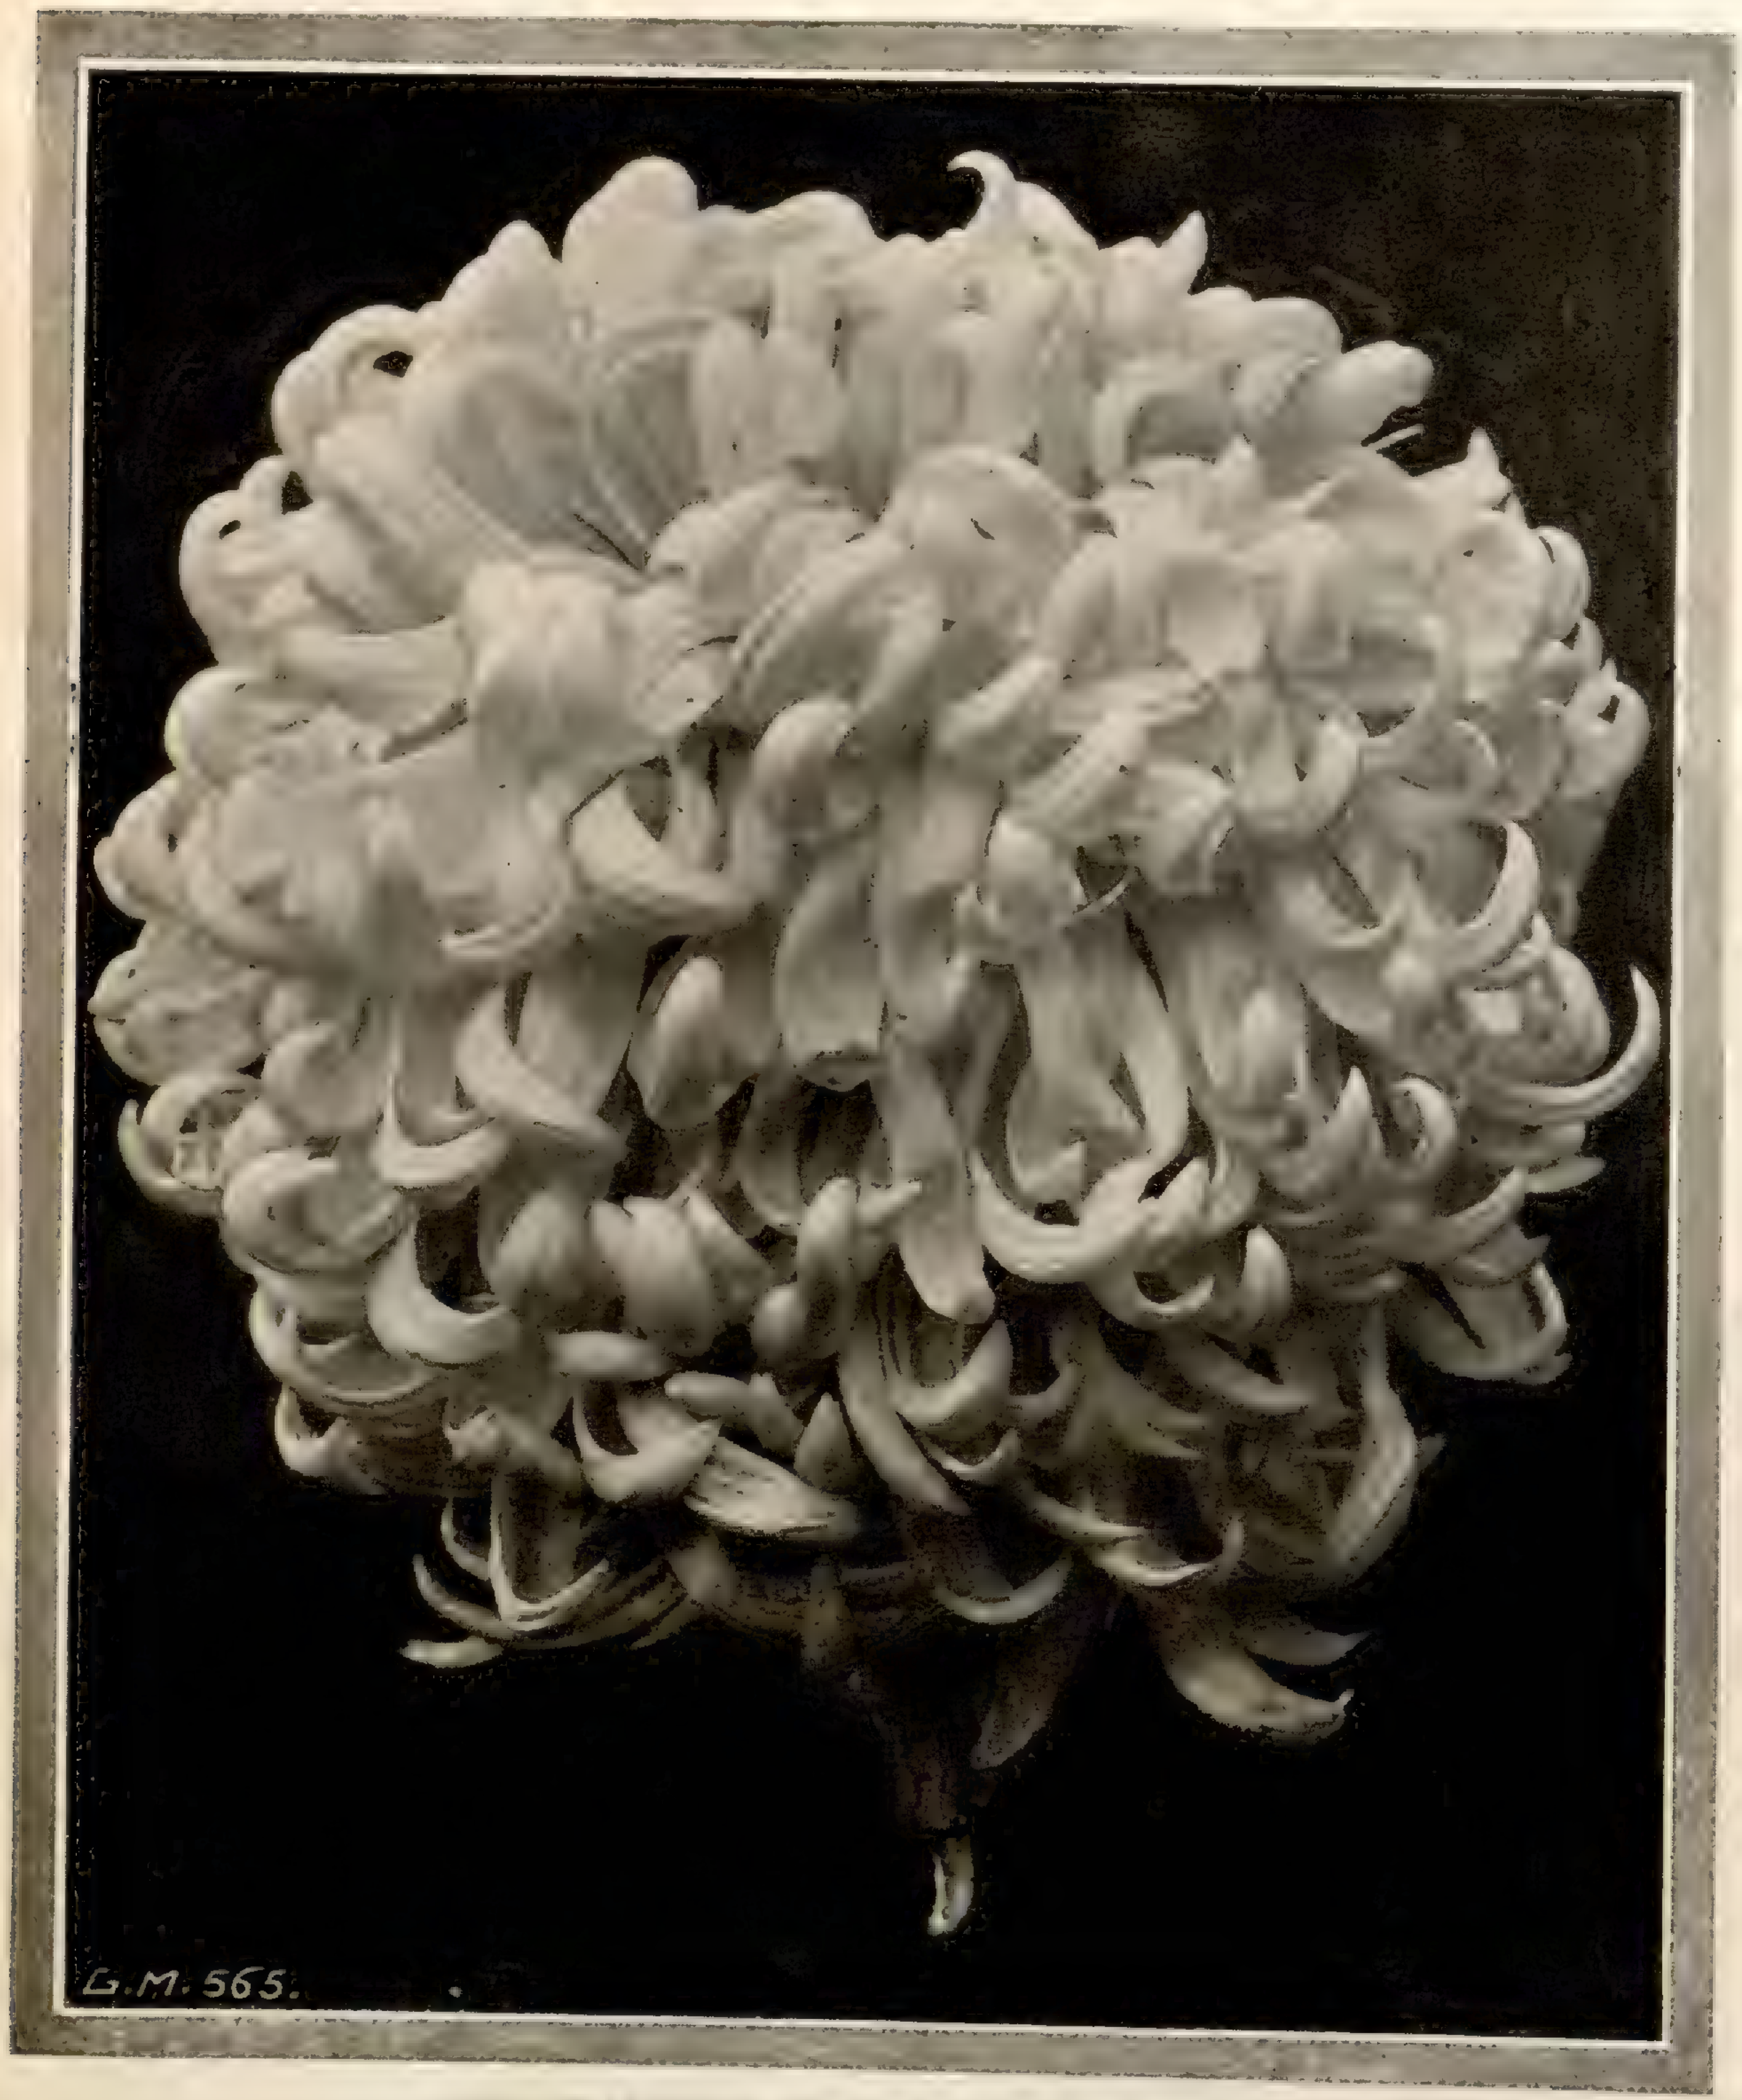
In humid parts of the country, and particularly where, as in Devon and Dorset, stone dykes are frequent, consisting practically of two rough stone walls with an earthern core between them, seedlings of nearly all species are found associated; but, of course, the larger growers normally are stunted and small. Under such conditions we find all the polypodies, and also the bladder ferns, associated with spleenworts, these being able to hold their own, owing to the more robust species being held in check for lack of soil and root room.

As a matter of fact, all the larger-growing hardy ferns will thrive in ordinary good open garden soil; but stiff clay is totally unsuited, and for pot culture it is well in any case to see that the openness of the soil is secured by a liberal admixture of leaf-mould, plus some coarse silver sand. It is not well to sift the compost fine, as a more or less lumpy condition facilitates the aeration of the soil, and prevents sourness by stagnation of the moisture. For the wall or rock species a good admixture of old lime rubbish or pieces of porous stone is advisable; and, above all, good drainage must be provided for.

For filmy ferns, the tenants of wet and even dripping caves or of ever-wet rocks, a coarse peaty, sandy compost is required, plus the protection of a glass shade or Wardian case, as these fronds are so susceptible to drought as, if once shrivelled, to be irrecoverable.

The limestone ferns—Polypodium calcareum and Lastrea rigida—require some lime to be mixed with the soil. P. vulgare attains its largest size in hedges or on accumulations of dead wood, in woods, and in both cases we shall find the rambling rootstocks to be anchored by their roots proper in very loose, leafy, sandy material, on the surface of which the rhizomes travel freely. The stiffer the soil under cultivation the less the plant thrives.

C. T. Druery, V.M.H.



CHRYSANTHEMUM MRS. W. T. SMITH.

A new pearly-white Japanese variety; F.C.C., N.C.S., November 11; A.M., R.H.S., November 21. Mr. A. Smith, Convent Gardens, Roehampton.

## CHRYSANTHEMUM MRS. W. T. SMITH.

The number of new seedling white chrysanthemums that come up each year for the consideration of the Floral Committee of the National Chrysanthemum Society or the Floral Committee of the Royal Horticultural Society is very large, and, though "many be called, few are chosen." Lately, however, exhibitors have had little to complain of in connection with white Japanese varieties. Mrs. A. T. Miller, Wm. Turner, and the two new sorts, Queen Mary (see p. 861), and Mrs. W. T. Smith, make up a splendid quartet. The last-named was raised by Mr. A. Smith, The Convent Gardens, Roehampton, and is a seedling from Mrs. A. T. Miller. It is a pleasing variety of refined appearance and pearly whiteness. Flowers of large size are made up of loosely incurving florets, but the blooms are firm to the touch, though quite graceful. If the variety takes after Mrs. A. T. Miller in being "an easy doer," then it should have a brilliant future. It was on November 11 that Mrs. W. T. Smith secured a First Class Certificate from the National Chrysanthemum Society, and it was ten days later that the Royal Horticultural Society granted it an Award of Merit. We understand that the stock of this new variety has passed into the hands of Mr. H. J. Jones, Ryecroft Nurseries, Lewisham.

**Oxalis Ortgiesi.**—Some of the oxalis— in foliage at least—closely mimic members of the clover family, but this species is widely removed therefrom. It is of a fibrous-rooted nature, and pushes up a stout branching stem to a height of eighteen inches or thereabouts. The shoots and also the petioles of the leaves are deep red. The leaves are trifoliate, and the leaflets, which are dark green above and purple beneath, are remarkable for a curious triangular notch in the apex of each. The flowers are yellow, and produced over a lengthened period.—K.

# AUTUMN EFFECTS AT GUNNERSBURY HOUSE.

We are told by Allingham in one of his charming poems that

> "October skies are misty, cool, and grey,"

and that the stubbles, being emptied of their latest sheaf and the meadows of its mounds, the woods assume a noble grief for these and other charms, of which the world has been bereft in the course of the passing of the days from the glories of the summer to the cold, sombre, and otherwise comfortless conditions that are associated with the winter season. Allingham's description of the October skies are unquestionably true of some, but not all, for in that month we usually have short periods of the most delightful weather in which it is possible to derive an immense amount of pleasure from the garden when provisions are made for plants that bloom in autumn. In these delightful reminders of the season of summer the sun and the flowers vie with each other in their efforts to beautify the face of the earth, and thus contribute to the happiness of those who have their abode thereon.

A BEAUTIFUL FLOWER BORDER IN OCTOBER AT GUNNERSBURY HOUSE.

It was on one of these glorious October days that the writer made a short visit to the Gunnersbury House gardens, and at its close, instead of taking a gloomy view of the month and its peculiarities, was inclined to join with Byrant in asking:

> "Is this a time to be cloudy and sad,
> When our mother Nature laughs around;
> When even the deep blue heavens look glad,
> And gladness breathes from the blossoming ground?"

Also to express full agreement with him when he sings:

> "The clouds are at play in the azure space,
> And their shadows at play on the bright green vale;
> And here they stretch to the frolic chase,
> And there they roll on the easy gale.
> There's a dance of leaves in that aspen bower;
> There's a titter of winds in the beechen tree;
> There's a smile on the fruit, and a smile on the flower,
> And a laugh on the brook that runs to the sea.
> And look at the broad-faced sun, how he smiles
> On the dewy earth, that smiles in his ray!
> On the leaping waters and gay young isles—
> Aye, look! and he'll smile thy gloom away!"

It was a truly delightful day, a little too brilliant perhaps for the production of perfect photographs, and the display of flowers was remarkable for the month of October. The magnificent roof garden of the mansion was aglow with the brilliantly-coloured flowers of Salvia Glory of Zurich and of Tropæolum Lobbianum; a considerable area of the lawn was bespangled with the exquisitely beautiful blue flowers of the autumn crocuses; huge specimens of yellow and orange-coloured chrysanthemums produced glorious colour effects on the lawn; great breadths of roses and tasteful mounds of heliotropiums rendered the air redolent with perfume, and in the broad border to the north-west of the mansion was a glorious display of hardy flowers. A richer floral feast in the garden after the middle of October cannot well be imagined, and to avoid any misapprehension with regard to the production of floral displays thus late in the season it should be mentioned that the family is in residence during the autumn, and that Mr. J. Hudson so shapes his procedure as to have the gardens as attractive as possible at that season. At the same time it should be stated that there is not a day in the whole year in which the gardens of Gunnersbury House are not as interesting and attractive as the generous owner and his talented gardener can make them.

The furnishing of the verandah was in its way a triumph of decorative art, and invariably evoked the warmest expression of praise from the many visitors to the gardens during the summer months. The variety of Tropæolum Lobbianum that is used by Mr. Hudson with so much success as a screen is that known as Fireball which is strong in growth and profuse in blooming. The flowers are brilliant orange-scarlet, and produce a striking contrast to the grey-green leaves. The plants are raised from cuttings struck early in the year, as also are the salvias which are associated with them in beautifying the verandah and furnishing the roof garden. Both are planted in the broad box fixed on the parapet, and the splendidly developed spikes of scarlet flowers of Salvia Glory of Zurich rising above the tropæolums produce, with the white walls of the mansion as a background, a brilliant effect. Pyramidal specimens of sweet-scented pelargoniums are used with singular success for clothing the columns supporting the verandah, and the tubs in which they are grown are hidden with the variegated ophiopogan and scarlet salvias. The salvias used in furnishing the roof garden are grown in a series of long boxes throughout the summer and autumn, and, judging from the brilliancy of the display, there must be many thousands of flower spikes fully developed at one time. Salvias are also successfully utilised in beautifying the bridge by which the water on the south-western side of the lake is crossed. Here they are grown in a receptacle of brickwork formed on either parapet, and, as elsewhere in the gardens, are enveloped in flowers, and produce an effect that is at once brilliant and pleasing.

The manner in which the early-flowering chrysanthemums are utilised in beautifying the gardens in autumn is especially deserving of attention. The whole of the specimens are grown in large tubs, and during the greater part of the season they are given a convenient position in the kitchen garden. They are made up with plants raised from spring-struck cuttings, and, as the tubs are of large size, the plants are grown to considerable dimensions before they are put into them. It need hardly be said that the tubs are efficiently drained, a rich compost used, and the watering carefully attended to, for such things follow as a matter of course. But it must be mentioned that when the specimens are full grown and coming into bloom they measure fully six feet in diameter. The varieties are selected with due regard to the colour of the leaves of the trees with which they will be associated when in bloom to ensure a perfect colour harmony in the scenes of which they form a part. Thus for flanking the Japanese tea house, which occupies a prominent position on the lawn, has a framework of brownish bamboos, and a background of Prunus Pissardi and Catalpa bignonioides, the variety is Abercorn Beauty, which has red-orange coloured flowers. When the photograph was taken the colour contrast was surprisingly beautiful. Then, for the six or seven specimen chrysanthemums that were arranged in front of the trees on the margin of the lake, the bright yellow-flowered Horace Martin was used. These, of which two only are shown in the illustration, had mulberry trees for a background, the leaves of which had then changed to a rich yellow hue. Thus the harmony of colour was perfect, and Mr. Hudson obtained full justification for the attention he has devoted to the study of colour contrasts in the garden for many years past. To grow chrysanthemums that are remarkable for the pleasing form and attractive colouring of their flowers is desirable, but it is not less so that the colour of the flowers should be in harmony with that of the leaves of the subjects with which they are associated when in bloom, more especially when they are grown for beautifying the garden.

In the arrangement of the broad border which skirts the carriage drive on the north-west side of the mansion, a high degree of success, as will be readily seen from the illustration, was achieved. A portion only of the border is shown, but the plants in the whole of the area are arranged in huge irregular masses. The charming Aster Amellus bessarabicus occupies a prominent position in the foreground, with Rudbeckia Neumanni behind to the left, and Solidago Shorti and a helianthus next to it on the left. Other plants that have a place in this part of the border include Aster Robert Parker nanus, Polygonum orientale, Anemone Queen Charlotte, and Sylphium perfoliatum, the last-named about ten feet high, and showing in the distance. The plant used for clothing the lamp-post is Convolvulus major, which soon hides the post with its handsome leaves and blooms freely throughout the season.

One might have written at length on the several autumn effects of the Gunnersbury House gardens in October, but the photographic reproductions will afford a far better idea of their characteristics than lengthy descriptions, and the brief reference to them will, in conjunction with the illustrations, be sufficient to indicate the possibilities in the embellishment of the garden late in the autumn season. G.

THE VERANDAH OF GUNNERSBURY HOUSE IN OCTOBER LAST.
The plants with which the verandah was embellished included Salvia Glory of Zurich, Tropæolum Lobbianum Fireball, and scented-leaved pelargoniums.

## THE SWEET OR DESSERT CHERRY IN COLD HOUSES.

The cherry may be cultivated most satisfactorily in cold houses where only sufficient piping is arranged for to exclude frost, and also in what are termed orchard houses, without any such provision. In the latter instance, however, no semblance of the slightest forcing should be attempted. The fruits, when fully ripe, will, on the average, be of finer flavour than from trees in the open, whilst they will also remain in good condition for nearly or quite a month, and there will not be any depreciation in the flavour.

By growing the sweet cherry in this way there is ample opportunity of adding to the varieties beyond what I included in the list as being suitable for forcing. I should certainly include Early Rivers in this instance, as a first early, also Frogmore Bigarreau; both of these hang well. These will be followed by Bigarreau Novide Guben, a fine black variety, and very prolific, and by Montstruese de Mezel, one of the very finest of all dark red or black cherries, and with fruits of enormous size. Bigarreau Napoleon is well worthy of cultivation under glass also; it is a good cropper and of excellent constitution, whereas it hangs well. Emperor Francis is rather later than the preceding, in other respects very similar to it, but with a little more colour. The best, in my opinion, of the late dessert cherries is Géante d'Hedelfinger; this will remain in good condition until the end of August. I have had no experience of Noble, but it is well spoken of as a fine cherry. I should have included Elton also to follow Frogmore; it is an excellent cropper, and has a handsome fruit.

Jas. Hudson, V.M.H.

## SOLDANELLAS.

Delightful alpines are the soldanellas, or blue alpine moonflowers, which are beloved of everyone who owns a rock garden, and can induce them to flower. But, alas! this latter condition is not easy to secure, and too many have reason to lament the fact that these delightful plants never deign to favour them with their exquisite blooms. These are lovely enough to send the spectator into the seventh heaven of delight, so perfect are these flowers in their form and colouring. These charms of theirs are combined with an almost perfect habit also, so that it is hardly possible to picture anything in the world of alpine flowers more beautiful. This is rare praise, yet it is amply deserved, and those who know the soldanellas best will agree with the writer in this assertion. Authors have given us glowing pictures of the charms of these daintiest of flowers, as they have seen them piercing the virgin snow with the approach of spring, and peering amid the snowy coverlet which has protected the plant so long.

Those of us who know the soldanellas in cultivation can seldom enjoy this picture in our gardens, but we have one little less fascinating in the appearance of our plants, with their bonnie tufts of rounded, glossy leaves, whence rise the delightful slender stems carrying their exquisite blue or purple bells, either fringed or notched in the most delightful way. How to obtain these flowers is a problem for many, yet with most cultivators they can be secured with a little consideration and trouble.

In our climate the soldanellas have not the protection of frost and snow in winter they have at home, where they are dry and snug until the lengthening days and the strengthening sunshine call them to wake from their winter's rest. On the contrary, with us they have to undergo many vicissitudes. One day the soldanellas are soaked with rain; the next, or even the same evening, they are frozen hard without any protecting snow; and so the tale continues, our many alternations of weather telling sorely upon them, and rendering them flowerless. The solution is not usually difficult to adopt, once it is known, and it lies in covering the plants with glass for the winter months, but not coddling them in heat or keeping them from the fresh air. A sheet of glass held over them by a wire support, or other contrivance having the same effect, will suffice, this being placed above the plants towards the end of September or the beginning of October, and allowed to remain until the flowering is over. This will supply all that is required in most gardens, provided that the soil and position are suitable.

With the writer they do best in a sheltered place, low down in the rock garden, and in a soil which has plenty of sand and grit, with leaf-soil or peat about it, with full drainage, yet where an ample supply of water can be given in times of drought. Here the soldanellas, with this glass roof, generally flower well, although they have still another enemy to encounter in certain gardens. This foe is to be found in the shape of the field mouse, which seems to take a delight in gnawing through the dainty stems, when the flowers are undeveloped, leaving our hearts saddened by the havoc they inflict upon these yearned-for flowers. It is always safe to set a trap or two near the soldanellas if mice are present in the garden.

Yet there are soldanellas and soldanellas, so far as flowering is concerned. The best, perhaps, is the variety of S. alpina which is called pyrolæflora, and is the most useful of all, sometimes flowering, indeed, without the aid of the glass, but more certainly with it. Then, S. montana, var. hungarica, usually sold as S. Clussi, comes next, and with these two one might almost feel content were it not for the presence of S. pusilla and S. minima, the smallest of the set, or the knowledge that there are white soldanellas, which have an innate fascination to the alpinist.

It seems needless to give a long description of these alpine moonflowers. They are well known through illustrations, but to those who know them not, no description will serve a really useful purpose, inasmuch as they are so full of charm that verbal description forms only a delusion and a snare. Dainty little bells of purple and white, beautifully fringed or notched, suspended over the leathery, glossy, rounded little leaves on slender stems, will serve as well as, or even better than, prolix statements of a botanical kind. The species in cultivation include S. alpina, with its varieties alba and pyrolæflora, already alluded to; S. minima, a very small species; S. montana, a vigorous one, with its variety hungarica or Clusi; and S. pusilla, with its variety alba. There is also one called hybrida, a hybrid between alpine and pusilla.

The soldanellas may still be planted, especially out of pots, and are increased by division or by seeds.

S. Arnott.

AN EFFECTIVE GROUPING OF SPECIMEN CHRYSANTHEMUMS AT GUNNERSBURY HOUSE.

The variety represented is the bright yellow October-flowering variety, Horace Martin, and the tree under whose shadow the specimens are placed is the mulberry tree, the leaves of which had assumed the rich golden hue characteristic of autumn.

---

**The Pyracantha.**—As with most berried trees and shrubs, this has been particularly fine during the autumn of 1912, wet and dull as was the summer. It is more than probable that the sunny autumn of 1911 had something to do with the matter. Though so generally trained to a wall the value of the pyracantha for growing in open positions is worth more consideration than it usually receives.—W.

## RAISING APPLE TREES.

If the amateur makes a practice of raising his own trees to save buying them from a nurseryman, he will get very little reward for his trouble, besides which he will be giving up space and losing years of fruitfulness while his trees are growing into bearing condition. In addition, he will probably have some badly-shaped trees if he is raising just the number he wants, for it must be remembered that, when a nurseryman has, say, a hundred two-year-old trees of a given variety, he will choose those for espaliers which, by their manner of growth, are best adapted for that form, and those for cordons, pyramids, etc., in the same way, so that each tree is trained into that form for which, by its natural shape and manner of growth, it is best suited. The amateur, on the other hand, who wants a dozen bushes and buds or grafts as many stocks, will find some of them very ill-fitted for this form, but, not liking to waste them, will let them grow on and make badly-shaped trees. This will apply still more forcibly if, instead of bushes—perhaps the simplest form to raise—he is aiming at cordons, fan-trained trees, or other fancy forms. When, besides all this, we think of the bother of procuring suitable stocks, as well as buds and scions of the varieties desired, it will be seen what an unremunerative business the amateur undertakes when he sets about rearing his own fruit trees.

A JAPANESE TEA HOUSE AT GUNNERSBURY.
With specimens of Beauty of Abercorn chrysanthemum, and a background of crimson and gold foliage.

When, however, all has been said that can be said to show the advisability of letting the nurseryman raise our fruit trees for us, it is still sometimes worth while to raise two or three trees for ourselves when they are of a kind which we cannot be sure of being able to buy, especially as it takes a couple of years to find out whether we can buy them or not. Anyone going into an orchard or plantation where there are a number of trees of one kind of apple, even if it consists of only a dozen trees, will, on taking careful note of them, observe that the fruits are not of quite the same character on all the trees, and he will detect this more readily if it is a variety with which he is very familiar, say, King of the Pippins or Blenheim Orange, to instance two kinds which are rather notorious for their varying character. Though we generally speak as if by budding or grafting a variety we always kept that variety true, yet it is a fact that, owing to what is known as bud variation, it is possible to have different strains of the same named variety. And this is not the only point to be noticed when looking at a number of trees of the same variety, for we shall find that some of the trees are of a healthier and cleaner growth than others, more vigorous, or of a more fruitful nature, one desirable tree, perhaps, by a lucky chance, possessing all these good qualities.

Now, in buying trees from a nursery we cannot be sure what kind of a strain we may have, unless we are dealing with one of the more careful nurserymen who select stocks, scions, and buds very carefully, which is a very difficult matter where the work is on a vast scale, and has necessarily to be left to men who cannot be supervised in all the small details of the work throughout the day. It is in connection with this aspect of the subject that it will sometimes pay us to raise a tree or two for ourselves. When we come across a specially fine strain of a favourite apple, say a Ribston Pippin tree, which is of unusually vigorous and healthy growth, or a Wyken Pippin bearing fruit which is unusually large, or of an exceptionally deep bronzy-yellow, we can beg or buy a few buds in July, or scions in early February, and work them upon any stocks we happen to have in readiness for such an eventuality, or on the shoots of an old tree of an indifferent sort which has been beheaded for the purpose, or the young growths resulting therefrom. This kind of work is of the most absorbing interest, for there is not only the pleasure of watching the development of a tree of our own making, as it were, but the acquiring of a strain of a variety superior probably to that in general cultivation. If amateur fruit growers generally were on the watch for opportunities of this kind there is little doubt that improvements in some of our apples would result.

There is another aspect, too, of this occasional raising of trees for ourselves, and that is the field it gives us for experimenting with stocks. There is a considerable field here, not only for most interesting work, but for original research, which might possibly have valuable results. Little seems to have been done in the matter of the double grafting of apples by using an intermediate stock between the Paradise or crab stock, and the variety grown. Neither has much been done in this country in experimenting with different kinds of stocks to see if any give immunity from certain diseases. If a few hundred people each raised two or three trees with some such object in view, some valuable results might be obtained, while in the matter of interest there is no work in the garden more absorbing than trying some fresh device and watching the result. Alger Petts.

---

**Stenanthium robustum.**—This is an exceedingly handsome perennial of comparatively recent introduction. Its attractive white plumes attain a height of quite six feet under good cultivation, and are especially effective, whether located in the hardy flower borders or in the wild garden. It prefers a moist rooting medium, such as that found near the stream-side.—J. Gardner.

## THE REMOVAL AND DESTRUCTION OF TREE BUTTS.

The felling and disposal of timber is often a more simple matter than the extraction and destruction of the stumps, or butts, and the owner of a garden sometimes finds a difficulty in accomplishing the work. Some people get over the difficulty by leaving the butts in the ground to rot. That, however, is usually out of the question where ornamental trees are concerned, and at the best of times it is not a wise plan, if it can be avoided.

It may be argued that butts are frequently left in the ground in forest areas which are to be replanted; therefore there is no reason why they should not be left in gardens. It is, however, almost solely a matter of expense in forestry operations; and were it possible, in felling, for the same expense or a little more, to remove the roots from the ground, they would undoubtedly be removed, except in places where they are absolutely necessary for the purpose of binding the soil. Decaying butts do a certain amount of good by adding humus to the soil; but they are often a source of danger to the succeeding crop from the presence of insect and fungus pests which infest them. Considerable areas of young plantations have at times been devastated by the pests which have had their origin in decayed stumps; and deaths amongst ornamental trees have been traced to the same source.

The familiar Collar Rot fungus (Armillaria mellea), which attacks most kinds of trees, often spreads from decaying roots to living trees. The presence of partly-buried butts is also a source of danger to people and animals, particularly when a heavy rainfall succeeds a period of drought, for the decayed parts give way, and a sudden subsidence of the surface soil is the result.

When tree butts are to be removed from the grounds, the trees ought always to be grubbed—that is, a trench made round the trunks, and the roots cut through. The leverage obtained by the trunks when the tree falls is usually sufficient to raise the butts well out of the ground, thus simplifying their removal to a considerable extent. Before the butt is severed from the trunk it should be cleaned by the removal of as much soil as possible. During the progress of the work a number of large roots and buttresses may be removed, which will substantially reduce the weight. The ground beneath the butt must then be made up, and a stout piece of timber placed so that the root cannot fall over when the trunk is removed. A heap of soil or log of wood placed on the margin of the hole in the direction in which the tree is to fall sometimes helps to lift the butt out of the hole. This is only the case, however, when the head is considerably heavier than the butt.

When trees have been sawn off a few inches above the ground it is often difficult to extract the butts, for there is no top leverage to assist in tearing away central roots which cannot be cut. The soil cannot be cleared away from the roots, and the whole mass is deep in the ground.

There are various ways of disposing of these butts. They may be used for facing informal terraces for the culture of plants like rambling roses; or be upturned and covered with ivy or some other trailing plant. In such cases disease does not appear as prevalent as when the butts are left in the ground. Where firewood is scarce and fuel dear, workmen will sometimes undertake to break them up in their own time, if they are given the wood. Usually, however, the best means of disposal is by burning. Theoretically, the lop and top of an ornamental tree is considered to be sufficient small material to burn the butt. This does not always hold good, though, and the thicker branches are too valuable to put to the purpose; therefore it is advisable to remove all to one centre, and allow them to dry for a few months, when they may be made to burn one another up. The writer has known over 100 butts, varying from 1½ to 4ft. in the diameter of the sawn surface, burnt in less than a fortnight by two men.

Small butts may be easily removed to a convenient burning centre by two men with a cart or trolley. By the aid of a horse, planks, rollers, and levers, the same number of men can load butts up to 15cwt.; while with another man, or two, greater weights may be dealt with. For large, heavy butts, a low, strong, broad-wheeled trolley is very necessary; while, where many have to be handled, Barron's tree-lifting machine will be found to be a great acquisition. With such a machine four or five men can remove butts two or three tons in weight from the holes in which they may be lying, providing they have sufficient planks to carry the machine over loose ground.

When the butts are in an open position, where there is little danger of anything being damaged by concussion or by flying pieces, blasting may be resorted to for reducing unwieldy butts to a size at which they may be conveniently handled. This is done by boring a hole at least one inch in diameter from the sawn surface to the point of union between trunk and roots. In the case of a perfectly sound butt, the hole should be as near the centre as possible; but with one which is partly decayed the soundest point should be chosen for the hole. Take from three to five ounces of blasting powder, according to the size of the butt, and place one-third of it in the bottom of the hole. Then insert a section of fuse, to extend at least 3 or 4in. beyond the surface of the hole, previously ascertaining the length of time per inch which is taken for fire to consume the fuse. Round the fuse the remainder of the powder must be placed, the hole being afterwards plugged tightly up with slightly damp paper, felt, or clay. Apply a light to the fuse, and seek a safe place immediately. Such a charge will blow a good-sized butt into several pieces. Should any pieces be too large to handle conveniently, they may be reduced in size by small charges of powder.

Blasting operations may also be carried out by means of dynamite cartridges, but unless the operator is expert in the use of that explosive, powder had better be relied on. Whichever is used, it is necessary to make a trench round the butts and cut the main roots before using the explosive.

Reference has previously been made to the removal of butts to a central burning place by the aid of a trolley or machine, but a few hints are necessary as to the removal of the roots from the holes ready for loading, for a machine cannot always be placed in the necessary position for lifting. There are several ways by which this may be accomplished, the following being a few of the simpler ones. For heavy work a steel rope attached to a windlass may be secured to one of the stronger roots; then, by winding the rope in, the butt is gradually removed from the hole. This, however, is only possible in places where plenty of tackle is available. Heavy butts may also be removed by means of blocks and tackle, chains such as are used for loading timber being substituted for ropes. A steady-pulling horse or two may be utilised for this work. A slower method is the removal by means of a lifting-jack. Small bottle-jacks are of little use for the purpose, an ordinary rack timber-jack with double purchase being much better. An improvement even on this is Trewhella's Australian Monkey Jack. This may be obtained with double or triple purchase, is easily manipulated, and will move weights up to ten tons. It is used largely for the extraction of butts on forest areas abroad, where the trees have been saw-felled. By cutting a few of the stronger roots, it is possible for a good workman to extract 30 or 40 butts a day, with a sawn surface up to 2ft. in diameter, by its aid. A German invention, known as a "forest-devil," is used extensively both on the Continent and in this country for the removal of roots and tree trunks. It consists of a long, strong shaft, with three chains attached to one end. A long chain on one side is made fast to the object to be moved. The other two chains, which are comparatively short, are furnished with hooks. A fourth chain is attached to a strong tree or other stationary object some distance away; and into the links of this chain the hooks of the small chains are secured. By moving the lever formed by the pole or shaft backwards and forwards, the butt or tree is gradually removed from its bed, and as the work proceeds, the hooks are gradually moved up the fourth chain, thus securing the weight as it is moved. A modification of the block and tackle system is that known as the "Hawkeye" machine. In this case blocks and tackle are used, but a windlass is substituted for horses for haulage. Throughout the whole of the time that the work is about nothing but perfectly sound tackle must be used, for an inferior plank or rope might easily cause a serious accident.

When the roots are dry enough for burning, a fire of the smaller ones, and pieces of heavy wood, should be started. When a good heat has been obtained, the larger butts should be jacked on to the fire. As the roots burn, work as much soil as possible out with the aid of a sharp iron bar, for soil prevents burning. It may be possible to reduce the size of some butts by means of steel wedges and a heavy beetle or mallet; or some may be reduced with an axe. The smaller they can be made the easier they will burn.

Another means is sometimes recommended for destroying butts. This is to bore one or more holes into the surface, according to the size of the butt, each hole being an inch or more in diameter, and extending to the greatest possible depth. The holes are then filled with saltpetre and a little water, and corked up. They are left for three or four months, and are then uncorked, the holes filled with paraffin, and set on fire. They ought then to gradually smoulder away. It is a long-drawn-out process, and something often goes wrong, so that the result is not very satisfactory. As a matter of fact, it is wiser to go to a little more trouble, and remove butts bodily to a burning ground, or place them where they can be covered by a trailing plant. W. Dallimore.

---

**Potentilla Veitchi.** — This is a pretty shrubby species of potentilla, belonging to the same class as the well-known P. fruticosa. A native of China, Potentilla Veitchi is one of the many subjects we owe to Mr. E. H. Wilson, when travelling in the Far East on behalf of Messrs. J. Veitch and Sons. It forms a bush from three to four feet in height, and keeps up a succession of its snow-white blossoms from spring till autumn.—T.

# WORK FOR THE WEEK.

◆

## THE ORCHID HOUSES.

WINTER-FLOWERING CYPRIPEDIUMS.—These most useful plants are now in full beauty, and the many beautiful hybrids raised during recent years add charm and variety to our houses. Among the most useful are the finer varieties of C. Leeanum, C. Actæus, C. Thompsoni, C. Thalia, C. Germaine Opoix, C. Gaston Bulteel, C. Alcibiades, C. Earl of Tankerville, C. Beekmani, C. Lord Ossulston, C. Maudiæ (which, when strong, is always in flower), C. Prospero, C. Bianca, C. Euryades, and C. triumphans. As soon as possible after the flowering period is over, the plants should be carefully examined, and those that require repotting should receive attention. This is also much the best time to divide any that it is advisable to increase the stock of, but I do not recommend the division of the plants into the miserable scraps one often sees. There is more satisfaction in filling houses with good plants than with mere fragments. Even in the case of new and rare plants, I think it much the best practice to get a good plant before thinking of propagation. Care should be taken not to injure the roots, as these often run to considerable length, and are easily broken. All the old decomposed compost should be carefully picked out with a pointed stick, the plants placed in well-drained pots, and the new compost worked carefully between the roots nearly up to the top of the pots. Owing to the quantity of water cypripediums require when in full growth, it is advisable to leave a space for water, in the same way as for ordinary plants.

COMPOST.—To my mind, an excessive amount of loam is often recommended for cypripediums, as I find when this is used in excess the root action is not so free as when used in moderation. I would advise every grower to experiment a little in this matter, and find out for himself what answers his purpose the best. Many radical changes have been advocated during recent years in orchid composts, and many, I am afraid, are not to the good of the plants. I have given the compost we use with success in a previous number.

TEMPERATURE.—One often sees the cultivation of these plants attempted in too low a temperature. A temperature of 60 degrees at night, with a proportionate rise during the day should be provided for them. The atmosphere in which these plants are grown should at all times be kept humid, with a circulation of fresh air. If grown in a dry atmosphere, thrips attack the young leaves, and soon disfigure them.—J. T. Barker, The West Hill Gardens.

## CONSERVATORY AND GREENHOUSE.

LILIUMS.—Large quantities of bulbs are now being imported, and the present is a good time to procure them for next summer's display. It is advisable to obtain the best-grade bulbs. I have had bulbs of Lilium speciosum Melpomene which cost less than 1s. each produce three spikes, carrying from thirty to forty flowers altogether. The cultivation is quite simple when properly understood. Most of the bulbs are imported from Japan, but some come over from the Continent. I prefer the Japanese bulbs, as they are larger and weightier, and generally can be relied on to give stronger flower spikes. When the bulbs are received they should be potted at once. Liliums delight in a rich, porous compost, two parts good fibrous loam, one part peat or leaf-mould, and one part coarse sand. The most convenient way is to place two bulbs in each ten-inch pot. The pots should be clean and well crocked; place a layer of rotten manure over the crocks, and fill the pots with the prepared compost to two-thirds their depth; the bulbs should be just buried and the compost be made firm. After the potting operation the pots should be placed in the vineries, or any cool house. The bulbs soon become active, and, when well rooted, the growths appear from the centre; as the stems advance they will produce roots freely, above the bulbs, and when this occurs the pots should be filled up with rich soil. The most useful liliums for pots are: L. longiflorum, L. Harrisi, L. speciosum album, L. s. rubrum, and L. s. Melpomene; Lilium auratum is also very fine for pots, but it is not to be generally recommended, as the odour is too strong for drawing-rooms, etc.

ROSES IN POTS.—The present is a good time to overhaul the stock of pot roses. To keep the stock up to date the best way is to discard old, worn-out plants, and to fill their places with newer introductions. I find it a good practice to add half a dozen plants of a new variety, which, after a season's growth in the rose garden, has proved itself. The plants should be lifted at once, their roots trimmed with a sharp knife, and potted in 8in. pots, using a rich fibrous compost. The pots should then be plunged in a cold frame, with the lights removed, except in extreme cold weather or heavy rains; the roses will commence to make fibrous roots in a very short time. By February the plants will be ready for potting into 10in. pots, and will take their place to be pruned and treated with the older plants, which will then need top-dressing. Where large drawing-rooms, etc., have to be furnished, the climbing varieties, such as Dorothy Perkins, Hiawatha, Lady Gay, Excelsa, Coquina, and Tausendschon, are delightful subjects when grown to a height of 6ft. or 8ft. These should also be lifted as small plants, potted, and plunged in an ash-bed, and grown for a season to encourage them to make strong growth. Plants that were treated in this way last year will need top-dressing at once, as the ramblers commence to grow much earlier than the others.

FLOWERING SHRUBS. — Batches of these should be introduced to heat, and it will be found, with the turn of the days, they will respond readily to warmth. Azalea indica and A. mollis, Prunus triloba, Spiræa confusa and S. arguta, Viburnum opulus, rhododendrons, Staphylea colchica, Deutzia gracilis, lilacs Charles X. and Marie Legraye, should all play their part in the floral displays during the coming spring months.—Lewis Smith, Cadland Gardens.

## HARDY FRUITS.

CORDON APPLES AND PEARS. — Whether grown on walls or in open quarters, pruning and other details are carried out on much the same lines. Providing the trees have received the necessary attention in the way of pinching and late summer pruning, there remains very little to be done so far as the use of the knife is concerned, a slight reduction of the remaining growth may be required, cutting them back to two or three buds; many varieties both of apples and pears naturally form a great number of fruit buds in clusters. Where this occurs it is advisable to remove a large portion of them. Two or three fruit buds on a spur will invariably give better results than if eight or ten fruit buds are allowed to develop and ultimately flower in a dense mass, for under such circumstances the prospects of a good set are somewhat remote. The leading growths on maidens, or older trees where space permits of extension, should be shortened back according to the strength of the growth and habit of the particular variety. Some varieties form fruit spurs freely, others do not, and in the latter case it is necessary to cut back sufficiently hard to insure the lower buds breaking into growth and ultimately clothing the main stem with fruit spurs. Over-luxuriance of growth can be checked by root-pruning and the withholding of manures of a gross feeding character. Trees which are in good order and give promise of a good show of blossom will receive material benefit from an application of suitable artificial manures.

ORCHARD TREES.—Advantage should be taken to examine the trees in the orchard when the weather conditions will not allow the continuance of operations on wall trees, etc. In orchards where the trees are annually attended to, the amount of pruning required will be principally confined to thinning out superfluous growths arising from the main branches, the removal of branches which are awkwardly placed or inclined to grow crosswise, and the cutting out of all damaged or dead shoots or branches. After the removal of a large branch the cut should be made smooth and clean with a sharp knife. Should the trees have been neglected it will be necessary to use drastic means and boldly remove branches that interfere with due admission of light and air to all parts of the tree. The loose bark on the main branches and stem of the tree should be removed. For this purpose a piece of hoop iron or a small onion hand hoe will be found serviceable. It is under the old loose bark that insect pests find a refuge, and, unless removed, it is a difficult matter to eradicate them when spraying operations take place. Cases of canker should be treated by removing the dead bark, and using a sharp knife, so that a smooth, clean wound down to the live portion may be left.

THE MANURING OF ORCHARDS is an essential matter, and should on no account be neglected, particularly in the case of old-established trees on grass; a liberal application of liquid manure, supplemented by artificials, according to the nature and requirements of various kinds of soils, will have a marked effect for good on the growth and produce of the trees.—W. Messenger, Woolverstone Park Gardens.

## THE KITCHEN GARDEN.

ROOT CROPS.—During inclement weather the root stores should be examined, as some decay may have set in. This examination will aerate the whole, and naturally prolong their keeping qualities. If this sort of work was carried out more often at this season of the year roots would keep sounder than is usually the case. Onions, too, whether in trays or ropes, should be looked over, and those that show the least signs of growth should be consumed first; keep them dry and cool.

LEEKS that are still in trenches will need protection should severe weather set in; use a mulching of long stable litter, bracken, or similar material. Celery should be treated likewise, but in mild weather (even for a few hours) it is better to draw the straw off.

SEAKALE.—The crop retained for indoor forcing can now be lifted during open weather, the thongs trimmed off carefully, and the crowns laid in fine ashes or soil, thickly, under a hedge or wall facing north. The crowns can then be transferred quickly to the forcing quarters as desired. The thongs can be made into sets during rough weather, tying them into bundles of fifty, and straightway placing them in boxes of soil; when finished place the boxes in a cold house or frame, as this crop cannot be started too early so long as no undue haste is given the sets at this period.

RHUBARB can be taken up in plenty now with safety. It will then be on hand for immediate transference to the forcing quarters, thus saving valuable time when more pressing work is on hand early in the year. Cover such crowns over with old leaf-soil till required.

SPINACH.—Up till now the crop of this vegetable is in capital condition, the open weather having caused constant growth. Give regular hoeings, with dustings of soot, and keep any decayed leaves picked off. Should cold weather set in, particularly cold, cutting winds, place boughs of yew or spruce, hedge-like, on the north and east sides, as this helps wonderfully to maintain growth.

CABBAGE.—The early batches are looking well in this neighbourhood, and need hoeing and moulding up. This latter is very beneficial, as it keeps the stems from swaying in the wind, beside making them frost-proof.—George Ellwood, Swanmore Park Gardens.

## FRUIT TREES IN POTS.

I have advised (p. 978) that the trees, after potting, be placed under cover. That may not in every case be convenient. So as an alternative, as in the case of trees that are allowed to come into flower under natural conditions, I recommend that they be protected from frost at the roots by being covered well over the rims with either ashes or litter. I prefer the former, as it does not keep the roots quite so wet. If not in any way protected, there is a great risk of cracked pots during frost. All trees in pots should be brought under cover before they come into flower, and one good fumigation be given them. There should not be any exception to this rule. I have already alluded to, and advised, a hive of bees to ensure a good set of fruit, so no further remark on this is necessary.

### After the Fruit has Set.

When it is seen that a good set of fruit has been secured, the process of thinning should soon be commenced. First remove all the weakly and smaller fruits, then wait for a few days. Secondly, remove those badly placed, and thin the fruits that are too thickly studded on the branches. Afterwards proceed with caution, even to removing no more than one fruit at a time on the smaller trees. As previously alluded to in the case of the larger-fruited varieties, 10in. pots, it is a bad plan to attempt to carry a heavy crop of fruit. Of peaches, nectarines, pears, and apples from six to eight fruits are ample to be left at the final thinning. Of plums the same number in the case of the larger fruited varieties, and no more than a dozen of the smaller ones. Bear in mind that one well-developed fruit is better than two second-rate ones. In dealing with cherries I find it better to thin with a pair of grape scissors rather than by means of the hand or knife. Here again, do not attempt to ripen a very heavy crop of fruit. This will be safer, at times, when the trees gain age and experience has been arrived at. The final thinning should be when the fruits are seen to be fairly well over the stoning period in the case of stone fruits, and of pears and apples when a little larger. All trees should be fumigated as soon as the fruit is seen to be quite safely set.

### Plums and Cherries.

In the case of both cherries and plums small, dark-looking caterpillars oftentimes make their appearance. These must be most persistently hunted down, or considerable damage to the embryo fruits will ensue. In the case of cherries we also remove all outer scales that envelop the flower buds, for these we find are lurking places for this pest. This is done with a finely-pointed stick in preference to anything else. As soon as the cherry crop is seen to be fairly swelling away, which it will do very soon indeed after the fruit is set, we commence to shade the roof. For this purpose I prefer to use a sliding blind made of a thin material, which is known as No. 3 shading. This is the stock name of this material, though some purveyors of shading may attach another name to it. This we fix on a running wire, and the blind is thus easily run out, or drawn in, according to the state of the weather. We also find this same blind very useful when cold nights ensue in the spring, rather than employ too much fire-heat.

By why shade cherries, some cultivators may ask. My reply is in another question. Has anyone ever noticed that a good proportion of the fruits, after swelling rapidly for a few days, turn yellow and drop off? It is to remedy this that I advise shading. Oftentimes (we, at least, experience it), there may be some days of cloudy weather, then a bright clear day when the temperature is run up rapidly. This is the cause of cherries under glass turning yellow and dropping off. (If any cultivator of cherries in the open has ever experienced this annoying failing, I recommend the adoption of a thin blind.) This same blind we find to be extremely useful when the fruits are fully ripened.

### Top-dressing.

This we find to be a great assistance in the final swelling of the fruits, and it should be applied rather in advance of that stage, and when it can be easily discerned that the young rootlets are upon the surface. For this purpose we make up a mixture of about one-third each of turfy loam, short horse droppings (or some old mushroom bed manure), and Wakeley's Hop Manure. This is all well mixed, and then fairly well moistened, so that it may be built up around the outer edge of the surface, somewhat in the way of mortar, and in the form of a ring, the centre portion being left without any top-dressing. Into this the roots soon find their way, and can be clearly seen upon the exterior of the dressing.

### Other Manurial Aids.

We commence to feed somewhat earlier than this stage of top-dressing by giving occasional applications of liquid manure made from fresh horse-droppings that have been placed in a tub, or a tank, in which also some old scrap iron has been placed, this latter will give some aid in the final colouring. When the ripening stage is advancing no more of any stimulant is applied, for obvious reasons.

### Gathering the Fruits.

A few remarks on this point are perhaps necessary. We find that, with both peaches and nectarines it is better to sever the fruit with the stalk attached thereto rather than attempt to remove it by a twist, for however carefully this may be done there is always the risk of a slight bruise at the base. Early Rivers nectarine is a case in point to illustrate this method of taking the fruit; this variety, in pots particularly, swells its fruit up hard to the wood upon which it is attached. To remove it in the usual course would create a bruise at once. Never allow either peaches or nectarines to remain upon the trees until at all over-ripe, otherwise they will not keep so well. It is better to gather them and keep them in a cool place.

### After-treatment.

When the fruit is gathered, and the trees well hardened off, they should be placed outside to make room for the later crops. Ours are all plunged over the rims of the pots, the watering thence onwards through the summer being done with the hose, which also helps to cleanse the trees of any possible insects. Our cherries are plunged slightly under the shade of an apple tree, as, in my opinion, I think too much sunshine is not beneficial to them, even at this stage. The rest are all plunged, as much as possible, in the full sunshine. Thence onwards, until the leaves begin to fall, two or three applications of artificial manure is given them. That this treatment is favourable to the trees may be noted by referring to the cherry tree (as illustrated in the previous issue) before being turned out of its pot for repotting.

### Syringing and Other Routine Work.

In this there is no departure from that which obtains with planted-out trees, but it may be noted that in the case of trees in pots it is possible to reach the foliage from all directions with the syringe. Overluxuriant and sappy growth will rarely, if ever, occur with the trees in pots. Finally, do not think of growing trees in pots under the shade of other trees or plants. This is only to court failure.

Gunnersbury House Gardens.

## CASTILLEJA MINIATA.

A goodly number of attempts have been made to establish the effective Castillejas in our gardens, but, unfortunately, the efforts have generally been in vain. I suppose there can be no manner of doubt that several of the Castillejas (sometimes spelled Castilleias, by the way) are perennial, and that they ought to be hardy with us, or, at least, some of them. However, that is another story, and in actual practice we find them very difficult indeed to make anything of in our climate. This is a pretty general experience, yet the flowers, which bear in the New World the expressive name of "Painted Cups," are so brilliant that it must be with reluctance that we write them down as "uncertain, coy, and hard to please."

One most able writer who has succeeded with one of them, thinks that they may be parasitic or semi-parasitic. He is quite correct in his impressions, as we are informed on no less authority than Messrs. Britton and Brown that the Castillejas are "parasitic on the roots of other plants." Doubtless this accounts largely for many of our failures, and if these authorities had deigned to consider the wants of the gardener they would have informed us what plants they selected as their hosts, as it is quite probable that they have their own requirements in this respect. It is a hopeless thing, indeed, for us to set about finding out what plants will be hospitable enough to give the Castillejas board and lodgings free of cost. Amid the thousand-and-one plants of our gardens it would be mere chance which would enable us to hit upon the generous or simple ones which would serve the Painted Cups.

Then we are met with another trouble. The perennial Castellejas, and some of the annuals as well, evidently love a moist soil at home, while with us in some gardens this is anathema to them, and they forthwith sulk and die if given what we might assume to be their natural element.

Now, of the few Castillejas we have the chance of securing, that named C. miniata appears to be th emost obliging if we dare venture to use the term obliging with respect to a churlish, though beautiful, plant like this. I call it miniata, but I fancy that we have in our miniata the real C. acuminata of the botanist, and here, I see, the learned writer already referred to agrees. Well, I have seen it doing fairly well in a crevice well up on the rockery, and I hear of it thriving on a peat bed, well drained underneath; while from the Emerald Isle comes the news that it is flourishing with a south-east exposure on a sloping, well-drained bed.

As for myself, I am still in the throes of the experimental stage. So far, a moist climate and our winter wet seems not only hurtful, but even fatal, to the Painted Cups. Could we learn the host plants, we might be better off, and be able to write down the Painted Cups as a "joy for ever." I have now a feeling that a moraine, with water underneath, would be a good testing ground. In the meantime I counsel all who read this not to purchase a Castilleja in the confident expectation that they will succeed. That success for me lies still in the lap of the gods.

S. Arnott.

## EDUCATION OF GARDENERS.

While so many able articles have appeared in the Gardeners' Magazine of late on the education of gardeners, it may perhaps seem superfluous to add one more, were it not that few have appeared from the young men under consideration. While not making a claim to be young—having had 20 years' gardening experience—I feel that I may be able to add something of interest to what has already been written.

It seems to me the chief advice that has been given to young gardeners has been—Educate yourselves. With all due deference to your able correspondents, I should like to ask how many lads entering gardening at, say 14, feel the need for such education, and in how many cases do they begin with anything better than a Board School education? Admitting that they feel the need for such education, or have someone to point out to them that they need it, they probably take up botany as the science having the most direct bearing on their calling, and find, as one correspondent point out, their spelling is at fault, the terms meaningless symbols, and a great deal of it, to them, unintelligible. I hold that what is required before young gardeners begin their scientific education is a knowledge of geometry, elementary mathematics, physics, and chemistry. A knowledge of these things will stand a young man in better stead at the beginning of his career than the study of abstruse subjects. I would advise young men to see first of all that the foundations of general education are well and truly laid before attempting to rear the superstructure.

It would be interesting to know how many young men are hindered in taking up the theoretical side of their craft, by their fellow workers. How much good are you going to derive from an improved education is the question often asked; but such a question prevents a good many making the attempt to improve their education. A word in season, a kindly enquiry as to progress, and a little encouragement from their superiors, not necessarily always the head gardener, would do much to induce many to enter on useful studies.

As to the question—Does it pay? My answer to that would be—Yes. If, as many think, knowledge carries with it its own reward, the answer is obvious; but if enhanced positions or increased wages are expected as the reward, then the question becomes more difficult to answer; but I should say it does pay in most cases. Take my own case in point. In applying for my present position, I had the practical side of my work called into question as the result of stating that I held several certificates in botany and mathematics, and one each for chemistry and land surveying, and only the influence of a friend secured me an interview, which led to my appointment. A generous increase in the matter of wages before twelve months were up proved the satisfaction of both parties, and the remark, "He's not afraid of work, anyhow," made two years after to the aforesaid friend, showed that it was felt by some of those in authority that a liberal education was not favourable to a close application to the practical side of garden management. It was my experience to serve an apprenticeship of three years in a nursery, and though the slip-shod methods of some of the work took some time to eradicate, the knowledge of how to use tools, the names and characteristics of the various trees and shrubs, and their methods of propagation, has ever since stood me in good stead. I quite agree with "H. E." (p. 652) that the gardener should by all means be practical first, for after a few years the theoretical side becomes increasingly interesting, and the knowledge thereof is absorbed in one quarter the time. Like one or two of your previous correspondents, I question "J. C. W.'s" remarks on (p. 574) in regard to drawing the middle-classes into gardening. I contend that, until the working-man gardener obtains the recognition due to his services, he need not fear the competition of the middle-class.

One other point that acts as a deterrent to a good many young men in taking up science, is the amount of material they have to work up (other than what they require) before a certificate can be obtained showing they have passed such subject. Until some society such as the Royal Horticultural Society, for instance, adopts a syllabus more adapted to the needs of practical men; but little progress will be made in improving the education of gardeners. Above all things, let it be realised that the gardener's duties render it necessary for those engaged in garden management to study the theoretical side as well as to become proficient in the practical side, as not until this is done will gardeners take the most important step towards raising the status of the oldest profession.

J. M.

## IMPORTATION OF NURSERY STOCK INTO THE UNITED STATES.

The following regulations have been made by the Secretary of Agriculture of the United States with regard to the importation of nursery stock:

### Definition.

The term "nursery stock" includes all field-grown florist's stock, trees, shrubs, vines, cuttings, grafts, scions, buds, fruit pits, and other seeds of fruit and ornamental trees or shrubs, and other plants and plant products for propagation, but does not include field, vegetable, and flower seeds, bedding plants, and other herbaceous plants, bulbs, and roots. All woody plants and parts thereof for propagation or planting are included within the term "nursery stock."

### Permits for Importation.

Persons wishing to import nursery stock must apply to the Secretary of Agriculture for a permit, stating the general nature and quantity of the nursery stock, the district or locality where grown, the name and address of the exporter, together with the name and address of the importer in the United States and the proposed port of entry. Applications for permits should be made in advance of the shipment of the nursery stock, but if, through no fault of the importer, stock shall arrive before the issue of a permit, the stock will be held in customs custody at the risk and expense of the importer for a period not exceeding ten days, pending the issue of a permit.

On approval by the Secretary of Agriculture of an application for the importation of nursery stock from countries which maintain nursery stock inspection, a permit will be issued. Permits will expire on the 30th day of June of the year following the date of issue.

### Entry of Nursery Stock.

Entry of nursery stock will not be allowed unless accompanied by a certificate issued by a duly authorised official of the country from which it is shipped, stating that it has been thoroughly inspected by him or under his direction, and was found, or believed to be, free from injurious plant diseases and insect pests. In the case of stock to be shipped between October 1 and May 31 this inspection must be made on or after October 1, and for stock shipped during the growing season inspection must be made not more than 30 days prior to date of shipment. Until July 31, 1913, however, the usual inspection certificate covering the previous growing season will be accepted. When the country from which any nursery stock is shipped maintains no official inspection, articles for which a permit has been issued will be admitted only through the ports of New York, San Francisco, Seattle, Jacksonville, and New Orleans, after examination by inspectors of the Department of Agriculture at the port of arrival, if found to be free from plant diseases and insect pests.

Entry will not be allowed unless the case, box, etc., is plainly and correctly marked to show the number of permit, the general nature and quantity of the contents, the district or locality and country where grown the name and address of the exported, and the name and address of the importer.

Nursery stock offered for importation without compliance with these regulations will be refused admission. Nursery stock, inspected as provided, which is found to be carrying dangerous insects or plant diseases, may be treated or destroyed, as circumstances require.

### Foreign Certificate of Inspection.

Certificates of inspection will be accepted if countersigned by duly authorised officials of foreign countries or their agents. On and after July 1, 1913, certificates must give the date of inspection, name of the grower, the district or locality and country where grown, a statement that the stock has been inspected by a duly authorised official, and found, or believed to be, free from dangerous insects and plant diseases, and must bear the name of the responsible inspection official for the country of origin.

### Declaration.

All shipments of nursery stock to the United States from countries which maintain an official system of nursery stock inspection must be accompanied by a declaration of the shipper, produced before an American consular officer. The declaration must contain a statement by the shipper that he believes the nursery stock to contain no injurious plant diseases or insect pests, the district or locality and country where grown, the name of the grower, the port of origin, and destination of the consignment, the date of inspection of the stock, and the name of the inspector, and the number of the permit issued by the Secretary of Agriculture. Consular invoices covering shipments of nursery stock to the United States must bear the number of the permit issued by the Secretary of Agriculture, and have attached to them the shippers' declaration.

## GARDENING ENGAGEMENT.

Mr. E. Knowles, for five and a-half years gardener to the late Mr. Alderman R. Clough, at Buckcliffe House, Keighley, has been appointed gardener to Sir Prince Smith, Bart., Southburn, Driffield.

# EXHIBITIONS AND MEETINGS.

◆

## Beckenham Horticultural Society.

An excellent lecture on "Perpetual Flowering Carnations" was given before this society by Mr. Leech, of Dulwich, a few days ago. Mr. Leech pointed out that the American varieties were responsible for the beginning of the present popularity of carnations. The plants required such simple treatment that it was in this very simplicity the stumbling block was so often found. Cuttings should only be taken from good healthy plants; they should be neither too hard or too soft, or from the bottom of plant, as these latter had a tendency to go to growth. The cuttings should be inserted in pure sand in a bottom heat of 50 or 60 degrees, while the house temperature should be a few degrees lower. When rooted they must be potted on in a mixture of loam and a little sand in small thumb pots, and as soon as established therein be given cooler conditions, for they must on no account be coddled. The next potting would be into 60's, and it is here they are first stopped, rather low down, to get a good number of growths on them, emphasised on account of its importance in providing a good foundation. The next shift should be into 32's, and here the plant is stopped again, and a good plan advised was to stop at intervals, to give a succession of bloom.

The ideal loam Mr. Leech recommended was from some good old pasture land, but where the soil was poor the addition of bone-meal, wood ashes, lime, and a sprinkling of soot would enrich it. The plants should be grown outside all the summer, preferably in frames, as they can then be covered over during wet periods. In the winter the carnation house must be kept dry by the aid of a little heat, about 50 degrees, as the flowers will then open much better, and be of good colour. In connection with the diseases of carnations, the lecturer strongly advised preventure by sprinkling the plants with lime and sulphur.

## Bournemouth Gardeners' Association.

Mr. J. Smith, gardener to Lady de Tabley, Berry Court, Bournemouth, gave a very interesting and instructive lecture, illustrated by lantern views, on "The Cultivation of Currants" on Tuesday, December 17.

Messrs. Evans, Pearce, and Heath staged some nice plants of crotons, dracænas, and Primula sinensis for the "points" prizes. The primulas were well grown, profusely-flowered plants.

Mr. Smith first dealt with the preparation of the soil and the planting of the young bushes. He advised deep trenching, then the application of a heavy dressing of manure placed on the surface and thoroughly mixed with the top soil only. He also advised cultivators to add a fair quantity of old lime rubble and salt. He would have the bushes planted 4ft. apart each way. Dealing with the young plants of red and white currants, he said it was a mistake to allow any young basal shoots to grow after sufficient had been secured to form the bush itself. All main branches should be so trained as to allow of a man's hat being freely passed between them after the winter pruning had been done. For standards, the lecturer advised the Red Dutch mainly. He described the method of forming a standard from the cutting stage. Mr. Smith showed on the screen standards growing alternately with bushes, with strawberries in front. He advocated early pruning.

Having referred in detail to the treatment of black currants, and named varieties that had succeeded well in the neighbourhood, Mr. Smith answered a number of questions, and a free discussion took place. Mr. King, gardener to W. W. Moore, Esq., presided, and hearty votes of thanks were accorded both the chairman and the lecturer.

# ANSWERS TO CORRESPONDENTS.

EXHIBITIONS FOR 1913.—S. B., Watford: Where can I obtain a good list of the principal horticultural exhibitions, etc., for 1913?—We shall present our annual Almanac with the issue of the GARDENERS' MAGAZINE of January 4, and this will contain the best available list of horticultural fixtures.

PRICES OF TIMBER.—J. G., Gloucester: I shall be glad if you will tell me what price good Austrian pine timber should fetch, and also the usual price of holly timber?—Austrian pine is not likely to fetch more than 4d. per foot, probably less. Holly is not quoted as it is so seldom offered, and there is no regular supply. If someone wanted holly timber for ebonising or other special purpose a fair price would be offered, but, with such exception, the wood has only a firewood value.

INCURVED CHRYSANTHEMUMS. — M. E. M., Lincoln: I gather from the reports given and remarks made in the GARDENERS' MAGAZINE, that fewer incurved chrysanthemums have been shown this season than in previous years, and the inference is that this section is experiencing a decline in public favour. I am loth to believe that this is so, but perhaps you could say what the position is.—As an exhibition flower on the show board there has been a decline in the popularity of incurved chrysanthemums during the last few years, and we much regret this is so, as we have a great admiration for finely-grown and finely-shown blooms of this type. Raisers are devoting less attention to the section, and, as competition lessens, societies reduce or withdraw prizes for incurved flowers. However, on the other hand, the market growers appreciate the value of incurved varieties, and grow many of them for the production of cut flowers; the blooms are, of course, not so solid and formal as those grown for show purposes. Mr. W. Higgs, of Fetcham Park Gardens, Leatherhead, our foremost exponent of the culture and exhibition of incurved chrysanthemums, drew attention to these matters at a Conference held by the National Chrysanthemum Society at Essex Hall, in the late autumn of 1910. In concluding a lecture given on that occasion, Mr. Higgs said: "I should like to remark that of late years fewer incurveds have been exhibited at our shows. The true cause of this is rather difficult to determine. It may be that they require more care and attention, more skill in staging and dressing than Japanese, or it may be that they are losing favour with the public. We have now reached a period when popular sympathy is with the Japanese, and the single is rapidly gaining the admiration of flower-lovers. A great many people prefer decoration to the formal incurved blooms on the showboard. But in spite of these drawbacks, I feel sure that if incurved chrysanthemums do gradually assume the fourth place, it will be due to lack of interest, not amongst the public, but amongst the growers. Personally, I should like to see many more entries in the incurved classes of our exhibitions. Interest in them would then revive, their culture would advance more rapidly, and raisers would be encouraged to produce more new sorts every season. At the present time the number of new varieties brought out each year is lamentably small. I believe I am right in saying that the Floral Committee of the N.C.S. has labelled only one new incurved F.C.C. this season—Ethel Thorp. If we go on at this rate, the progress of cultivation of incurveds will be much slower than that of Japanese and singles. Therefore, let us do all we can to further the advance of one of the most beautiful flowers it is possible to cultivate."

JUDGING SWEET PEAS.—F. F. C., Newcastle: Is there any recognised code of judging for sweet peas? If so, I shall be glad if you will publish it in your "Answers" column.—The Royal Horticultural Society deals with this matter, but we fancy their code is not generally adopted by sweet pea enthusiasts. Following its annual meeting a year ago, the National Sweet Pea Society held a conference, at which the question of judging sweet peas was discussed, and at the conclusion of the discussion, Mr. William Cuthbertson proposed, and Mr. R. Bolton seconded, that the following code of judging sweet peas be recommended for general use. The motion was carried unanimously: (a) When starting, count the exhibits in each class with the secretary's assistant, to make sure none is omitted. (b) Count the number of vases. (c) See that the exact number of varieties specified in the schedule are present in each exhibit. (d) Make a preliminary survey, an rule out those stands that are palpably defective, in order to be able to concentrate attention on the eligibles. (e) Look through the vases in the selected stands for mixed types. (f) Be prepared to make the awards on freshness, number of flowers per stem, size of flowers, disposition, and blending of colours. Compare vases of the same varieties side by side. (g) Give a maximum of 6 points per bunch. This maximum to be allocated to the best bunch, or bunches in the stands, and then point the other bunches, by half points if necessary, working

NEWS FROM HEADQUARTERS.
A GIFT APPRECIATED BY ALL,

Although unable to change the seasons, we can help to brighten the dull and often depressing days which occasionally occur during even the most favourable autumn and winter months, by creating an atmosphere reminiscent of those summer days when the honeyed fragrance of garden favourites was wafted through open windows.

The judicious use of our night-scented stock or sweet pea perfume will quickly dispel an atmosphere of pessimism, and suggest the sweetness of wind-borne fragrance from your summer garden, so true to the natural aroma are the perfumes we offer. These extractions from the natural blossoms are so subtle and delicate, that they convey to the mind the actual flowers rather than suggest a perfume. Instead of being overpowering and productive of langour, as is usual with so many perfumes, their fragrance is crisp and invigorating, and has an exhilarating effect upon the olfactory senses. To fully realise the delicate fragrance of these concentrated essences, they must be used sparingly, so that they suggest rather than define the flower they represent. Where a sweet perfume, without the exhilarating qualities of the above is preferred, we advise our Gardenia Extract, which possesses this quality without suggesting the heaviness characteristic of many Eastern scents and bouquets. For evening use it is particularly pleasing.

In the distillation of these perfumes, our foremost object is to produce the natural fragrance of the blossoms. They are, therefore, always suggestive of that refinement which is so important to those who are fond of delicate perfumes, but cannot tolerate the heaviness so prevalent in many kinds in frequent use.

Are you in a quandary concerning a Christmas or New Year Gift for members of your family or friends? The selection of suitable presents is always an anxious problem, and the fear that you may send a similar gift to one already received is always present. Save yourself this extra little worry by sending some Night-scented Stock, Sweet Pea, or Gardenia Perfume, which we particularly recommend.

JAMES CARTER & CO.,
Seedsmen to His Majesty the King,
RAYNES PARK, LONDON, S.W.

downwards from the maximum. In awarding these points due regard must be given to freshness, quality, and size of the flowers, as referred to above. (h) It is also recommended, where necessary (i.e., when the bunch pointing brings an equality, or nearly so) that 6 points extra be taken as a maximum for arrangement and blending of colours, the points so obtained being added to the total bunch points. (i) Double-standard flowers should not be discounted.

HISTORY OF KEW.—N. A., Chester: I should like to obtain some information concerning the history of the Royal Botanic Gardens, Kew, and if you can tell me where this is to be found in readily accessible fashion at a modest outlay, I shall be grateful.—Sixpence, plus a penny for postage, is certainly a modest outlay, and for this sum you can obtain the new "Popular Official Guide" to Kew, from Darling and Son, 34-40, Bacon Street, London, E., or from Kew itself. This contains an historic notice and descriptions of the collections in the Botanic Gardens proper, the glass houses, museums, and Arboretum. It will, we believe, give you all the information you require, and it has the advantage of including a capital index.

FAILURE WITH SPIRÆAS.—C. R., Manchester: I enclose spikes of Spiræa Queen Alexandra for your inspection. Will you kindly inform me what kind of disease has attacked them? The plants are very healthy up to the stage of producing spikes. No artificials have been given them and the plants have stood in a newly painted house, air being admitted night and day.—We cannot trace any signs of disease in the specimens sent, and can only conclude that some cultural mistake is answerable for the collapse of the plants just previous to flowering. Poorly-rooted specimens, errors in watering, excessive heat, new paint in the house—all these may have some bearing upon the failure. We are inclined to think that the cause of the trouble lies between the water-pot and the new paint.

### NAMES OF PLANTS.

J. G. B., Oswestry.—1, Pilea muscosa; 2, Phrynium variegatum; 3, Cedrus atlantica.

P. L., Leicester.—1, Cedrus Deodara; 2, Buxus sempervirens; 3, Thuia gigantea; 4, Pinus sylvestris.

A. M., Dorchester.—1, Lonicera Standishi; 2, Jasminum nudiflorum; 3, Viburnum Tinus; 4, Arbutus Unedo.

### NAMES OF FRUITS.

C. P. T., Enfield.—1, Cox's Orange Pippin; 2, Mère de Ménage.

F. S. J., Sandy.—1, Dumelow's Seedling; 2, Court Pendu Plat.

E. V. B., Brentwood: 1, Margil; 2, Allen's Everlasting; 3, Uvedale's St. Germain.

H. S., Gloucester.—1, London Pippin; 2, Bramley's Seedling; 3, Fearn's Pippin; 4, probably Cornish Aromatic.

## MARKETS.

◆

### COVENT GARDEN.

### Flowers.

This has been a very short week, but there was a large amount of business done before Christmas Day. Almost all kinds of flowers found a ready sale.

*Our Illustrated Booklets tell all about us. Send for No. 2 Catalogue and self-measurement forms.*
D. NORWELL & SON,
Perth, Scotland.
Established over 100 Years.
*Trust the Man Behind the Boot.*

## CATALOGUES RECEIVED.

KELWAY and SON, Langport, Somerset.—Kelway's Manual of Horticulture for 1913 is something more than a catalogue; it is a guide to hardy flowers and a work of reference for the flower garden. Capitally arranged, freely descriptive, finely illustrated (the coloured plates are especially good), and extending to 352 pages, it is a valuable production.

SUTTON and SONS, Reading.—Dressed in an attractive and yet simple cover of old-gold and silver colouring, the Reading firm's seed catalogue for 1913, is, as usual, got up in a most interesting and instructive fashion. Half-tone illustrations are abundant, and there are coloured plates of sweet peas; of the firm's group of cinerarias, begonias, etc., at the International Horticultural Exhibition; of lavateras; and of a border of Sutton's antirrhinums at Claremont, Esher. The catalogue covers a wide range in flowers and vegetables.

E. WEBB and SONS, Wordsley, Stourbridge.—A very freely illustrated catalogue of flower and vegetable seeds. The firm's specialities in potatoes, tomatoes, peas, stocks, asters, etc., etc., are very well represented. Fifty-two gold medals and silver cups have been awarded to Webb's vegetables and flowers in four years.
